1. No or reduced sound from speaker 2. Amplifier inoperative/no sound from speakers * Noticeable audio distortion possible				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio and at the amplifier (if equipped) have a DC bias voltage that is one half of the battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. This voltage will vary depending on what type of audio is being listened to, talk or music, and type of music, as well as the volume setting of the system. Low volume and talk settings will measure around 1V AC and less, where constant music may measure 3V AC and slightly higher. In an amplified audio system, these similar AC voltage measurements may be slightly higher on the output of the amplifier, and the typical AC voltage readings at the output of the radio are less than 1V AC .

Conditions for Running the DTC

The radio is ON.

Conditions for Setting the DTC

B1025 01, B1035 01, B1045 01, B1055 01

A short to voltage is detected on the specified (+) or (-) signal circuit

B1025 02, B1035 02, B1045 02, B1055 02

A short to ground is detected on the specified (+) or (-) signal circuit

Action Taken When the DTC Sets

The radio disables audio output on the appropriate channel

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting are no longer seen
- A history DTC will clear after 100 malfunction free ignition cycles

Circuit/System Verification

Radio ON, adjust the fade and balance controls on the radio to test all four channels individually. Each of the four channels should produce clear and even sound.

Circuit/System Testing

Without Amplifier

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.
2. Radio ON, test for 5.0-7.5 volts between each signal circuit terminal A and terminal B and ground.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the speaker.

With Amplifier

1. Ignition OFF, disconnect the X1 connector at the amplifier.
2. Radio ON, test for 5.0-7.5 volts between the appropriate signal circuit terminal listed below and ground.
    - Left front low level audio signal (+) - terminal 15 X1
    - Left front low level audio signal (-) - terminal 7 X1
    - Right front low level audio signal (+) - terminal 14 X1
    - Right front low level audio signal (-) - terminal 6 X1
    - Left rear low level audio signal (+) - terminal 13 X1
    - Left rear low level audio signal (-) - terminal 5 X1
    - Right rear low level audio signal (+) - terminal 12 X1
    - Right rear low level audio signal (-) - terminal 4 X1
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the amplifier.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Left Audio Signal (-)	2	2	2	-
Right Audio Signal (+)	3	3	3	-
Right Audio Signal (-)	3	3	3	-
Digital Radio Antenna Coax	B1259 02	B1259 05	B1259 05	-
Ground	-	1	-	-
1. No communication with DRR/XM not available 2. No or distorted audio from left side speakers when listening to digital radio 3. No or distorted audio from right side speakers when listening to digital radio				

Circuit/System Description

The digital radio receiver (DRR) receives an XM satellite radio signal via the digital radio antenna. This signal is passed to the DRR through the digital radio antenna coax. The DRR sends a varying AC mV signal through separate left and right audio circuits (+ and -) to the radio. The voltage amount and rate of change is dependent upon the type of signal being received. The radio then processes these signals and passes the audio to the appropriate speakers or amplifier.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

B1259 02

The DRR detects a short to ground in the antenna circuit.

B1259 05

The DRR detects a short to voltage or an open in the antenna circuit.

Action Taken When the DTC Sets

The radio displays No XM Signal.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC clears after 100 malfunction-free ignition cycles.

Diagnostic Aids

When diagnosing digital radio concerns, the vehicle should be located outside with an unobstructed view of the southern sky to ensure proper reception of the satellite signal. Reception may limited, intermittent or not possible inside structures or under heavy cover.

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit System Verification

With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM. Verify XM reception is clear and the No XM Signal message is not displayed on the radio.

Circuit/System Testing

1. Ignition OFF, disconnect the antenna coax from the DRR. Connect the **EL-48028** antenna to the DRR.
2. Radio ON, tuned to XM, verify DTC B1259 is not set as current.
    - If the DTC is current, replace the DRR.
3. Ignition OFF, reconnect the antenna coax to the DRR, disconnect the digital radio antenna coax from the digital radio antenna.
4. Ignition ON, test for 4.5-5.5 volts between the antenna coax center terminal and the coax outer shield.
    - If not within the specified range, replace the antenna coax.
5. If all circuits test normal, replace the digital radio antenna.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Antenna 14V Switched Supply	B1287 02	B1287 04	B1287 01	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Voltage				

Circuit/System Description

The amplifier receives PWM signals on the antenna 14V switch supply voltage circuit at varying duty cycle percentages for controlling the ON and OFF functions of the amplifier. The radio outputs a low duty cycle signal to produce an ON condition at the amplifier. The radio outputs a high duty cycle signal to produce a OFF condition at the amplifier.

Conditions for Running the DTC

- Radio is ON
- The system voltage is at between 9 volts and 16 volts

Conditions for Setting the DTC

A short to voltage, short to ground, or an open is seen on the remote enable circuit

Action Taken When the DTC Sets

Amplifier functions are disabled

Conditions for Clearing the DTC

- A current DTC clears when the condition for setting the DTC is no longer present
- A history DTC clears after 100 malfunction- free ignition cycles

DTC B1446 OR B1447: BACKUP POWER SOURCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1446

Replace Backup Power Source Below Minimum Threshold

DTC B1447

Backup Power Source Open Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Backup Battery B+	B1447 03	B1447 04	-	-
Backup Battery Low Reference	B1447 03	B1447 04	-	-

Circuit/System Description

The backup power source provides voltage to the telematics communication interface control module , to be able to successfully place a call in the event of a main battery disconnect during a collision event.

Conditions for Running the DTC

B1446 03

- Ignition On/Vehicle in Service Mode.
- System voltage is between 9.5 and 15.5 V.
- DTC B1447 is not set.

B1447 04

- Ignition On/Vehicle in Service Mode.
- System voltage is between 9.5 and 15.5 V.
- The above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B1446 03

The telematics communication interface control module detects that the backup power source voltage has dropped below the minimum threshold value.

B1447 04

The telematics communication interface control module detects no voltage from the backup power source.

Action Taken When the DTC Sets

B1446 03

The OnStarÂ® status LED turns red.

B1447 04

- The OnStarÂ® status LED turns red.
- The telematics communication interface control module will be unable to place a call in the event of a main battery disconnect during a collision event.

Conditions for Clearing the DTC

- A current DTC B1446 will clear when the telematics communication interface control module detects the voltage of the backup power source is above the minimum threshold value.
- A current DTC B1447 will clear when the telematics communication interface control module detects voltage from the backup power source.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- Shorting the backup power source positive voltage circuit to the backup power source ground circuit or chassis ground will activate the internal circuit protection of the backup power source, rendering the backup power source inoperative.

- DTC B1447 may set if the K73 Telematics Communication Interface Control Module has been incorrectly disconnected or serviced. When disconnecting the K73 Telematics Communication Interface Control Module , disconnect the harness connector X1 at the K73 Telematics Communication Interface Control Module prior to disconnecting any other harness connectors. This will ensure the backup power source is preserved when voltage is removed from the K73 Telematics Communication Interface Control Module .

DTC B2455: CELLULAR PHONE MICROPHONE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC B2455 02

Cellular Phone Microphone Circuit Short to Ground

DTC B2455 04

Cellular Phone Microphone Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Microphone Signal Circuit	B2455 02	B2455 04	1	-
Low Reference Circuit	-	B2455 04	B2455 04	-
1. OnStar Microphone Inoperative - Caller Cannot Be Heard				

Circuit/System Description

The Telematics Communication Interface Control Module provides the Cellular Phone Microphone with a supplied voltage on the Cellular Phone Microphone signal circuit. When the microphone is in use, voice data from the user is sent back to the Telematics Communication Interface Control Module on the signal circuit. The Telematics Communication Interface Control Module provides a ground for the Cellular Phone Microphone via the low reference wire.

Conditions for Running the DTC

- The ignition must be in the RUN or ACC position.
- The system voltage is at least 9.5 V and no more than 15.5 V.
- All the above conditions are present for greater than 10 seconds.

Conditions for Setting the DTC

B2455 02

The Telematics Communication Interface Control Module detects a short to ground in the Cellular Phone Microphone signal circuit for 10 seconds or greater.

B2455 04

The following conditions will set this DTC:

- The Telematics Communication Interface Control Module detects an open/high resistance in the Cellular

Phone Microphone signal circuit for 10 seconds or greater.

- The Telematics Communication Interface Control Module detects an open/high resistance in the low reference circuit for 10 seconds or greater.

Action Taken When the DTC Sets

- The OnStarÂ® status LED turns red.
- The Telematics Communication Interface Control Module will not receive a signal from the Cellular Phone Microphone.
- Calls can be placed but the caller cannot be heard.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON.
2. Test for 8-10.5 V between the microphone signal circuit terminal B and ground.
    - **If less than 8 V**
    1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the microphone signal circuit and ground.

- If less than infinite resistance, repair the short to ground in the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the microphone signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.

- **If greater than 10.5 V**

1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
2. Test for less than 1 V between the microphone signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.

- **If between 8-10.5 V**

3. Test for less than 1 V between the low signal circuit terminal A and ground.
    - **If greater than 1 V**

    1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, repair the K73 Telematics Communication Interface Control Module.

    - **If less than 1 V**

4. Test for greater than 8 V between the microphone signal circuit terminal B and the low reference circuit terminal A.
    - **If less than 8 V**

    1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.

    - **If greater than 9.5 V**

5. Test or replace the B24 Cellular Phone Microphone.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mobile Telephone Microphone Replacement**
- **Control Module References** for Telematics Communication Interface Control Module replacement, programming and setup.

DTC B2470: CELLULAR PHONE ANTENNA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B2470 02

Cellular Phone Antenna Circuit Malfunction Short to Ground

DTC B2470 04

Cellular Phone Antenna Circuit Malfunction Open Circuit

Circuit/System Description

The cellular antenna is connected to the vehicle communication interface module (VCIM) with a RG-58 coax cable. The VCIM polls the data from the cellular antenna once every second.

Conditions for Running the DTC

- Ignition in the RUN or ACC position.
- System voltage is between 9.5 volts and 15.5 volts.
- The above conditions are present for greater than 1 second.

Conditions for Setting the DTC

- The VCIM does not detect the presence of a cellular antenna.
- The above conditions are present for greater than 1 second.

Action Taken When the DTC Sets

- The vehicle is unable to connect to the OnStarÂ® Call Center.
- The OnStarÂ® status LED turns red.

Conditions for Clearing the DTC

- The VCIM detects the presence of a cellular antenna.
- A history DTC clears after 50 malfunction-free ignition cycles.

Special Tools

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Verification

Verify that the cellular antenna and cellular antenna coupling assembly are not damaged.

- If the antenna assembly is damaged, replace the cellular antenna.

Circuit/System Testing

NOTE: **The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.**

1. Ignition OFF, disconnect the GPS and cellular coax cable connector at the VCIM.
2. Using the EL-49903-3 kit (EL-49903-5 adapter and EL-49903-4 coax cable), connect the **EL-49903** kit to the VCIM.
3. Clear the DTCs and operate the vehicle within the conditions for running the DTC. Verify DTC B2470 does not set.
    - If the DTC sets, replace the VCIM.
4. Ignition OFF, disconnect the **EL-49903** kit from the VCIM and perform the coax cable test on the coax cable between the VCIM and the cellular phone antenna.
    - If the coax cable does not pass the test, replace the coax cable.
5. If all circuits test normal, replace the cellular phone antenna.

Component Testing

CAUTION: **Refer to Test Probe Caution .**

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the GPS and cellular phone coax cable at both components.
2. Test both for less than 5 Ω between both ends of the coax cables center terminals.
   - If greater than the specified range, replace the failed coax cable.
3. Test for greater than 10k Ω between the coax cable center wire and the outer coax shield.
   - If less than the specified range, replace the coax cable.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Ground	-	B2476 04	-	-
1. OnStarÂ® Buttons Inoperative				

Circuit/System Description

The OnStarÂ® button assembly consists of 3 buttons: Call/Answer, OnStarÂ® Call Center, and OnStarÂ® Emergency. The telematics communication interface control module supplies the OnStarÂ® button assembly with 10 V via the 10 V reference circuit . Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been pressed.

Conditions for Running the DTC

- Ignition ON.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B2476 04

The telematics communication interface control module detects a short to voltage or an open/high resistance on the keypad 10 V reference circuit.

B2482 and B2476 59

The telematics communication interface control module detects a valid signal on the keypad signal circuit for longer than 15 seconds. If one of the OnStarÂ® buttons is held or stuck for 15 seconds or greater, the telematics communication interface control module will set this DTC.

Action Taken When the DTC Sets

- The OnStarÂ® status LED turns red.
- No calls can be placed.
- The telematics communication interface control module will ignore all inputs from the OnStarÂ® button assembly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

NOTE: **Contact the OnStarÂ® Call Center first before pressing the emergency button in order to notify them of the test.**

1. Ignition ON.
2. Verify that each button of the S51 Telematics Button Assembly operates normally by pressing each button individually.
   - **If none of the buttons operate normally**

     Refer to Circuit/System testing

   - **If some, but not all, of the buttons operate normally**

     Test or replace the A10 Inside Rearview Mirror

   - **If all of the buttons operate normally**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for 8.0-10.5 V between the 10 V reference circuit terminal 12 and ground.
   - **If less than 8.0 V**

1. Ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module.
2. Test for infinite resistance between the 10 V reference circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the 10 V reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.

- **If greater than 10.5 V**

1. Ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
2. Test for less than 1 V between the 10 V reference circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.

- **If between 8.0-10.5 V**

5. Ignition OFF.
6. Test for 500-900 Ω between the signal circuit terminal 11 and ground.

- **If less than 500 Ω**

1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K73 Telematics Communication Interface Control Module.

- **If greater than 900 Ω**

1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.

- **If between 500-900 Ω**

7. Test or replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- **Inside Rearview Mirror Replacement**

- **Control Module References** for telematics communication interface control module replacement, programming, and setup.

DTC B2485: WIRELESS COMMUNICATION ANTENNA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC B2485 02

Wireless Communication Antenna Circuit Short to Ground

DTC B2485 04

Wireless Communication Antenna Circuit Open Circuit

Circuit/System Description

The Bluetooth Â® antenna is a small fixed antenna connected directly to the communication interface module (CIM) and is used to send and receive signals from a Bluetooth Â® enabled cellular phone. The antenna utilizes no cabling and is not external to the vehicle.

Conditions for Running the DTC

- Ignition ON.
- Battery voltage must be between 9-16 V.
- The CIM tests the antenna once every second.

Conditions for Setting the DTC

B2485 02

The CIM detects a short to ground in the Bluetooth Â® antenna.

B2485 04

The CIM detects an open/high resistance in the Bluetooth Â® antenna.

Actions Taken When the DTC Sets

- The OnStar Â® status LED turns red.
- Bluetooth Â® functionality is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Verify the Bluetooth Â® antenna is properly connected to the CIM and is not damaged.
    - If the antenna is disconnected or damaged, repair or replace as necessary.
2. Ignition ON, verify the DTC B2485 is not set .
    - If the DTC is set, replace the Bluetooth Â® antenna. Clear the DTC and cycle the ignition OFF then back ON. If the DTC resets as current, replace the CIM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Wireless Communication Interface Antenna Replacement**
- **Control Module References** for CIM replacement, setup, and programming

SYMPTOMS - CELLULAR COMMUNICATION

NOTE: **The following steps must be completed before using the symptom table.**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **OnStar Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to **Checking Aftermarket Accessories** .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Bluetooth Malfunction**
- **OnStar Global Positioning System (GPS) Data Not Current or Inaccurate**
- **OnStar Microphone Malfunction**
- **OnStar Audio Malfunction**
- **OnStar Button LED Malfunction**
- **OnStar Call Center Remote Function Requests Malfunction**
- **OnStar Button Malfunction**
- **Unable to Contact OnStar Call Center**
- **OnStar Voice Recognition Malfunction**
- **OnStar Steering Wheel Control Functions Malfunction**

SYMPTOMS - ENTERTAINMENT

IMPORTANT: The following steps must be completed before using the symptom table.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Radio/Audio System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to **Checking Aftermarket Accessories** .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Digital Radio Malfunction**
- **Radio Poor Reception**
- **Speaker Malfunction**

BLUETOOTH MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The Bluetooth Â® antenna is a small fixed antenna connected directly to the communication interface module (CIM) and is used to send and receive signals from a Bluetooth Â® enabled cellular phone. The antenna utilizes no cabling and is not external to the vehicle.

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the Bluetooth Â® functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. For safety reasons, the pairing process is disabled while the vehicle is moving.

Diagnostic Aids

- The purpose of this diagnostic is to verify the ability of the CIM to pair to a Bluetooth Â® device.
- Before performing this test, verify compatibility of the cellular phone(s) the customer is attempting to use with the vehicle. Based on the cellular phone's service provider and the manufacturer's implementation of Bluetooth Â®, not all phones support all available Bluetooth Â® functionality. A vehicle and feature compatibility list will be provided via the GM Bluetooth Â® website: http://www.onstar.com /web/Bluetooth/
- If the vehicle passes the following tests and a compatible device is being used, the concern may be due to a device malfunction or an incomplete/improper pairing attempt.
- A Bluetooth Â® test tool or equivalent can also be used to verify the ability of the customers cellular phone(s) to pair with another device.

Control Module References for scan tool information

Circuit/System Verification

1. Verify DTC B2485 is not set.
    - If DTC B2485 is set , refer to **DTC B2485**.
2. Set up a Bluetooth Â® test tool or equivalent.
3. Ignition ON, perform the discovery/search operation with the test tool. Verify the vehicle appears in the list of available devices.
    - If the vehicle is not in the list of available devices, repeat the discovery/search operation. If the vehicle is still not in the list of available devices, replace the CIM.
4. Follow the instructions provided in the Vehicle Owners Manual for pairing a device. Verify successful pairing with the test tool.
    - If pairing is not successful, repeat the pairing process. If pairing is still not successful, replace the CIM.
5. Refer to Diagnostic Aids.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for CIM replacement, programming and setup

DIGITAL RADIO MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ Voltage	-	1	-	-
Left Audio Signal (+)	2	2	2	-
Left Audio Signal (-)	2	2	2	-
Right Audio Signal (+)	3	3	3	-
Right Audio Signal (-)	3	3	3	-
Digital Radio Antenna Coax	B1259 02	B1259 05	B1259 05	-
Ground	-	1	-	-
1. No communication with DRR/XM not available 2. No or distorted audio from left side speakers when listening to digital radio 3. No or distorted audio from right side speakers when listening to digital radio				

Circuit/System Description

The digital radio receiver (DRR) receives an XM satellite radio signal via the digital radio antenna. This signal is passed to the DRR through the digital radio antenna coax. The DRR sends a varying AC mV signal through separate left and right audio circuits (+ and -) to the radio. The voltage amount and rate of change is dependent upon the type of signal being received. The radio then processes these signals and passes the audio to the appropriate speakers or amplifier.

Diagnostic Aids

When diagnosing digital radio concerns, the vehicle should be located outside with an unobstructed view of the southern sky to ensure proper reception of the satellite signal. Reception may be limited, intermittent or not possible inside structures or under heavy cover.

Scan Tool Reference

Control Module References for scan tool information

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit/System Verification

1. Verify that the Check XM Receiver message is not displayed on the radio.
    - If a Check XM Receiver message is displayed, replace the DRR.
2. Tune to a strong AM or FM station and verify each speaker is producing clear and even sound, with no distortion.
    - If any speaker is not producing sound or the sound produced is distorted, refer to **Speaker Malfunction**.
3. With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM. Verify XM reception is clear and the No XM Signal message is not displayed on the radio.
    - If the No XM Signal message is displayed or XM reception is poor, refer to Digital Radio Antenna Circuit Malfunction.
4. Radio tuned to XM, use the radio balance function to transfer audio between the left and right side of the vehicle. Verify clear and even sound is heard from each side of the vehicle.
    - If either side of the vehicle is not producing sound or the sound produced is distorted, refer to Digital Radio Output Circuit Malfunction.
5. Verify if the XM band is receiving all channels (preview mode).
    - If no channels are displayed, advise the customer to refer to the owners manual for XM contact information in regards to an active account status and/or a refresh request.

Circuit/System Testing

Digital Radio Antenna Circuit Malfunction

1. Ignition OFF, disconnect the antenna coax from the DRR. Connect the **EL-48028** antenna to the DRR.
2. Ignition ON, radio tuned to XM, verify XM reception is clear and uninterrupted.
    - If reception is not clear, replace the DRR.
3. Ignition OFF, reconnect the antenna coax to the DRR, disconnect the digital radio antenna coax from the digital radio antenna.
4. Ignition ON, test for 4.5-5.5 volts between the antenna coax center terminal and the coax outer shield.
    - If not within the specified range, replace the antenna coax.
5. If all circuits test normal, replace the digital radio antenna.

Digital Radio Output Circuit Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the radio.
2. Ignition ON, radio ON and tuned to XM, test for varying mV AC voltage between the following signal circuit terminals listed below and ground:
    - Left audio signal (+) - connector X2, terminal 1

- Right audio signal (+) - connector X2, terminal 2
- Left audio signal (-) - connector X2, terminal 9
- Right audio signal (-) - connector X2, terminal 10
- If the varying mV A/C voltage is not present, test the signal circuit for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the DRR.

3. If all circuits test normal, replace the radio.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Cellular Communications/Digital Radio Antenna Replacement**
- **Control Module References** for radio or DRR replacement, setup, and programming

ONSTAR GLOBAL POSITIONING SYSTEM (GPS) DATA NOT CURRENT OR INACCURATE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The vehicle communication interface module (VCIM) receives information from a specific navigation antenna located on the outside of the vehicle. The navigation antenna is connected to the vehicle communication interface module via a shielded coaxial cable. The antenna cable also provides a path for DC current for powering the antenna.

Diagnostic Aids

- The GPS signal title on the scan tool will display a Yes or No dependant upon whether or not the module sees an increment of the seconds transmitted by GPS signals to the vehicle communication interface module. Upon entering this screen, the GPS signal title will automatically display Yes, regardless of the presence of time increment, for at least 2 seconds, while the algorithm in the scan tool determines the status of the clock. If increment is found, Yes is continually displayed. If the clock remains static, No is displayed. The scan tool looks for increment every second, regardless of current display.
- Inaccurate or aged GPS position concerns which are no longer present may have been due to the temporary loss of GPS signal reception by the vehicle. Conditions such as driving through tunnels or parking structures while making an OnStarÂ® keypress will restrict the navigation antenna from a clear view of the satellites in the sky and may have caused this temporary data loss.

Special Tools

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Verification

NOTE: **It is important to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from the satellites. It is also necessary to inform the OnStarÂ® Call Center advisor that this call is for vehicle diagnostic purposes.**

1. Ignition ON, observe the GPS signal status indicator for at least 10 seconds with a scan tool. The indicator should display Yes.
   - If the indicator does not display Yes, refer to Circuit/System Testing.
2. Call and verify the OnStar advisor has received the GPS data.
   - If the advisor did not receive the GPS data and the call was a "fail to voice", contact the GM Technical Assistance Center.
   - If the advisor did not receive the GPS data and the call was not a "fail to voice", refer to Circuit/System Testing.
3. Verify with the OnStar Call Center advisor that your actual position is within a reasonable distance from the actual location of the vehicle.
   - If your actual position is not within a reasonable distance from the actual location of the vehicle, replace the vehicle communication interface module.

Circuit/System Testing

1. Ignition OFF, disconnect the GPS and cell coax cable connector at the vehicle communication interface module.
2. Using the EL-49903-3 kit (EL-49903-5 adapter and EL-49903-4 coax cable), connect the **EL-49903** kit to the vehicle communication interface module, place the test antenna on the roof of the vehicle.

3. Ignition ON, wait 5 minutes, then contact the OnStar call center consultant by pressing the blue OnStar button. A call center consultant should answer the call, ask the consultant to verify the vehicle location to confirm the GPS system is functioning.
    - If the OnStar GPS does not function, replace the vehicle communication interface module.
4. Reconnect the coax cable to the vehicle communication interface module. Disconnect the coax cable from the navigation antenna.
5. Test for 4.5-5.5 V between the coax cable center conductor and the outer shield.
    - If not within the specified range, replace the coax cable.
6. If all circuits test normal, replace the navigation antenna.

Circuit/System Verification

NOTE: **It is necessary to have the vehicle in a quiet, open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.**

1. Ignition ON.
2. Verify that DTC B2455 is not set.
   - **If DTC B2455 is set**

     Refer to **DTC B2455**

   - **If DTC B2455 is not set**
3. Verify that a successful OnStar voice command can be made.
   - **If your voice can not be heard clearly**

     Refer to Circuit/System Testing.

   - **If your voice can be heard clearly**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON.
2. Test for 9.5-10.5 V between the signal circuit terminal B and ground.
   - **If less than 9.5 V**
   1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.
- **If greater than 10.5 V**

1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
- **If between 9.5-10.5 V**

3. Test for 9.5-10.5 V between the signal circuit terminal B and the low reference circuit terminal A.
    - **If less than 9.5 V**

    1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.
    - **If greater than 10.5 V**

    1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
    2. Test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
    - **If between 9.5-10.5 V**

4. Test or replace the B24 Cellular Phone Microphone.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Verification

1. Tune radio to a known good station and verify the audio is heard clearly through all speaker channels.
   - If audio is not heard clearly, refer to **Speaker Malfunction**.
2. Ignition ON, radio ON, set volume to comfortable level and press OnStarÂ® Call Center button. Verify Connecting to OnStarÂ® message is heard clearly through the audio system.
   - If OnStarÂ® message is noisy or distorted, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the radio.
2. Disconnect the X2 harness connector at the vehicle communication interface control module.
3. Ignition ON, test for less than 1 V between the vehicle communication interface control module cellular telephone voice signal circuit terminal 1 X2 and ground.
    - If not the specified value, test the cellular telephone voice signal circuit for a short to voltage.
4. Test for less than 1 V between the vehicle communication interface control module cellular telephone voice low reference circuit terminal 2 X2 and ground.
    - If not the specified value, test the cellular telephone voice low reference circuit for a short to voltage.
5. Ignition OFF, test for infinite resistance between the vehicle communication interface control module cellular telephone voice signal circuit terminal 1 X2 and ground.
    - If not the specified value, test the cellular telephone voice signal circuit for a short to ground.
6. Test for infinite resistance between the vehicle communication interface control module cellular telephone voice low reference circuit terminal 2 X2 and ground.
    - If not the specified value, test the cellular telephone voice low reference circuit for a short to ground.
7. Test for less than 2 Ω between the vehicle communication interface control module cellular telephone voice signal circuit terminal 1 X2 and the radio terminal 20 X1.
    - If not the specified value, test the cellular telephone voice signal circuit for a open/high resistance.
8. Test for less than 2 Ω between the vehicle communication interface control module cellular telephone voice low reference circuit terminal 2 X2 and the radio terminal 6 X1.
    - If not the specified value, test the cellular telephone voice low reference circuit for a open/high resistance.
9. If all circuits test normal, replace the vehicle communication interface control module.
10. If all circuits test normal, replace the radio.

1. OnStarÂ® LED Inoperative 2. LED Illuminated At All Times 3. OnStarÂ® Buttons Inoperative				

Circuit Description

The OnStarÂ® status LEDs are located in the inside rearview mirror telematic button assembly. The green LED is illuminated when the system is ON and operating normally. When the green LED is green and flashing, it is an indication that a call is in progress. When the red LED is illuminated, a system malfunction is present. In the event there is a system malfunction and the OnStarÂ® system is still able to make a call, the LED will flash red during the call. The OnStarÂ® LEDs are controlled by the telematics communication interface control module via the keypad green LED control circuit and the keypad red LED control circuit.

Circuit/System Verification

NOTE: **If the green LED is off with the ignition ON and the LED does not function when**

commanded with the scan tool, contact the OnStar Center to confirm the vehicle has a current subscription.

1. Ignition ON.
2. Verify that the green LED turns ON and OFF when commanding the K73 telematics communication interface control module green indicator ON and OFF with a scan tool.
   - **If the green LED does not turn ON and OFF**

     Refer to Circuit/System Testing - Green LED Test

   - **If the green LED turns ON and OFF**
3. Verify that the red LED turns ON and OFF when commanding the K73 telematics communication interface control module red indicator ON and OFF with a scan tool.
   - **If the red LED does not turn ON and OFF**

     Refer to Circuit/System Testing - Red LED Test

   - **If the red LED turns ON and OFF**
4. All OK.

Circuit/System Testing

Green LED Test

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the A10 inside rearview mirror. It may take up to 2 minutes for all vehicle systems to power down. Doors closed, courtesy lamps OFF.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for less than 1 V between the control circuit terminal 14 and ground while commanding the K73 telematics communication interface control module green indicator OFF with a scan tool.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K73 telematics communication interface control module, ignition ON.
   2. Test for less than 1 V between the control circuit terminal 14 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K73 telematics communication interface control module.
   - **If less than 1 V**

5. Test for greater than 8 V between the control circuit terminal 14 and ground while commanding the K73 telematics communication interface control module green indicator ON with a scan tool.
    - **If 8 V or less**
    1. Ignition OFF, disconnect the X1 harness connector at the K73 telematics communication interface control module.
    2. Test for infinite resistance between the control circuit terminal 14 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K73 telematics communication interface control module.
    - **If greater than 8 V**
6. Test or replace the A10 inside rearview mirror.

Red LED Test

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the A10 inside rearview mirror. It may take up to 2 minutes for all vehicle systems to power down. Doors closed, courtesy lamps OFF.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for less than 1 V between the control circuit terminal 15 and ground while commanding the K73 telematics communication interface control module red indicator OFF with a scan tool.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K73 telematics communication interface control module, ignition ON.
    2. Test for less than 1 V between the control circuit terminal 15 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K73 telematics communication interface control module.
    - **If less than 1 V**
5. Test for greater than 8 V between the control circuit terminal 15 and ground while commanding the K73 telematics communication interface control module red indicator ON with a scan tool.
    - **If 8 V or less**
    1. Ignition OFF, disconnect the X1 harness connector at the K73 telematics communication interface control module.

2. Test for infinite resistance between the control circuit terminal 15 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K73 telematics communication interface control module.

- **If greater than 8 V**

6. Test or replace the A10 inside rearview mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Rearview Mirror Replacement**
- **Control Module References** for telematics communication interface control module replacement, programming and setup.

ONSTAR CALL CENTER REMOTE FUNCTION REQUESTS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module has the capability of commanding the horn, initiating door lock/unlock, or operating the exterior lamps using the serial data circuits. These functions are commanded by the OnStarÂ® Call Center per a customer request.

Diagnostic Aids

The customer concern may have been due to a lack of cellular service in a given area, or a failure in the National Cellular Network infrastructure that has since been corrected.

Circuit/System Verification

NOTE:

- **It is necessary to inform the OnStarÂ® Call Center advisor that this call is for vehicle diagnostic purposes.**
- **It is necessary to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.**

1. Ignition ON/vehicle in Service Mode.
2. Verify that the horn, lights, and the door locks on the vehicle operate properly.
   - **If an applicable vehicle system does not operate properly**

     Refer to **Diagnostic System Check - Vehicle** .

   - **If all applicable vehicle systems operate properly**
3. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
   - **If unable to contact the OnStarÂ® call center**

     Refer to **Unable to Contact OnStar Call Center**

   - **If able to contact the OnStar Call Center**
4. Verify with the OnStar advisor that all remote functions (door locks, lights, and horn) work.
   - **If the remote functions do not operate when requested**

     Replace the K73 Telematics Communication Interface Control Module

   - **If the remote functions operate when requested**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Terminal 15	1	1	2	-
Signal Terminal 11	3	3	2	B2476 59, B2482 00
Ground	-	B2476 04	-	-
1. OnStarÂ® LED Inoperative 2. LED Illuminated At All Times 3. OnStarÂ® Buttons Inoperative				

Circuit/System Description

The OnStarÂ® button assembly consists of 3 buttons: Call/Answer, OnStarÂ® Call Center, and OnStarÂ® Emergency. The telematics communication interface control module supplies the OnStarÂ® button assembly with 10 V via the keypad supply voltage circuit . Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been activated.

Circuit/System Verification

NOTE: **Contact the OnStarÂ® Call Center first before pressing the emergency button in order to notify them of the test.**

1. Ignition ON.
2. Verify the buttons operate normally by pressing each button individually.
   - **If none of the buttons operate normally**

     Refer to Circuit/System Testing.

   - **If some, but not all, of the buttons operate normally**

     Test or replace the A10 inside rearview mirror.

   - **If all of the buttons operate normally**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 inside rearview mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 Ω between the ground circuit terminal 8 and ground.
   - **If 15 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 15 Ω**
3. Ignition ON.
4. Test for 9.5-10.5 V between the 10 V reference circuit terminal 12 and ground.
   - **If less than 9.5 V**
   1. Ignition OFF, disconnect the harness connector at the K73 telematics communication interface control module.
   2. Test for infinite resistance between the 10 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 10 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K73 telematics communication interface control module.

- **If greater than 10.5 V**

1. Ignition OFF, disconnect the harness connector at the K73 telematics communication interface control module, ignition ON.
2. Test for less than 1 V between the 10 V reference circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K73 telematics communication interface control module.

- **If between 9.5-10.5 V**

5. Ignition OFF.
6. Test for 500-900 Ω between the signal circuit terminal 11 and ground.

- **If less than 500 Ω**

1. Disconnect the X1 harness connector at the K73 telematics communication interface control module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K73 telematics communication interface control module.

- **If greater than 900 Ω**

1. Disconnect the X1 harness connector at the K73 telematics communication interface control module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K73 telematics communication interface control module.

- **If between 500-900 Ω**

7. Test or replace the A10 inside rearview mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Rearview Mirror Replacement**
- **Control Module References** for telematics communication interface control module replacement, programming and setup.

ONSTAR STEERING WHEEL CONTROL FUNCTIONS MALFUNCTION

Some vehicles equipped with the OnStarÂ® system have the capability of accessing voice mailboxes and other automated phone systems by means of the steering wheel controls, while the OnStarÂ® Personal Calling

feature is in use. If the "Talk" or "Mute" button (depending upon the vehicle) on the steering wheel controls is depressed during an OnStarÂ® Personal Calling call, the telematics communication interface control module receives the message on the serial data bus from either the radio or body control module. This message is interpreted as a request to turn any spoken numbers into dual tone multi-frequency tones to be delivered over the airwaves to the phone system the user is communicating with. Complete instructions for operation of these features can be found in the information provided to the customer with the OnStarÂ® system.

The steering wheel controls are a resistor network that consist of multiple momentary contact switches and a series of resistors. The switches and resistor network are arranged so that each switch has a different resistance value. When a switch is pressed, a voltage drop occurs in the resistor network, which produces a specific voltage value unique to the switch selected, to be interpreted by either the radio or BCM. In the event the OnStarÂ® steering wheel control functions are inoperative, technicians should refer to **Steering Wheel Controls Malfunction** , to begin diagnosis of the steering wheel control concern.

RADIO POOR RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

AM and FM radio reception is dependent on the following components:

- Radio antenna - part of the rear glass
- Radio antenna module
- Coax cable between the radio antenna module and the radio
- Radio

Diagnostic Aids

NOTE: **Radio systems with the antenna(s) in the glass are subject to possible interference when an aftermarket window tint is applied, especially when there is a metallic present in the film.**

Poor AM and FM radio reception is dependent on multiple influences, some of which may not be vehicle related. Areas which have high RF traffic or block the signal path may cause a degradation in radio reception. Radio reception may also be influenced by items within the vehicle, but not part of the radio system. Such examples are aftermarket electrical accessories or other items which may generated noise in the vehicle electrical system.

AM reception is highly dependent on the antenna module receiving battery voltage from the radio and being properly grounded. The antenna module has a built in antenna amplifier that boosts both AM and FM reception. When the antenna module does not receive power, AM stations will not be received and FM reception will be limited. If the module is not properly grounded, excessive interference in the signal may occur, or reception may be limited.

Circuit/System Testing

Rear Glass Antenna Inspection

1. Ignition OFF, disconnect the coax from the antenna located at the rear glass.
2. Verify the coax connector at the back glass is properly secured and free of any damage.
    - If damage is found, repair or replace as necessary.
3. Inspect the antenna on the rear glass. Verify all branches of the antenna are intact, with no scratches or other damage.
    - If damage is found, repair or replace as necessary.

Antenna Coaxial Cable Testing

1. Disconnect the antenna coax from the radio and the radio antenna module.
2. Test for infinite resistance between the antenna coax center terminal and ground.
    - If less than the specified value, replace the antenna coax.
3. Test for less than 5 ohms of resistance on the antenna coax center terminal from end to end.
    - If greater than the specified range, replace the antenna coax.
4. Test for less than 5 ohms of resistance on the antenna coax outer shield from end to end.
    - If greater than the specified range, replace the antenna coax.
5. Test for infinite resistance between the coax center terminal and the outer shield.

- If less than the specified value, replace the antenna coax.

Radio Antenna Module Test

1. Inspect the radio antenna module grounding surfaces and the mounting hardware for any corrosion that may cause a poor ground.
   - If corrosion is noted, clean the grounding surfaces or hardware.
2. Ignition OFF, disconnect the harness connector at the radio antenna module.
3. Radio ON, verify a test lamp illuminates between the signal circuit terminal 1 and ground.
   - If the test lamp does not illuminate, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
4. If all circuits test normal, replace the radio antenna module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

1. No or reduced sound from speaker 2. Amplifier inoperative/no sound from speakers * Noticeable audio distortion possible				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio and at the amplifier (if equipped) have a DC bias voltage that is one half of the battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. This voltage will vary depending on what type of audio is being listened to, talk or music, and type of music, as well as the volume setting of the system. Low volume and talk settings will measure around 1 V AC and less, where constant music may measure 3 V AC and slightly higher. In an amplified audio system, these similar AC voltage measurements may be slightly higher on the output of the amplifier, and the typical AC voltage readings at the output of the radio are less than 1V AC .

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting.

  The EL-50334-6 Audio System Diagnostic CD contains audio tracks that can be used to duplicate and isolate such concerns. Tracks 11 and 12 contain audio sweep tones for testing for speaker and grill rattles.

  If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.

- When equipped with an amplifier, it is possible for some individual circuit faults to affect more than one speakers operation. Perform diagnostic tests in the sequence listed to avoid misdiagnosis.

Circuit/System Verification

Without Amplifier

Radio ON, verify clear audio is heard from each audio speaker.

- If audio is inoperative from all speakers, replace the radio.
- If audio is inoperative from one or more, but not all, speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - without Amplifier.

With Amplifier

Radio ON, verify clear audio is heard from each audio speaker.

- If audio is inoperative from all speakers, refer to Amplifier Circuit Malfunction.
- If audio is inoperative from one or more, but not all, speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - with Amplifier.

Circuit/System Testing

Speaker Circuit Malfunction - without Amplifier

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.

2. Radio ON, test for 5.0-7.5 V between each signal circuit terminal A and terminal B and ground.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the speaker.

Amplifier Circuit Malfunction

1. Ignition OFF, disconnect the X3 harness connector at the amplifier.
2. Test for less than 10 Ω of resistance between the ground circuit terminal 8 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Test for B+ between the battery voltage circuit terminal 4 and ground.
    - If less than the specified value, test the circuit for a short to ground or an open/high resistance.
4. Disconnect the X1 harness connector at the amplifier.
5. Radio ON, test for B+ between the signal circuit terminal 8 and ground.
    - If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
6. If all circuits test normal, replace the amplifier.

Speaker Circuit Malfunction - with Amplifier

1. Ignition OFF, disconnect the X1 connector at the amplifier.
2. Radio ON, test for 5.0-7.5 V between the appropriate signal circuit terminal listed below and ground.
    - Left front low level audio signal (+) - terminal 15 X1
    - Left front low level audio signal (-) - terminal 7 X1
    - Right front low level audio signal (+) - terminal 14 X1
    - Right front low level audio signal (-) - terminal 6 X1
    - Left rear low level audio signal (+) - terminal 13 X1
    - Left rear low level audio signal (-) - terminal 5 X1
    - Right rear low level audio signal (+) - terminal 12 X1
    - Right rear low level audio signal (-) - terminal 4 X1
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
3. Ignition OFF, disconnect the X2 and X3 harness connectors at the amplifier.
4. Ignition ON, test for less than 1 V between each of the signal circuit terminals listed below and ground.
    - Left front speaker output (-) - terminal 3 X2
    - Left front speaker output (+) - terminal 4 X2
    - Right front speaker output (-) - terminal 1 X2

- Right front speaker output (-) - terminal 2 X2
- Left rear speaker output (-) - terminal 7 X2
- Left rear speaker output (+) - terminal 8 X2
- Right rear speaker output (-) - terminal 5 X2
- Right rear speaker output (-) - terminal 6 X2
- Left subwoofer speaker output (-) - terminal 3 X3
- Left subwoofer speaker output (+) - terminal 7 X3
- Right subwoofer speaker output (-) - terminal 2 X3
- Right subwoofer speaker output (+) - terminal 6 X3
- If greater than the specified range, test both signal circuits of the affected speaker for a short to voltage.

5. Ignition OFF, test for infinite resistance between each of the signal circuit terminals listed below and ground.
    - Left front speaker output (-) - terminal 3 X2
    - Left front speaker output (+) - terminal 4 X2
    - Right front speaker output (-) - terminal 1 X2
    - Right front speaker output (+) - terminal 2 X2
    - Left rear speaker output (-) - terminal 7 X2
    - Left rear speaker output (+) - terminal 8 X2
    - Right rear speaker output (-) - terminal 5 X2
    - Right rear speaker output (+) - terminal 6 X2
    - Left subwoofer speaker output (-) - terminal 3 X3
    - Left subwoofer speaker output (+) - terminal 7 X3
    - Right subwoofer speaker output (-) - terminal 2 X3
    - Right subwoofer speaker output (+) - terminal 6 X3
    - If less than the specified range, test both signal circuits of the affected speaker for a short to ground.
6. Ignition OFF, reconnect all harness connectors at the amplifier. Disconnect the harness connector at the appropriate speaker.
7. Radio ON, test for 5.0-7.5 V between the appropriate signal circuit terminals listed below and ground.
    - Front door speakers - terminal A and B
    - Front A pillar speakers - terminal A and B
    - Rear tweeters - terminal A and B
    - Rear subwoofers - terminal C and D
    - If less than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the amplifier.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the amplifier.
8. If all circuits test normal, replace the speaker.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Speaker Replacement Reference**
- **Control Module References** for amplifier or radio replacement, programming and setup

UNABLE TO CONTACT ONSTAR CALL CENTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The vehicle communication interface module (VCIM) is a cellular device that allows the user to communicate data and voice signals over the national cellular network. When an OnStar keypress is made, the VCIM activates and connects the system to the cellular carriers communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular phone and navigation antenna and cellular antenna coax.

Diagnostic Aids

- The customer concern may have been due to a lack of cellular service in a given area. A failure in the National Cellular Network infrastructure at the time of the customers failed connection that has since been repaired may also have been the cause.
- If an OnStarÂ® emergency call is able to successfully connect the vehicle to the OnStarÂ® Call Center when an OnStarÂ® Call Center button press is not, there may be a failure in the ability of the OnStarÂ® system in the vehicle to be recognized by the local cellular carrier.
- If the prompt "OnStarÂ® request ended" is heard, without pressing the white dot button at the end of the OnStarÂ® keypress, the OnStarÂ® system at one time has made a successful cellular connection, but was unable to complete the call.
- It is important to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.

Special Tools

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Verification

NOTE: **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 minutes after turning key on for the GPS satellites to acquire vehicle signal.**

Ignition ON, wait 5 minutes, then contact the OnStar call center consultant by pressing the blue OnStar button. A call center consultant should answer the call, verifying the vehicle OnStar system is functioning and the consultant can locate the vehicle.

- If the unit does not connect to the OnStar Call Center, use a scan tool to obtain and record the following information: Electronic Serial Number (ESN), Station Identifier (STID), GM 8-digit part number, Mobile Identification Number (MIN), Mobile Dialed Number (MDN), Transceiver ID (Trans ID) and call GM TAC to confirm a valid subscription.

Circuit/System Testing

NOTE: **The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.**

1. Ignition OFF, disconnect the GPS and cellular coax cable connector at the VCIM.
2. Using the EL-49903-3 kit (EL-49903-5 adapter and EL-49903-4 coax cable), connect the **EL-49903** kit to the VCIM.
3. Ignition ON, wait 5 minutes, and then contact the OnStar call center consultant by pressing the blue OnStar button. A call center consultant should answer the call.
    - If the unit does not connect to the OnStar Call Center, replace the VCIM.
4. Ignition OFF, disconnect the **EL-49903** kit from the VCIM and perform the coax cable test on the coax cable between the VCIM and the cellular antenna.
    - If the coax cable does not pass the test, replace the coax cable.
5. If all circuits test normal, replace the cellular antenna.

Component Testing

CAUTION: **Refer to Test Probe Caution .**

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the GPS and cellular phone coax cable at both components.
2. Test both for less than 5 Ω between both ends of the coax cables center terminals.
    - If greater than the specified range, replace the failed coax cable.
3. Test for greater than 10k Ω between the coax cable center wire and the outer coax shield.
    - If less than the specified range, replace the coax cable.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Cellular Communications/Digital Radio Antenna Replacement**
- **Control Module References** for VCIM replacement, setup, and programming

ONSTAR VOICE RECOGNITION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module is capable of interpreting voice commands received over the cellular microphone circuit. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over the cellular communication network. The module attempts to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

Description and Operation

OnStar Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

NOTE:

- **It is necessary to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.**
- **The vehicle should be located in a quiet area.**

1. Ignition ON/vehicle in Service Mode, press the blue OnStar Call button.
2. Verify that your voice is heard clearly by the OnStar Call center.
   - **If your voice can not be heard clearly**

     Refer to **OnStar Microphone Malfunction**
   - **If your voice can be heard clearly**
3. Verify that the system responds appropriately to all voice commands by pressing the voice command button and attempting to operate the system using multiple voice commands.
   - **If the OnStar system does not respond to any voice commands**

     Replace the K73 Telematics Communication Interface Control Module
   - **If the OnStar system responds to some, but not all voice commands**

     Refer to **OnStar Description and Operation** for tips on proper pronunciation
   - **If the OnStar system responds to all voice commands**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

Control Module References for telematics communication interface control module replacement, programming, and setup.

REPAIR INSTRUCTIONS

MOBILE TELEPHONE MICROPHONE REPLACEMENT

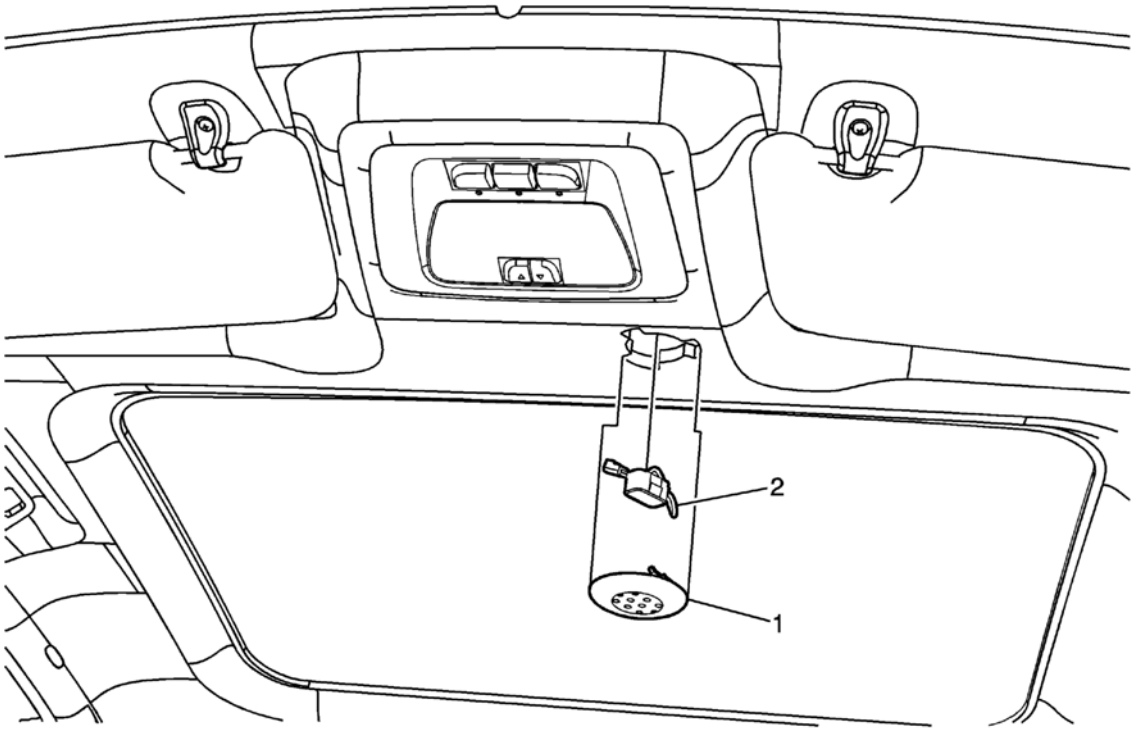

Fig. 9: Mobile Telephone Microphone
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Mobile Telephone Microphone Bezel **Procedure** Snap the bezel out of the headliner.
2	Mobile Telephone Microphone **Procedure** Disconnect the electrical connector.

COMMUNICATION INTERFACE MODULE REPLACEMENT

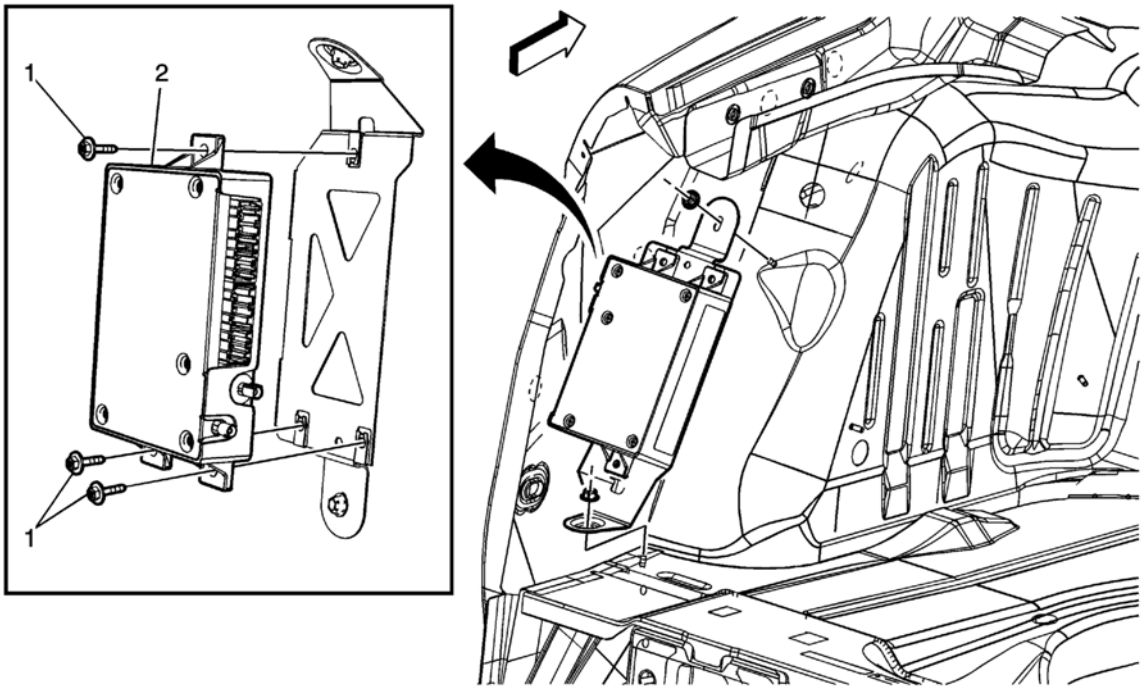

Fig. 10: Communication Interface Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** . 2. Pull back the left rear compartment trim panel in order to expose the communication interface module. 3. For programming and set up, Refer to **Control Module References** .	
1	Communication Interface Bolt/Screw (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** • The vehicle communication interface module (VCIM) has a specific set of unique numbers that tie the module to each vehicle. These numbers, the 10-digit station identification and the 11-digit electronic serial number, are used by the National Cellular Network and OnStarÂ® to identify the specific vehicle. Because these numbers are tied to the vehicle identification number of the vehicle, you must never exchange these parts with those of another vehicle. • After replacing the vehicle communication interface module, you must reconfigure the

Callout	Component Name
	OnStarÂ® system. Failure to reconfigure the system will result in an additional customer visit for repair. In addition, pressing and holding the white dot button on the keypad will NOT reset this version of the OnStarÂ® system. This action will cause a DTC to set. • When replacing the VCIM be sure to transfer Bluetooth Antenna, if equipped. **Tighten** 5 N.m (44 lb in)
2	Communication Interface Module **Procedure** For programming and set up information, refer to **Control Module References** .

COMMUNICATION INTERFACE MODULE BATTERY REPLACEMENT

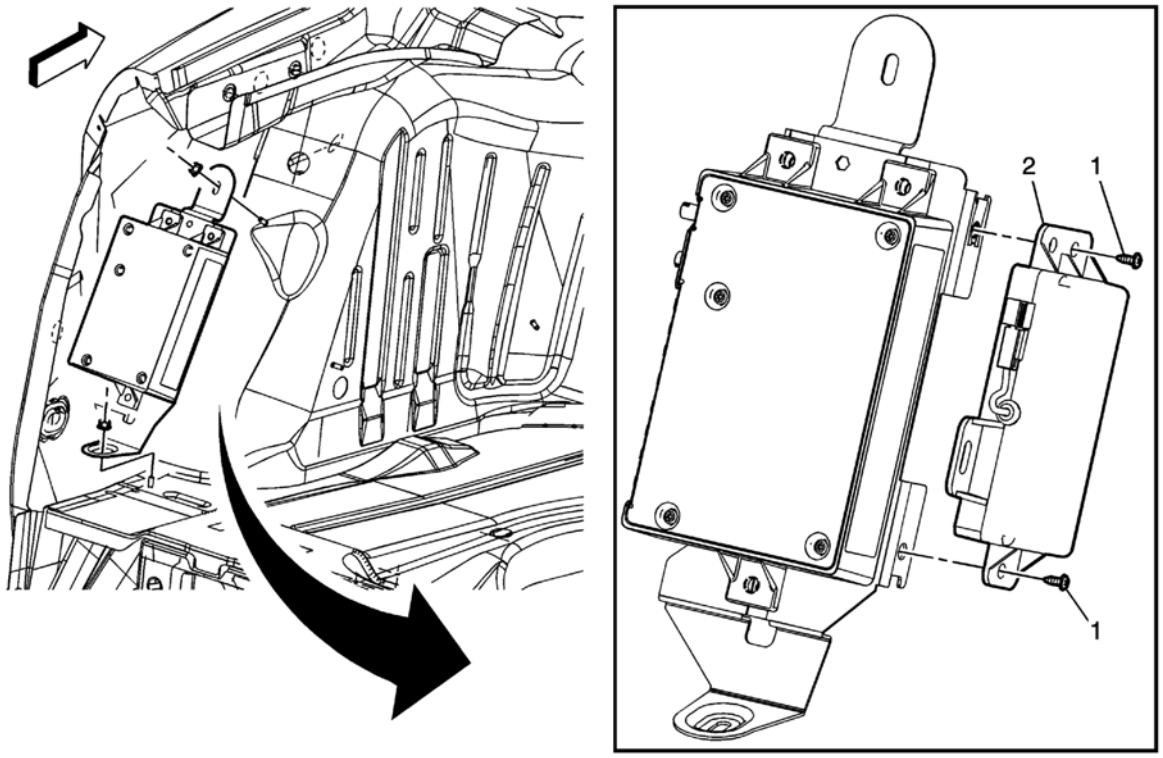

Fig. 11: Communication Interface Module Battery
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the left side rear compartment trim. 2. Program the communication interface module (OnStarÂ®) after replacement. Refer to **Control Module References** .	

Callout	Component Name
1	Communication Interface Module Battery Screw (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 2.5 N.m (22 lb in)
2	Communication Interface Module Battery • The vehicle communication interface module (VCIM) has a specific set of unique numbers that tie the module to each vehicle. These numbers, the 10-digit station identification and the 11-digit electronic serial number, are used by the National Cellular Network and OnStarÂ® to identify the specific vehicle. Because these numbers are tied to the vehicle identification number of the vehicle, you must never exchange these parts with those of another vehicle. • Replacement of the back-up battery (BUB) does not require reconfiguration of the VCIM. If a trouble code is indicated before the battery is replaced, the DTC must be cleared following the installation of the new battery. The OnStarÂ® system does not need to be reconfigured unless the VCIM is replaced. • When the VCIM is replaced, the OnStarÂ® system must be reconfigured. Failure to reconfigure the system will result in an additional customer visit for repair. In addition, pressing and holding the white dot button on the keypad will NOT reset this version of the OnStarÂ® system. This action will cause a DTC to set.

WIRELESS COMMUNICATION INTERFACE ANTENNA REPLACEMENT

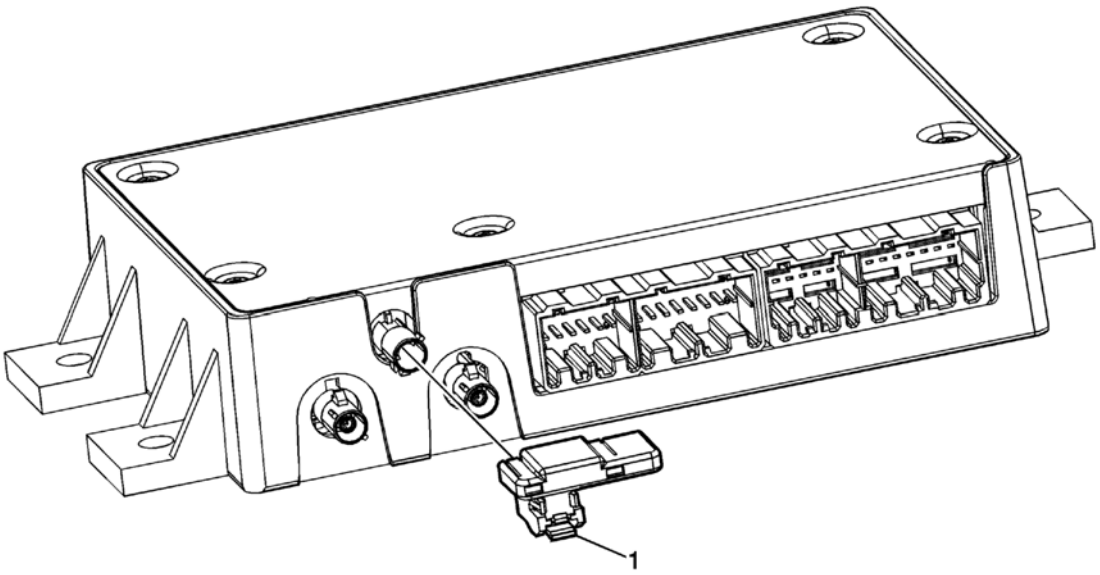

Fig. 12: Wireless Communication Interface Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the communication interface module. Refer to **Communication Interface Module Replacement**	
1	Wireless Communication Interface Antenna Bluetooth Module **Procedure** Unsnap the Antenna from Communication Module.

RADIO REPLACEMENT

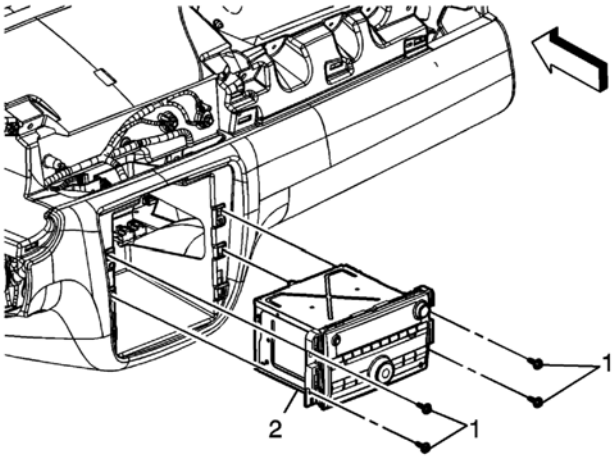

Fig. 13: Radio
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel accessory trim plate. Refer to **Instrument Panel Accessory Trim Plate Replacement** 2. Remove the heating and air conditioning control module. Refer to **Heater and Air Conditioning Control Replacement** 3. Slightly push the antenna lead toward the radio to relieve tension on the internal fingers. Pull back on the spring-loaded locking ring and remove the connector from the radio. 4. To install the antenna lead, plug the antenna lead into the socket until it clicks. 5. Program the radio after replacement. Refer to **Control Module References**	
1	Radio Bolt/Screw (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	AM/FM Stereo Radio

DIGITAL RADIO RECEIVER REPLACEMENT

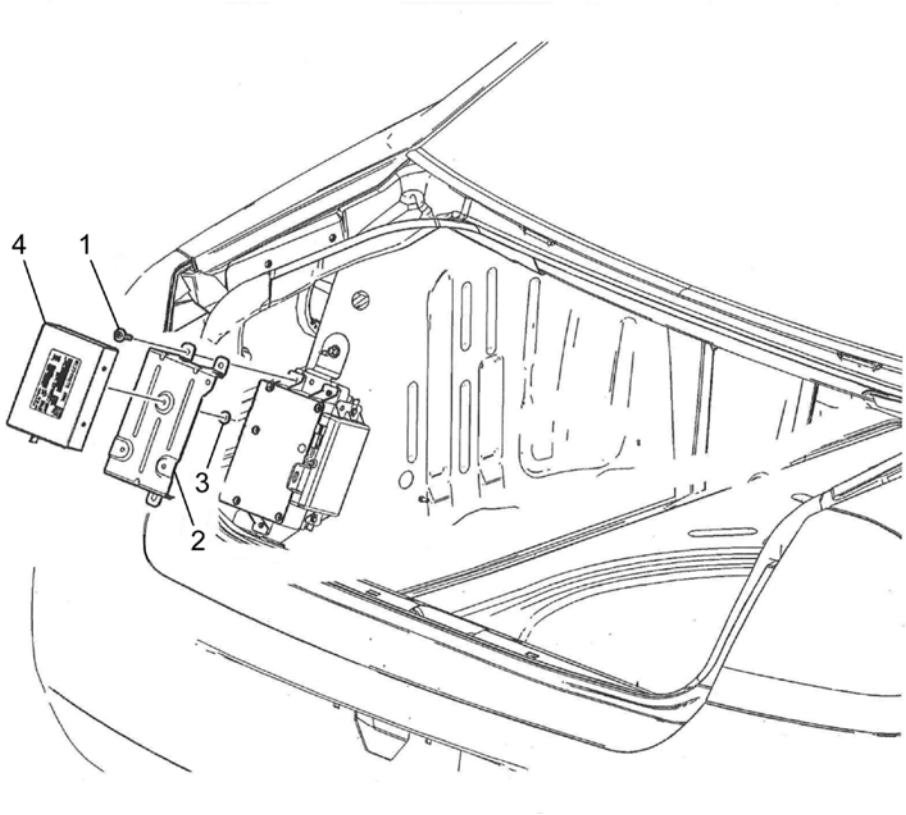

Fig. 14: Digital Radio Receiver
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the right rear compartment trim. Refer to **Rear Compartment Side Trim Replacement - Right Side** .	
1	Digital Radio Receiver Bracket Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** **.**
2	Digital Radio Receiver Bracket
3	Digital Radio Receiver Nut (Qty: 3)
4	Digital Radio Receiver **Procedure** 1. Disconnect the electrical connectors. 2. Refer to **Control Module References** for programming and set up, if required.

RADIO SPEAKER AMPLIFIER REPLACEMENT

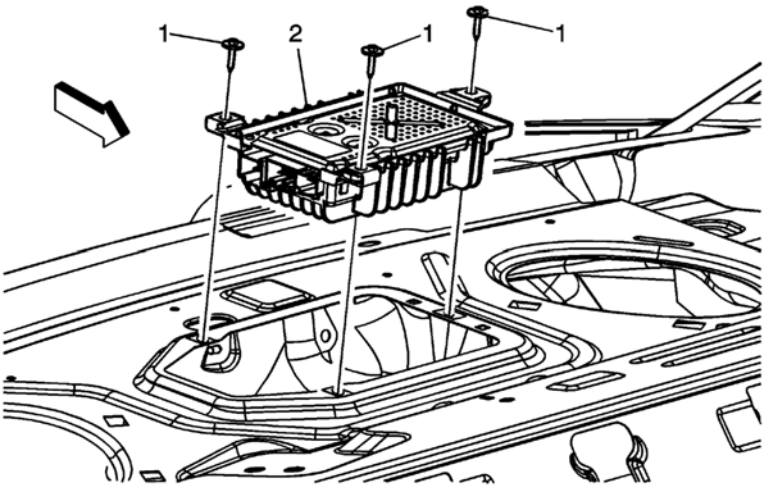

Fig. 15: Radio Speaker Amplifier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear window shelf trim panel. Refer to **Rear Window Shelf Trim Panel Replacement** .	
1	Low Frequency Audio Amplifier Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2.5 N.m (22 lb in)
2	Low Frequency Audio Amplifier Assembly Refer to **Control Module References** for programming and setup information.

MOBILE TELEPHONE DIGITAL ANTENNA REPLACEMENT

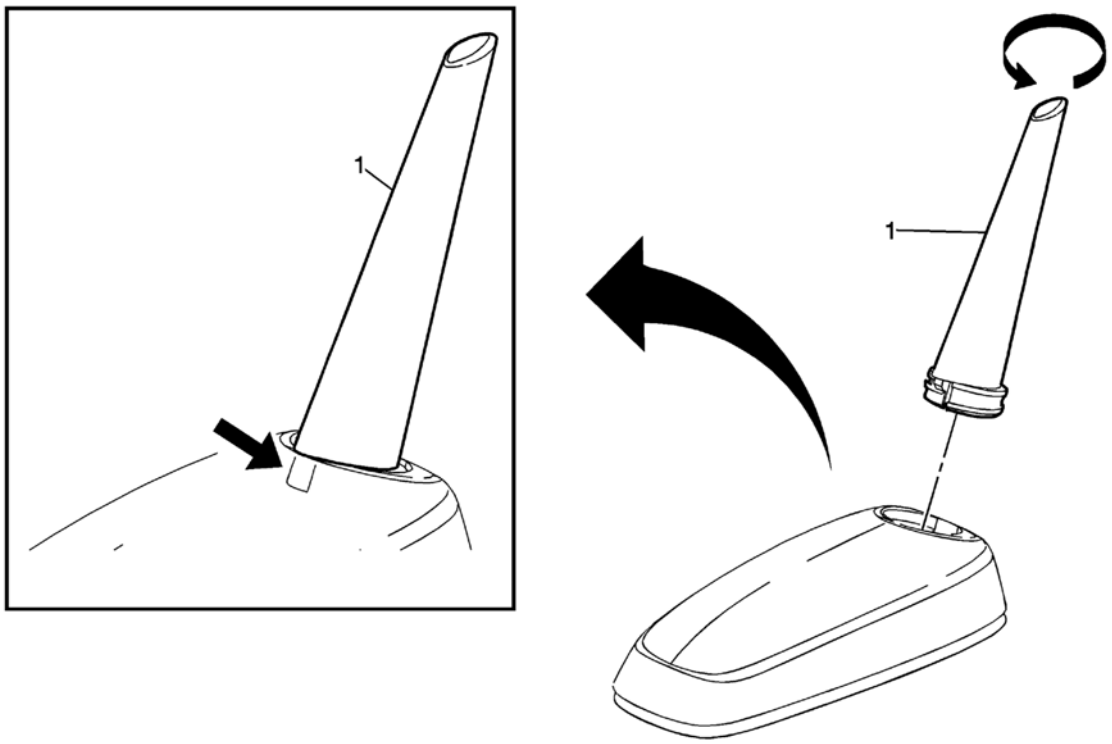

Fig. 16: Mobile Telephone Digital Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Mobile Telephone Digital Antenna Assembly • The release tab is not visible with the mast assembled to the antenna base. • Using a small flat-bladed tool, push in and hold the release tab, then rotate the mast counterclockwise in order to release the mast from the antenna base.

CELLULAR COMMUNICATIONS/DIGITAL RADIO ANTENNA REPLACEMENT

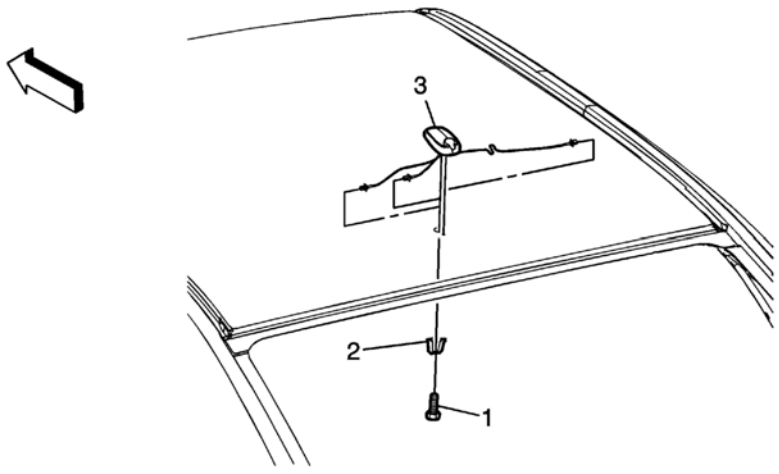

Fig. 17: Cellular Communications/Digital Radio Antenna

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Lower the rear of the headliner. Refer to **Headlining Trim Panel Replacement** .	
1	Mobile Telephone and Vehicle Location Antenna Base Bolt **CAUTION:** **Refer to** **Fastener Caution** . **TIP:** Disconnect the electrical connections. **Tighten** 9 N.m (80 lb in)
2	Mobile Telephone and Vehicle Location Antenna Base Expansion Sleeve
3	Mobile Telephone and Vehicle Location Antenna Base Assembly

RADIO ANTENNA MODULE REPLACEMENT

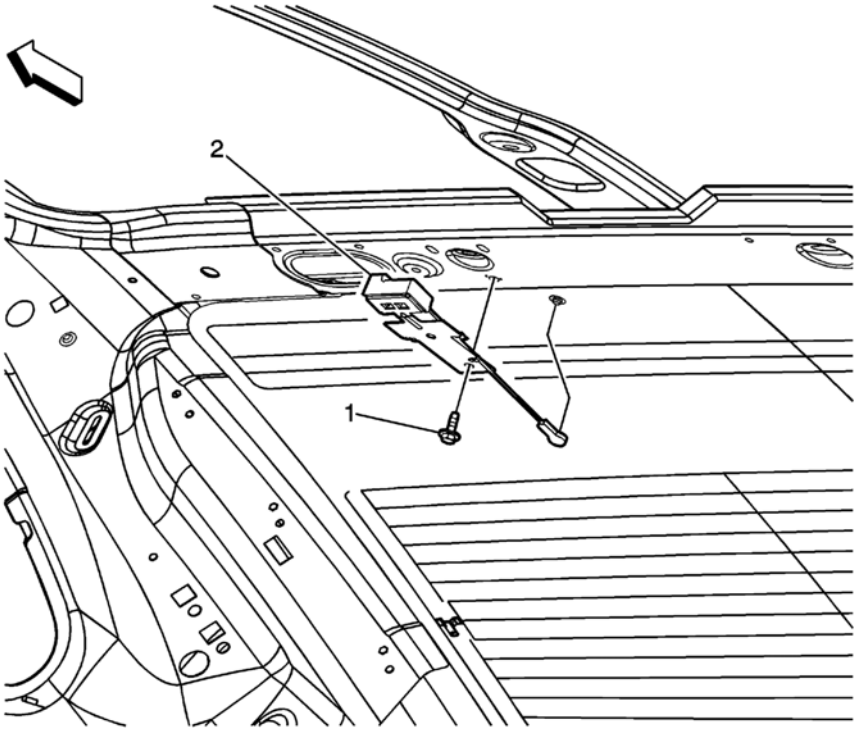

Fig. 18: Radio Antenna Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Lower the rear of the headliner. Refer to **Headlining Trim Panel Replacement** .	

Callout	Component Name
1	Radio Antenna Module Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 10 N.m (89 lb in)
2	Radio Antenna Module Assembly • Disconnect the antenna lead from the rear window. • Disconnect the electrical connector.

DIGITAL RADIO ANTENNA CABLE REPLACEMENT

Removal Procedure

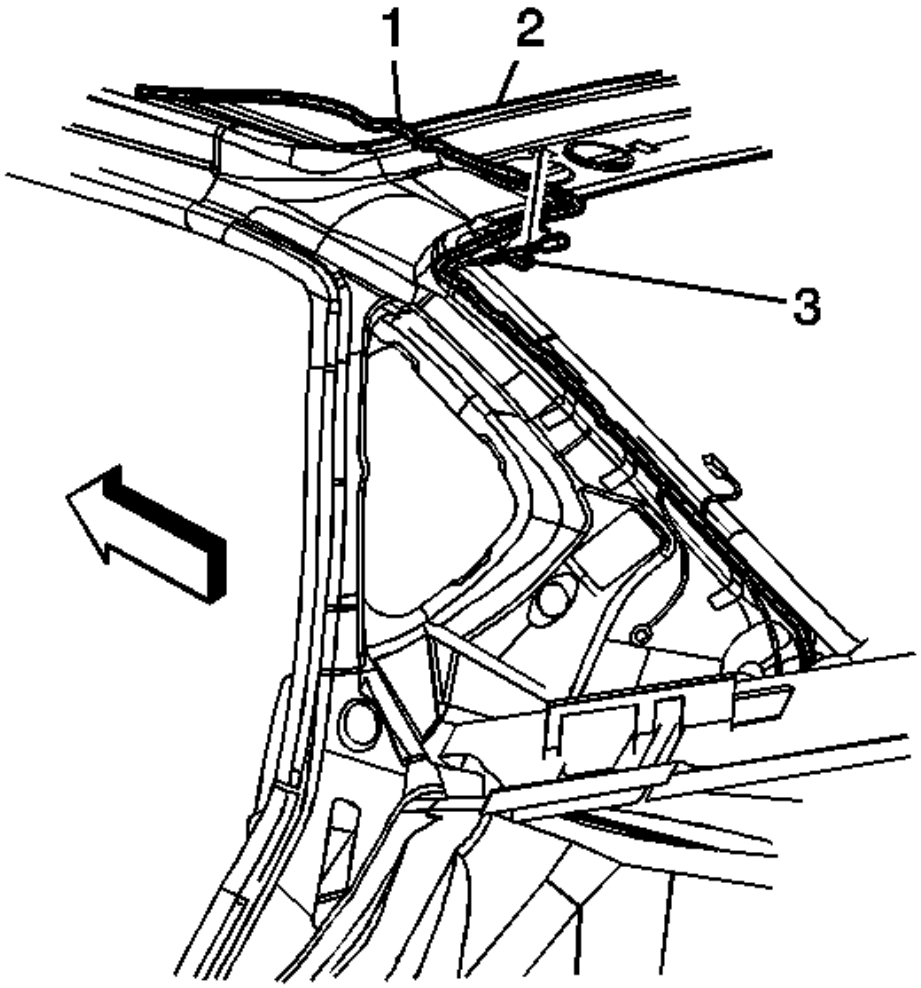

Fig. 19: Antenna Cable, Retainer & Rear Header
Courtesy of GENERAL MOTORS COMPANY

1. Remove the right rear upper quarter trim panel. Refer to **Quarter Upper Trim Panel Replacement** .
2. Lower the rear of the headliner for access to the antenna/cable attachment. Refer to **Headlining Trim Panel Replacement** .
3. Adjust the antenna cable mastic patch/tape at the roof.
4. Disconnect the antenna cable from the antenna base cable connector.
5. Remove the antenna cable retainer (3) from the rear header (2).

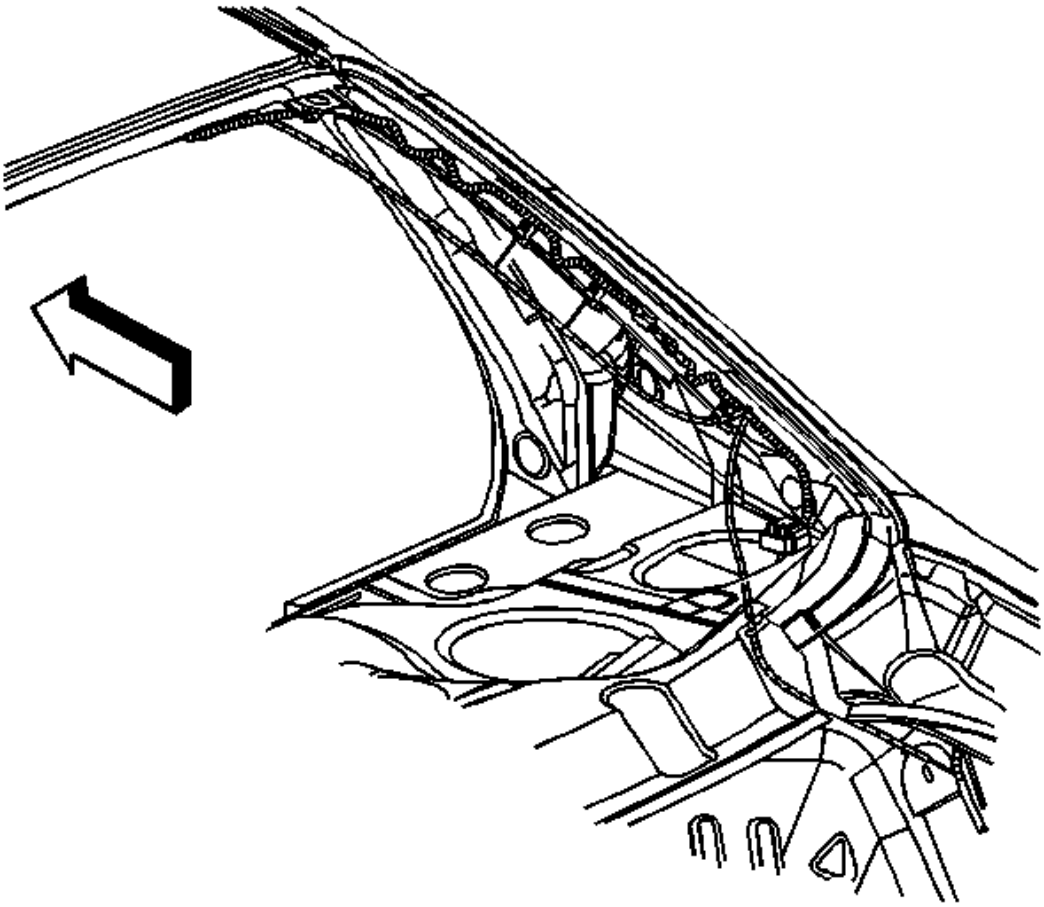

Fig. 20: Routing Antenna Cable
Courtesy of GENERAL MOTORS COMPANY

6. Remove the antenna cable from the dome lamp harness clips.
7. Remove the antenna cable from between the dome lamp harness and the upper quarter panel.
8. Attach a piece of wire or string to the end of the antenna cable.
9. Route the antenna cable through the rear shelf and along the rear wheel house.
10. Adjust the right rear compartment trim panel.

11. Disconnect the antenna cable from the digital radio receiver.
12. Remove the antenna cable retainers from the receiver bracket.
13. Remove the wire or string from the antenna cable.
14. Remove the antenna cable.

Installation Procedure

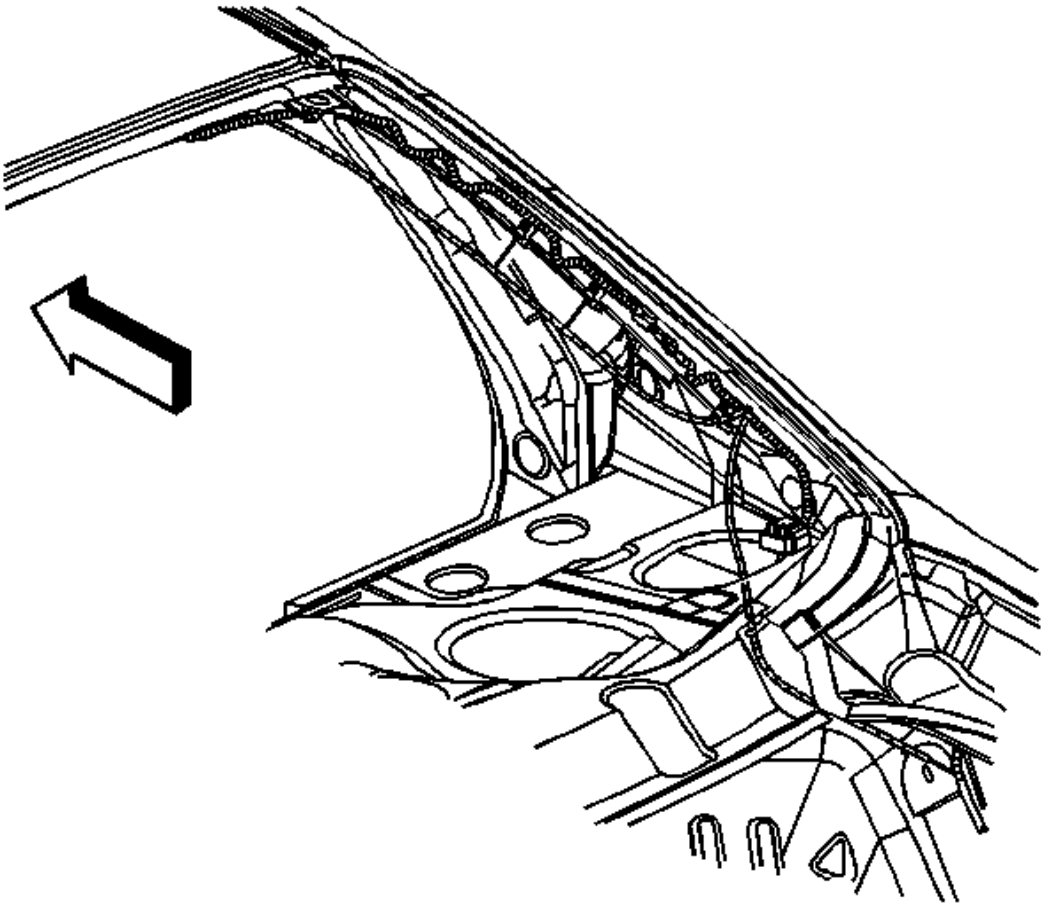

Fig. 21: Routing Antenna Cable
Courtesy of GENERAL MOTORS COMPANY

1. Install the antenna cable retainers to the receiver bracket.
2. Connect the antenna cable to the digital radio receiver.
3. Attach the wire or string used in the removal procedure to the cable being installed.
4. Carefully pull the antenna cable through the rear shelf into the passenger compartment.
5. Install the right rear compartment trim panel.
6. Remove the wire or string from the antenna cable.
7. Route the antenna cable between the dome lamp harness and the upper quarter panel.
8. Install the antenna cable to the dome lamp harness clips.

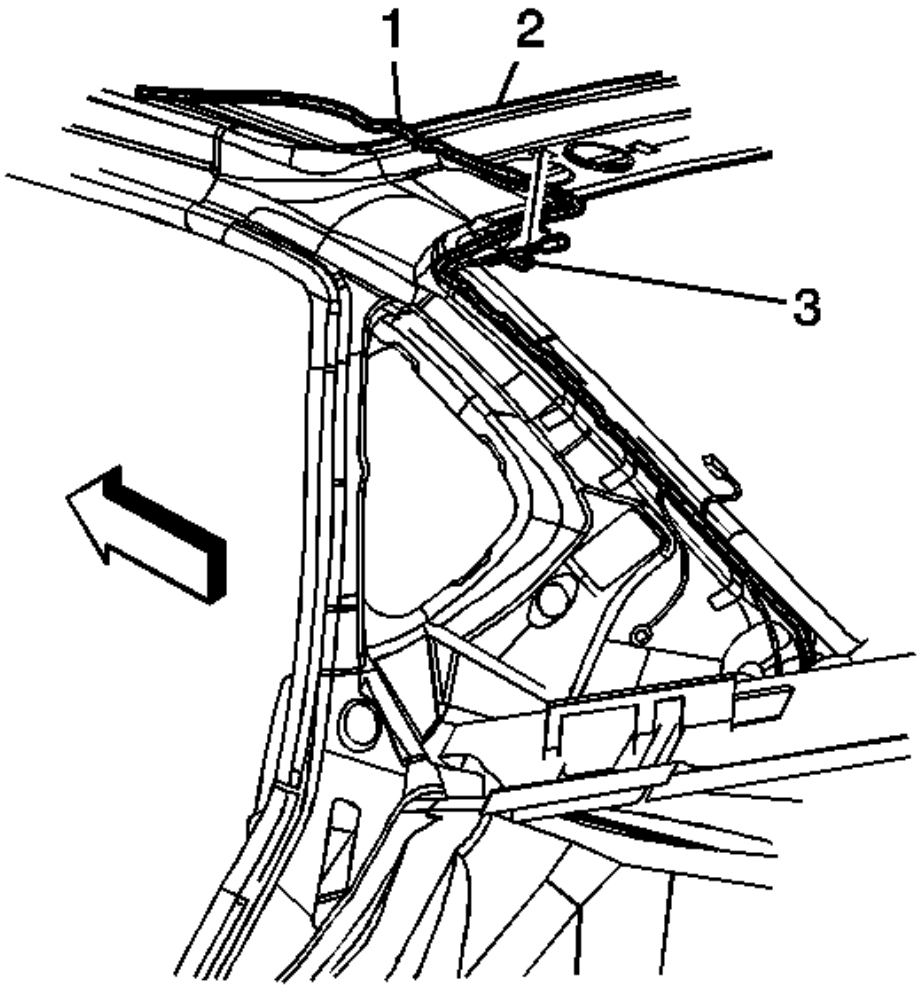

Fig. 22: Antenna Cable, Retainer & Rear Header
Courtesy of GENERAL MOTORS COMPANY

9. Install the antenna cable retainer (3) to the rear header (2).
10. Connect the antenna cable to the antenna base cable connector.
11. Install the antenna cable mastic patch/tape at the roof.
12. Install the rear of the headliner. Refer to **Headlining Trim Panel Replacement** .
13. Install the right rear upper quarter trim panel. Refer to **Quarter Upper Trim Panel Replacement** .

ANTENNA CABLE REPLACEMENT

Removal Procedure

1. Remove the rear upper quarter trim panel. Refer to **Quarter Upper Trim Panel Replacement** .

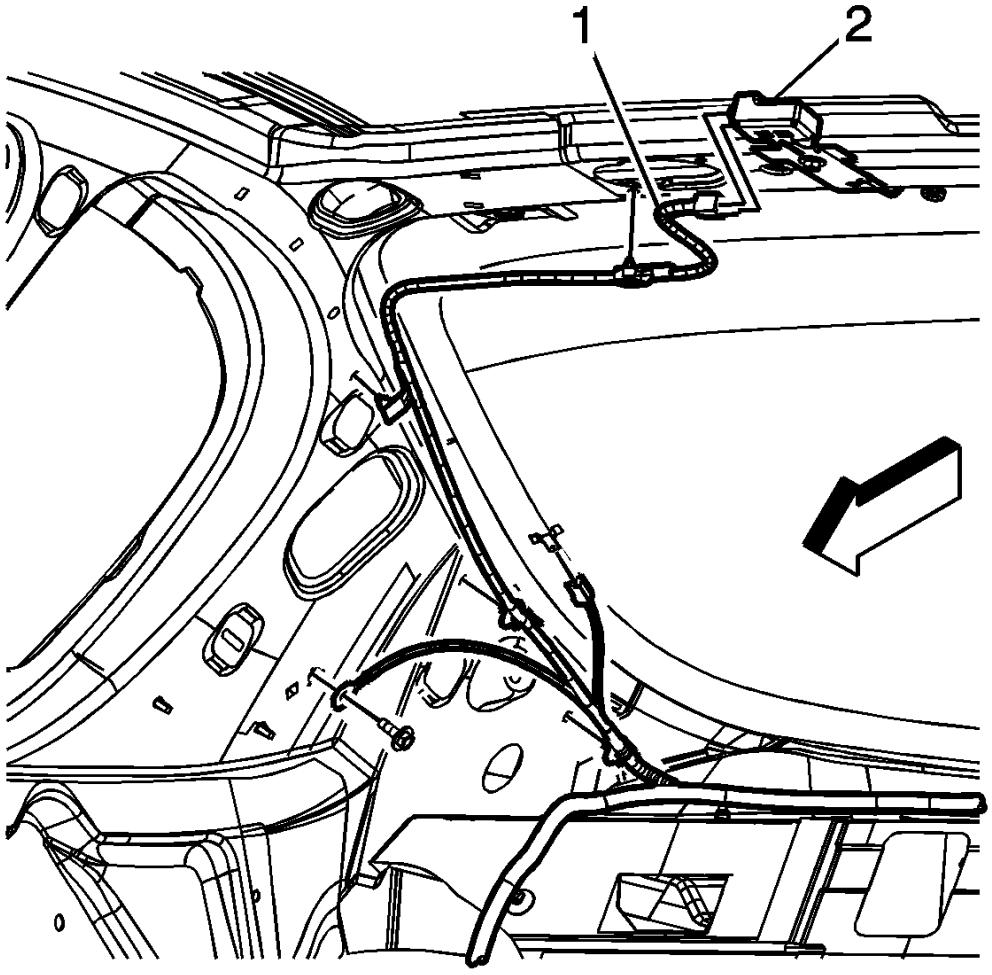

Fig. 23: Antenna Cable & Radio Antenna Module
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the antenna cable (1) from the radio antenna module (2).
3. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala)** .
   Remove the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala)** .
4.

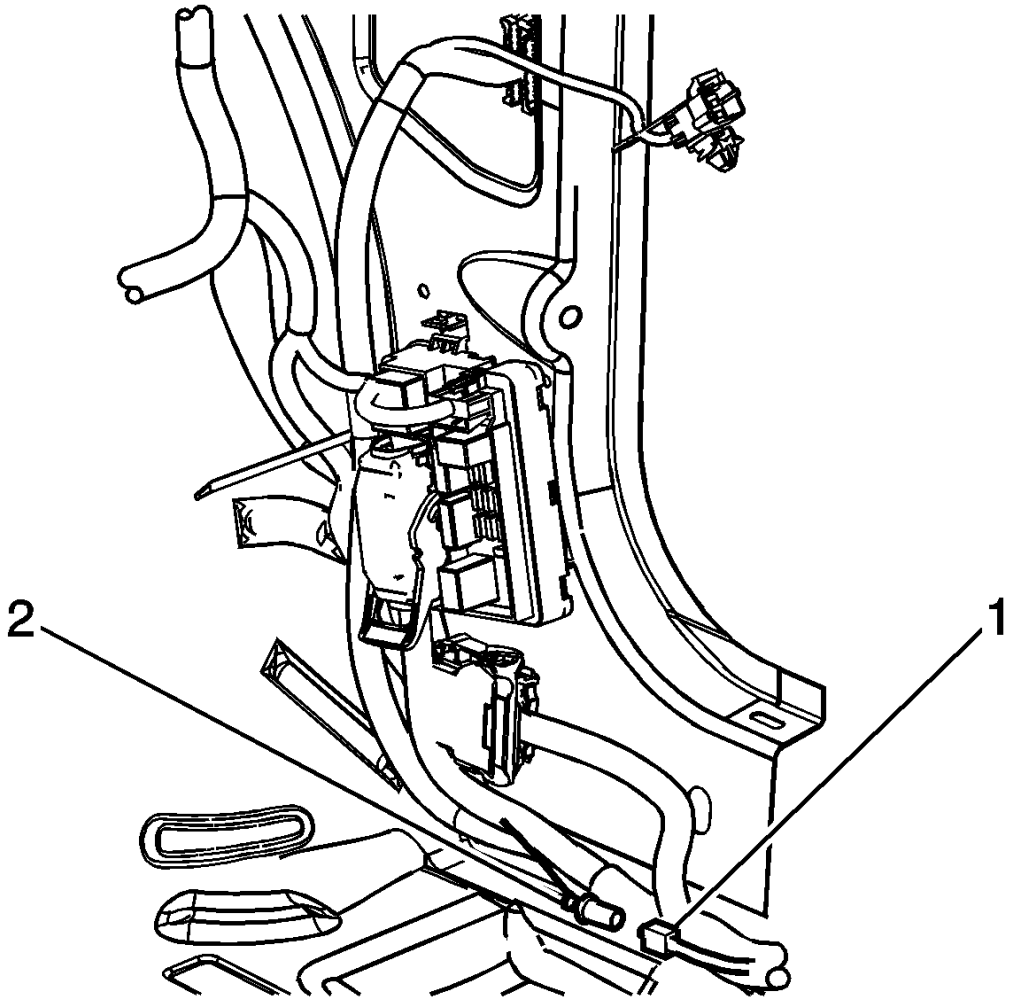

Fig. 24: Identifying Antenna Cable & Antenna Extension Cable
Courtesy of GENERAL MOTORS COMPANY

5. Remove the right carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .
6. Remove the right lower center pillar trim panel. Refer to **Center Pillar Lower Trim Panel Replacement** .
7. Adjust the carpet for access to the antenna cable as required.
8. Disconnect the antenna cable (1) from the antenna extension cable (2).
9. Cut off the visible end of the antenna cable from the wiring harness in the following locations:
   - The kick panel area
   - The rear shelf area

Installation Procedure

1. Install the antenna cable to the vehicle. Use electrical tape in order to secure the antenna extension cable to the top of the wiring harness. Secure the cable to the harness at least every 150 mm (6 in).

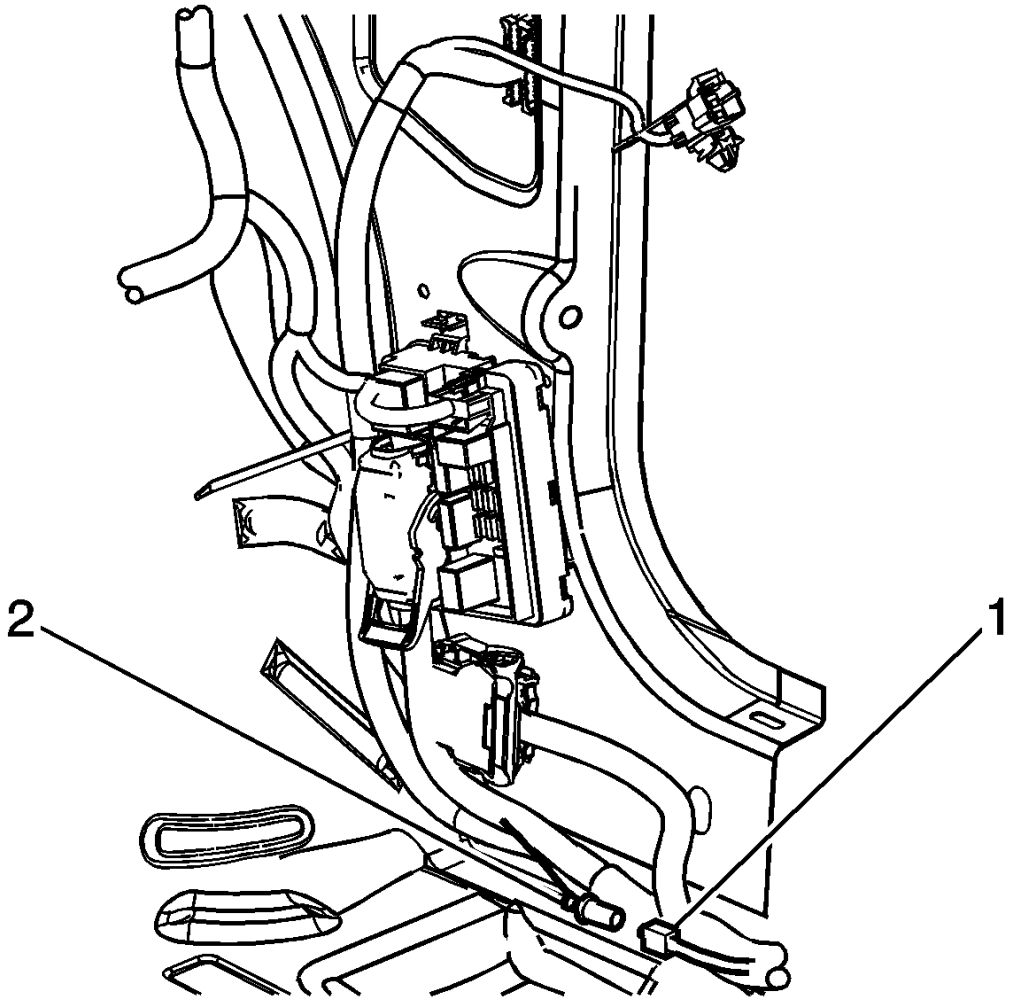

Fig. 25: Antenna Cable & Antenna Extension Cable
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: The antenna cable uses a sliding snap-lock. Holding the sliding lock feature will prevent installation.

2. Connect the antenna extension cable (2) from the radio to the antenna cable (1) near the kick panel:
    1. Position the antenna extension cable behind the sliding lock feature.
    2. Install the antenna extension cable to the sliding lock feature.
3. Install the carpet.
4. Install the right lower center pillar trim panel. Refer to **Center Pillar Lower Trim Panel Replacement** .
5. Install the right carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .

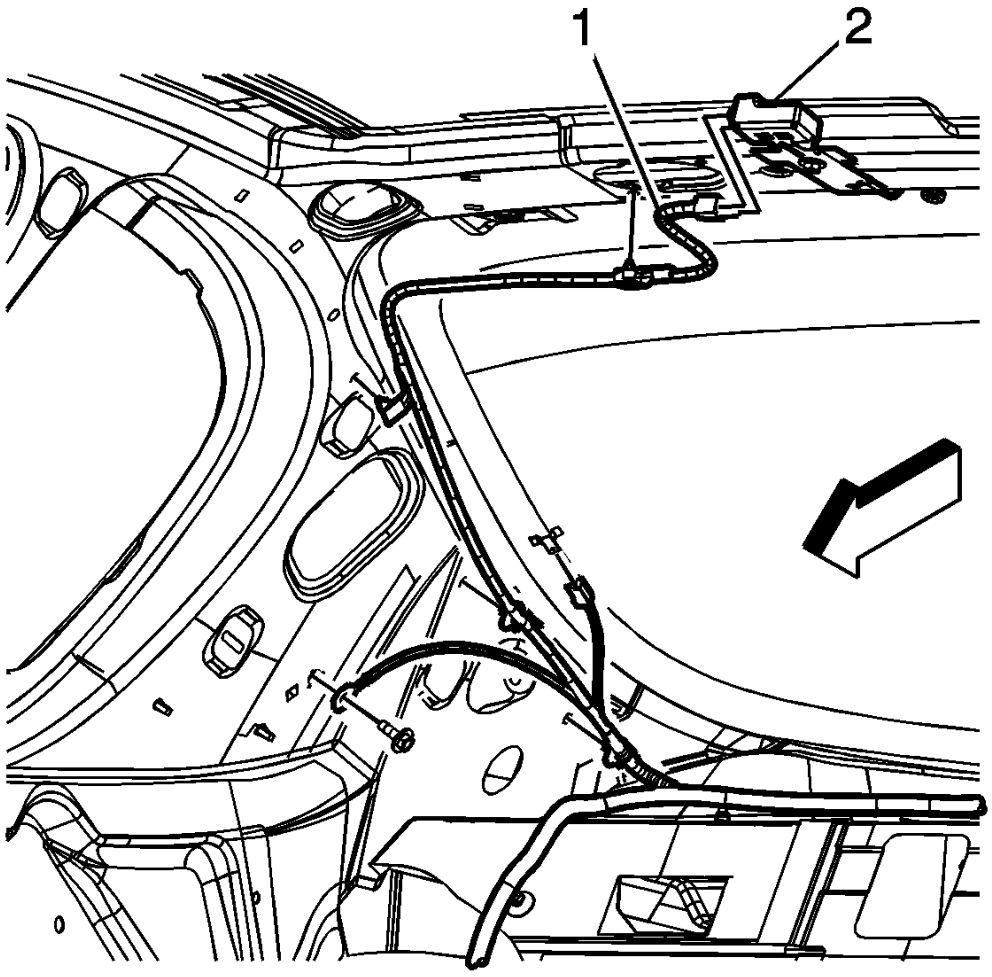

Fig. 26: Antenna Cable & Radio Antenna Module
Courtesy of GENERAL MOTORS COMPANY

6. Install the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala)** .
7. Install the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala)** .

IMPORTANT: The antenna cable uses a sliding snap-lock. Holding the sliding lock feature will prevent installation.

8. Connect the antenna cable (1) to the radio antenna module (2):
    1. Position the antenna cable behind the sliding lock feature.
    2. Install the antenna cable to the sliding lock feature.
9. Install the rear upper quarter trim panel. Refer to **Quarter Upper Trim Panel Replacement** .

RADIO ANTENNA CABLE EXTENSION CABLE REPLACEMENT

Removal Procedure

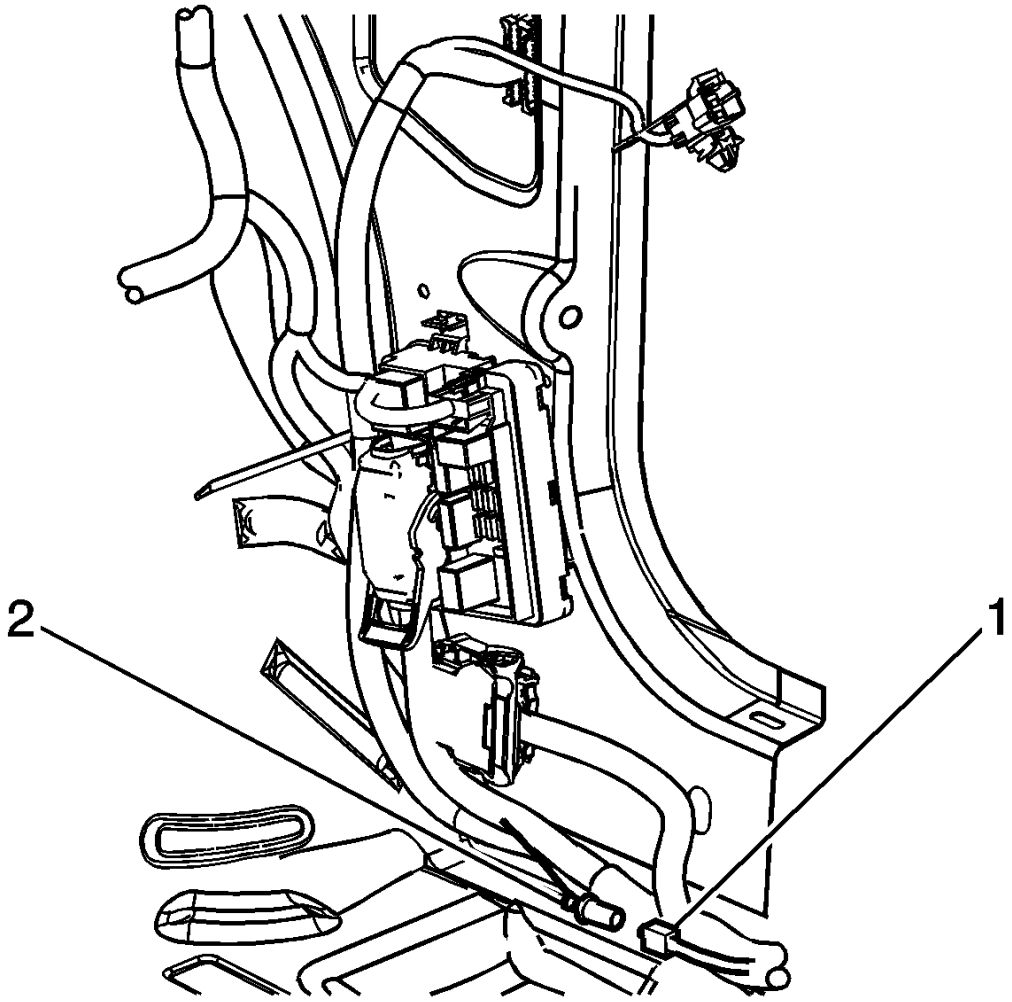

Fig. 27: Antenna Cable & Antenna Extension Cable
Courtesy of GENERAL MOTORS COMPANY

1. Remove the right carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .
2. Adjust the carpet for access.
3. Disconnect the antenna extension cable (2) from the antenna cable (1).
4. Remove the right instrument panel insulator. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** .

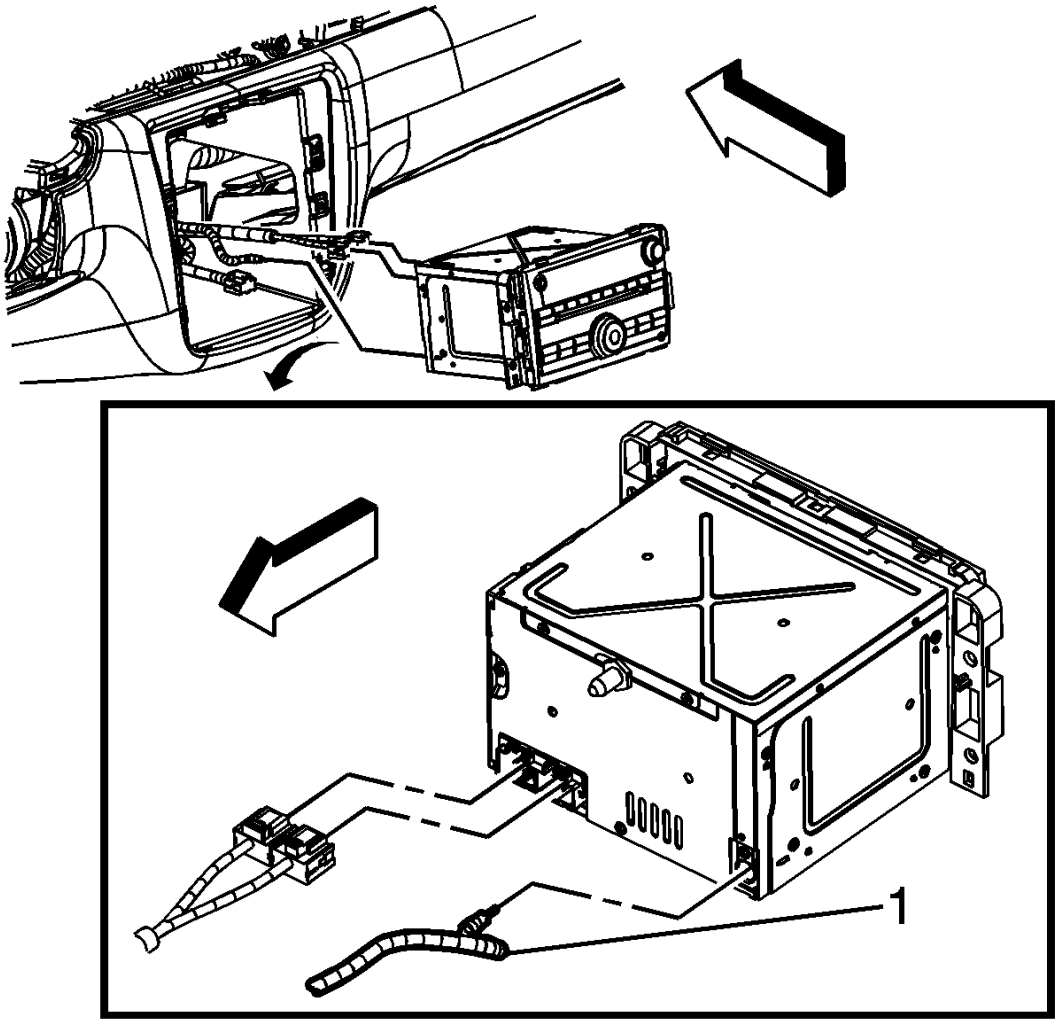

Fig. 28: Antenna Extension Cable & Radio
Courtesy of GENERAL MOTORS COMPANY

5. Adjust the radio for access. Disconnect the antenna extension cable (1) from the radio. Refer to **Radio Replacement**.
6. Cut off the visible ends of the antenna extension cable.

Installation Procedure

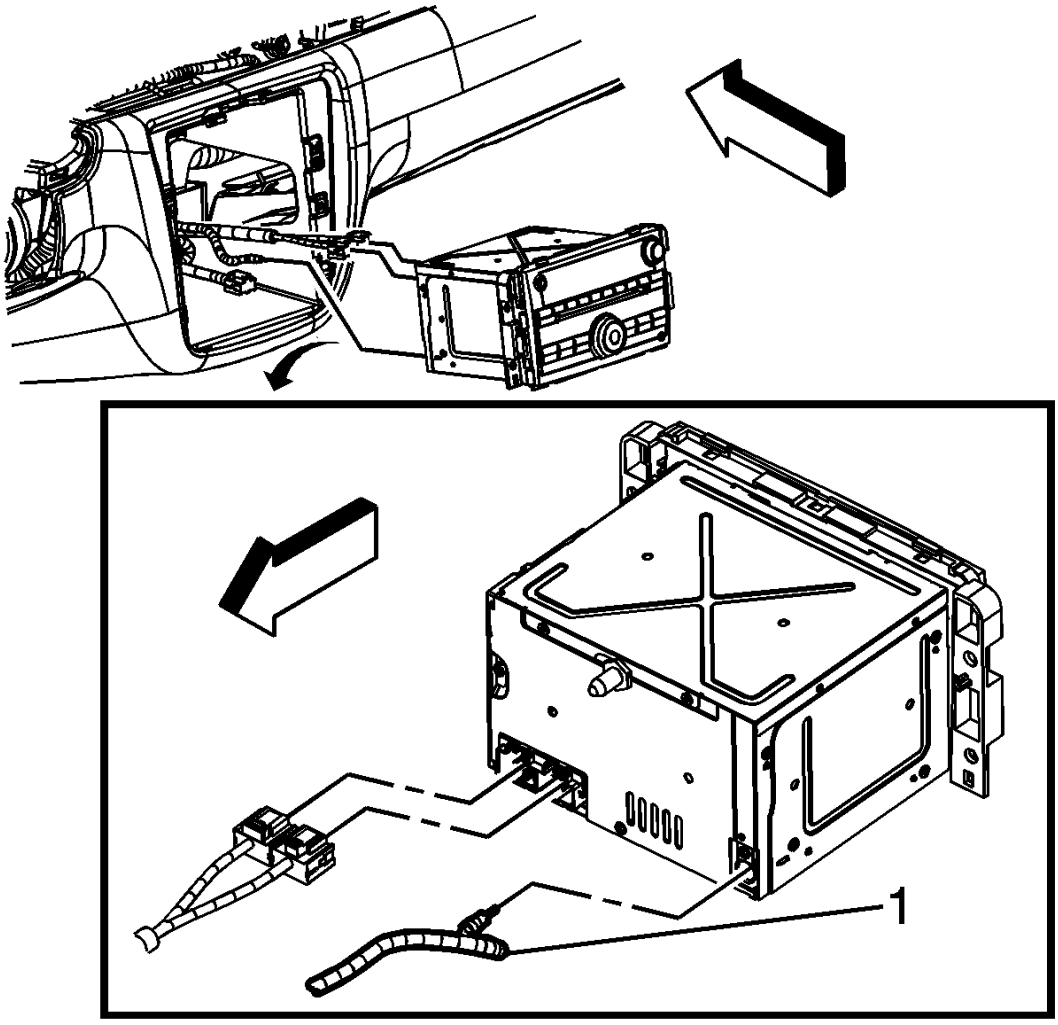

Fig. 29: Antenna Extension Cable & Radio
Courtesy of GENERAL MOTORS COMPANY

1. Route the antenna extension cable. Secure the cable.
2. Connect the antenna extension cable (1) to the radio. Install the radio. Refer to **Radio Replacement**.

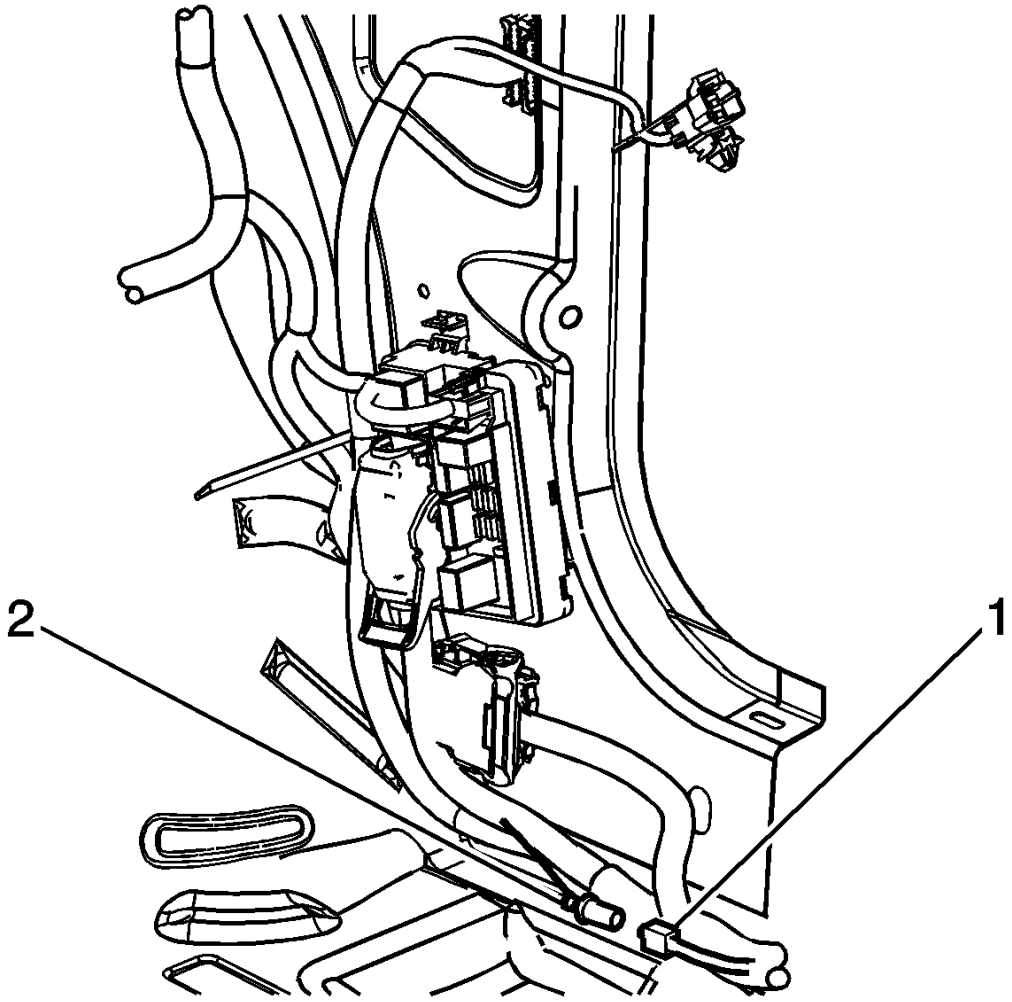

Fig. 30: Antenna Cable & Antenna Extension Cable
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: The antenna cable uses a sliding snap-lock. Holding the sliding lock feature will prevent installation.

3. Connect the antenna extension cable (2) from the radio to the antenna cable (1) near the kick panel:
    1. Position the antenna extension cable behind the sliding lock feature.
    2. Install the antenna extension cable to the sliding lock feature.
4. Install the right instrument panel insulator. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** .
5. Install the carpet.
6. Install the right carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .

MOBILE TELEPHONE AND NAVIGATION ANTENNA COAXIAL CABLE REPLACEMENT (IMPALA)

Removal Procedure

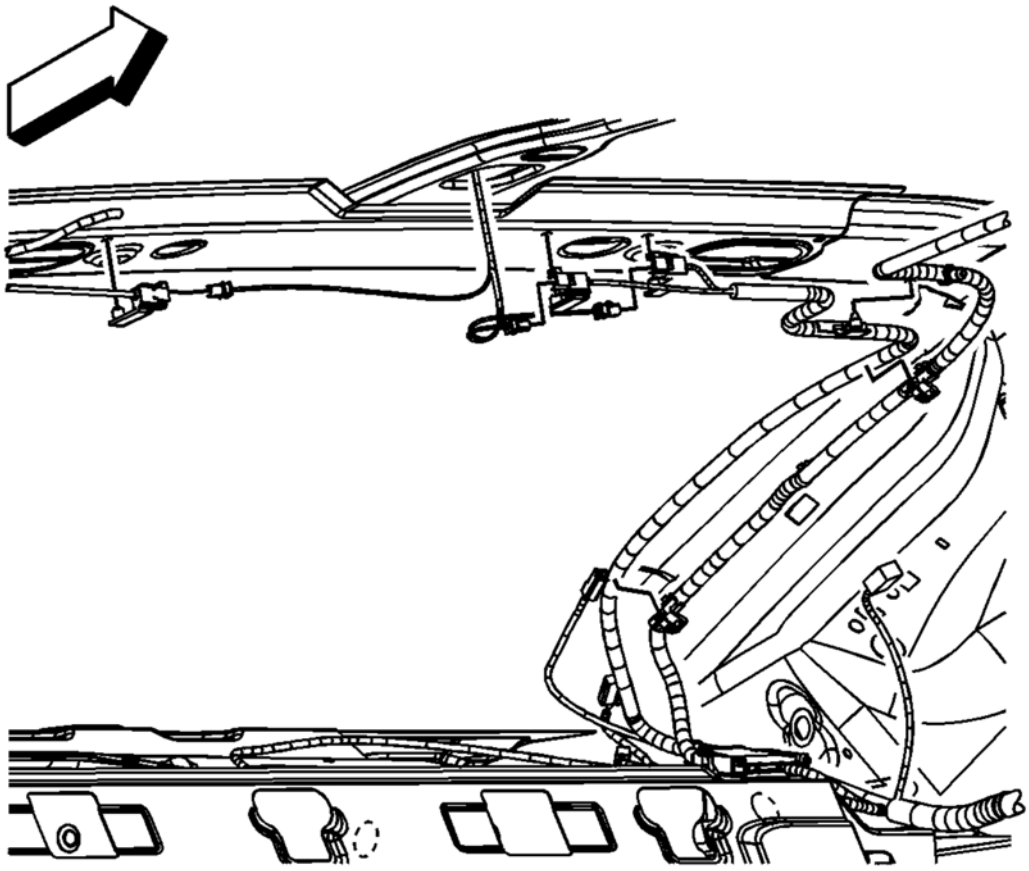

Fig. 31: Headliner & Digital Antenna
Courtesy of GENERAL MOTORS COMPANY

1. Lower the rear of the headliner to access the digital antenna connection. Refer to **Headlining Trim Panel Replacement** .
2. Disconnect the digital antenna connection and cut the connector on the harness side off.
3. Remove the left rear compartment side trim. Refer to **Rear Compartment Side Trim Replacement - Left Side** .

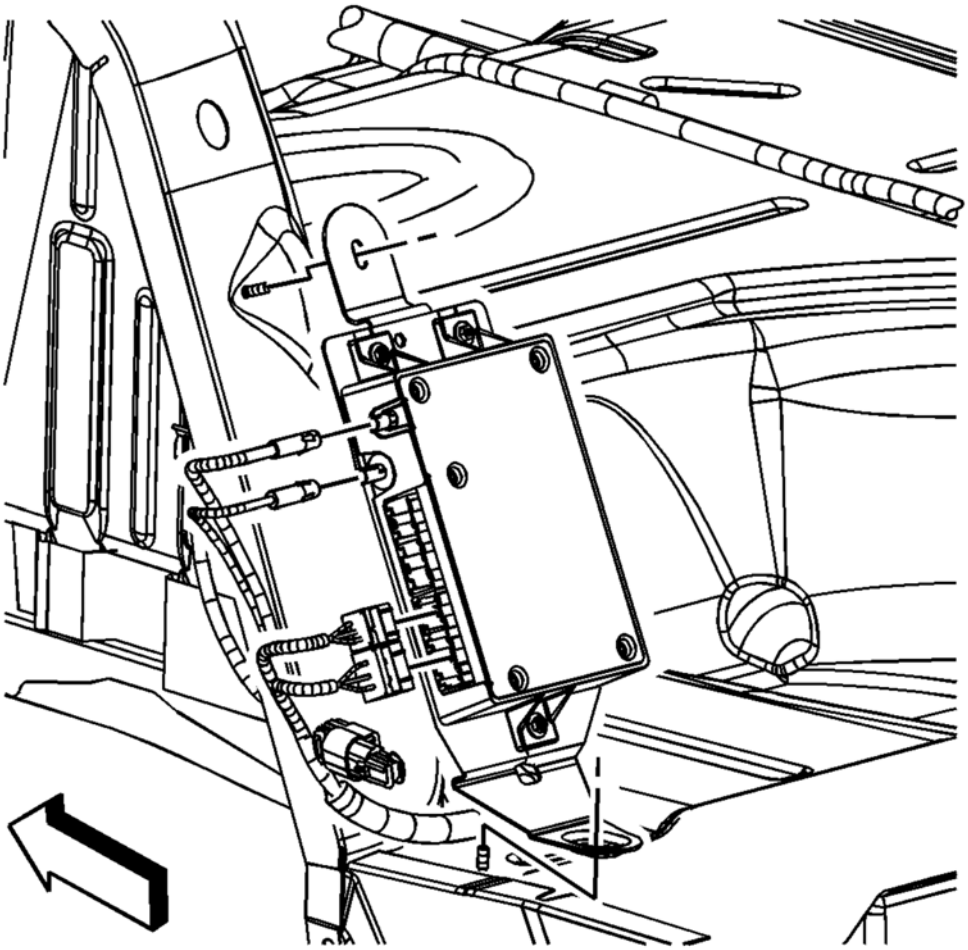

Fig. 32: Antenna Cable Connector & Harness Side
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the antenna cable connector and cut the end off on the harness side.

Installation Procedure

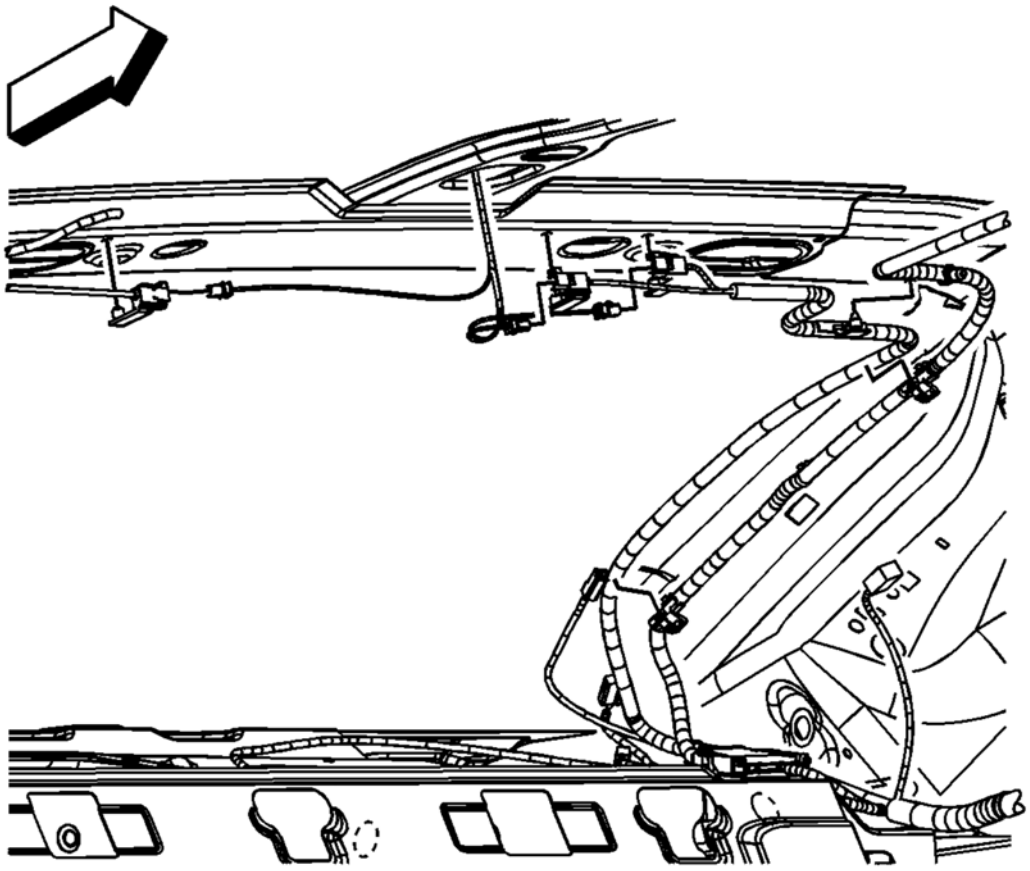

Fig. 33: Headliner & Digital Antenna
Courtesy of GENERAL MOTORS COMPANY

1. Route the new cellular antenna cable from the interior of the vehicle to the rear compartment area following the same path as the old cable. A piece of mechnic's wire may be used as needed to assist in the procedure. Secure the new cable as needed with tie straps.

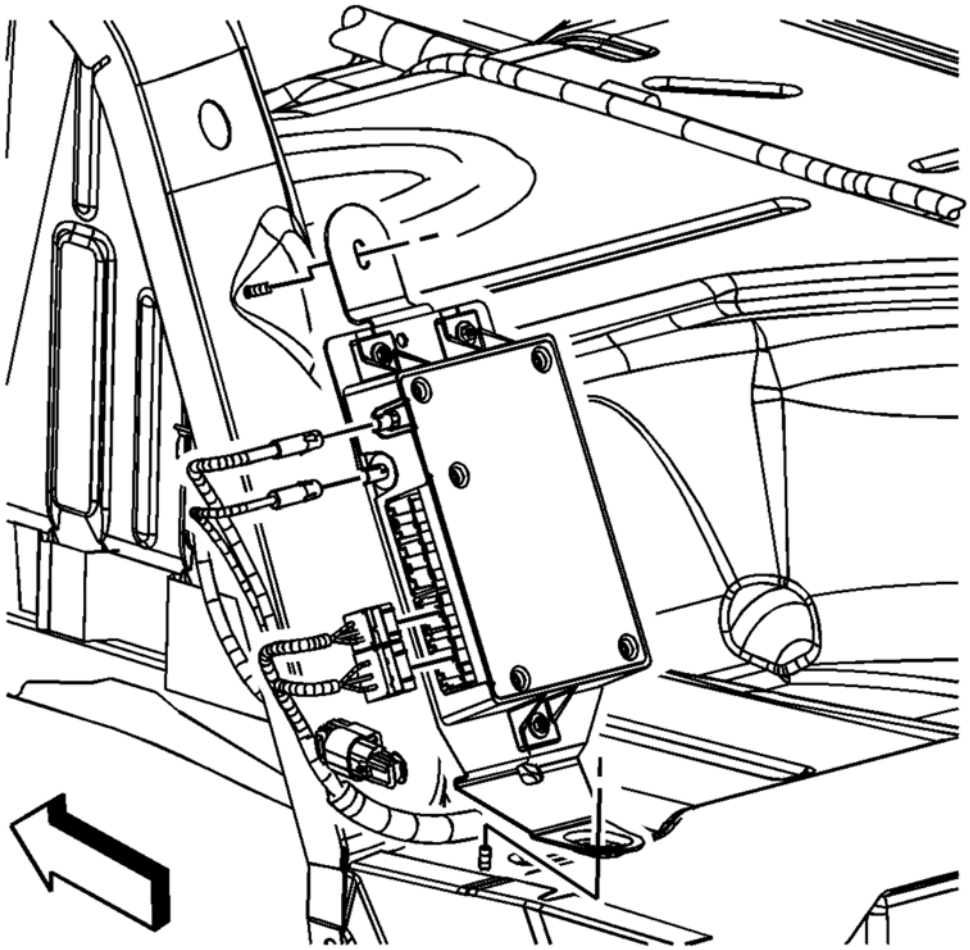

Fig. 34: Antenna Cable Connector & Harness Side
Courtesy of GENERAL MOTORS COMPANY

2. Connect the new cable to the ONSTAR module and install the left rear compartment side trim. Refer to **Rear Compartment Side Trim Replacement - Left Side** .
3. Connect the new cable to the digital antenna and secure the headliner. Refer to **Headlining Trim Panel Replacement** .

RADIO REAR SPEAKER GRILLE REPLACEMENT

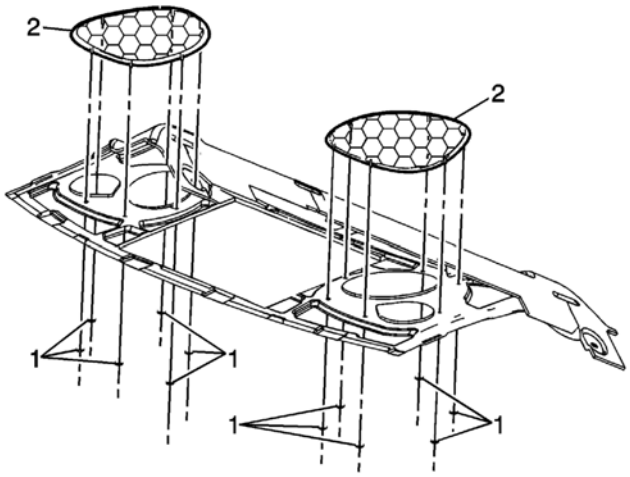

Fig. 35: Radio Rear Speaker Grille
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear window shelf trim panel. Refer to **Rear Window Shelf Trim Panel Replacement** .	
1	Radio Rear Speaker Grille Nut **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2 N.m (18 lb in)
2	Radio Rear Speaker Grille

FRONT UPPER SPEAKER REPLACEMENT

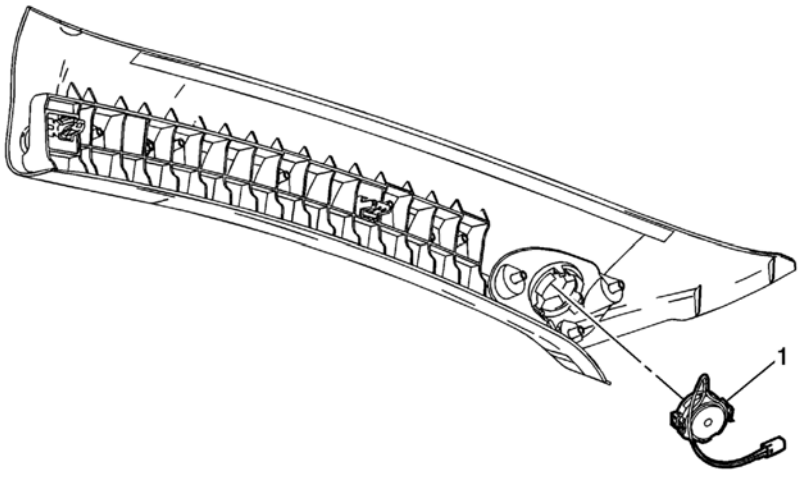

Fig. 36: Front Upper Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel (I/P) outer trim cover. Refer to **Instrument Panel Outer Trim Cover Replacement - Right Side** , or **Instrument Panel Outer Trim Cover Replacement - Left Side** . 2. Remove the windshield pillar garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** .	
1	Radio Windshield Side Garnish Molding Speaker Assembly **TIP:** Release the tabs on the windshield pillar speaker carrier to remove the speaker from the molding.

RADIO FRONT SIDE DOOR SPEAKER REPLACEMENT

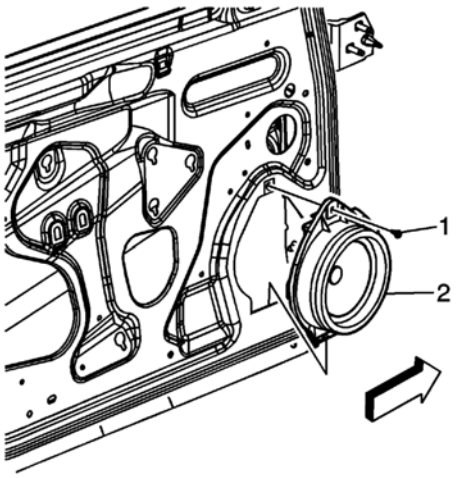

Fig. 37: Radio Front Side Door Lower Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement**	
1	Radio Front Side Door Speaker Housing Bolt/Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)

Callout	Component Name
2	Radio Front Side Door Speaker Assembly **Procedure** Disconnect electrical connections.

RADIO REAR SPEAKER REPLACEMENT (IMPALA W/UW6)

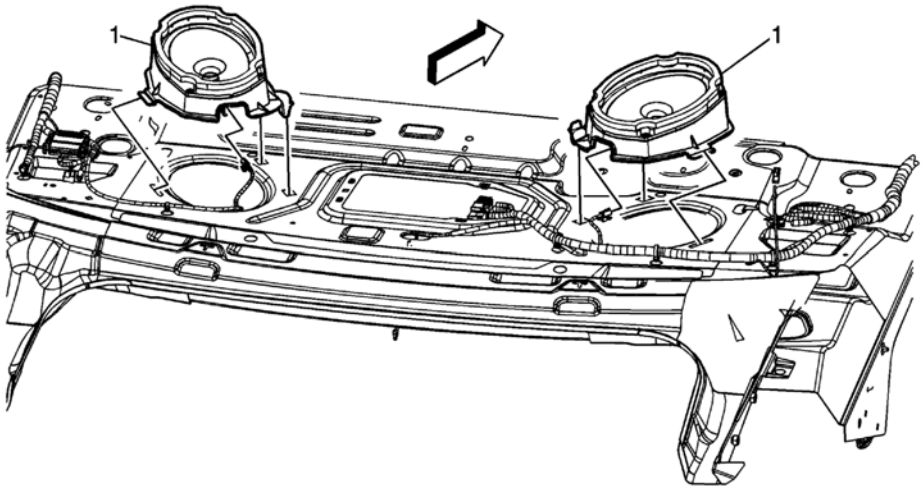

Fig. 38: Radio Rear Speaker (Impala w/UW6)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear window shelf trim panel. Refer to **Rear Window Shelf Trim Panel Replacement** .	
1	Radio Rear Speaker Assembly (Qty: 2) • Push in on the tabs on the speaker in order to release. • Disconnect the electrical connector.

RADIO REAR SPEAKER REPLACEMENT (IMPALA W/UQ3)

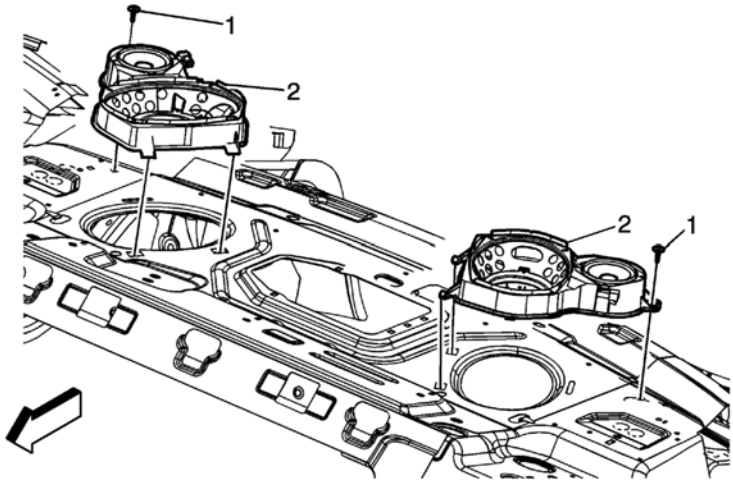

Fig. 39: Radio Rear Speaker (Impala w/UQ3)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear window shelf trim panel. Refer to **Rear Window Shelf Trim Panel Replacement** .	
1	Radio Rear Speaker Bolt/Screw **CAUTION:** **Refer to** **Fastener** **Caution** . **TIP:** Disconnect the electrical connector. **Tighten** 2.5 N.m (22 lb in)
2	Radio Rear Speaker Assembly

DESCRIPTION AND OPERATION

ONSTAR DESCRIPTION AND OPERATION

This OnStarÂ® system consists of the following components:

- Telematics communication interface control module
- OnStarÂ® three button assembly
- Microphone
- Cellular antenna
- Navigation antenna
- BluetoothÂ® antenna (If equipped)
- Back up battery (If equipped)

This system also interfaces with the factory installed vehicle audio system.

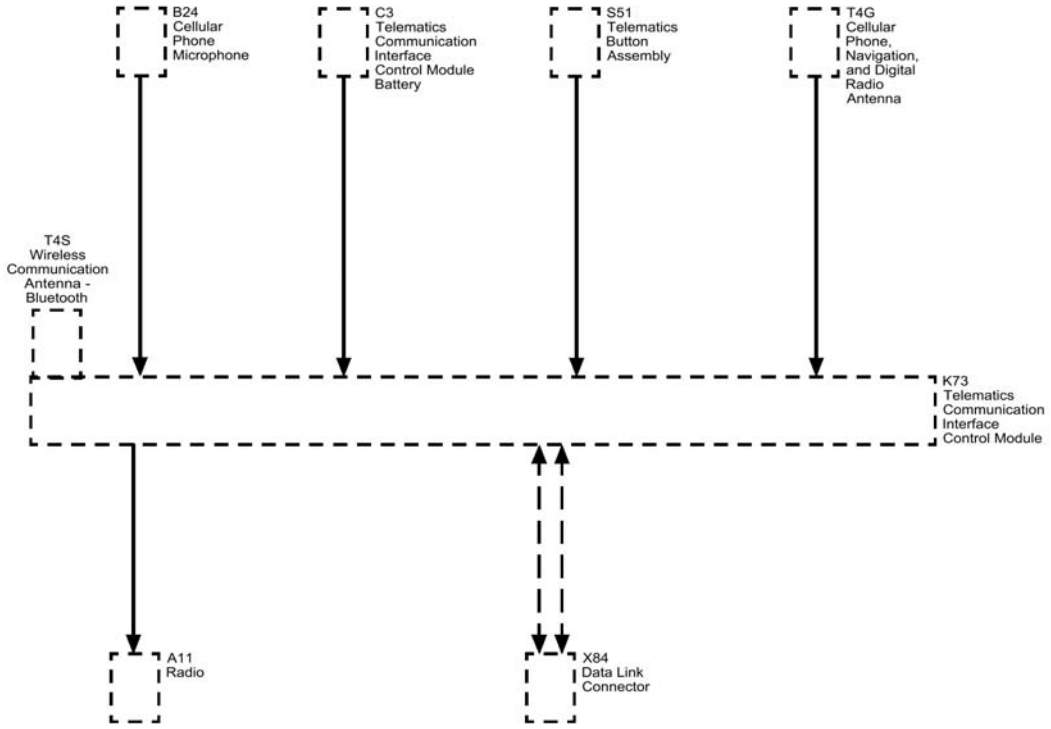

Fig. 40: Identifying Onstar Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
B24	B24 Cellular Phone Microphone
C3	C3 Telematics Communication Interface Control Module Battery
S51	S51 Telematics Button Assembly
T4G	T4G Cellular Phone, Navigation, and Digital Radio Antenna
T4S	T4S Wireless Communication Antenna - Bluetooth
K73	K73 Telematics Communication Interface Control Module
A11	A11 Radio
X84	X84 Data Link Connector

Telematics Communication Interface Control Module

The telematics communication interface control module is a cellular device that allows the user to communicate data and voice signals over the national cellular network. Power is provided by a dedicated, fused B+ circuit. Ground is provided through the vehicle wiring harness attached to the module. The ignition state is determined

by the telematics communication interface control module through serial data messaging.

Dedicated circuits are used to connect the telematics communication interface control module to a microphone, the button assembly, and to command the status LED. The telematics communication interface control module communicates with the rest of the vehicle over the serial data bus.

The module houses 2 technology systems, one to process GPS data, and another for cellular information. The cellular system connects the OnStarÂ® system to the cellular carrier's communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular antenna and cellular antenna coax. GPS satellites orbiting earth are constantly transmitting signals of their current location. The OnStarÂ® system uses the GPS signals to provide location on demand.

The module also has the capability of activating the horn, initiating door lock/unlock, or activating the exterior lamps using the serial data circuits. These functions can be commanded by the OnStarÂ® Call Center per a customer request.

OnStarÂ® Three Button Assembly

Base Mirror

- The OnStarÂ® button assembly may be part of the rearview mirror, or a separate, stand alone unit. The button assembly is comprised of 3 buttons and a status LED. The buttons are defined as follows:
  - The answer/end call button, which is black with a white phone icon, allows the user to answer and end calls or initiate speech recognition.
  - The blue OnStarÂ® call center button, which displays the OnStarÂ® logo, allows the user to connect to the OnStarÂ® call center.
  - The emergency button, which displays a white cross with a red background, sends a high priority emergency call to the OnStarÂ® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStarÂ® button assembly on the keypad supply voltage circuit. When pressed, each button completes a circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStarÂ® status LED is located with the button assembly. The LED is green when the system is ON and operating normally. When the status LED is green and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStarÂ® system is still able to make a call, the LED will flash red during the call.

If the mirror has the rear vision camera display in the mirror, the LED's are then interior to the mirror and controlled via data communication on the Low Speed GMLAN bus from the Telematics Communication Interface Control Module to the mirror.

If the LED does not illuminate, this may indicate that the customers OnStarÂ® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Each LED is controlled by the telematics communication interface control module over dedicated LED signal circuits. Ground for the LED is provided by the wiring harness attached to the button assembly.

Prismatic Mirror (If Equipped)

- The OnStarÂ® button assembly is apart of the rearview mirror. The button assembly is comprised of 3 capacitive touch buttons and a status LED. The buttons are defined as follows:
  - The answer/end call button, which is a white driver figure seated with voice signals near it's face, allows the user to answer and end calls or initiate speech recognition.
  - The blue OnStarÂ® call center button, which displays the blue OnStarÂ® logo, allows the user to connect to the OnStarÂ® call center.
  - The emergency button, which displays red letters "SOS" as an illuminated Indicator, sends a high priority emergency call to the OnStarÂ® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStarÂ® button assembly on the keypad supply voltage circuit. When pressed, each button press is processed and completes a circuit across an internal resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStarÂ® status LED is located within the mirror near the buttons. The LED is green when the system is ON and operating normally. When the status LED is green and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStarÂ® system is still able to make a call, the LED will flash red during the call.

If the LED does not illuminate, this may indicate that the customers OnStarÂ® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Each LED is controlled by the telematics communication interface control module over dedicated LED signal circuits. Ground for the LED is provided by the wiring harness attached to the button assembly.

Electrochromic Mirror (If Equipped)

- The OnStarÂ® button assembly is apart of the rearview mirror. The button assembly is comprised of 3 capacitive touch buttons and an error indicator. The buttons are defined as follows:
  - The answer/end call button, which is a white driver figure seated with voice signals near it's face, allows the user to answer and end calls or initiate speech recognition.
  - The blue OnStarÂ® call center button, which displays the blue OnStarÂ® logo, allows the user to connect to the OnStarÂ® call center.
  - The emergency button, which displays red letters "SOS" as an illuminated Indicator, sends a high priority emergency call to the OnStarÂ® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStarÂ® button assembly on the keypad supply voltage circuit. When pressed, each button press is processed and completes a circuit across an internal resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed and illuminate associated indicator above each button.

The OnStarÂ® error indicator is located within the mirror above the buttons between the OnStarÂ® indicator and emergency "SOS" indicator. All three indicators associated with a button press are illuminated when the

system is ON and operating normally. When any indicator is illuminated and flashing, it is an indication that a call is in progress. When the OnStarÂ® error indicator is illuminated, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStarÂ® system is still able to make a call, the OnStarÂ® error indicator will remain illuminated during the call.

If the indicators do not illuminate, this may indicate that the customers OnStarÂ® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Secondary OnStarÂ® Controls

Some vehicles may have an additional button that when pushed can engage the OnStarÂ® system. The button may be a symbol of a face with sound waves, or may say MUTE, or be a symbol of a radio speaker with a slash through it.

By engaging the OnStarÂ® system with this feature, the user can interact with the system by use of voice commands. A complete list of these commands is supplied in the information provided to the customer. If the information is not available for reference, at any command prompt the user can say "HELP" and the telematics communication interface control module will return an audible list of available commands.

OnStarÂ® Microphone

The OnStarÂ®, or cellular microphone, can be a part of the rearview mirror assembly, or on some vehicle lines, a separate, stand alone unit. In either case, the telematics communication interface control module supplies approximately 10 volts to the microphone on the cellular microphone signal circuit, and voice data from the user is sent back to the telematics communication interface control module over the same circuit. A cellular microphone low reference circuit or a drain wire provides a ground for the microphone.

Cellular and GPS Antennas

This vehicle will be equipped with one of the following types of antennas:

- A combination cellular and navigation antenna, which brings the functions of both into a single part
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the functionality of the digital radio receiver satellite antenna (XM).
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the AM/FM antenna.

The cellular antenna is the component that allows the OnStarÂ® system to send and receive data over airwaves by means of cellular technology. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module.

The GPS antenna is used to collect the signals of the orbiting GPS satellites. Within the antenna is housed a low noise amplifier that allows for a more broad and precise reception of this data. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module. The cable also provides a path for DC current for powering the antenna.

The OnStarÂ® Call Center also has the capability of communicating with the vehicle during an OnStarÂ® call to retrieve the latest GPS location and transmit it to the OnStarÂ® Call Center. A history location of the last recorded position of the vehicle is stored in the module and marked as aged, for as long as the module power is not removed. Actual GPS location may take up to 10 minutes to register in the event of a loss of power.

OnStarÂ® RemoteLink

OnStarÂ® RemoteLink is a mobile app to link mobile devices to a vehicle for diagnostics and feature controls. After downloading the app and registering the device, vehicle owners with an eligible vehicle can use their mobile devices to access real-time data from their vehicle and perform specific commands remotely.

All communication between the app and the vehicle is powered by OnStar'sÂ® advanced connected vehicle technology. An active OnStarÂ® account as well as a valid OnStarÂ® username and password are required to use the app. The remote commands must be enabled by logging into the user's OnStarÂ® account prior to using the app.

Vehicle Control Features

- Lock/Unlock doors
- Start vehicle remotely
- Activate your Horn & Lights
- Contact an OnStar Advisor, Roadside Assistance or your Preferred Dealer

Available Vehicle Data:

- Real-time fuel information, including fuel range, fuel remaining, and lifetime MPG
- Lifetime mileage
- Remaining oil life
- Current tire pressure information
- OnStarÂ® account information

Compass Heading

The telematics communication interface module has a compass feature to calculate vehicle direction which is displayed via the instrument panel cluster or designated display. The compass heading is determined by dead reckoning until the GPS 3d fix is established. The dead reckoning is accomplished by using the yaw rate sensors and wheel ticks to determine heading changes from a GPS known heading. The GPS 3d fix heading is determined by the deferential of two locations.

BluetoothÂ® (If Equipped)

BluetoothÂ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have BluetoothÂ® functionality. In order to utilize the vehicle's BluetoothÂ® system, a BluetoothÂ® equipped cellular phone is required.

The BluetoothÂ® antenna is a small fixed antenna connected directly to the telematics communication interface control module and is used to send and receive signals from a BluetoothÂ® enabled cellular phone. The antenna utilizes no cabling and is not external to the vehicle. The available features and functions are determined by the software within the device being used and the telematics communication interface control module. The operating range of the signal from the vehicle is approximately 30 feet. Note that the operating range is dependent upon the cellular phone being used and battery level of the phone.

With BluetoothÂ® technology customers can experience hands-free calling as their BluetoothÂ® capable

cellular phones are wirelessly connected to the vehicle. It will allow customers to place and receive calls using the steering wheel controls and voice recognition. The vehicle audio system will allow you to listen to your call through the vehicle speakers and adjust volume through steering wheel or radio controls.

Not all BluetoothÂ® cellular phones are guaranteed to work with the vehicle's BluetoothÂ® system. Based on the cellular phone's service provider and the manufacturer's implementation of BluetoothÂ®, not all phones support all available BluetoothÂ® functionality. BluetoothÂ® enabled cellular phones will be tested for vehicle compatibility and a feature compatibility list will be provided via the GM BluetoothÂ® website: http://www.gm.com/vc/bluetooth/

BluetoothÂ® Features Supported

The following is a list of features supported by the BluetoothÂ® system. Note that not all devices will support all of the listed functions.

- Automatic reconnection - highest priority phone will automatically be connected to vehicle when vehicle ignition is on
- Hands-free dialing- via digits, redial, name tags (phone number saved to a nametag via voice recognition)
- Answering a call
- Ending a call
- Mute a Call
- Rejecting a call - ignore an incoming call
- Call Waiting
- Three-way Calling - initiated from hands-free system
- Send Number During a Call - this is used when calling a menu-driven phone system
- Transfer a Call - transfer call from vehicle to cellular phone and visa versa
- Voice Pass-Thru - allow access to the voice recognition commands on the cellular phone

Pairing a BluetoothÂ® Cellular Phone to the Vehicle

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the BluetoothÂ® functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. For safety reasons, the pairing process is disabled while the vehicle is moving.

Once the BluetoothÂ® cellular phone has been paired with vehicle, it will automatically connect to the vehicle when the ignition is on and the device is on. When more than one paired phone is in the vehicle, the phone with the highest priority will be connected. If the cellular phone is in use while getting into the vehicle, the phone can be switched to hands-free mode with the press of a button. In addition, a call in progress can be transferred from the vehicle hands-free mode to the phone to continue the call as the customer exits the vehicle.

Complete pairing instructions are provided in the Vehicle Owners Manual.

Back-up Battery (If Equipped)

IMPORTANT: Do not disconnect the main vehicle battery or remove the OnStarÂ® fuse with the ignition key

in any position other than OFF. Disconnecting power to the OnStarÂ® module in any way while the ignition is ON or with retained accessory power activated may cause activation of the OnStarÂ® Back-Up Battery. This action is per design as the back-up battery is designed to provide power to the telematics communication interface control module so an emergency notification call can be made after an event where the main battery is disabled. Once the Back-Up Battery is activated it will stay on until the power is restored back to the telematics communication interface control module. The telematics communication interface control module naturally chooses the main supply voltage as it's default supply, but if the main supply is removed or lost for any reason the OnStarÂ® module will use the Back-Up Battery as a power supply as long as the default supply can not be detected. The back-up battery is not rechargeable and once discharged below 9.5 volts the back-up battery must be replaced.

Certain OnStarÂ® equipped vehicles may also be equipped with a back-up battery. The back-up battery is a non-rechargeable, lithium battery intended to provide an auxiliary power source for the telematics communication interface control module in the event where power from the main vehicle battery is lost.

The back-up battery is intended to have a life span of approximately 4 years and is designed to maintain an open circuit voltage between 16 V and 9 V throughout this period. This allows the battery to power the basic functions of the telematics communication interface control module for least one 200 second (5 minute) call at the end of the 4 year span, should the main vehicle battery be lost. In the case of a vehicle losing vehicle battery power, OnStar will switch over to the backup battery based on an internal algorithm. It will look for an air-bag deploy, or near-deploy, messages from the SDM. If there are no messages the OnStar module will stay wake for a few minutes longer and monitor the buttons in the mirror. If not pressed, the modules will power down and shut off completely.

The back-up battery is connected to the telematics communication interface control module through the back-up battery positive voltage circuit and back-up battery ground circuit and is protected from a short circuit by means of an internal fuse. In the event the back-up battery, battery positive voltage circuit is shorted to the back-up battery ground circuit or chassis ground, the fuse will open and render the back-up battery permanently inoperable. The status of the back-up battery and its associated wiring is monitored by the telematics communication interface control module.

Audio System Interface

When the OnStarÂ® requires audio output, a serial data message is sent to the audio system to mute all radio functions and transmit OnStarÂ® originated audio. The OnStarÂ® audio is transmitted to the vehicle audio system by a dedicated signal circuit and a low reference circuit.

The audio system will mute and an audible ring will be heard though the speakers if the vehicle receives a call with the radio ON.

On some vehicles, the HVAC blower speed may be reduced when the OnStarÂ® system is active to aid in reducing interior noise. When the system is no longer active, the blower speed will return to its previous setting.

OnStarÂ® Sleep Cycle

The OnStarÂ® system uses a unique sleep cycle to allow the system to receive cellular calls while the ignition is in the OFF position and retained accessory power mode has ended. This cycle enables the telematics communication interface control module to perform remote functions, such as door unlock, as commanded over

the air by the OnStarÂ® Call Center, and to continue to maintain an acceptable level of battery electrical drain.

The OnStarÂ® system uses 4 states of readiness, depending upon the type of cellular market the vehicle is in when the ignition is put into the OFF state:

- High power
- Low power
- Sleep
- Digital standby

The high power state is in effect whenever the ignition is in the ON or RUN position, or retained accessory power is enabled, and the OnStarÂ® system is sending or receiving calls or when the system is performing a remote function.

The low power state is in effect when the OnStarÂ® system is idle with the ignition in the ON or RUN position, or with retained accessory power enabled.

The sleep state is entered after the vehicle has been shut off and the retained accessory power has timed out while in an analog cellular area. At a predetermined time recorded within the telematics communication interface control module, the system re-enters the low power state to listen for a call from the OnStarÂ® Call Center for 1 minute. After this interval, the system will again return to the sleep state for 9 minutes. If a call is sent during the 1 minute interval, the OnStarÂ® system will receive the call and immediately go into the high power mode to perform any requested functions. If no call is received during the 1 minute interval, the system will go back into the sleep mode for another 9 minutes. This process will continue for up to 48 hours, after which the OnStarÂ® system will turn off until the ignition is turned to the ON or RUN position.

The digital standby power state is entered after the vehicle has been shut off and the retained accessory power has timed out while in a digital cellular area. When in digital standby mode, the OnStarÂ® module is able to perform all remote functions as commanded by an OnStarÂ® advisor at any time, for a continuous 120 hours. After 120 hours, the OnStarÂ® module will go into sleep mode until a wake up signal from the vehicle is seen by the telematics communication interface control module. If the OnStar module loses the digital cellular signal it will revert to analog mode and follow the standard sleep state (9 minutes OFF, 1 minute standby) based on the time of the GPS signals, this will continue until a digital cellular signal is again received.

If the OnStarÂ® system loses battery power while the system is in a standby or sleep mode, the system will remain OFF until battery power is restored and the ignition is turned to the ON or RUN position.

Features

OnStarÂ® Personal Calling

The hands free, OnStarÂ® personal calling cellular phone feature is an additional feature of the OnStarÂ® system. This feature is embedded within the telematics communication interface control module; however it must be activated by an OnStarÂ® advisor. OnStarÂ® personal calling operates similar to most hand held cellular phones in that the availability for its usage is based on minutes or units. The customer must have a current OnStarÂ® subscription, as this feature cannot be utilized without it. To use OnStarÂ® personal calling, the customer must also purchase units (minutes) as outlined in the owners guide provided with the OnStarÂ® system. Units begin to deplete, 1 unit is equal to 1 minute, as the customer makes outbound phone calls, answers inbound phone calls, or while connected to the OnStarÂ® virtual advisor. In addition, units may also

have an expiration date, depending upon the type of units purchased.

Customers have the ability to store telephone numbers within the module, referenced by a nametag for the convenience of frequently dialed numbers. After storing a nametag, the user can dial this number by initiating the OnStarÂ® personal calling feature, speaking the word "call," and repeating the nametag assigned.

Turn by Turn Navigation

Turn by Turn Navigation allows the driver to contact OnStarÂ® to obtain directions for driving from a current location to a desired location. The Turn by Turn Navigation system stores your planned route and continually checks your position along that route, when you deviate from the planned route, the system will recognize this and prompt the driver with verbal prompts for how to proceed. The driver then responds verbally to direct the system to continue the current routing or to recalculate the route because of a missed turn.

Advisor Record Feature

The Advisor Record Feature allows the user to store any information given during a call with an OnStarÂ® Advisor. Recording is activated by pressing the blue OnStar button during a call; pressing the button a second time stops the recording. The stored information can be played back by pressing the phone button on the three button assembly and using the voice command "Advisor Playback".

Deactivated OnStarÂ® Accounts

In the event a customer has not renewed their OnStarÂ® account after expiration or the account was never activated, OnStarÂ® will make a discrete cellular call to the vehicle to deactivate the OnStarÂ® system. Before taking this action, customers are notified that the OnStarÂ® system in their vehicle will be deactivated unless they elect to renew the account. After the OnStarÂ® account has been deactivated, customers will experience the following:

- The OnStarÂ® status LED will not illuminate.
- The OnStarÂ® system will NOT attempt to connect to the OnStarÂ® Call Center in the event of a collision or if the vehicle's front air bags deploy for any other reason.
- An emergency button press will play a demo message indicating the service has been deactivated.
- An OnStarÂ® Call Center button press will connect the customer with a dedicated sales team who can sell an OnStarÂ® subscription and reactivate the vehicle. Depending on the type of OnStarÂ® hardware in the vehicle, the customer may first hear a demonstration message stating there is no current OnStarÂ® subscription for the vehicle, and directing the customer what to do to activate services.
- OnStarÂ® personal calling will not be available, as this feature requires the customer to have a current OnStarÂ® account. Attempts to use this feature may result in cellular connection failure messages and the inability to connect to the number dialed.

Certain vehicles that have never had an active OnStarÂ® account, or that have been deactivated, may be unable to establish a connection with the OnStarÂ® Call Center. When normal published diagnostic procedures do not indicate a possible cause for the no connect concern, the vehicle may have been deactivated. For deactivated vehicles, a no connect response should be considered normal operation. Further diagnosis and subsequent repair is only necessary should the customer elect to become an active OnStarÂ® subscriber or renew the account subscription.

OnStarÂ® Cellular, GPS, and Diagnostic Limitations

The proper operation of the OnStarÂ® System is dependent on several elements outside the components integrated into the vehicle. These include the National Cellular Network Infrastructure, the cellular telephone carriers within the network, and the GPS.

The cellular operation of the OnStarÂ® system may be inhibited by factors such as the users range from an analog or digital cellular tower, the state of the cellular carrier's equipment, and the location where the call is placed. Making an OnStarÂ® key press in areas that lack sufficient cellular coverage or have a temporary equipment failure will result in either the inability of a call to complete with a data transfer or the complete inability to connect to the OnStarÂ® Call Center. The OnStarÂ® system may also experience connection issues if the identification numbers for the module, station identification number, electronic serial number or manufacturers electronic ID, are not recognized by the cellular carriers local signal receiving towers.

The satellites that orbit earth providing the OnStar system with GPS data have almost no failures associated with them. In the event of a no GPS concern, the failure will likely lie with the inability of the system to gain GPS signals because of its location, i.e. in a parking structure, hardware failure, or being mistaken with an OnStarÂ® call which has reached the Call Center without vehicle data.

During diagnostic testing of the OnStarÂ® system, the technician should ensure the vehicle is located in an area that has a clear unobstructed view of the open sky, and preferably, an area where analog or digital cellular calls have been successfully placed. These areas can be found by successfully making an OnStarÂ® keypress in a known good OnStarÂ® equipped vehicle and confirming success with the OnStarÂ® Call Center advisor. Such places can be used as a permanent reference for future OnStarÂ® testing.

Mobile Identification Number and Mobile Directory Number

The telematics communication interface control module utilizes 2 numbers for cellular device identification, call routing and connection, a mobile identification number and a mobile directory number. The mobile identification number represents the number used by the cellular carrier for call routing purposes while the mobile directory number represents the number dialed to reach the cellular device.

Operation of the OnStarÂ® Speech Recognition Systems

OnStarÂ® users communicate with 2 speech recognition systems. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over a phone line. The computer tries to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

- Personal Calling uses a speech recognition system that resides in the vehicle. When the user presses the phone button, the system states, Ready, and listens for the user's command. The user can speak commands to control the hands-free phone.
- Virtual advisor is a remote speech recognition system that the caller can access by making a phone call. The user connects to virtual advisor by requesting it during personal calling use. The user is then transferred to the virtual advisor server and talks to it via a cellular connection.

The OnStarÂ® speech recognition systems use speech technology that is designed to understand a wide range of American English speakers. Although there is no one right way to speak English, the system will work best when users try to modify their pronunciation should they encounter difficulty. Users who do not obtain good results are advised to try the tips and workarounds found in this section.

General Tips for Better Speech Recognition

Concern	Tip for Better Result
Noise	Noise may confuse the speech recognition system. You usually get better performance from the system in quieter conditions: • The HVAC fan creates noise. Turn it down or OFF for better speech system performance. • Driving at high speeds creates louder engine noise and wind noise. You may get better results at lower speeds. • An open window or an open sunroof allows more noise to enter the vehicle. Close all windows for better results. • Noisy rainstorms can also reduce performance. • If passengers are talking while you use the speech system, it may be confused by their speech. You will get better results if all occupants of the vehicle are quiet while the system is listening for commands.
When to Speak	In Personal Calling, the system is only listening after it prompts you to speak with a beep. • When the system prompts you to speak, you have about 5 seconds to respond. If the system does not hear a response, it will prompt you again, or cancel the transaction. • If you begin to speak too soon, try pausing for a half second before speaking after the beep. • In the Virtual Advisor, the system is always listening for commands, even while it is speaking.
How to Speak	Speak forcefully, and clearly. • The noisier the environment, the louder you need to speak. If you are in the driver seat, speak facing the front of the car. If you are a passenger, speak facing the rearview mirror. • Speak calmly, and naturally. The system may sometimes fail your repeated attempts to give a command. If your speech is distorted by shouting or frustration, this may cause more errors. • People with high-pitched voices may have better results by speaking in a deeper, lower-pitched voice. However, do not lower the volume of the voice. • Avoid speaking with a rising intonation, like asking a question. Use a flat or falling intonation, like giving an answer.
What to Say	Personal Calling: One-word commands • The Personal Calling system listens for only one word at a time. There are some exceptions, 2-word phrases that are spoken and understood as a single word, e.g. "virtual advisor", "voice feedback", and "my number". You can enter phone numbers only one digit at a

Concern	Tip for Better Result
	time, and the system repeats each digit as it hears it. • Say "Help" at the Ready prompt to hear the list of Personal Calling commands. • Virtual Advisor can understand sentences with more than one word. It also expects to hear a 4-digit number all at once when it asks for your PIN. • Say, "What are my choices?" to hear a list of commands that the Virtual Advisor understands.
Entering a phone number	• If you have trouble getting numbers correctly into the system, store your frequently-called number in the directory, so the system will remember them. After you have stored a number with a nametag, then you simply say "call" and the nametag in order to call the number. • If the system cannot understand your numbers, ask another person to help you enter your frequently-called numbers. This person can speak the numbers, then you can speak the nametag.
Storing or dialing a number	When you have finished speaking your phone number, you do not need to say "store" or "dial" to indicate that you are done. If you pause and say nothing, the system will ask you if you want to store or dial. Say "yes".
Creating nametags	• Short nametags that are similar may be easily confused by the system. You may get better recognition of your nametags if you make them longer, for example "George Washington" without pause, instead of "George" only. • If you want to use nametags while driving, it is best to store the nametag with some vehicle noise in the background. If you are in park while you are storing nametags, you can turn the fan on low or open windows in order to create some background noise.
Virtual Advisor 4-digit PIN	Say the 4 digits in a natural way, without pausing between digits.
Interrupting	• When the Virtual Advisor is speaking, you can interrupt it with another command. The first word in your command helps to get its attention. • If the Virtual Advisor has trouble understanding your commands when you interrupt, try speaking the first word loudly and clearly, then pause for an instant, then continue with the rest of the command. For example: "Get ... my weather" or "Lookup... a quote for General Motors".

RADIO/AUDIO SYSTEM DESCRIPTION AND OPERATION

The entertainment system on this vehicle may have several different configurations available to it. To determine

the specific configuration of the vehicle, please see the Service Parts ID Label, and refer to **RPO Code List** .

The entertainment system on this vehicle is configured with either a base or an uplevel system. The base and uplevel systems each contain a radio, antenna, speakers, and on some systems an audio amplifier. The uplevel system differs from the base system by providing the customer with enhanced audio system features. Some of those features may include the radio data system (RDS), an audio amplifier, programmable equalizer (EQ), and digital satellite radio (U2K).

Each item in the list below represents topics covered in detail below.

- Radio Circuit Operation
- Antenna System
- AM/FM Reception
- Digital Radio Receiver
- Speaker Operation
- Audio Amplifier
- Radio Data System (RDS)
- Radio Data System (RDS) Messages
- MP3/CD Formatting Information for MP3/CD Radios (If equipped)
- Integral Multi Disc CD Changer (IMDX)
- Noise Compensation
- Radio Error Messages
- Theft Deterrent
- OnStar Â®
- Steering Wheel Controls
- Auxiliary Input Jack
- Noise Compensation

Radio Circuit Operation

Radio Power

The radio does not use a discrete ignition feed circuit for power moding. The power mode master (PMM) provides the system power mode to the radio via serial data messages. The PMM determines the system power mode by processing power mode information from ignition switch inputs. Serial data power modes supported by the radio are OFF, ACCESSORY, RUN, and CRANK REQUEST.

Radio Grounds

The vehicle harness provides a ground for the radio circuits. The radio may also be case grounded.

Radio Data Link Communication

The radio communicates with other modules via serial data.

Radio Outputs

At minimum volume, the plus (+) and minus (-) speaker outputs are approximately half battery voltage, measured to vehicle ground. As the volume increases, the plus and minus change to create a voltage difference between each other either driving the voice coil of the speaker, or being fed to an amplifier.

Radio Head Dimming

Dimming and backlighting levels are determined by the serial data messages the radio receives.

Antenna System

Backglass Antenna

The AM-FM antenna is on the backglass with the rear window defogger, at the top of the rear window.

Make sure that the inside surface of the rear window is not scratched and that the lines on the glass are not damaged. If the inside surface is damaged, it could interfere with radio reception. Using a razor blade or sharp object to clear or clean the inside rear window may damage the rear window antenna and/or the rear window defogger. Do not apply aftermarket glass tinting with metallic film. The metallic film in some tinting materials will interfere with the incoming radio reception.

Antenna Module

The radio antenna is connected to the antenna module. The antenna module is powered by a battery voltage circuit supplied by the radio. The antenna module boosts the received signal and transmits the signal to the radio via a coaxial cable.

Multi-Band Antenna

The multi-band antenna is located on the roof of the vehicle. This type of antenna may be used with the AM/FM radio, but is primarily for OnStarÂ® and the XM™ Satellite Radio Service System, if the vehicle has these features. Keep this antenna clear of snow and ice build up for clear reception. If the vehicle has a sunroof, the performance of the system may be affected if the sunroof is open. Loading items onto the roof of the vehicle can interfere with the performance of the system, ensure the multi-band antenna is not obstructed.

AM/FM Reception

Radio Signal

The radio signal is sent from a broadcast station and is then received by an antenna. The strength of the signal received depends on the following:

- The power output (wattage) of the broadcasting station
- The location of the vehicle (or receiver) relative to the broadcast tower.
- Obstacles between the tower and the receiver
- Atmospheric conditions
- What band (AM or FM) the station is broadcasting
- Type of antenna and the ground plane

AM Reception

The AM band has a lower frequency range than the FM band. These longer wavelengths:

- Bend around Obstacles
- Follow the curvature of the earth
- May reflect off the ionosphere (skip)

The AM frequencies have longer range due to the ground wave. The ground wave follows the curvature of the earth and is effected by its conductivity. Greater conductivity equates to less signal loss thus transmission over water is better than over land. The AM band has a range of 80-320 km (50-200 miles).

FM Reception

The shorter wavelengths of the higher frequency FM band:

- Reflect off obstacles
- Are absorbed by the ground
- Penetrate the ionosphere

Broadcasts in the FM band are to line of sight reception which is typically 40 km (25 miles). Even when out of a direct line of sight, the signal may be reflected into areas that would be in a shadow otherwise. Factors which affect the line of sight include:

- Height of the broadcast antenna
- Height of the receiving antenna
- Terrain and buildings in the broadcast path

Digital Radio Receiver (If equipped)

XM satellite radio provides digital radio reception. The XM signal is broadcast from two satellites and, where necessary, terrestrial repeaters. The high power satellites allow the antenna to receive the XM signal even when foliage and other partial obstructions block the antennas view of the satellite. Terrestrial repeaters are used in dense urban areas. These repeaters will receive the satellite signal and re-broadcast them at much higher power levels in order to ensure reception in areas with densely packed tall buildings. A service fee is required in order to receive the XM service.

The radio communicates with the digital radio receiver (DRR) via serial data. During XM operation the audio signals are sent over the left and right audio signal circuits from the DRR to the radio.

Speaker Operation

Speakers turn electrical energy into mechanical energy to move air, using a permanent magnet and an electromagnet. The electromagnet is energized when the radio or amplifier (if equipped) delivers current to the voice coil on the speaker. The voice coil will form a north and south pole that will cause the voice coil and the speaker cone to move in relation to the permanent magnet. The current delivered to the speaker is rapidly changing alternating current (A/C). This causes the speaker cone to move in two directions producing sound. When the speaker is at rest, such as when the volume at a minimum value, the voltage applied to each side of the speaker is 1/2 ignition system voltage. This way, the speaker cone can be moved in either direction.

Audio Amplifier (If equipped)

Amplifier Interface

A fused battery voltage circuit provides the main amplifier power. A switched 12-volt output from the radio is used to control the power-state of the amplifier. To respond quickly to audio input and control signals, the amplifier is ON in all vehicle power modes except OFF and CRANK Request. The internal amplifier bridges are fully powered and unmuted when the amplifier receives the switched 12-volt input. This type of amplifier does not have serial data communication capability, and can not set DTCs.

Amplifier Operation

The purpose of the amplifier is to increase the power of a voltage or current signal. The output signal of an amplifier may consist of the same frequencies as the input signal or it may consist of only a portion of the frequencies as in the case of a subwoofer or midrange speaker. The radio creates a low level stereo audio output signal, which is sent at the user-defined volume level to the audio amplifier. The audio amplifier amplifies the signal and sends it to the appropriate speakers.

Radio Data System (RDS) (If equipped)

The radio may be equipped with the Radio Data System (RDS). The RDS feature is available only on FM stations that broadcast RDS information. This system relies upon receiving specific information from these stations and only works when the information is available. While the radio is tuned to an FM-RDS station, the station name or call letters display.

RDS data is carried in what is known as a "subcarrier". A subcarrier is a frequency that the FM broadcaster is authorized to use to send data that is not audible in the main audio program.

- RDS functions will only work with FM broadcast stations that are broadcasting RDS data.
- Not all FM Broadcast stations broadcast RDS data or offer all of the RDS services.
- The information displayed is dependent upon the information broadcast by the particular station. The information may vary greatly between stations.
- RDS functions may not work properly when reception is weak, reception is of poor quality, or RDS is not implemented properly by the FM Broadcaster.
- In some cases, a radio station broadcasting incorrect information may cause the RDS features of the radio to appear to work improperly.

With RDS, the radio can do the following:

- Seek to stations broadcasting the selected type of programming
- Receive announcements concerning local and national emergencies
- Display messages from radio stations

RDS may display text information such as:

- The name of the station.
- The type of program.
- General information such as artist and song title, call in phone numbers, etc.

RDS Messages

- ALERT!: Alert warns of local or national emergencies. When an alert announcement comes on the current radio station, ALERT! displays. You will hear the announcement, even if the volume is low or a CD is playing. If a CD is playing, play stops during the announcement. Alert announcements cannot be turned off. ALERT! is not affected by tests of the emergency broadcast system. This feature is not supported by all RDS stations.
- INFO (Information): If the current station has a message, the information symbol or INFO displays. Press this button to see the message. The message can display the artist, song title, call in phone numbers, etc. If the entire message can not be displayed, parts of the message appear every three seconds. To scroll through the message, press and release the INFO button. A new group of words displays after every press of this button. Once the complete message has displayed, the information symbol or INFO disappears from the display until another new message is received. The last message is displayed by pressing the INFO button. View the last message until a new message is received or you tune to a different station.

MP3/CD Formatting Information for MP3/CD Radios

The MP3/CD equipped radios will play standard audio CDs, CD-Rs, and CD-RWs. The CD-R/RWs may contain either standard audio (*.cda) or compressed audio (*.mp3). Customers who record their own music CDs should be aware of the following:

- The files can be recorded on a CD-R/RW disc with a maximum capacity of 700 MB.
- The radio will play only compressed audio files recorded in the *.mp3 format. It also supports playlists that can be made and saved with popular MP3 software (in the *.m3u format). A playlist name must be no more than 32 characters in length. If the name of a playlist is longer than 32 characters, the radio will ignore the playlist.
- The radio will only play audio from a CD-R/RW, it cannot record audio.
- The radio will play a mixed mode CD-R/RW (one recorded with both *.cda and *.mp3 files). If a mixed mode CD is inserted in the radio, the radio will assign the standard CD audio to a directory which is listed as ROM audio directory.
- ID3 tag information is displayed by the radio, if available. The ID3 tag information can either be version 1 or 2. The radio will display the filename, song name, artist name, album name, directory name, and playlist name, etc.
- The radio supports multi-session discs, but only the files from the last session will be played.
- There are a total of 20 directories (folders) allowed on a disc. The file structure can be 0-4 directories deep (a folder within a folder, within a folder, etc.) Anything more than 20 directories will be ignored. Each directory may have up to 99 files contained within it. Files not having the *.mp3 extension will not be played, but still count toward the maximum. Anything more than the first 99 files within a directory will be ignored. A single disc may have up to 254 files and directories. Anything beyond the 254 limit will be ignored.
- MP3 files must be written to a CD-R/RW in one of the following industry-standard formats:
    - ISO 9660 Level 1
    - ISO 9660 Level 2
    - Joliet
    - Romeo

If the customer does not follow these guidelines when recording a CD-R/RW, the disc may not play in the MP3

Radio.

Integral Multi Disc CD Changer (IMDX) (If equipped)

The integral multi disc CD changer has the capability of storing and playing up to six (6) compact discs. The integral multi disc CD changer has a shock-absorbing system. Only under extreme operating temperatures or severe shock or vibration should the compact disc player skip or mute. If the customer travels an abnormally rough road, a skip condition may be normal. Test drive the vehicle on a normal road with a known good CD. If the condition is still present, replace the radio. The use of CD lens cleaner discs is not advised, due to the risk of contaminating the lens of the CD optics with lubricants internal to the CD mechanism.

The CD mechanism within the ICDX radio will begin an initialization routine after a battery connect (e.g., connecting radio connector C1). The initialization process takes approximately 25 seconds to complete. It is very critical that the initialization is completed before removing battery power from the radio, in order for the complex moving parts of the CD mechanism to be positioned properly before shipping and/or handling purposes. Damage may result to the moving parts of the CD mechanism if battery power is removed during the initialization routine. The damage occurs to the CD mechanism during subsequent shipping or handling operations. The extent of the damage causes the CD mechanism not to recover and the mechanism becomes inoperative.

Theft Deterrent

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. A VIN sequence is the last 6 digits of the VIN. The radio receives this information via serial data. A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

The radio has the following theft operating modes as part of the theft deterrent system:

- Normal Mode-A radio has received a VIN sequence. The radio only learns the VIN sequence if the VIN sequence contained all 6 digits. In this mode the radio has full functionality.
- No VIN Mode-A radio that has not received or learned a VIN. In this mode the radio has functionality.
- Theft Detected Mode-A radio that had previously learned a VIN sequence and subsequently received a VIN sequence not matching the learned sequence. In this mode the radio has functionality.

Radio Error Messages

The Radio may display the following Error Messages (Not all messages may be applicable):

- ERR: This message is displayed when the radio is unable to play the inserted cassette or CD
- LOC: This message is displayed when the radio has entered Theft mode.
- CAL/CAL ERR: This message is displayed when the radio has detected an invalid calibration.
- CDX ERR: Displays if communication is lost with the remote CD changer.
- CHECK CD: Displays when the player encounters a focus or tracking error.
- CHK CDXX: Displays when the CD changer encounters a focus or tracking error .
- CHK TAPE: Displays if a tape has been inserted but is unable to be played due to an error.

- DOOR OPEN: Displays when the CD changer door has been left open.
- NO DISC: Displays when the radio expected a disc to be inserted.
- NONE: Displays when the radio is unable to detect the vehicle speed data information via the serial data circuit.

If an error message is displayed, perform the appropriate diagnostics.

OnStar Â® (If equipped)

When OnStar is activated, a serial data message is sent to the radio that activates a software program. When the software begins its process, the fade goes to the front, Bass and Treble are set to the mid range, the outputs are mono, and the audio source is OnStar. OnStar takes priority over any other audio source. All of these actions are preset values stored in the radio.

For additional OnStar information, refer to **OnStar Description and Operation**.

Steering Wheel Controls (If equipped)

Some audio functions are available using the steering wheel controls. The steering wheel controls duplicate the function of the primary controls available on the radio.

For additional information on steering wheel controls, refer to **Steering Wheel Controls Description and Operation** .

Using the Auxiliary Input Jack (If equipped)

The radio system may have a 3.5 mm auxiliary input jack located on the faceplate. An external audio device such as an MP3 player, CD changer, laptop computer, cassette tape player, etc. can be connected to the auxiliary input jack for use as another source for audio listening. This is not an audio output; do not plug a headphone set into the front auxiliary input jack.

To use a portable audio player, connect a 3.5 mm (1/8 inch) cable to the radio's front auxiliary input jack. While a device is connected, press the radio CD/AUX button to begin playing audio from the device over the vehicle speakers. If there is a CD in the player, pressing the button once will play the CD, pressing again will switch it to the AUX feature.

Noise Compensation (If equipped)

A microphone mounted in the vehicle passenger compartment monitors background noise (such as wind noise from a window being opened) and digitally modifies the system's volume and equalization to ensure optimal sound and performance. This replaces the conventional speed/volume compensation (SCV) adjustment, which automatically adjusted the audio system volume according to vehicle speed.

VIDEO ENTERTAINMENT SYSTEM DESCRIPTION AND OPERATION (DUAL HEADREST DVD SYSTEMS)

Each item in the list below represents topics covered in detail below.

- Dual Headrest DVD Circuit Operation
- Dual Headrest DVD System Components

- Dual Headrest DVD Player
- Playing a Disc
- DVD Messages
- Parental Control
- Video Screen
- Remote Control
- Wireless Headphones
- AUX Inputs
- Audio Outputs
- Wired Headphone Jacks

Dual Headrest DVD Circuit Operation

Dual Headrest DVD Power

The Dual Headrest DVD uses a switched battery voltage feed circuit for power moding.

Dual Headrest DVD Grounds

The vehicle harness provides a ground for the Dual Headrest DVD system.

Dual Headrest DVD Data Link Communication

The Dual Headrest DVD system does not communicate with serial data.

Dual Headrest DVD Outputs

The Dual Headrest DVD system can only output video to each screen and through the AV output for external devices such as a camcorder.

Dual Headrest DVD Components

The Dual Headrest DVD system includes:

- Two video display screens
- DVD Control Module
- A Digital Versatile Disc (DVD) player built into each monitor - If equipped with Dual Player
- Two sets of wireless infrared headphones
- A remote control
- Stereo audio and video inputs for playing an auxiliary device

Dual Headrest DVD Player

The DVD players are integrated the display screen. The DVD player can be controlled by both the buttons on the DVD player and by the buttons on the remote control. The DVD player power may be turned on when the ignition is in the run, accessory, or retained accessory power (RAP) power modes. DVDs are manufactured with different region codes based on the country in which they are sold. Therefore, the DVD player is only

compatible with the region code where the vehicle is sold. The DVD region code is printed on the jacket of most DVDs. Home recorded CDs, CD-R or CD-RW formats, may not play in the DVD player.

Playing a Disc

To play a disc, gently insert the disc with the label side facing the back of the vehicle, into the loading slot. The DVD player will continue to load the disc and the player will automatically start if the vehicle ignition is in an enabled power mode. If a disc is already in the player, press the play/pause button on the face of the DVD player or on the remote control. Some DVDs will not allow the user to fast forward or skip the copyright or previews. Some DVDs will automatically begin to play after the previews have finished. If the DVD does not begin to play the main title, refer to the on-screen instructions, and press play on the DVD player buttons or on the remote control.

DVD Messages

The following errors may be displayed on the video screen monitor.

Disc Format Error

This message will be displayed if a disc is inserted upside down, the disc is not able to be read, or if the disc format is not compatible with the DVD player.

Load / Eject Error

This message will be displayed if the disc is not able to properly load or eject.

Disc Play Error

This message will be displayed if the DVD player cannot play the disc. Severely damaged discs will cause this error.

Region Code Error

This message will be displayed if the region code of the DVD media is not compatible with the DVD player.

No Disc

This message will be displayed if the play button is pressed and there is no disc in the DVD player. If the disc is inserted wrong, the DVD player automatically ejects the disc and No Disc displays.

Parental Control

Part of the SETUP MENU lets users control the type of movie rating content (from G to Adult) that can be viewed and is only accessible when no disc is loaded. The parental control feature limits viewing to the selected preference. If a disc is inserted into the DVD compartment slot and it exceeds the Parental Setting, the following message appears on display: "The Parental Setting of this player prohibits play. Would you like to allow this disc to play?"

If yes if selected, the six digit password must be entered for the disc to play. If the wrong password is entered, the following message appears: " This movie will not play due to the Parental Setting of the player. To create a

six digit password, use the numeric keypad on the remote control. Press the ENTER button to confirm." The default password is 136900.

Video Screen

The rear display screen shows video from either DVD player, or an AUX input device, such as a video game console or camera. Each video screen has a dedicated video signal circuit to the DVD control. If the vehicle is equipped with rear seat entertainment, there is no way to source the movie from the rear seat entertainment to the Dual Headrest DVD screens.

DVD Control Module

The two video screens are linked together by the DVD Control Module. This module allows screen 1 to source the media being played on screen 2. Video, audio, power, and remote signals are sent from the DVD Control Module, to each of the video screens. Video and audio signals are sent from the screen to the control module, and then to both screens.

Remote Control

To use the remote control, aim it at the infrared window above the video screen and press the desired remote control button. Direct sunlight or very bright light may affect the ability of the entertainment system to receive signals from the remote control. If the remote control does not seem to be working, the batteries may need to be replaced. Objects blocking the line of sight may affect the function of the remote control.

If the remote control is to be stored for a long period of time, remove the batteries and keep them in a cool, dry place. Do not store the remote control in heat or direct sunlight. This could damage the remote control. Keep the remote control stored in a cool, dry place.

Wireless Headphones

Wireless headphones allow for rear seat passengers to use the Dual Headrest DVD player without disturbing the listening of front seat passengers. The wireless headphones receive audio signals from the infrared (IR) transmitters on the overhead console. This transmission is line of sight only, so audio quality will be degraded if anything blocks the transmitter signal from reaching the headphones, or if the headphones are placed in the front of the vehicle. On some models, the infrared transmitter will have red LEDs illuminated when activated.

The wireless headphones include 2 channels. This allows rear seat passengers to utilize both screens individually without disturbing one another.

Each set of headphones has a rotary volume control. To adjust the volume, adjust this control. The headphones may automatically turn OFF if they lose the infrared signal from the system for approximately 4 minutes in order to preserve their battery power. The signal may be lost if the system is turned off or if the headphones are out of range of the infrared signal transmitters that are located near the video display screen.

AUX Inputs

The AUX input jacks are standard color-coded RCA-style jacks. Video is yellow, right audio is red, and left audio is white. The jacks are located on the front of the monitor. A number of devices may be plugged into the AUX jacks, including, but not to video game consoles, digital cameras, camcorders, or other devices. Audio only sources can be played through the AUX jacks from portable audio devices.

Audio Outputs

Audio from the DVD player or auxiliary inputs may be heard through the following possible sources:

- Wireless infrared headphones
- Vehicle speakers - via the FM transmitter (if equipped)
- Wired headphone jacks on each monitor

The Dual Headrest DVD system will always transmit the audio signal by infrared to the wireless headphones, if there is audio available. The Dual Headrest DVD system may be capable of outputting audio to the vehicle speakers via the FM transmitter. Once the correct FM frequency is selected as an audio source on the radio you may adjust the speaker volume on the radio to control the volume of the audio to the speakers. Only one audio source can be heard through the vehicle's speakers at a time. The audio source being used is specified by the A/V (audio/video) source selected on the driver side head restraint monitor.

The Dual Headrest DVD system is capable of outputting audio through the wired headphone jacks on the monitors.

Wired Headphone Jacks

Each headrest monitor is equipped with a 2.5 mm jack for wired headphones. To use the wired headphones, plug the headphones into the jacks. The headphones can be used to listen to any source the Dual Headrest DVD system can source.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Signal	1	P0564	B3794 08, P0567, P0568	B3794 61, P0564
1. Cruise Control Malfunction				

Circuit/System Description

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The engine control module (ECM) receives the requested cruise control switch function from the BCM via a serial data message.

Conditions for Running the DTC

- The cruise switch is ON.
- The ignition is ON.

Conditions for Setting the DTC

B3794 08

The BCM detects an invalid voltage signal on the cruise control switch signal circuit for 1 second.

B3794 61

Stuck switch for either Resume/Accelerate or Set/Coast button for 60 seconds.

P0564, P0565, P0567, P0568, P056C

- The BCM detects an invalid voltage signal on the cruise control switch signal circuit for greater than 2 seconds and sends a serial data message to the ECM. The ECM sets these DTCs when the message is received.
- The ECM runs this diagnostic continuously.

P0580, P0581

- The ECM detects an invalid voltage signal on the cruise control switch signal circuit.
- The above condition is present for greater than 2 seconds.
- The ECM runs this diagnostic continuously.

P155A

The ECM is unable to determine the state of the cruise control switch.

P162C

The ECM is unable to determine the state of the vehicle speed limiting switch.

Actions Taken When the DTC Sets

B3794

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs

Conditions for Clearing the DTC

B3794

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that the stop lamps operate properly and that no B22 Brake Pedal Position Sensor related DTCs are

set.

- **If brake pedal position sensor related DTCs are set**

  Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no brake pedal position sensor related DTCs are set**

3. Verify the scan tool BCM Cruise Control Switch Status parameter changes between Off and On, Resume and Set when switching between each position on the cruise control switch.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
4. Verify that no conditions that may inhibit cruise control operation are present. Refer to the ECM scan tool data list Cruise Control Inhibit Reason parameter. Refer to the **Cruise Control Description and Operation**for a list of inhibit reasons.
   - **If the cruise control system has a reason why it is inhibited**

     Repair the condition that is causing the inhibit reason.

   - **If the cruise control system does not have any reasons why it may be inhibited**
5. Verify that no cruise control related DTCs are set.
   - **If any cruise control related DTCs are set**

     Refer to Circuit/System Testing.

   - **If no cruise control related DTCs are set**
6. All OK.

Circuit/System Testing

NOTE:

- **An open ignition circuit or fuse before the control module will cause communication DTCs or power mode mismatch DTCs to set against or in the control module. This failure mode will be diagnosed in the no communications diagnostic procedure or power mode mismatch.**
- **This test assumes the ignition circuit has a driver that will open under a high current condition before the fuse opens.**
- **The driver can open under normal conditions such as battery run down protection or a retained accessory power mode.**

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch-Left, ignition ON.
2. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for greater than 100 Ω between the ignition circuit and ground.
    - If 100 Ω or less, repair the short to ground on the circuit.
    - If greater than 100 Ω
3. Test for less than 2 Ω in the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Verify the scan tool ECM Cruise Control Switch Status parameter is Off.
    - **If not Off**

    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.

    - **If Off**

4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ignition circuit terminal 1.
5. Verify the scan tool ECM Cruise Control parameter is Disabled.
    - **If not Error**

    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 9 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.

    - **If Error**

6. Test or replace the S70L Steering Wheel Controls Switch-Left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0571: CRUISE CONTROL BRAKE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0571

Cruise Control Brake Switch Circuit

Circuit/System Description

The engine control module (ECM) monitors the brake pedal position sensor. When the brake pedal is applied, the ECM detects a predetermined voltage signal. The ECM sends a serial data message to the body control module (BCM) indicating the status of the stop lamps.

This diagnostic test functions on the assumption that a sudden decrease in vehicle speed is caused by a brake pedal application. When the ECM detects that there is a 4.2 km/h (2.6 mph) or greater decrease in vehicle speed within 0.25 s without a transition of the stop lamp switch, the ECM sets DTC P0571.

Conditions for Running the DTC

- The engine speed is greater than 700 RPM.
- The traction control system or the antilock brake system are not active and have not malfunctioned.
- The vehicle speed is greater than 48 km/h (30 mph).
- The diagnostic will disable when the wheel speed is less than 16 km/h (10 mph).

Conditions for Setting the DTC

The BCM detects either a low voltage signal on the stop lamp switch signal circuit when the serial data message from the ECM indicates the brakes are applied, or a high voltage signal on the stop lamp switch signal circuit when the serial data message from the ECM indicates the brakes are not applied.

Actions Taken When the DTC Sets

- The cruise control system is disabled.
- The malfunction indicator lamp (MIL) will not illuminate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Verify that the stop lamps operate properly and that no B22 Brake Pedal Position Sensor related DTCs are set.
    - **If brake pedal position sensor related DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If no brake pedal position sensor related DTCs are set**
2. Verify that no DTCs are set, except DTC P0571.
    - **If any other DTC is set, except DTC P0571**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If only DTC P0571 is set**
3. Replace the K20 Engine Control Module.
4. Verify DTC P0571 does not set when operating the vehicle within the conditions for running the DTC.
    - **If the DTC sets**

      Replace the K9 Body Control Module.

    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM or ECM replacement, programming and setup.

DTC P0572 OR P0573: BRAKE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0572

Brake Switch Circuit 1 Low Voltage

DTC P0573

Brake Switch Circuit 1 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Stop Lamp Switch Signal	C0297 02, P0572	P0572	P0573	P0572, P0573

Circuit/System Description

The stop lamp switch signal circuit is a B+ input from the body control module (BCM) to the engine control module (ECM). The ECM monitors the stop lamp switch circuit to detect when the brake pedal has been applied. The BCM monitors the brake pedal position sensor to determine when the brake pedal is applied. When the brake pedal is applied, the BCM supplies B+ on the stop lamp switch signal circuit and also sends a serial data message to the ECM indicating that the brake pedal has been applied.

Conditions for Running the DTC

- The engine is running.
- Battery voltage is greater than 11.5 V.
- Brakes applied.

Conditions for Setting the DTC

P0572

This DTC will set when the ECM detects a short to ground or an open on the discrete brake signal circuit when the serial data message from the BCM indicates the brakes are applied. This diagnostic will run when the serial data message and the voltage signal on the brake switch signal circuit do not match for 8 out 10 times, and the condition is present for greater than 2 s.

P0573

This DTC will set when the ECM detects a short to voltage on the discrete brake signal circuit when the serial data message from the BCM indicates the brakes are not applied. This diagnostic will run when the serial data message and the voltage signal on the brake switch signal circuit do not match for 8 out 10 times, and the condition is present for greater than 2 s.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Ignition ON.
2. Verify that the stop lamps operate properly and that no B22 Brake Pedal Position Sensor related DTCs are set.
    - **If brake pedal position sensor related DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If no brake pedal position sensor related DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, ignition ON.
2. Connect a test lamp between the signal circuit terminal 57 and ground.
3. Verify the test lamp turns ON and OFF when pressing and releasing the brake pedal.
    - **If the test lamp is always OFF**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit and ground.
    - If not infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance.
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

4. Replace the K20 Engine Control Module.

DTC P0575: CRUISE CONTROL SWITCH SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0575

Cruise Control Switch Signal Message Counter Incorrect

Circuit/System Description

When a cruise control function switch is activated, the body control module (BCM) detects a predetermined voltage. The BCM sends a serial data message to the engine control module (ECM) indicating the function that has been requested.

Conditions for Running the DTC

- The ignition is ON.
- The vehicle speed is greater than 40 km/h (25 MPH) and the cruise control is engaged.

Conditions for Setting the DTC

- The ECM receives an invalid cruise control switch status serial data message from the BCM.

- This diagnostic runs continuously.

Actions Taken When the DTC Sets

DTC P0575 is a type C DTC.

Conditions for Clearing the DTC

DTC P0575 is a type C DTC.

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM or ECM replacement, programming, and setup.

SYMPTOMS - CRUISE CONTROL

NOTE: **The following steps must be completed before using the symptom tables.**

1. Before using the symptom diagnostic table, perform the **Diagnostic System Check - Vehicle** in order to verify the following conditions:
    - There are no DTCs set.
    - The module can communicate via the serial data.
2. Review the system operation in order to understand the system functions. Refer to **Cruise Control Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the Cruise Control System. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
- **Cruise Control Indicator Malfunction**

CRUISE CONTROL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster illuminates the cruise control engaged indicator based on serial data messages received from the engine control module (ECM). The indicator is commanded ON when the cruise control system is controlling vehicle speed, and turned OFF with the system disengaged.

Control Module References for scan tool information

Circuit/System Verification

1. Verify the cruise control indicator turns ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
    - **If the indicator does not turn ON and OFF**

      Replace the P16 Instrument Cluster.

    - **If the indicator turns ON and OFF**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DESCRIPTION AND OPERATION

CRUISE CONTROL DESCRIPTION AND OPERATION

Cruise Control System Block Diagram

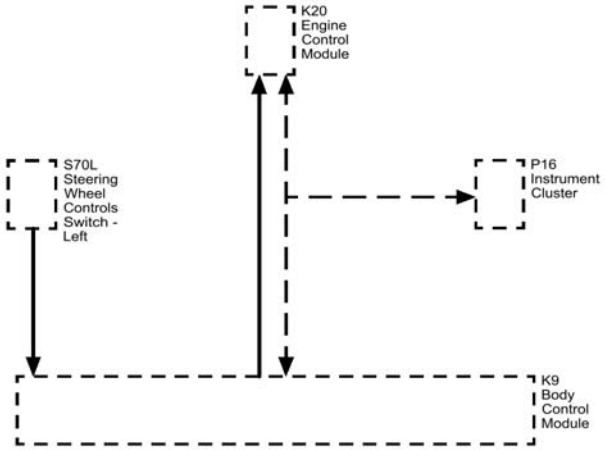

Fig. 2: Cruise Control System Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K20	K20 Engine Control Module
S70L	S70L Steering Wheel Controls Switch - Left
P16	P16 Instrument Cluster
K9	K9 Body Control Module

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions at speeds above 40 km/h (25 mph). Steep grades may cause variations in the selected vehicle speeds.

The following are the main components of the Cruise Control System:

- The accelerator pedal
- The brake pedal position (BPP) sensor
- The body control module (BCM)
- The cruise on/off switch
- The cruise control cancel switch
- The + RES switch (equivalent to resume/accelerate switch)
- The - SET switch (equivalent to set/coast switch)
- The engine control module (ECM)
- The throttle actuator control (TAC) motor (gasoline engines only)
- The vehicle speed sensor

The body control module (BCM) monitors the signal circuit of the cruise control switches, which are located on the steering wheel. The BCM relays the cruise control switch status to the engine control module (ECM) via the serial data circuit. The ECM uses the status of the cruise control switch to determine when to capture and maintain the vehicle speed. The ECM monitors the vehicle speed signal circuit in order to determine the desired vehicle speed.

Voltage is supplied to the cruise control switch via the steering wheel control switch reference voltage circuit supplied by the BCM. The cruise control function switches are arranged in a resistive ladder design, with each cruise control function switch having a different resistance value. The BCM detects a specific voltage value that is associated with the cruise control function switch being activated. The BCM sends a serial data message to the ECM indicating that the on/off switch is active. Similarly, when the normally open + RES switch or the normally open - SET switch are pressed, the switch closes and the BCM detects the predetermined voltage signal on the cruise control resume/accel and set/coast switch signal circuit. The BCM sends a serial data message to the ECM indicating that the + RES switch or the - SET switch is active.

Cruise Control Engaged

The Cruise Control System will engage and adjust vehicle speeds, based on the activation of the following cruise control switches, which are located on the steering wheel:

- On/Off
- + RES
- - SET

To engage the Cruise Control System, ensure that the vehicle speed is above 40.2 km/h (25 mph), turn the cruise On/Off switch ON and momentarily press the - SET switch. The ECM will engage the Cruise Control System and record the vehicle speed. The ECM sends a serial data message to the instrument panel cluster (IPC) in order to illuminate the Cruise Engaged indicator in the IPC. Refer to the vehicle owner's manual for the location and operation of the cruise control On/Off indicators and driver information center (DIC) messages.

Pressing the accelerator pedal while the Cruise Control System is engaged, allows the driver to override the Cruise Control System in order to accelerate the vehicle beyond the current set vehicle speed. When the accelerator pedal is released, the vehicle will decelerate and resume the current set vehicle speed.

The driver can also override the current set vehicle speed via the - SET switch and the + RES switch. When the Cruise Control System is engaged, pressing and holding the - SET switch will allow the vehicle to decelerate from the current set vehicle speed without deactivating the Cruise Control System. When the - SET switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the - SET switch will allow the vehicle to decelerate at a vehicle specific calibratable increment, commonly 1.6 km/h (1 mph), each time that the - SET is momentarily pressed, with a minimum vehicle speed of 38 km/h (24 mph). Refer to the vehicle Owner's Manual for more information.

Pressing and holding the + RES switch, when the Cruise Control System is engaged, will allow the vehicle to accelerate to a greater vehicle speed than the current set vehicle speed. When the + RES switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the + RES switch will allow the vehicle to accelerate at a vehicle specific calibratable increment, commonly 1.6 km/h (1 mph), each time that the + RES switch is momentarily pressed. Momentarily activating the + RES switch will recall the previous vehicle speed, after the

cruise control system has been disengaged by pressing the brake pedal, or CANCEL switch. Refer to the vehicle Owner's Manual for more information.

Cruise Control Disengaged

The engine control module (ECM) disengages the cruise control operation based on the signals from the following switches:

- The brake pedal position (BPP) sensor
- The On/Off switch
- The cruise control cancel switch

The Cruise Control System will disengage when the brake pedal is applied. The body control module (BCM) monitors the BPP sensor via the BPP sensor signal circuit as the voltage signal increases while the pedal is further applied. The ECM monitors the BPP signal through a discrete input and a serial data message signal from the BCM indicating the brake status. When either signal indicates the brake pedal is applied, the ECM will disengage the cruise control system.

The Cruise Control System will also disengage when the cruise control on/off switch is switched OFF, or the cruise control cancel switch is activated. The body control module (BCM) determines when the cruise control cancel switch is activated. When the normally open cancel switch is closed, the BCM detects the predetermined voltage signal on the cruise control function switch circuit. The vehicle speed stored in the memory of the engine control module will be erased when the cruise control On/Off switch is turned OFF, or the ignition switch is turned OFF. The BCM sends a serial data message to the ECM in order to disengage the cruise control system. When the Cruise Control System has been disengaged, the ECM sends a serial message to the instrument panel cluster (IPC) in order to turn OFF the Cruise Engaged indicator.

Every time the Cruise Control System is disengaged, the ECM will keep track of the reason for system disengagement. The last 8 disengagement reasons will be recorded within the ECM memory. The scan tool will display the last 8 Cruise Disengage History parameters, in which one out of approximately 50 possible reasons will be displayed in each of these 8 parameters. For the disengagement reason to be displayed within the scan tool parameter the Cruise Control System is active and disengagement is requested.

When engagement of the system is requested but an engagement inhibit is present, the most recent inhibit reason is recorded in the ECM history. The scan tool will display the most recent inhibit reason, in which one out of approximately 50 possible reasons will be displayed.

Cruise Control Inhibited

The engine control module (ECM) inhibits the cruise control operation when any of the following conditions exist:

- The ECM has not detected a brake pedal activation from the body control module (BCM) this ignition cycle.
- A Cruise Control System DTC has been set.
- The vehicle speed is less than 38.6 km/h (24 mph).
- The vehicle speed is too high.
- The vehicle is in PARK, REVERSE, NEUTRAL, or 1st gear.

- The engine RPM is low.
- The engine RPM is high.
- The system voltage is not between 9 volts and 16 volts.
- The Antilock Brake System (ABS)/Traction Control System (TCS) is active for more than a calibratable time (typically 0.3 to 0.7 seconds).

Cruise Control Inhibit Reasons

This is a general list of inhibit reasons. Not every inhibit reason is applicable to all vehicles. Refer to the scan tool inhibit reason list for the last 8 reasons that have been recorded during the current ignition cycle.

Scan Tool Name	Description	Long Description
ACC BRAKE INOP	Adaptive Cruise Control Automatic Braking Failed	Adaptive Cruise Control Automatic Braking Inoperative
ACC DATA	Serial data fault for Adaptive Cruise Control Throttle Control and Brake Control signals sent by Adaptive Cruise Control module	Adaptive Cruise Control Module serial data fault is active or communication has been lost between ACC module and ECM.
ACC INHIBIT	Adaptive Cruise Control Inhibited	Adaptive Cruise Control Inhibited
ACC OPTION	Adaptive Cruise Control option mismatch	Cruise control type (adaptive cruise or conventional cruise) mismatched between ECM and BCM.
ACCEL RATE	High acceleration	Vehicle acceleration rate is too high.
ACCEL Time	Rate Limiting Fault	Cruise torque request rate limiting active too long
APP OVERRIDE	Pedal greater than cruise (override)	Driver has overridden cruise control set speed with accelerator pedal for greater than an allowable time.
Auto Brk Data	Automatic Braking Engine Torque Request Signal Communication Malfunction	ECM to EBCM serial data fault is active or communication has been lost between ECM and EBCM.
AXLE RANGE	Rear Axle Low	Rear axle in low range
BPP DATA	DTC P0703 active or maximum time elapsed without receiving valid Brake Pedal Position signal.	Serial data fault is active or communication has been lost with module sending brake pedal apply state
BPP DTC	Brake Pedal Position signal invalid	Brake Pedal Apply Circuit fault has been detected.
BPP Not Learned	Brake Apply Sensor Home Position Not Learned	Brake Pedal Position Sensor Released Position Not Learned.
BRAKE	Brake pedal apply	Brake Pedal was applied.
Brk Ped Press	Brake Pedal Driver Applied Pressure Detected	A Brake Pedal Apply has been detected based on brake pedal pressure as measured by the EBCM.
Calc Eng Torque	Calculated Torque	Engine torque calculation is incorrect.
CANCEL	Cancel switch active	Cancel Switch was depressed.

Scan Tool Name	Description	Long Description
CLUTCH	Clutch switch active	Clutch Pedal was applied.
COAST DISENGAGE	Coast disengage	Cruise control is in coast mode with the Set/Coast switch depressed and is requesting no throttle
COAST SPEED LOW	Coast below low speed inhibit	Set / Coast switch was depressed. Vehicle slowed below minimum cruise operating speed.
Cruise Brk Inop	Brake System Malfunction	EBCM has detected a failure that does not allow automatic braking to be performed.
CRUISE S/W	Sequence of completion checks	Cruise control software execution error has occurred.
CRUISE SW DATA	Serial data fault (Cruise switch serial communication fault)	Cruise switch serial data fault is active or communication has been lost with module sending cruise switch states
CRUISE SW. OFF	On/Off switch in Off state	Cruise On/Off switch turned Off
DECEL RATE	High deceleration	Vehicle deceleration rate is too high.
DLC OVERRIDE	ALDL	Scan Tool plugged into ALDL connector
DTC SET	Malfunction in PCM/ECM (DTC active)	DTC is active or in history that inhibits cruise control operation.
D WHL SPD HI	Driven Whl Spd Greater (wheel slip detection)	Driven wheel speed greater than Non Driven wheel speed (slip detection)
D WHL SPD LOW	Un-driven Whl speed Greater	Non Driven wheel speed greater than driven wheel speed
ECM INHIBIT	PCM/ECM inhibit (RAM corruption)	ECM internal communication error
ECM RESET	ECM Running Reset	ECM Running Reset occurred
ECT OVERTEMP	Engine metal overtemp active	Engine over temperature. Overheated.
ENG RUN TIME	Engine run time not elapsed	Engine has not been running long enough, typically five seconds.
ENGINE SPEED	Engine speed too low or too high	Engine RPM too low (near stall) or too high (near engine RPM fuel shutoff).
FIRST GEAR	1st Gear	Transmission is engaged in 1st gear
HIGH SPEED	Vehicle speed exceeds high speed threshold	Vehicle speed has exceeded maximum cruise operating speed
HIGH VOLTAGE	Voltage above high voltage threshold	Ignition Voltage High at ECM (typically 18 volts)
ILLEGAL MODE	Illegal cruise mode	Cruise control mode is incorrect based on switch states.
LOST FWD GEAR	Transmission in neutral. Reverse or park	Gear selector not in forward gear

Scan Tool Name	Description	Long Description
LOW SPEED	Vehicle speed drops below low speed threshold	Vehicle speed dropped below the cruise control minimum operating speed. May be due to hilly terrain and low vehicle speed. Manual transmission gear selection and engine torque may contribute to this disengagement reason.
LOW VOLTAGE	Voltage below low voltage threshold	Ignition Voltage Low at ECM (typically 9 volts)
MEMORY DTC	Memory Failure	Control module memory failure detected.
MPH LIMIT	MPH Fuel (Vehicle overspeed fuel cut-off active)	Vehicle overspeed protection active with fuel cut off active
M/T Gear Changed	Manual transmission out of gear with no clutch pedal apply	Manual transmission shifted to Neutral without clutch pedal being applied.
NONE	None	This disengagement reason may be displayed after a dead battery repair or module replacement.
OVER SET SPEED	Over schedule	Vehicle speed has exceeded driver selected set speed by more than an allowable amount. This may occur while driving down a significant grade or driver overriding cruise while performing a passing maneuver.
PARK BRAKE	Park Brake Switch signal Active	Parking Brake Applied
PEDAL INITIALIZE	Brake before cruise	The brake pedal has not been seen as applied prior to driver request to engage cruise with set switch. A brake pedal apply must be seen before allowing cruise engagement during each key cycle. On a vehicle equipped with a manual transmission, a clutch pedal apply may satisfy the brake pedal apply criteria.
PTO ACTIVE	Power Take Off Active	Power Take Off is active.
Ram DTC	Processor Integrity Fault (Ram corruption)	ECM software error has occurred
RPM LIMIT	Injectors Disabled (Engine overspeed fuel cut-off active)	Engine RPM limiter active with fuel cut off active.
S/C ON SPEED HI	Over schedule tap-down	Set/Coast switch selected, vehicle speed is above set speed and does not decrease. May be due to traveling down hill

Scan Tool Name	Description	Long Description
SIMUL S/C-R/A	SET and RESUME switches simultaneously active	Set/Coast and Resume Accelerate switches pressed simultaneously
SL/W Sys On	Speed Limiter / Warning On/Off switch turned on	Driver has turned on the Speed Limiter/Warning on/off switch. Cruise is disabled / inhibited and cruise on/off switch will be set to OFF.
SW. INVALID	Analog cruise switch input out of range	Cruise switch voltage signal in invalid range
TAC INHIBIT	ETC prevents cruise operation	Electronic Throttle Control has detected a failure in the throttle control hardware
TCS	Traction control active	Traction Control was Active
TRANS DTC	Trans Gear Fault	Transmission DTC is active or in history that inhibits cruise control operation
UNDER SET SPEED	Under schedule	Vehicle speed is below cruise control set speed by more than an allowable amount
VSES	Vehicle stability active	Vehicle Stability Control was active
4WD Low	4WD Low	Transfer case in low range

DIAGNOSTIC INFORMATION AND PROCEDURES

CONTROL MODULE U CODE LIST

This list includes all Data Communications related U-code DTCs in alphanumeric order with descriptors for all modules. Not all DTCs listed will be applicable to all vehicles.

DTC	DTC Descriptor
U0001 00	High Speed CAN Bus Malfunction
U0002 00	High Speed CAN Bus
U0010 00	Medium Speed CAN Bus
U0020 00	Low Speed CAN Bus
U0073 00	Control Module Communication Bus A Off
U0073 71	ECU HS Bus Off
U0073 72	ECU LS Bus Off
U0074 00	Control Module Communication Bus B Off
U0075 00	Control Module Communication Bus C Off
U0100 00	Lost Communication with Engine/Powertrain Control Module (ECM/PCM)
U0100 75	Lost Communication with Engine/Powertrain Control Module (ECM)
U0100 7F	Lost Communication with Engine/Powertrain Control Module (ECM)

DTC	DTC Descriptor
U0101 00	Lost Communication with Transmission Control Module (TCM)
U0101 75	Lost Communication with Transmission Control Module (TCM)
U0102 00	Lost Communication with Transfer Case Control Module
U0104 00	Lost Communication with Cruise Control Module
U0104 7F	Lost Communication with Cruise Control Module
U0106 00	Lost Communication with Glow Plug Control Module
U0109 00	Lost Communication with Fuel Pump Control Module
	Lost Communication with CNG Control Module
U010E 00	Lost Communication with Reductant Sensor Module
U010F 00	Lost Communication with Air Conditioning Control Module
U0111 00	Lost Communication with Battery Energy Control Module
U0115 00	Lost Communication with ECM/PCM B
U0117 00	Lost Communication PTO Control Module
U0121 00	Lost Communication with Electronic Brake Control Module (EBCM)
U0122 00	Lost Communication with Vehicle Stability Control Module (ESCM)
U0123 00	Lost Communication with Yaw Rate Sensor Module
U0126 00	Lost Communication with Steering Wheel Angle Sensor Module
U0128 00	Lost Communication with Park Brake Control Module
U0129 00	Lost Communication with Brake System Control Module
U0131 00	Lost Communication with Power Steering Control Module
U0132 00	Lost Communication with Suspension Control Module
U0134 00	Lost Communication with Power Steering Control Module - Rear

Circuit/System Description

The internal fault detection is handled inside the control module. No external circuits are involved.

Conditions for Running the DTC

The module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The module has detected an internal malfunction.

Action Taken When the DTC Sets

The module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 100, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the control module.
- Do not replace a control module based only on DTC B1000 being set in history with the exception of the following control modules:
  - Sensing and Diagnostic Module (SDM)
  - Rollover Sensor
  - Passenger Presence System Module
- If DTC B1000 is set as current, replace the appropriate control module.

Circuit/System Verification

If the DTC is set, replace the appropriate control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for module replacement, setup, and programming

DTC B1001: OPTION CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001 00

Option Configuration Error

DTC B1001 45

Option Configuration Error Variant Not Programmed

DTC B1001 46

Option Configuration Error

DTC B1001 4B

Option Configuration Error Calibration Not Learned

Circuit/System Description

Some control modules must be configured with serial numbers, vehicle options, or other information. If a control module was not properly configured after installation, that module may set DTC B1001.

Conditions for Running the DTC

Battery voltage is between 9-16 volts and data link communications operate normally.

Conditions for Setting the DTC

The control module is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Program or configure the module or related module that set DTC B1001. The module should successfully configure.
    - If the module will not configure, replace the module that set the DTC.
2. With a scan tool, clear the DTC.
3. Ignition OFF, remove the scan tool, open and close the drivers door.
4. Wait 60 seconds, then recheck for DTCs. DTC B1001 should not set.
    - If DTC B1001 sets, replace the module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control module replacement, setup, and programming

DTC B1016: VIN NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1016 00

VIN Not Programmed

Circuit/System Description

The internal fault detection is handled inside the control module. No external circuits are involved.

Conditions for Running the DTC

The only requirements are voltage and ground.

Conditions for Setting the DTC

The module has detected that the VIN is not programmed.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Program the VIN information to the module that set the DTC.
2. Turn the ignition OFF, wait several seconds and then turn the ignition ON.
3. Retrieve DTCs from the module that set the DTC. DTC B1016 should change to a history DTC.
    - If this DTC is retrieved as a current DTC, replace the module that set the DTC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM replacement, setup, and programming

DTC B101D: ELECTRONIC CONTROL UNIT HARDWARE

Circuit/System Description

The internal fault detection is handled inside the control module. The symptom byte listed in the DTC

Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

- The control module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.
- The keyless entry control module will set this DTC with symptom byte 39 when the keyless entry control module antenna is activated.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

The control module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- If DTC B101D is set as history or current in the K36 Inflatable Restraint Sensing and Diagnostic Module (SDM) and there are Air Bag or Pretensioner DTC's with symptom byte 02, it is important to repair the deployment loop issue first prior to replacing the K36 SDM. Failure to repair the Air Bag or Pretensioner wiring concern first may cause B101D to reset in the replacement K36 SDM.
- This DTC may be stored as a history DTC without affecting the operation of the control module.
- Do not replace a control module based only on DTC B101D being set in history with the exception of the following control modules:
  - K36 Inflatable Restraint Sensing and Diagnostic Module (SDM)
  - K85 Passenger Presence Detection Module
- If DTC B101D is set as current, replace the appropriate control module.

Circuit/System Verification

Verify that DTC B101D is not set.

- If the DTC is set with symptom byte 43, program the control module that set the DTC. If the DTC resets, replace the control module that set the DTC.
- If the DTC is set with other symptom bytes, replace the control module that set the DTC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, setup, and programming

Circuit/System Description

The internal fault detection is handled inside the control module. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The module has detected an internal malfunction.

Action Taken When the DTC Sets

The module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the module.
- If this DTC is retrieved as both a current and history DTC, replace the module that set the DTC.

Circuit/System Verification

1. Verify that DTC B1325, B1330, B1370, B1380, B1424, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - If any of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Verify that DTC C0550 is not set.
    - If the DTC is set with symptom byte 39 or 43, program the control module that set the DTC. If the DTC resets, replace the control module that set the DTC.
    - If the DTC is set with other symptom bytes, replace the control module that set the DTC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC U0020: LOW SPEED CAN COMMUNICATION BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0020 00

Low Speed CAN Communication Bus Performance

Circuit/System Description

Modules connected to the GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the modules. The modules have programmed information about what messages are needed to be exchanged on the serial data circuits. The messages are also supervised and some periodic messages are used by the receiver module as an availability indication of the transmitter module.

DTC U0020 will set when fewer modules are detected on the bus before the modules can learn the other modules IDs. If the communication bus is opened, or if the modules power supply is lost when the vehicle is in the OFF power mode, and then placed in the RUN power mode, U0020 will set in specific modules.

Conditions for Running the DTCs

- Voltage at the modules is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U2100 does not have a current status.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTCs Sets

The module uses a default value for the missing parameter.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Diagnosis of this DTC is accomplished via the symptom, **DTC U0100-U02FF**.

DTC U0073 OR U2100: COMMUNICATION BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0073 00

Control Module Communication Bus Off

DTC U0073 71

ECU HS Bus Off

DTC U0073 72

ECU LS Bus Off

DTC U2100 00

Controller Area Network (CAN) Bus Communication

DTC U2100 47

Controller Area Network (CAN) Bus Communication

Circuit/System Description

The serial data circuits are serial data buses are used to communicate information between the control modules. The serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTCs

- Supply voltage at the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 seconds.

Action Taken When the DTCs Sets

- The module suspends all message transmission.
- The module uses default values for all parameters received on the serial data circuits.
- In the TCM, DTC U0073 will cause the transmission to go into default gears.
- In the ECM and TCM, DTC U0073 will cause the malfunction indicator lamp (MIL) to illuminate.
- The module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- The ECM/TCM modules turn OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Refer to **Data Link References** to determine which serial data system is used for a specific control module.

2. This DTC cannot be retrieved with a current status. Diagnosis is accomplished using the symptom **Scan Tool Does Not Communicate with High Speed GMLAN Device**, or **Scan Tool Does Not Communicate with Low Speed GMLAN Device**.

DTC U0100-U02FF: CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

Refer to **Control Module U Code List**.

1. Scan tool does not communicate with low speed GMLAN device 2. Scan tool does not communicate with high speed GMLAN device				

Circuit/System Description

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the ignition switch is in RUN, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control

module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non-communicating control module. The DTC is unique to the control module which is not communicating and one or more control modules may set the same exact code. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9-16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

- Specific subsystems will not function.
- DTC U0100 in the TCM will cause the transmission to go into default gears.
- Both DTC U0100 in the TCM and DTC U0101 in the ECM will cause the malfunction indicator lamp (MIL) to illuminate.

Conditions for Clearing the DTC

- The ECM/TCM module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of- communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A control module on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more control modules was interrupted during diagnosis.
    - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be

interpreted as an intermittent fault, causing you to replace a part.

- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the BCM and the scan tool with either the low or high speed GMLAN serial data system inoperative. This condition is due to the BCM using both the low and high speed GMLAN systems.
- Use **Data Link References** to determine if the control module uses high or low speed GMLAN serial data communications.
- Some control modules may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the control module that set the communication DTC, the control module that the communication DTC was set against, and any inline harness connectors between the two control modules. Do not replace a control module based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition.
- This diagnostic can be used for any control module that is not communicating, regardless of the type of serial data circuit it is connected to, providing the vehicle is equipped with the control module.

Control Module References for scan tool information

Circuit/System Verification

1. Determine the control module that is not communicating. Refer to **Control Module U Code List**.
2. Verify that DTC U0073, U2100, U0074, U0078, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - If any of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
3. Engine running for 10 seconds.
4. Ignition ON, engine OFF, verify that DTC U0100-U02FF is not set with symptom byte 00.
   - If the DTC U0100-U02FF is set with symptom byte 00, refer to Circuit/System Testing.
5. Verify that DTC U0100-U02FF is not set with symptom byte 71 or 72.
   - If the DTC U0100-U02FF is set with symptom byte 71 or 72 along with other DTCs set, diagnose all other codes first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
   - If the DTC U0100-U02FF is set with symptom byte 71 or 72 and without other DTCs set, reprogram the control module. If the DTC resets, replace the control module.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Control modules the vehicle is equipped with**
- **Control module locations on the low and high speed GMLAN serial data circuits**
- **The control modules B+, ignition, ground, communication enable and serial data circuit terminals**

1. Ignition OFF, disconnect the harness connector at of the control module that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, ignition ON, verify that a test lamp illuminates between each B+ circuit terminal and ground.
   - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.
4. If equipped, ignition ON, verify that a test lamp illuminates between each ignition circuit terminal and ground.
   - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.

NOTE: **Only the high speed GMLAN modules have a serial data communication enable circuit OR an accessory wakeup serial data circuit, and the K9 body control module is the output for these circuits. Refer to the control module schematics to identify which control modules have these circuits.**

5. If equipped, ignition ON, verify that a test lamp illuminates between the communication enable circuit terminal OR the accessory wakeup circuit terminal and ground.
    - If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 Body Control Module, for an open/high resistance or short to ground. If the circuits test normal, replace the K9 Body Control Module.

NOTE: **The following test step is only applicable to low speed GMLAN modules.**

6. Test for less than 4.5 V between each low speed GMLAN serial data circuit terminal and ground.
    - If greater than the specified range, refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** to test for a short to voltage in the serial data circuit.
7. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters away from vehicle. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the serial data circuit terminals and the appropriate X84 data link connector (DLC) terminal listed below:
    - Class 2 serial data circuit terminal 2
    - Low speed GMLAN serial data terminal 1
    - High speed GMLAN serial data terminal 6 or 14
    - Mid speed GMLAN serial data terminal 3 or 11
    - Chassis high speed GMLAN serial data terminal 12 or 13
    - If greater than the specified range, test the serial data circuit for an open/high resistance between the non communicating control module and a module setting the DTC or a serial data splice pack.

NOTE: **The following test step is only applicable to high speed GMLAN modules.**

8. Test for less than 130 Ω between each pair of high speed GMLAN serial data circuits.
    - If greater than the specified range, refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for an open/high resistance in the serial data circuit.
9. If all circuits test normal, replace the control module that is not communicating.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC U1814: POWERTRAIN HIGH SPEED COMMUNICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U1814 00

Powertrain High Speed Communication Enable Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Signal Serial Data	U1814	U0100	-	-

Circuit/System Description

The accessory wake up serial data circuit is a voltage wake up signal from the body control module (BCM) to the engine control module (ECM) and the transmission control module (TCM). The signal is activated in 2 ways; any time the ignition switch is in the ACC or RUN position, or anytime the BCM determines that communication is needed from the powertrain. When the ignition switch is in the ACC or RUN position, the accessory voltage circuit input to the BCM is internally connected to the accessory wake up serial data circuit output, and voltage is supplied to the modules. The BCM also supplies voltage to the accessory wake up serial data circuit when it determines that communication is necessary with the powertrain and the ignition is not in the ACC or RUN position such as during remote start.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the accessory wake up serial data circuit.

Action Taken When the DTC Sets

- The modules use a default value for the missing parameters until the next ignition cycle.
- The modules is never signaled, therefore the specific subsystems will not function.
- The vehicle may not start.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Short to ground may open the fuse feeding the ignition switch.
- Short to ground may also set multiple no communication DTCs for GMLAN high speed modules.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the ECM and the TCM one at a time. After each disconnect, test for current DTCs. DTC U1814 should remain current.
    - If the DTC becomes history, replace the module disconnected when the DTC became history.
2. Ignition OFF, disconnect the X4 harness connector at the BCM.
3. Test for infinite resistance between the signal circuit terminal 19 and ground.
    - If less than the specified value, test the signal circuit for a short to ground.
4. If all circuits tests normal, replace the BCM.

Steering Wheel Position Sensor Ground	-	1	-	-
Vehicle Yaw Sensor 12 V Reference	1	1	-	-
Steering Wheel Position Sensor 12 V Reference	1	1	-	-
1. Circuit Inoperative				

Circuit/System Description

The electronic brake control module (EBCM) activates the other modules connected to the CAN serial data circuits by applying voltage when the ignition key is in ACC, ON or START. The EBCM, Yaw Rate Sensor, and the Steering Angle or Steering Wheel Position Sensor are the only modules connected to the CAN bus serial data circuits. For more information on CAN bus serial data refer to **Data Link Communications Description and Operation**.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

- The vehicle stability enhancement system (VSES), if equipped, and traction control system (TCS) will not function.
- System OFF lamps will illuminate for these systems.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DTC Descriptor list above to determine the module which is not communicating.
- If there are multiple non-communicating modules choose the one closest to the EBCM.

Circuit/System Testing

Yaw Rate Sensor DTC U1826

1. Ignition OFF, disconnect the harness connector at the Yaw Rate Sensor.
2. Test for less than 10 Ω between the Yaw Rate Sensor ground circuit terminal 6 and ground.
    - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the Yaw Rate Sensor voltage (12 V reference) circuit terminal 1 and ground.
    - If the test lamp does not illuminate, test the circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the EBCM.
4. Ignition OFF, disconnect the harness connector at the EBCM.
5. Test for less than 2 Ω in each pair of serial data circuits between the Yaw Rate Sensor and the EBCM:
    - Yaw Rate Sensor serial data circuit terminal 2 and EBCM serial data circuit terminal 33
    - Yaw Rate Sensor serial data circuit terminal 3 and EBCM serial data circuit terminal 21
    - If greater than 2 Ω, test the Yaw Rate Sensor serial data circuits terminals 2 and 3 for an open/high resistance.
6. If all circuits test normal, replace the Yaw Rate Sensor.

Steering Wheel Position Sensor (Steering Angle Sensor) DTC U1827

1. Ignition OFF, disconnect the harness connector at the Steering Wheel Position Sensor.
2. Test for less than 10 Ω between the Steering Wheel Position Sensor ground circuit terminal 1 and ground.
    - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the Steering Wheel Position Sensor voltage (12

V reference) circuit terminal 2 and ground.

- If the test lamp does not illuminate, test the circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the EBCM.

4. Ignition OFF, disconnect the harness connector at the Yaw Rate Sensor.
5. Test for less than 2 Ω in each pair of serial data circuits between the Steering Wheel Position Sensor and the Yaw Rate Sensor:
   - Steering Wheel Position Sensor serial data circuit terminal 3 and Yaw Rate Sensor serial data circuit terminal 4
   - Steering Wheel Position Sensor serial data circuit terminal 4 and Yaw Rate Sensor serial data circuit terminal 5
   - If greater than 2 Ω, test the Steering Wheel Position Sensor serial data circuits terminals 3 and 4 for an open/high resistance.
6. If all circuits test normal, replace the Steering Wheel Position Sensor.

DTC U2099: HIGH SPEED COMMUNICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U2099 00

High Speed Communication Enable Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Communication Enable	U2099, U0100-U0299[1]	U0100-U0299	U0100-U0299[2]	-

[1] Vehicle will not start.
[2] History only. If cleared the DTC will return after several ignition cycles.

Circuit/System Description

The body control module (BCM) activates the serial data communication enable circuit, when the ignition key is in ACC, ON or START. The serial data communication enable circuit wakes up the electronic brake control module (EBCM) for buss communication.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the serial data communication enable circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The modules use a default value for the missing parameters until the next ignition cycle.
- The module(s) is never signaled, therefore the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to ground will also set multiple history no communication codes for GMLAN high speed modules.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the EBCM.
2. Retest for current DTCs. DTC U2099 should remain current.
    - If the DTC becomes history, replace the EBCM.
3. Ignition OFF, disconnect the X 3 harness connector at the BCM.
4. Test for infinite resistance between the serial data communication enable circuit terminal 19 and ground.
    - If less than infinite resistance, repair the enable circuit for a short to ground.
5. If all circuits tests normal, replace the BCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for module replacement, setup, and programming

SYMPTOMS - DATA COMMUNICATIONS

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
    - **Body Control System Description and Operation**
    - **Data Link Communications Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Scan Tool Does Not Power Up**
- **Scan Tool Does Not Communicate with High Speed GMLAN Device**

- **Scan Tool Does Not Communicate with Low Speed GMLAN Device**

SCAN TOOL DOES NOT POWER UP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
DLC B+	1	1	-	-
DLC Ground	-	1	-	-
1. Scan Tool Does Not Power Up				

Circuit/System Description

The data link connector (DLC) is a standardized 16 cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool B+ voltage at terminal 16
- Scan tool ground at terminal 4
- Common ground at terminal 5

Diagnostic Aids

- The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON and the power mode master (PMM) module sends the appropriate power mode message.
- If the B+ circuit, ground circuits, and connections of the DLC are functioning properly, the malfunction must be due to the scan tool/CANdi module.

Control Module References for scan tool information.

Circuit/System Testing

1. Test for less than 2.0 ohms between the ground circuits terminal 4 of the DLC and ground, and terminal 5 of the DLC and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
2. Ignition ON, verify a test lamp illuminates between the B+ circuit terminal 16 at the DLC and ground.
   - If the test lamp does not illuminate, test the voltage supply circuit for a short to ground or an open/high resistance.
3. If all circuits test normal, refer to the scan tool/CANdi module user guide.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

SCAN TOOL DOES NOT COMMUNICATE WITH HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	1	U0100-U02FF*	1	-
High Speed GMLAN Serial Data (-)	1	U0100-U02FF*	1	-
Ground (DLC, terminal 5)	-	1	-	-
* No communications with one or more high speed GMLAN modules. An open in only one high speed GMLAN serial data circuit may allow degraded communication between the control modules. An open between the data link connector (DLC) and the first splice will only effect the communication with the scan tool. The vehicle modules will still communicate. 1. No communication with any high speed GMLAN module				

Circuit/System Description

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 Ω resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another control module. The resistors are used as the load for the high speed GMLAN bus during normal vehicle operation. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds one volt to the high speed GMLAN serial data bus (+) circuit and subtracts one volt from the high speed GMLAN serial data bus (-) circuit. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note that a loss of serial data DTC does not represent a failure of the control module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A control module on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more modules was interrupted during diagnosis
    - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the body control module (BCM) and the scan tool with the high speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle. When the scan tool attempts to communicate with the vehicle a message "no CANdi module detected" will be displayed.
- The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed GMLAN communications with the scan tool.
- These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:
    - Vehicle will not crank.
    - Vehicle cranks but will not start.
    - Vehicle stability enhancement system warning lights and messages.

- PRNDL gear indicator position errors.
- Tire Pressure Monitor (TPM) system warning lights.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

NOTE: **Each control module may need to be disconnected to isolate a circuit fault. Use the schematic and component connector end views to identify the following:**

- **Control modules the vehicle is equipped with**
- **High speed GMLAN serial data circuit terminating resistors**
- **Control module locations on the high speed GMLAN serial data circuits**
- **Each control module's high speed GMLAN serial data circuit terminals**

1. Attempt to communicate with all control modules on the high speed GMLAN serial data circuit, refer to **Data Link References**. Communications should not be available with two or more control modules on the high speed GMLAN serial data circuit.
   - If only one control module is not communicating, diagnose that control module only; refer to **DTC U0100-U02FF**.
2. Disconnect the scan tool from the DLC. The following tests will be done at the DLC connector.
3. All access doors closed, ignition OFF for 60 seconds, test for less than 10 Ω between the ground circuit terminal 5 and ground.

- If greater than the specified range, test the ground circuit for an open/high resistance.

4. Ignition ON, test for less than 4.5 V between the serial data circuits listed below and ground:
    - Terminal 6
    - Terminal 14
    - If greater than the specified range, test the serial data circuit for a short to voltage; refer to Testing the Serial Data Circuits for a Short to Voltage.
5. Ignition OFF for 60 seconds, test for greater than 100 Ω between the serial data circuits listed below and ground:
    - Terminal 6
    - Terminal 14
    - If less than the specified range, test the serial data circuit for a short to ground; refer to Testing the Serial Data Circuits for a Short to Ground.
6. Test for 50-70 Ω between the serial data circuits terminal 6 and terminal 14.
    - If less than 35 Ω, test for a short between the serial data circuits; refer to Testing the Serial Data Circuits for a Short between the Circuits.
    - If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.
    - If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance; refer to Testing the Serial Data Circuits for an Open/High Resistance.
    - If infinite, test the serial data circuits between the DLC and the first connection to the serial data circuit for an open/high resistance.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module.
2. Ignition ON, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are greater than 4.5 V.
    - If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Ignition ON, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are greater than 4.5 V.
    - If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
    - A short to voltage on the serial data circuit between 2 control modules
    - A short to voltage on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module.
2. Ignition OFF for 60 seconds, test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω.
    - If all serial data circuits are greater than the specified range, replace the control module that was disconnected.
3. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to ground.
4. Ignition OFF for 60 seconds, test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω.
    - If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
    - A short to ground on the serial data circuit between 2 control modules
    - A short to ground on the serial data circuit between a control module and a terminating resistor

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Ignition OFF for 60 seconds, test for less than 35 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 35 Ω.
    - If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Ignition OFF for 60 seconds, test for less than 35 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 35 Ω.
    - If each pair of serial data circuits is within the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
    - Serial data circuits shorted together between 2 control modules
    - Serial data circuits shorted together between a control module and a terminating resistor
    - A shorted terminating resistor

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Ignition OFF for 60 seconds, test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater

than 130 Ω.

- If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.

3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Ignition OFF for 60 seconds, test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω.
   - If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
   - An open/high resistance on the serial data circuit between 2 control modules
   - An open/high resistance on the serial data circuit between a control module and a terminating resistor
   - An open/high resistance terminating resistor

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **Control Module References** for control module replacement, setup, and programming

SCAN TOOL DOES NOT COMMUNICATE WITH LOW SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Speed GMLAN Serial Data	1	U0100-U0299*	1	-
Ground (DLC, terminal 5)	-	1*	-	-
* An open between the data link connector serial data circuit terminal 1 or ground circuit terminal 5 and the BCM circuit will only effect the communication with the scan tool. 1. No communication on any low speed GMLAN module				

Circuit/System Description

The serial data is transmitted over a single wire to the appropriate control modules. The transmission speed for GMLAN low speed is up to 83.33 Kb/s. Under normal vehicle operating conditions, the speed of the buss is 33.33 Kb/s. The control modules toggle the serial data circuit between 0-5 V during normal communications.

To wake the control modules connected to the GMLAN low speed serial data circuit, a voltage wake up pulse of 10 V is sent out. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note: a loss of serial data communications DTC does not represent a failure of the module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they're transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A control module on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more modules was interrupted during diagnosis
    - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the BCM and the scan tool with the low speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
- An open in the low speed GMLAN serial data circuit between the splice pack and a module will only affect that specific module. This type of failure will set a loss of communication DTC for each module effected, and the other modules will still communicate.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle. When the scan tool attempts to communicate with the vehicle a No CANdi Module Detected message will be displayed.
- An open between the DLC and JX 205 will only effect the communication with the scan tool. The vehicle modules will still communicate, and the vehicle will start.
- The engine will not start when there is a total malfunction of the low speed GMLAN serial data circuit.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed LAN communications with the scan tool.

  These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:

    - Vehicle will not crank.
    - Vehicle cranks but will not start.

- Vehicle stability enhancement system warning lights and messages.
- PRNDL gear indicator position errors.
- Tire Pressure Monitor (TPM) system warning light.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Control modules the vehicle is equipped with**
- **Control module locations on the low speed GMLAN serial data circuit**
- **The low speed GMLAN serial data circuit terminals for each control module**

1. Attempt to communicate with all control modules on the low speed GMLAN serial data circuit, refer to **Data Link References**. Communications should not be available with two or more control modules on the low speed GMLAN serial data circuit.
   - If only one control module is not communicating, diagnose that control module only, refer to **DTC U0100-U02FF**.
   - If one or more control modules are communicating but not all, refer to Testing the Serial Data Circuit for an Open/High Resistance.
2. Disconnect the scan tool from the DLC. The following tests will be done at the DLC connector.
3. All access doors closed, ignition OFF for 60 seconds, test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.

4. Ignition ON, test for less than 4.5 V between the serial data circuit terminal 1 and ground.
    - If greater than the specified range, test the serial data circuit for a short to voltage, refer to Testing the Serial Data Circuit for a Short to Voltage.
5. Ignition OFF for 60 seconds, test for greater than 100 Ω between the serial data circuit terminal 1 and ground.
    - If less than the specified range, test the serial data circuit for a short to ground, refer to Testing the Serial Data Circuits for a Short to ground.
6. Disconnect the appropriate harness connector at the JX 205 splice pack.
7. Test for less than 2 Ω between the DLC serial data circuit terminal 1 and the JX 205 splice pack terminal A.
    - If greater than the specified range, test the serial data circuit for an open/high resistance. If the circuits test normal, replace the splice pack.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 205 splice pack.
2. Ignition ON, test for less than 4.5 V between the DLC serial data circuit terminal 1 and ground.
    - If greater than the specified range, repair the short to voltage.
3. Test for less than 4.5 V between each serial data circuit at the splice pack connector and ground.
    - If greater than the specified range, perform the appropriate test listed below:
    - Serial data circuits with one control module, test the serial data circuit for a short to voltage. If the circuit tests normal replace the control module.
    - Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to voltage. If the circuits test normal, replace the control module that causes the short to voltage when connected.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 205 splice pack.
2. Test for infinite resistance between the DLC serial data circuit terminal 1 and ground.
    - If not the specified value, repair the short to ground.
3. Ignition OFF for 60 seconds, test for greater than 100 Ω between each serial data circuit at the splice pack and ground.
    - If less than the specified range, perform the appropriate test listed below:
    - Serial data circuits with one control module, test the serial data circuit for a short to ground. If the circuit tests normal replace the control module.
    - Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to voltage. If the circuits test normal, replace the control module that causes the short to ground when connected.

Testing the Serial Data Circuit for an Open/High Resistance

1. Ignition OFF, disconnect the appropriate harness connectors at the JX 205 splice pack.
2. Install a 3 A fused jumper wire between the disconnected splice pack connector terminal A and a low

speed GMLAN serial data circuit terminal that is not communicating.

3. Ignition ON, verify the scan tool communicates with the control modules connected to the low speed GMLAN serial data circuit.
    - If any control module does not communicate, test each section of the serial data circuit for an open/high resistance. If the circuits test normal, replace the control module that does not communicate when connected.
4. If all circuits test normal, replace the splice pack.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **Control Module References** for module replacement, setup, and programming

DATA LINK REFERENCES

This table identifies which serial data link that a particular module uses for in-vehicle data transmission. Some modules may use more than one data link to communicate. Some modules may have multiple communication circuits passing through them without actively communicating on that data link. This table is used to assist in correcting a communication malfunction. For the description and operation of these serial data communication circuits refer to **Data Link Communications Description and Operation**.

REPAIR INSTRUCTIONS

DATA LINK CONNECTOR REPLACEMENT

Removal Procedure

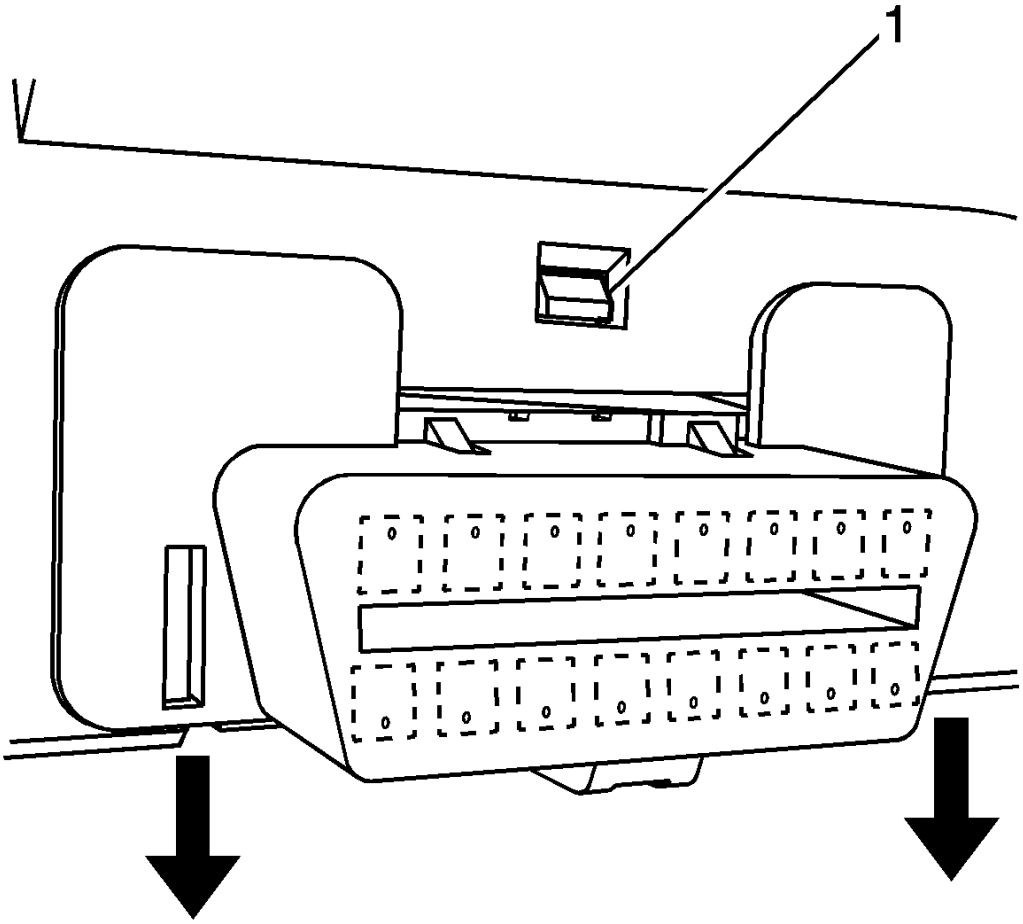

Fig. 8: View Of Data Link Connector (DLC)
Courtesy of GENERAL MOTORS COMPANY

1. Disengage the data link connector (DLC) tab (1).
2. Remove the DLC from the instrument panel (I/P) trim pad.

Installation Procedure

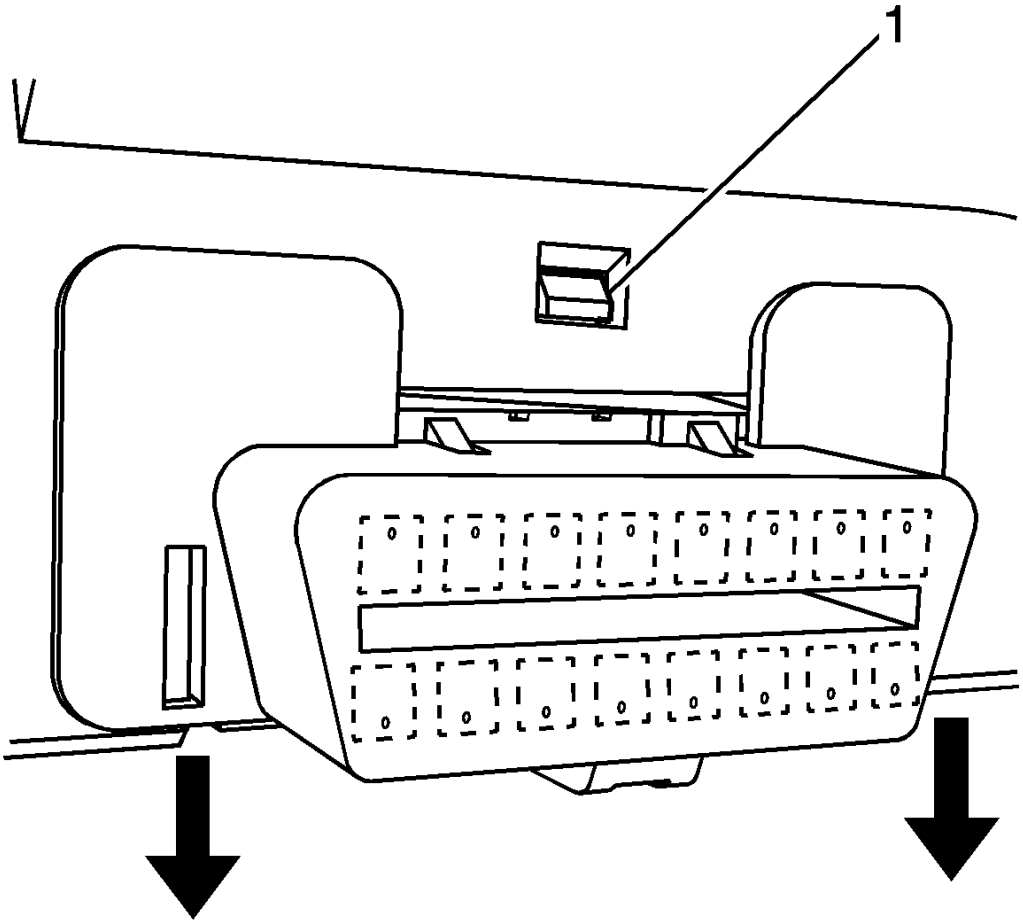

Fig. 9: View Of Data Link Connector (DLC)
Courtesy of GENERAL MOTORS COMPANY

1. Align the DLC to the I/P trim pad.
2. Slide the DLC upward in order to engage the tab (1).

BODY CONTROL MODULE REPLACEMENT

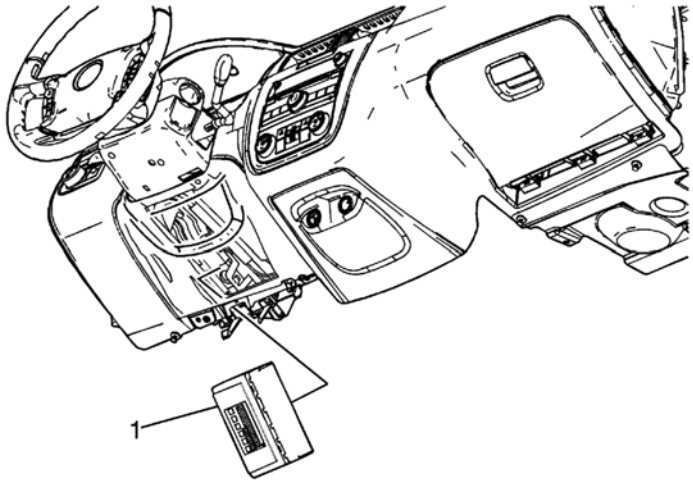

Fig. 10: Body Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the left closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** . 2. Program the body control module after replacement. Refer to **Control Module References** .	
1	Body Control Module (BCM) Assembly **TIP:** Release the tabs on the BCM bracket and lift the module up and out.

DESCRIPTION AND OPERATION

BODY CONTROL SYSTEM DESCRIPTION AND OPERATION

The body control system consists of the body control module (BCM), communications, and various input and outputs. Some inputs, outputs and messages require other modules to interact with the BCM. The BCM also has discrete input and output terminals to control the vehicle's body functions. Battery positive voltage is provided to the BCM from the BCM fuse in the underhood fuse block. The module has two grounds at G 202 as well as one directly to the vehicle battery. The BCM is wired to the GMLAN High speed serial data buss and the GMLAN Low speed serial data buss and acts as a gateway between them. If the BCM does not communicate the vehicle will not start due to the inability of the engine/powertrain control module (ECM/PCM) and vehicle theft deterrent (VTD) control module to communicate without the BCM providing the gateway function.

Power Mode Master

This vehicle body control module (BCM) functions as the power mode master (PMM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination the power mode that will be sent over the serial data circuits to the other modules that need this information, and so the PMM will activate relays and other direct outputs of the PMM as needed. Refer to **Power Mode Description and Operation** for a complete description of power mode functions.

Gateway

The body control module (BCM) in this vehicle functions as a gateway or translator. The purpose of the gateway is to translate serial data messages between the GMLAN high speed buss and the GMLAN low speed buss for communication between the various modules. The gateway will interact with each network according to that network's transmission protocol.

One example of this necessary communication is the communication between the engine/powertrain control module (ECM/PCM) which is high speed serial data and vehicle theft deterrent (VTD) control module which is low speed serial data. If these modules can not exchange information, the vehicle will not start.

All communication between the BCM and a scan tool is on the High speed GMLAN serial data circuits. A lost communication DTC typically is set in modules other than the module with a communication failure.

Body Control

The various body control module (BCM) input and output circuits are described in the corresponding functional areas indicated on the BCM electrical schematics. The BCM related systems include, but are not to the following:

- Chimes-Refer to **Audible Warnings Description and Operation** .
- Exterior lighting-Refer to **Exterior Lighting Systems Description and Operation** .
- Instrument cluster indicator control-Refer to **Instrument Cluster Description and Operation** .
- Interior lighting-Refer to **Interior Lighting Systems Description and Operation** .
- Power Windows-Refer to **Power Windows Description and Operation** .
- Remote function control-Refer to **Keyless Entry System Description and Operation** .
- Remote Start-Refer to **Keyless Entry System Description and Operation** .
- Retained accessory power (RAP)-Refer to **Retained Accessory Power Description and Operation** .
- Seat belt use sensing-Refer to **Seat Belt System Description and Operation** .
- Theft deterrent-Refer to **Immobilizer Description and Operation** , and **Theft Systems Description and Operation** .
- Wiper/Washer System functions-Refer to **Wiper/Washer System Description and Operation** .

DATA LINK COMMUNICATIONS DESCRIPTION AND OPERATION

Circuit Description

The communication among control modules is performed through the High speed GMLAN serial data circuits and the Low speed GMLAN serial data circuit. The modules that need real time communication are attached to the High speed GMLAN network. The body control module (BCM) is the gateway between the high and low speed networks. Communication is necessary between the high and low speed serial data modules for the vehicle to start. Refer to **Body Control System Description and Operation** for more information about the gateway.

Signal supervision is the process of determining whether an expected signal is being received or not. Some messages are sent on a periodic basis and are interpreted as a heartbeat of a device. If such a signal is lost, the signal supervision part of the software will set a no communication DTC (U code) against the missing device. This code is mapped on the Tech 2 screen as a code against the physical device. A lost communication DTC typically is set in modules other than the module with a communication failure.

GMLAN High Speed Circuit Description

The data link connector (DLC) allows a scan tool to communicate with the high speed GMLAN serial data circuit. The serial data is transmitted on two twisted wires that allow speed up to 500 Kb/s. The twisted pair is terminated with two 120 ohms resistors, one is internal to the engine control module (ECM) and the other is after the vehicle communication interface module (VCIM). The VCIM is considered a DLC termination point of the link although it does not contain the resistor and can be used as a diagnostic point. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level. The idle level, which is approximately 2.5 volts, is considered recessive transmitted data and is interpreted as a logic 1. Driving the lines to their extremes, adds one volt to the high speed GMLAN serial data bus (+) and subtracts one volt from the high speed GMLAN serial data bus (-) wire.

GMLAN Low Speed Circuit Description

The data link connector (DLC) allows a scan tool to communicate with the low speed GMLAN serial data circuit. The serial data is transmitted over a single wire to the appropriate control modules. Under normal vehicle operating conditions, the speed of the buss is 33.33 Kb/s. This protocol produces a simple pulse train sent out over the GMLAN low speed serial data bus. When a module pulls the buss high, 5 volts, this creates a logic state of 0 on the buss. When the buss is pulled low, 0 volts, it is translated as a logic state of 1. To wake the control modules connected to the GMLAN low speed serial data buss, a high voltage wake up pulse is sent out over the buss, the voltage level of the pulse is +10 volts. Modules connected to the GMLAN low speed buss can be part of a virtual network as described in GMLAN High Speed Circuit Description above. The modules on the GMLAN low speed serial data buss are connected to the buss using SP 205 as the common connection sometimes called a star connector. Refer to **Control Module References** for specific schematics information.

Data Link Connector (DLC)

The data link connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Pin 1 GMLAN low speed communications terminal
- Pin 4 Scan tool power ground terminal
- Pin 5 Common signal ground terminal
- Pin 6 High speed GMLAN serial data bus (+) terminal
- Pin 14 High speed GMLAN serial data bus (-) terminal
- Pin 16 Scan tool power, battery positive voltage terminal

Serial Data Reference

The scan tool communicates over the various busses on the vehicle. In order to avert misdiagnoses of No Communication with a specific module and to determine if a module is low or high speed, refer to **Data Link References** for a list of modules, the busses they communicate with, and the RPO codes for a specific module.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B3567: DRIVER INFORMATION CENTER SELECT SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3567 01

Driver Information Center Select Switch Circuit Short to Battery

DTC B3567 59

Driver Information Center Select Switch Circuit/Component Protection Time-Out

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
DIC Switch Signal	1	1	P3567 01	P3567 59
DIC Select Switch Signal	1	1	1	P3567
DIC Switch Low Reference	-	1	-	-
DIC Switch Ground	-	1	-	-
1. Driver Information Center (DIC) Switch Malfunction				

Circuit/System Description

The driver information center (DIC) switch is a multiplexed switch. Battery power is provided to the DIC switch via the instrument panel cluster (IPC). The DIC switch signal circuit is pulled up to battery voltage in the IPC. The IPC also provides the DIC switch with a low reference circuit. The switch input to the IPC is pulled low or grounded when a switch is activated. The DIC switch is a momentary contact switch that connects a series of resistors in a resistor ladder format. The IPC monitors the DIC switch signal circuit to determine the DIC switch inputs. Each switch state corresponds to a certain resistance value. The IPC determines the switch pressed by the voltage drop across the resistors. A stuck switch or a short to battery sets a DTC.

The Trip/Fuel switch is monitored on a separate circuit provided by the IPC. The TRIP/FUEL driver information center select menu switch signal circuit is monitored for a stuck switch but not a short to battery.

Conditions for Running the DTC

The ignition is in ACCESSORY or RUN.

Conditions for Setting the DTC

B3567 59

The IPC detects that the DIC switch is stuck.

B3567 01

The IPC detects that the DIC switch signal circuit is shorted to battery.

Action Taken When the DTC Sets

The IPC ignores the DIC switch inputs.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Diagnostic Aids

- When the Trip/Fuel switch is stuck, all other DIC switches will function correctly. When any of the DIC

switches are stuck, only the Trip/Fuel switch functions correctly.

- Only the DIC switch signal circuit can be diagnosed as shorted to battery.

Circuit/System Verification

Ignition ON, verify that when the DIC switches are pressed and released the DIC scan tool parameters toggle between Active and Inactive.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the DIC switch assembly.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal 2 and ground.
    - If greater than the specified range, test the low reference circuit for an open/high resistance.
3. Ignition OFF, test for less than 5 ohms between the ground terminal 6 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON, verify that all of the scan tool DIC Switch parameters are Inactive.
    - If any are not Inactive, test the signal circuit terminal listed below for a short to ground. If the circuit tests normal, replace the IPC.
    - Signal Terminal 1
    - Signal Terminal 3

5. Ignition ON, install a 3-A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool DIC Switch parameters, except the DIC Fuel Info. parameter, are Active.
    - If any are not Active, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
6. Ignition ON, install a 3-A fused jumper wire between the signal circuit terminal 3 and ground. Verify the scan tool DIC Fuel Info. parameter is Active.
    - If not Active, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the IPC.
7. If all the circuits test normal, test or replace the DIC switch assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Driver Information Display Switch Replacement**
- **Control Module References** for IPC replacement, setup and programming

DTC P0461: FUEL LEVEL SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0461

Fuel Level Sensor Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor Signal	P0462	1	P0463, P0464	P0463	P0461
Fuel Level Sensor Low Reference	-	1	P0463, P0464	P0463	P0461
1. Fuel Gauge Inaccurate or Inoperative					

Circuit/System Description

The fuel level sensor changes resistance in response to the fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the sensor resistance is low and the ECM senses a low signal voltage. When the fuel tank is empty, the sensor resistance is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level

percentage via serial data circuit to the instrument cluster in order to control the fuel gauge.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The ECM detects a change in fuel level of less than a specified amount (typically 3-10 L or 0.8-2.6 gal) over a specified driving distance (typically 240-320 km or 150-200 miles).

Action Taken When the DTC Sets

- The fuel gauge defaults to empty.
- The low fuel indicator illuminates.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Control Module References for scan tool information

Component Testing

1. Ignition OFF, remove the fuel level sender.

2. Sweep the fuel level sensor through its full range of motion while measuring resistance between the signal terminal B and the low reference terminal C.
3. Test for a minimum resistance value of 37-43 Ω and a maximum value of 245-255 Ω without any spikes or dropouts.
    - **If minimum resistance is not 37-43 Ω, maximum resistance is not 245-255 Ω, or if there are any spikes or dropouts**

      Replace the fuel level sensor.

    - **If minimum resistance is 37-43 Ω, maximum resistance is 245-255 Ω, and if there are no spikes or dropouts**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Level Sensor Replacement** for the 3.9L engine
- **Control Module References** for the ECM replacement, programming, and setup

DTC P0462: FUEL LEVEL SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0462

Fuel Level Sensor Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor Signal	P0462	1	P0463, P0464	P0463	P0461
Fuel Level Sensor Low Reference	-	1	P0463, P0464	P0463	P0461
1. Fuel Gauge Inaccurate or Inoperative					

Circuit/System Description

The fuel level sensor changes resistance in response to the fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the sensor resistance is low and the ECM senses a low signal voltage. When the fuel tank is empty, the sensor

resistance is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gauge.

Conditions for Running the DTC

- The ignition is ON, with the engine running.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- The sender output is less than 0.39 V.
- The above condition is present for greater than 30 seconds.

Action Taken When the DTC Sets

- The fuel gauge defaults to empty.
- The low fuel indicator illuminates.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Circuit/System Verification

With the scan tool installed and the ignition ON, the Fuel Tank Level Remaining parameter in the ECM EVAP Data List should indicate a value at or greater than 98 percent.

Circuit/System Testing

NOTE:

- **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**
- **If equipped, the following tests can be performed at an inline connector. See schematics for the corresponding terminals to test at.**

1. Ignition OFF, disconnect the harness connector at the fuel level sensor.
2. Ignition ON, verify that the scan tool Fuel Tank Level Remaining parameter display is less than 4 percent.
    - If greater than the specified range, test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.
3. If all circuits test normal, test or replace the fuel level sensor.

Component Testing

1. Ignition OFF, remove the fuel level sender.
2. Sweep the fuel level sensor through its full range of motion while measuring resistance between the signal terminal B and the low reference terminal C.
3. Test for a minimum resistance value of 37-43 Ω and a maximum value of 245-255 Ω without any spikes or dropouts.
    - **If minimum resistance is not 37-43 Ω, maximum resistance is not 245-255 Ω, or if there are any spikes or dropouts**

      Replace the fuel level sensor.

    - **If minimum resistance is 37-43 Ω, maximum resistance is 245-255 Ω, and if there are no spikes or dropouts**
4. All OK.

DTC Descriptor

DTC P0463

Fuel Level Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor Signal	P0462	1	P0463, P0464	P0463	P0461
Fuel Level Sensor Low Reference	-	1	P0463, P0464	P0463	P0461
1. Fuel Gauge Inaccurate or Inoperative					

Circuit/System Description

The fuel level sensor changes resistance in response to the fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the sensor resistance is low and the ECM senses a low signal voltage. When the fuel tank is empty, the sensor resistance is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gauge.

Conditions for Running the DTC

- The ignition is ON, with the engine running.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- The sensor output is greater than 2.9 V.
- The above condition is present for greater than 30 seconds.

Action Taken When the DTC Sets

- The fuel gauge defaults to empty.
- The low fuel indicator illuminates.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Circuit/System Verification

With the scan tool installed and the ignition ON, the Fuel Tank Level Remaining parameter in the ECM EVAP Data List indicates a value at or greater than 4 percent

Circuit/System Testing

NOTE:

- **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**
- **If equipped, the following tests can be performed at an inline connector. See schematics for the corresponding terminals to test at.**

1. Ignition OFF, disconnect the harness connector at the fuel level sensor.
2. Ignition OFF, test for less than 1 Ω between the low reference circuit terminal C and ground.
   - If greater than the specified range, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal C. Verify the scan tool Fuel Tank Level Remaining parameter display is greater than 98 percent.
   - If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
4. If all circuits test normal, test or replace the fuel level sensor.

Component Testing

1. Ignition OFF, remove the fuel level sender.
2. Sweep the fuel level sensor through its full range of motion while measuring resistance between the signal terminal B and the low reference terminal C.
3. Test for a minimum resistance value of 37-43 Ω and a maximum value of 245-255 Ω without any spikes or dropouts.
    - **If minimum resistance is not 37-43 Ω, maximum resistance is not 245-255 Ω, or if there are any spikes or dropouts**

      Replace the fuel level sensor.

    - **If minimum resistance is 37-43 Ω, maximum resistance is 245-255 Ω, and if there are no spikes or dropouts**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Level Sensor Replacement** for the 3.9L engine
- **Control Module References** for the ECM replacement, programming, and setup

DTC P0464: FUEL LEVEL SENSOR 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0464

Fuel Level Sensor 1 Circuit Intermittent

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor Signal	P0462	1	P0463, P0464	P0463	P0461
Fuel Level Sensor Low Reference	-	1	P0463, P0464	P0463	P0461
1. Fuel Gauge Inaccurate or Inoperative					

Circuit/System Description

The fuel level sensor changes resistance in response to the fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full,

the sensor resistance is low and the ECM senses a low signal voltage. When the fuel tank is empty, the sensor resistance is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gauge.

This diagnostic tests for an intermittent fuel level sensor signal. If a change in fuel level is detected, DTC P0442 is aborted due to a possible refueling event. If refueling is confirmed, the test for DTC P0464 is considered a pass. The refueling event test must pass two out of three times, otherwise, the DTC P0464 will set indicating an intermittent signal problem.

Conditions for Running the DTC

- The ignition is OFF.
- DTC P0442 is running.
- DTC P0464 runs and fails 2 out of 3 test cycles.

Conditions for Setting the DTC

- The fuel level change is greater than 10 percent.
- The above condition is present for less than 30 seconds.

Action Taken When the DTC Sets

- DTC P0442 is aborted.
- The ECM records the operating conditions at the time the diagnostic fails. The ECM displays the failure information in the Failure Records on the scan tool.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

J 33431-C Instrument Panel Tester

Circuit/System Testing

NOTE: **If equipped, the following tests can be performed at an inline connector. See schematics for the corresponding terminals to test at.**

1. Ignition OFF, disconnect the harness connector at the fuel level sensor.
2. Ignition OFF, test for less than 1 Ω between the low reference circuit terminal C and ground.
   - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuits tests normal, replace the ECM.
3. Install a Signal Generator and Instrument Panel Tester between the signal circuit terminal B and the low reference circuit terminal C.
4. Ignition ON, vary the signal generator resistance between 40 and 250 Ω. Verify that the scan tool Fuel Tank Level Remaining parameter displays a range that varies between 5 and 95 percent as the signal generator resistance changes.
   - If not within the specified range, test the signal circuit for an open/high resistance. If the circuit test normal, replace the ECM.
5. If all circuits test normal, perform the fuel level sensor component test before replacing the fuel level sensor.

Component Testing

1. Ignition OFF, remove the fuel level sender.
2. Sweep the fuel level sensor through its full range of motion while measuring resistance between the signal terminal B and the low reference terminal C.
3. Test for a minimum resistance value of 37-43 Ω and a maximum value of 245-255 Ω without any spikes or dropouts.
   - **If minimum resistance is not 37-43 Ω, maximum resistance is not 245-255 Ω, or if there are any spikes or dropouts**

     Replace the fuel level sensor.

   - **If minimum resistance is 37-43 Ω, maximum resistance is 245-255 Ω, and if there are no spikes or dropouts**
4. All OK.

Repair Instructions

DTC P0520: ECM REQUESTING EOP INDICATOR TURNED ON

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Oil Pressure Switch Signal	1	P0520	1	-
Low Reference	-	P0520	-	-
1. Engine Oil Pressure Indicator Malfunction				

Circuit/System Description

The engine oil pressure (EOP) switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the engine control module (ECM) should detect a low signal voltage input. With the engine running, the pressure switch opens, and the ECM should detect a high signal voltage input. The instrument panel cluster (IPC) illuminates the EOP indicator when the IPC receives a serial data message from the ECM requesting the EOP indicator turned ON.

Circuit/System Verification

Ignition ON, engine running, verify the scan tool Engine Oil Pressure Switch parameter is OK.

- If not the specified value, refer to:
- **Oil Pressure Diagnosis and Testing**

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

LY7 and LFW

1. Ignition OFF, disconnect the harness connector at the engine oil pressure (EOP) switch.
2. Ignition OFF, test for less than 1 ohm of resistance between the low reference circuit terminal B and ground.
   - If greater than the specified value, test the circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Engine Oil Pressure Switch parameter is OK.
   - If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the ECM.
4. Ignition ON, install a 3-amp fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool Engine Oil Pressure Switch parameter is Low.
   - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the engine oil pressure switch.

Repair Instructions

SYMPTOMS - DISPLAYS AND GAUGES

NOTE: **The following steps must be completed before using the symptom diagnostic tables.**

1. Before using the symptom diagnostic tables, perform the **Diagnostic System Check - Vehicle** in order to determine that there are no DTCs set, and that the control modules can communicate via the serial data link.

2. Review the system operation in order to understand the system functions. Refer to the following description and operations.
    - **Instrument Cluster Description and Operation**
    - **Indicator/Warning Message Description and Operation**
    - **Driver Information Center (DIC) Description and Operation**
    - **Audible Warnings Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the instrument panel cluster or the audible warnings system. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.
- Inspect for the proper fluid levels.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Gauges and Odometer

- **Fuel Gauge Malfunction**
- **Instrument Cluster Gauges Malfunction**

Indicators

CHARGE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) uses the generator turn ON signal circuit to control the load of the generator on the engine. A high side driver in the ECM applies a voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON signal circuit. The ECM should detect low voltage on the generator turn on signal circuit when the ignition is ON and the engine is OFF, or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the generator turn on signal circuit. The ECM performs key ON and RUN tests to determine the status of the generator turn on signal circuit. If a malfunction is detected the ECM will illuminate the charge indicator in the instrument panel cluster (IPC).

Circuit/System Verification

NOTE: **Before performing this diagnostics, make sure no indicator(s) are illuminated after the IPC performs the displays test. If any indicators are illuminated after the bulb test, perform the indicator diagnostics before this diagnostic.**

1. Ignition ON, headlamp switch OFF, verify the scan tool Headlamp Switch ON parameter is Inactive.
   - If not Inactive, refer to **Headlamps Malfunction** .
2. Ignition ON, park lamp switch OFF, verify the scan tool Park Lamp Switch parameter is Inactive.
   - If not Inactive, refer to **Park, License, and/or Tail Lamps Malfunction** .
3. Ignition ON, doors closed, verify the scan tool Door Ajar Switch parameters are Door Closed.
   - If not Door Closed, refer to **Courtesy Lamps Malfunction** .
4. Ignition ON, radio ON, adjust the radio balance and fade to the left front speaker.
   - If the speaker does not operate properly, refer to **Speaker Malfunction** .
5. Verify that the Key In Ignition Status parameter is Key In when the key is in the ignition and Key Out when the key is out of the ignition.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the ignition switch.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
   - If the test lamp does not illuminate, test the B+ circuit for an open/high resistance. If the circuit tests normal and the BCM circuit fuse is open, test the signal circuit terminal 5 for a short to ground.
3. Verify the scan tool Key In Ignition Status parameter is Key Out.
   - If not the specified value, test the signal circuit terminal 5 for a short to voltage. If the circuit tests normal, replace the BCM.
4. Install a 3A fused jumper wire between the signal circuit terminal 5 and the B+ circuit terminal 2. Verify

the scan tool Key in Ignition Status parameter is Key In.

- If not the specified value, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the BCM.

5. If all circuits test normal, test or replace the ignition switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Ignition and Start Switch Replacement**

COMPASS MALFUNCTION (DIC)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The compass information is displayed in the driver information center (DIC). As the vehicle travels with or against the earths magnetic pull, the compass heading signal to the DIC changes. As a result of the compass heading signal change, the DIC adjusts and changes the direction of the compass display. When an invalid signal is sent to the DIC or a malfunction exists in the compass heading, the DIC blanks the display and displays '- -' , 'CAL' or C.

DRIVER INFORMATION CENTER SWITCH MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
DIC Switch Signal	1	1	P3567 01	P3567 59
DIC Select Switch Signal	1	1	1	P3567
DIC Switch Low Reference	-	1	-	-
DIC Switch Ground	-	1	-	-
1. Driver Information Center (DIC) Switch Malfunction				

Circuit/System Description

The driver information center (DIC) switch is a multiplexed switch. Battery power is provided to the DIC switch via the instrument panel cluster (IPC) with the DIC switch signal circuit pulled up to battery voltage in the IPC. The IPC also provides the DIC switch with a low reference circuit. The switch input to the IPC is pulled low or grounded when a switch is activated. The DIC switch is a momentary contact switch that connects a series of resistors in a resistor ladder format. The IPC monitors the DIC switch signal circuit to determine the DIC switch inputs. Each switch state - SET/RESET, VEHICLE INFORMATION, PERSONALIZATION (CUSTOMIZATION) - corresponds to a certain resistance value. The IPC determines the switch state by the voltage drop across the resistors.

The TRIP/FUEL DIC switch is monitored on a separate circuit provided by the IPC. The TRIP/FUEL driver information center select menu switch signal circuit is monitored for a stuck switch but not a short to battery.

Circuit/System Verification

Ignition ON, verify that when the DIC switches are pressed and released the DIC scan tool parameters toggle between Active and Inactive.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the DIC switch assembly.
2. Ignition OFF, test for less than 1 ohm between the low reference terminal 2 and ground.

- If greater than the specified range, test the low reference circuit for an open/high resistance.

3. Ignition OFF, test for less than 1 ohm between the ground terminal 5 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON, verify that all of the scan tool DIC Switch parameters are Inactive.
    - If any are not Inactive, test the signal circuit terminal listed below for a short to ground. If the circuit tests normal, replace the IPC.
    - Signal Terminal 1
    - Signal Terminal 3
5. Ignition ON, install a 3-A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool DIC Switch parameters, except the DIC Fuel Info. parameter, are Active.
    - If any are not Active, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
6. Ignition ON, install a 3-A fused jumper wire between the signal circuit terminal 3 and ground. Verify the scan tool DIC Fuel Info. parameter is Active.
    - If not Active, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the IPC.
7. If all the circuits test normal, test or replace the DIC switch assembly.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Oil Pressure Switch Signal	1	P0520	1	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Reference	-	P0520	-	-
1. Engine Oil Pressure Indicator Malfunction				

Circuit/System Description

The engine oil pressure (EOP) switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the engine control module (ECM) should detect a low signal voltage input. With the engine running, the pressure switch opens, and the ECM should detect a high signal voltage input. The instrument panel cluster (IPC) illuminates the EOP indicator when the IPC receives a serial data message from the ECM requesting the EOP indicator turned ON.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, engine running, verify the scan tool Engine Oil Pressure Switch parameter is OK.

- If not the specified value, refer to:
- **Oil Pressure Diagnosis and Testing**

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with**

Circuit/System Testing.

LY7 and LFW

1. Ignition OFF, disconnect the harness connector at the engine oil pressure (EOP) switch.
2. Ignition OFF, test for less than 1 ohm of resistance between the low reference circuit terminal B and ground.
   - If greater than the specified value, test the circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Engine Oil Pressure Switch parameter is OK.
   - If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the ECM.
4. Ignition ON, install a 3-amp fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool Engine Oil Pressure Switch parameter is Low.
   - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the engine oil pressure switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

FUEL GAUGE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor Signal	P0462	1	P0463, P0464	P0463	P0461
Fuel Level Sensor Low Reference	-	1	P0463, P0464	P0463	P0461
1. Fuel Gauge Inaccurate or Inoperative					

Circuit/System Description

The fuel level sensor changes resistance in response to the fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the sensor resistance is low and the ECM senses a low signal voltage. When the fuel tank is empty, the sensor

resistance is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gauge.

Special Tools

J 33431-C Instrument Panel Tester

Circuit/System Testing

NOTE: **If equipped, the following tests can be performed at an inline connector. See schematics for the corresponding terminals to test at.**

1. Ignition OFF, disconnect the harness connector at the fuel level sensor.
2. Ignition OFF, test for less than 1 Ω between the low reference circuit terminal C and ground.
   - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuits tests normal, replace the ECM.
3. Install a Signal Generator and Instrument Panel Tester between the signal circuit terminal B and the fuel level sensor low reference circuit terminal C.
4. Ignition ON, vary the signal generator resistance between 40 and 250 Ω. Verify that the scan tool Fuel Tank Level Remaining parameter displays a range that varies between 5 and 95 percent as the signal generator resistance changes.
   - If not within the specified range, test the signal circuit for an open/high resistance. If the circuit test normal, replace the ECM.

5. Vary the signal generator resistance between 40 and 250 Ω. Verify that the fuel gauge displays a range that varies between empty and full as the signal generator resistance changes.
    - If the fuel gauge is incorrect, replace the fuel gauge.
6. If all circuits test normal, perform the fuel level sensor component test before replacing the fuel level sensor.

Component Testing

1. Ignition OFF, remove the fuel level sender.
2. Sweep the fuel level sensor through its full range of motion while measuring resistance between the signal terminal B and the low reference terminal C.
3. Test for a minimum resistance value of 37-43 Ω and a maximum value of 245-255 Ω without any spikes or dropouts.
    - **If minimum resistance is not 37-43 Ω, maximum resistance is not 245-255 Ω, or if there are any spikes or dropouts**

      Replace the fuel level sensor.

    - **If minimum resistance is 37-43 Ω, maximum resistance is 245-255 Ω, and if there are no spikes or dropouts**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

IMPORTANT: If the suspect gauge is the speedometer, the drive wheels of the vehicle must be raised and the transmission must be placed in drive or first gear.

1. Ignition ON, perform the IPC gauge sweep test with the scan tool. Verify that all the gauges sweep from their low to high position.
    - If any gauges do not sweep from their low to high position, replace the IPC.
2. Engine ON, transmission in drive or first gear, verify the scan tool Vehicle Speed parameter matches the speedometer display.
    - If the Vehicle Speed parameter does not match the speedometer display, test or replace the IPC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for the IPC replacement, setup and programming

REPAIR INSTRUCTIONS

DRIVER INFORMATION DISPLAY SWITCH REPLACEMENT

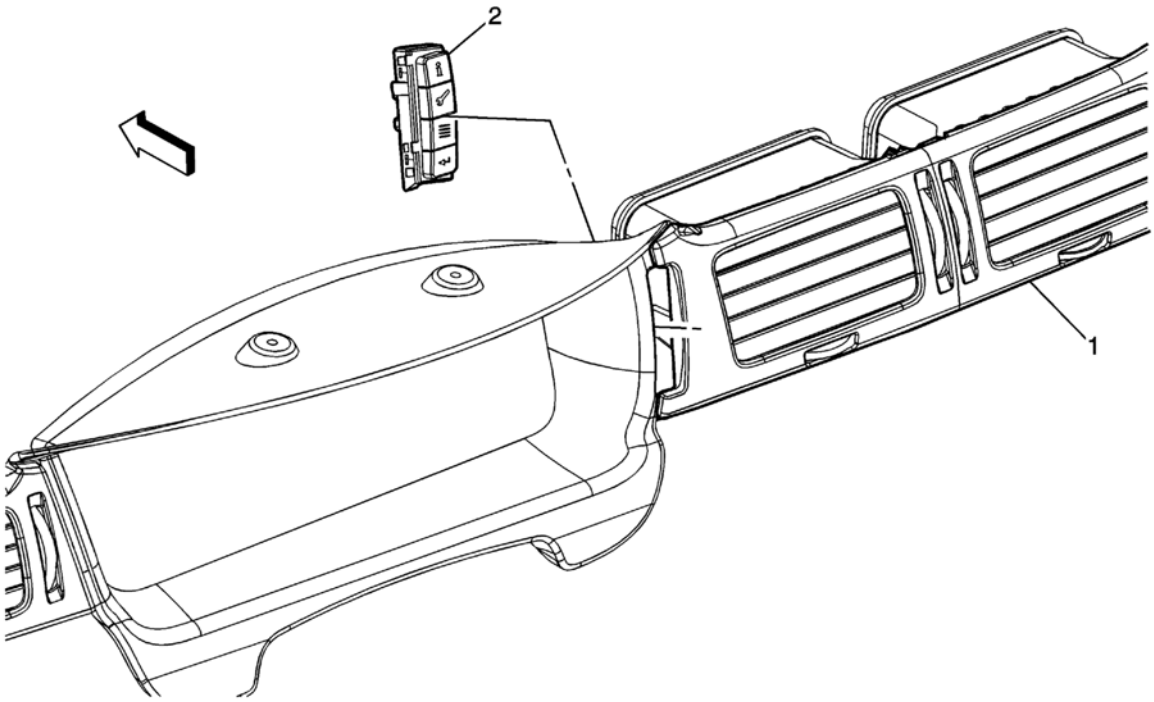

Fig. 5: Driver Information Center Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Trim Plate Assembly Refer to **Instrument Panel Trim Plate Replacement** .
2	Driver Information Center Switch Assembly

INSTRUMENT CLUSTER REPLACEMENT

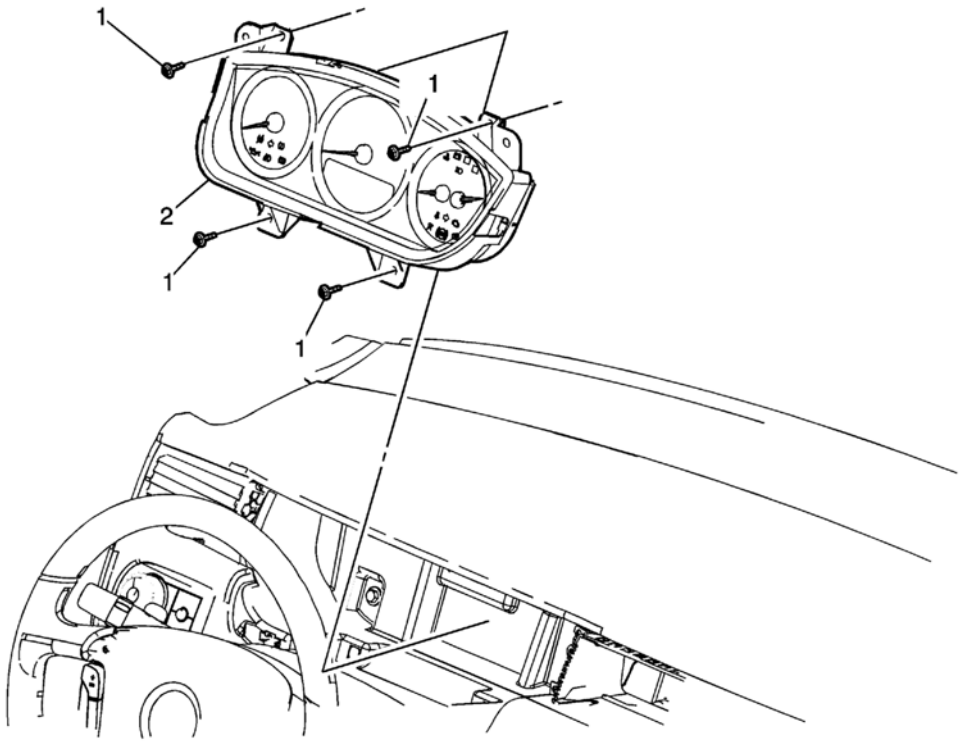

Fig. 6: Instrument Panel Cluster (IPC)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel (I/P) trim plate. Refer to **Instrument Panel Trim Plate Replacement** .	
1	Instrument Panel Cluster Screw (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Cluster Assembly **Procedure** 1. Disconnect the electrical connector. 2. Refer to **Control Module References** for programming and setup information.

DESCRIPTION AND OPERATION

AUDIBLE WARNINGS DESCRIPTION AND OPERATION

The audible warnings alert the driver of a system concern or a critical vehicle condition. The audio amplifier generates the audible warnings through the left front speaker. The audio amplifier receives audible warning requests via the serial data circuit. If the audio amplifier receives multiple audible warning requests, the warning with the highest priority sounds first. The following lists the audible warning priority and the pulse rate:

1. Fast rate chime-200 pulses per minute
2. Medium rate chime-150 pulses per minute
3. Slow rate chime-50 pulses per minute
4. Single chime

Fasten Safety Belt Warning

The audio amplifier activates the fasten safety belt audible warning as requested by the body control module (BCM). The BCM sends a serial data message to the audio amplifier indicating the chime frequency at a slow rate and a duration of 8 seconds. The fasten safety belt warning sounds and the fasten safety belt indicator illuminates when the following occurs:

- The ignition switch transitions to ON.
- The inflatable restraint sensing and diagnostic module (SDM) detects that the driver's seat belt is not buckled and the signal is low. The SDM sends a serial data message to the BCM indicating the seat belt status. The instrument panel cluster (IPC) receives a serial data message from the BCM indicating the driver seat belt status.

If the seat belt is buckled when the ignition is turned ON, the chime does not sound. If the seat belt is buckled while the chime is sounding, the chime stops. If the seat belt is unbuckled after the initial transition to ON, the chime does not sound.

Lights On Warning

The audio amplifier activates the lights on warning as requested by the body control module (BCM). The BCM sends a serial data message to the audio amplifier indicating the chime frequency of a fast rate and at a continuous duration. The lights on warning sounds when the following occurs:

- The ignition is OFF.
- The BCM determines that the driver door is open and the signal circuit is low.
- The BCM determines that the headlamp switch is in the park or head position.

Brake Warning

The audio amplifier activates the brake audible warning as requested by the instrument panel cluster (IPC). The IPC sends a serial data message to the audio amplifier indicating the chime frequency and duration. The brake audible warning sounds and the BRAKE indicator illuminates when the following occurs:

- The ignition is ON.
- The vehicle speed is greater than 4 km/h (2.5 mph). The IPC receives a serial data message from the engine control module (ECM) indicating the vehicle speed.
- The IPC determines that the park brake is engaged from a BCM serial data message.
- The brake fluid is low.

- The dynamic rear proportioning (DRP) failed (if equipped)

Key-In-Ignition Warning

The audio amplifier activates the key-in-ignition audible warning as requested by the body control module (BCM). The BCM sends a serial data message to the radio indicating the chime frequency of a medium rate and continuous duration. The key-in-ignition warning sounds when the following occurs:

- The ignition switch is OFF.
- The BCM determines that the driver door is open and the signal circuit is low. The IPC also receives a serial data message from the BCM indicating the door ajar status
- The BCM determines that the key-in-ignition switch is open and the signal circuit is high. The IPC receives a serial data message from the BCM indicating the key-in-ignition status.

Door Ajar Warning

The audio amplifier activates the door ajar audible warning as requested by the IPC. The IPC sends a serial data message to the radio indicating the chime frequency. The door ajar warning sounds and the door ajar message is displayed in the DIC when the following occurs:

- The IPC determines that the driver door is open and the signal circuit is low. The IPC also displays the appropriate door ajar message in the DIC.
- The vehicle is not in PARK. The IPC receives a serial data message from the BCM indicating the gear position.

Additional Audible Warnings

The following instrument panel cluster (IPC) indicators or driver information center (DIC) messages have an associated audible warning to alert the driver of a system concern or critical vehicle condition. The audio amplifier activates the audible warning as requested by the IPC via the serial data circuit.

- Antilock Brake System (ABS)
- Vehicle Dynamics Caution (VDC)
- Hot coolant temperature
- Turn Signal
- Low fuel
- Low engine oil pressure
- Transmission Hot Idle Engine
- Buckle Seat Belt
- Buckle Passenger Seat Belt
- Engine Overheated Stop Engine
- Hood Open
- Trunk Open
- Engine Power Reduced

Refer to **Indicator/Warning Message Description and Operation**.

COMPASS CALIBRATION AND MAGNETIC VARIANCE (DRIVER INFORMATION CENTER (DIC))

Compass Calibration

The compass direction will show CAL if it needs to be calibrated. Before calibrating the compass, drive the vehicle to an area that is magnetically clean (free of large metallic objects).

1. Turn ON the ignition.
2. Before calibrating the compass, make sure the compass is set to the variance zone in which the vehicle is travelling. See Compass Magnetic Variation Adjustment below.
3. Press the vehicle information button until the PRESS TO CALIBRATE COMPASS screen is displayed.
4. Press the set/reset button to start the compass calibration.
5. The DIC will display CALIBRATING: DRIVE IN CIRCLES. Drive the vehicle in circles at less than 8 km/h (5 mph) to complete the calibration. The DIC will display CALIBRATION COMPLETE when the calibration is complete.

Compass Magnetic Variation Adjustment

Compass variance is the difference between the earth's magnetic north and true geographic north. If not adjusted to account for compass variance, the compass in the vehicle could give false readings. Under certain circumstances, such as during a long distance cross-country trip, it will be necessary to compensate for compass variance and reset the zone through the DIC.

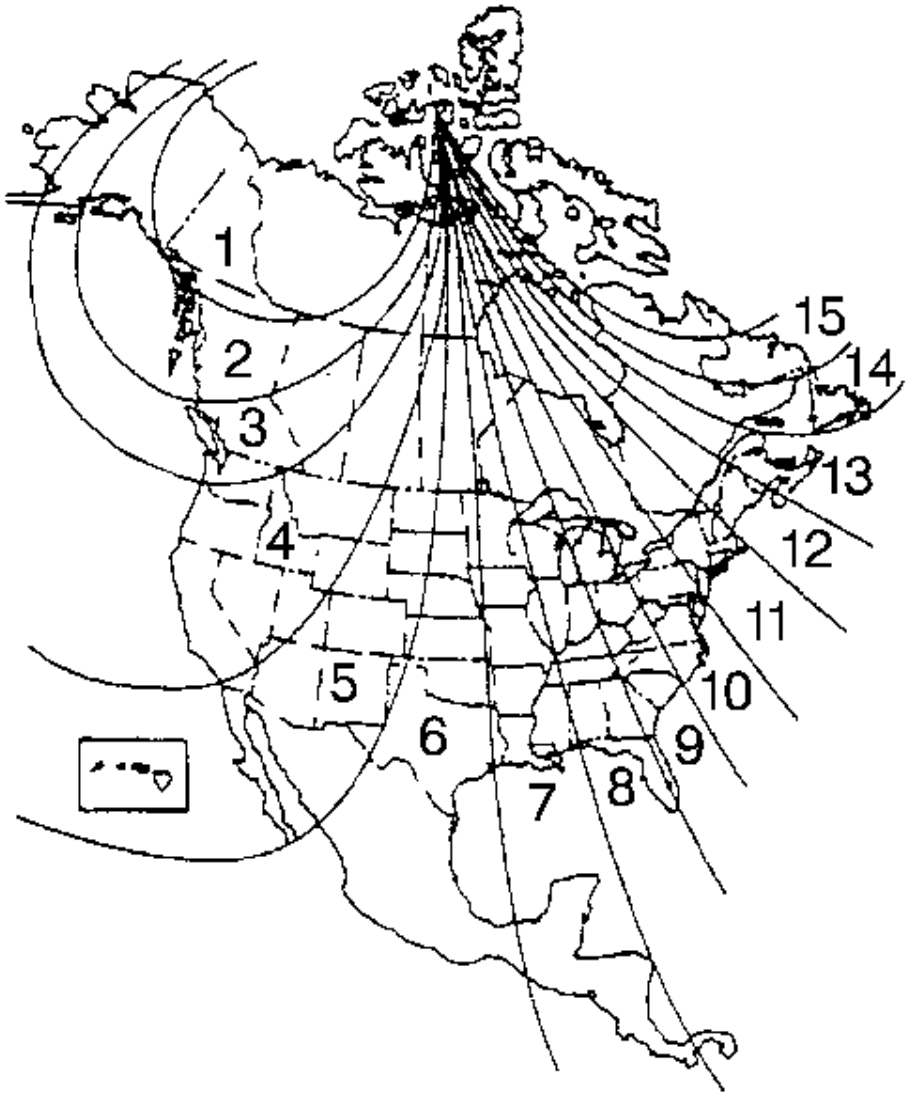

Fig. 7: Illustrating Magnetic Variation Zones
Courtesy of GENERAL MOTORS COMPANY

1. Locate your geographic location. Refer to the variation zone map.
2. Turn ON the ignition with the engine OFF.
3. Press the vehicle information button until PRESS TO CHANGE COMPASS ZONE displays on the DIC.
4. Press the set/reset button to scroll through and select the appropriate variance zone.
5. Navigate to one of the trip/fuel menu screens to view the direction the vehicle is moving. This will be shown in the top right corner of the DIC display.

If the compass needs to be calibrated, use the compass calibration procedure above.

DRIVER INFORMATION CENTER (DIC) DESCRIPTION AND OPERATION

The driver information center (DIC) displays the DIC WOW for 5 seconds when it first powers up. If enabled through Customization menu, the DIC then returns to the last display status before no power condition.

There are 4 switch functions for the DIC.

- Trip/Fuel Info Switch
- Vehicle Information Switch
- Customization Switch.
- Set/Reset Switch

Trip/Fuel Info Switch

The Trip/Fuel switch is used to navigate between vehicle fuel information parameters. Cycle through the following vehicle parameters by successive pressing of the Trip/Fuel Info switch.

- Blank Display
- Average Fuel Economy (AFE)
- Average Vehicle Speed (AVE)
- Displacement on Demand (DOD)
- Fuel Range
- Instantaneous Fuel Economy (IFE)/ Displacement on Demand (DOD)
- Instantaneous Fuel Economy (IFE)
- Odometer
- Trip A
- Trip B

Vehicle Information Switch

The Vehicle Information switch is used to navigate between vehicle information parameters. Cycle through the following vehicle parameters by successive pressing of the Vehicle Information switch.

- Blank Display
- Compass Zone Setting (without UE1)
- Compass Recalibration (without UE1)
- English/Metric Units
- Front Tire Pressure
    - Tire Pressure LF
    - Tire Pressure RF
- Key Fob Programming Menu (Relearn Remote Key)
- Oil Life Index (OLI)
- Rear Tire Pressure
    - Tire Pressure LR
    - Tire Pressure RR
- Tire Inflation Monitoring System (TIMS) Reset (Relearn Tire Position)

Customization Switch

The customization switch is used to set personalization features for the vehicle. Many of the parameters in the Trip/Fuel menu and the Vehicle Info menu can be programmed through the customization switch. In addition to the parameters in the Trip/Fuel and Vehicle Info menus, the following features can also be programmed. Refer to the vehicle owner's manual for more customization information.

- Approach Lighting
- Automatic Door Lock
- Automatic Door Unlock
- Chime Volume
- Delayed Door Lock
- Display Language
- Easy Exit Seat
- Exit Lighting
- Factory Setting
- Language
- Memory Seat Recall
- Remote Door Lock
- Remote Door Unlock
- Remote Start

Set/Reset Switch

Press the Set/Reset button in order to set or acknowledge any of the switch menu options.

Average Fuel Economy

Average fuel economy is calculated using the equation: AFE = Distance/Fuel

- Distance = The accumulated distance travelled since the last reset of this value
- Fuel = The accumulated fuel consumption since the last reset of this value

The ECM sends the average fuel economy serial data message to the IPC. The value of this mode is retained during ignition OFF and can be changed between English units and metric units by selecting from the English/Metric menu.

Average Speed

Average speed is calculated using the equation: Average Speed = AVS Distance/AVS Time

- Distance = The accumulated distance travelled since the last reset of this value
- Ignition On = The accumulated ignition on time since the last reset of this value

Fuel Range

This message indicates the estimated distance that the vehicle can travel under the current fuel economy and fuel level conditions since the last battery connection to the IPC. Fuel Range is calculated using the equation:

Fuel Range = Range Distance/Range Fuel Used.

- Range Distance = The accumulated distance travelled since the last reset of this value.
- Fuel Used = The accumulated fuel delivered since the last reset of this value

The ECM sends the fuel range value to the instrument panel cluster (IPC). The fuel range value is retained during ignition OFF and can be changed between English and Metric units by accessing the English/Metric menu. The Fuel Range display cannot be reset. LOW is displayed when fuel range is below a predetermined value.

Engine Oil Life Remaining

The engine control module (ECM) sends the engine oil life remaining percentage to the instrument panel cluster (IPC) via the serial data circuit. The instrument panel cluster receives a serial data message indicating the engine oil life remaining. The driver information center (DIC) displays the current percentage of the GM Oil Life System as determined by the ECM. When the oil life remaining percentage drops below 5 percent, the DIC displays CHANGE ENGINE OIL SOON. When the engine oil is changed, reset the GM Oil Life System. Refer to **GM Oil Life System Resetting** .

Tire Pressure Monitor

The instrument panel cluster (IPC) receives a serial data message from the tire pressure monitoring (TPM) system for front and rear tire pressure data. The driver information center (DIC) will display the pressure for each of the front and rear tires. When a tire with low air pressure is present, the DIC displays XX TIRE PRESSURE LOW.

English/Metric Button

The English/Metric button is used to toggle between English and Metric unit systems and can be accessed through the Vehicle Info switch function.

Trip A/B

The trip odometer A or B can be accessed through the Trip/Fuel switch function.

Language

The DIC is capable of displaying in three languages:

- English
- French
- Spanish

A simultaneous press of the vehicle Information and customization switches for about 1 second provides a shortcut to change the language without understanding the currently displayed language. The Language settings may also be assessed through the customization switch.

Compass

The DIC displays the compass information on the right most 2 characters of the first DIC line when the compass is an option on the vehicle. When corresponding to the true north radial degrees, the compass displays

the following directions

Compass Display

Radial Degree (True North)	Compass Direction
337.5 to 22.5	N
22.5 to 67.5	NE
67.5 to 112.5	E
112.5 to 157.5	SE
157.5 to 202.5	S
247.5 to 292.5	W

INDICATOR/WARNING MESSAGE DESCRIPTION AND OPERATION

INDICATOR LIGHT ON

Refer to the OWNER'S MANUAL for the descriptions and explanations of all indicator lights.

For diagnosis and repair information related to an indicator light refer to the System Diagnosis and the Description of Operation that the message relates to.

MESSAGE DISPLAYED

Refer to the OWNER'S MANUAL for descriptions and explanations of all messages displayed.

For diagnosis and repair information related to a displayed message refer to the System Diagnosis and the Description of Operation that the message relates to.

CHANGE TIMING BELT MESSAGE

The Instrument Cluster monitors the odometer mileage to determine when timing belt (if equipped) replacement may be necessary. After the vehicle has accumulated approximately 100,000 miles (160,000 kilometers), the Instrument Cluster may display the CHANGE TIMING BELT message. After the engine timing belt has been replaced, reset the CHANGE TIMING BELT message by locating and removing the fuses that supply power to the Instrument Cluster for two minutes.

BRAKES OVERHEATED

The Electronic Brake Control Module monitors brake usage and compares it to an internal thermal model to determine if the brakes could become overheated. If the Electronic Brake Control Module determines the brakes pads have exceeded a desirable temperature based on the thermal model, it sends a serial data message to the Instrument Cluster to display the BRAKES OVERHEATED message. The message remains displayed until the estimated temperature returns to a desirable range.

Transmission Shift Lever Position Indicator

The Transmission Shift Lever Position Indicator (if equipped) is located on the center console and indicates the current transmission shift lever position. The Transmission Shift Lever Position Indicator receives power and ground and is controlled by the Body Control Module (BCM) via serial data. The Transmission Control Module determines transmission shift lever position based on signals from the Transmission Internal Mode Switch and sends the shift lever position information to the BCM via serial data.

INSTRUMENT CLUSTER DESCRIPTION AND OPERATION

Displays Test

Certain instrument panel cluster (IPC) features are tested when the ignition is turned on in order to verify the features are working properly. The following occurs at key up:

- The air bag indicator flashes 7 times (not IPC controlled).
- The antilock brake systems (ABS) indicator illuminates briefly.
- The battery Indicator illuminates briefly.
- The brake indicator illuminates briefly.
- The coolant temperature indicator.
- The engine oil pressure indicator illuminates briefly.
- The malfunction indicator lamp (MIL) illuminates briefly (not IPC controlled).
- The seat belt indicator illuminates for 70 seconds or until the driver seat belt is latched (not IPC controlled).
- The security indicator illuminates briefly.
- The tire pressure low indicator
- The vehicle dynamics caution (VDC) indicator
- All message center segments illuminate briefly.
- All odometer segments illuminate briefly.
- The PRNDL segment illuminates briefly.

Indicators and Warning Messages

Refer to **Indicator/Warning Message Description and Operation**.

Engine Coolant Temperature Gauge

The instrument panel cluster (IPC) displays the engine coolant temperature as determined by the engine control module (ECM). The IPC receives a serial data message from the ECM indicating the engine coolant temperature. The IPC receives the coolant temperature information via serial data message from the body control module (BCM). The engine coolant temperature gauge defaults to 60Â°C (140Â°F) or below if:

- The ECM detects a malfunction in the engine coolant temperature sensor circuit.
- The IPC detects a loss of serial data communications with the ECM.
- The IPC detects a loss of serial data communications with the BCM.

Fuel Gauge

The instrument panel cluster (IPC) displays the fuel level as determined by the engine control module (ECM). The IPC receives a serial data message from the ECM indicating the fuel level percent. The body control module (BCM) sends the fuel level information from the ECM to the IPC via a serial data message indicating the fuel level percent. The fuel gauge defaults to empty if:

- The ECM detects a malfunction in the fuel level sensor circuit.
- The IPC detects a loss of serial data communications with the ECM.

- The IPC detects a loss of serial data communications with the BCM.

When the fuel level is less than a pre-determined value, the low fuel indicator illuminates in the IPC.

Odometer

The vehicle odometer is calculated and stored electronically in the instrument panel cluster (IPC). The IPC contains a season odometer and trip odometer A or B. Momentarily press the trip/fuel button in order to toggle between the season odometer and the trip odometer. Press the set/reset button for greater than 0.25 seconds, while the trip odometer is displayed, in order to reset the trip odometer. The IPC displays the vehicle mileage and trip mileage as determined by the engine control module (ECM). The IPC calculates the mileage based on the serial data vehicle speed information from the ECM. The odometer will display 'error' if an internal IPC memory failure is detected. The odometer displays either miles or kilometers and can be set through the customization menu in the driver information center (DIC).

PRNDL Display

The instrument panel cluster (IPC) displays the selected gear position as determined by the engine control module (ECM). The IPC receives a serial data message from the ECM indicating the gear position. The PRNDL display blanks if:

- The ECM detects a malfunction in the transmission range switch circuit.
- The IPC detects a loss of serial data communications with the ECM.
- The IPC detects a loss of serial data communications with the body control module (BCM).

Speedometer

The instrument panel cluster (IPC) displays the vehicle speed as determined by the engine control module (ECM). The IPC calculates the mileage based on serial data vehicle speed information from the ECM. The IPC receives vehicle speed information from the body control module (BCM) via a serial data message. The speedometer defaults to 0 km/h (0 mph) if the IPC detects a loss of serial data communications with the ECM or BCM.

Tachometer

The instrument panel cluster (IPC) displays the engine speed as determined by the engine control module (ECM). The IPC receives a serial data message from the ECM indicating the engine speed. The IPC receives the engine speed information from the body control module (BCM) via a serial data message. The tachometer will default to 0 RPM if:

- The ECM detects a malfunction in the engine speed sensor circuit.
- The IPC detects a loss of serial data communications with the ECM.
- The IPC detects a loss of serial data communications with the BCM.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0283: ELECTRIC REAR DEFROST CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0283 05

Electric Rear Defrost Circuit Short to Battery or Open

DTC B0283 06

Electric Rear Defrost Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B0283 06	B0283 05	B0283 05	-
Ground	-	B0283 05	-	-

Circuit/System Description

When the rear defogger button is pressed, voltage is supplied to the relay coil and the HVAC control module also illuminates the rear window defogger indicator. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger.

Conditions for Running the DTC

When the relay is being actively commanded by the HVAC control module.

Conditions for Setting the DTC

B0283 06

The HVAC control module detects a short to ground in the relay coil control circuit for 1 second or greater.

B0283 05

The HVAC control module detects a short to battery or open/high resistance in the relay coil control circuit for 1 second or greater.

Action Taken When the DTC Sets

The rear window defogger will malfunction.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine Running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defog Request On and Off with a scan tool.
    - **If the E18 Rear Defogger Grid does not turn ON or OFF**

      Refer to Circuit/System Testing

    - **If the E18 Rear Defogger Grid turns ON and OFF**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85, Engine Running.
4. Verify the test lamp turns ON and OFF when commanding the Rear Defog Request On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, replace the K33 HVAC Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K33 HVAC Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the KR5 Rear Defogger Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 Ω between terminals 85 and 86.
    - **If less than 60 Ω or greater than 180 Ω**

      Replace the KR5 Rear Defogger Relay.

    - **If between 60-180 Ω**
3. Test for infinite resistance between the terminals listed below:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - **If less than infinite resistance**

      Replace the KR5 Rear Defogger Relay.

    - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 Ω between terminals 30 and 87.
    - **If 2 Ω or greater**

      Replace the KR5 Rear Defogger Relay.

    - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Relay Replacement (Attached to Wire Harness) Relay Replacement (Within an Electrical Center)
- Control Module References for HVAC control module replacement, setup and programming

SYMPTOMS - FIXED AND MOVEABLE WINDOWS

IMPORTANT: For the rear window defogger system, the following steps must be performed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the power window system operation or rear window defogger system operation in order to familiarize yourself with the system functions. Refer to Rear Window Defogger Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window defogger. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Rear Window Defogger Malfunction
- Power Windows Malfunction

DEFOGGER GRID LINES DIAGNOSIS

NOTE: **If it has been observed during use that a grid line is inoperative, the following procedure can be used to find the break. If none of the grid lines is operating, a full system diagnosis should be completed before attempting to test the grid lines**

NOTE: **Lightly touch the grid lines when testing with the test lamp. If the test lamp point is scraped through the grid line it can cause an open in the circuit**

1. Engine running, command the Rear Defogger ON with a scan tool.
2. Verify that a test lamp illuminates between each rear window defogger grid line and ground. The test lamp should be off when testing at the ground side of the grid and get brighter as the test lamp moves

closer to the voltage supply side of the grid. The test lamp should be dim when testing each grid line in the middle

- **If the test lamp remains bright at the middle of the grid line.**

  The grid line is open between the test point and the ground side of the grid.

  Replace the rear window

- **If the test lamp remains off at the middle of the grid line.**

  The grid line is open between the test point and the voltage supply side of the grid.

  Replace the rear window

- **If the test lamp remains dim at the middle of each grid line.**

3. All OK

REAR WINDOW DEFOGGER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	2	2	-	-
Rear Defog Relay Control	B0283 06	B0283 05	B0283 05	-
Rear Window Defogger Grid Control	2	2	1	-
Relay Coil Ground	-	B0283 05	-	-
Rear Window Defogger Grid Ground	-	2	-	-
1. Rear defogger always On 2. Rear defogger inoperative				

Circuit/System Description

When the rear defogger button is pressed, voltage is supplied to the relay coil and the HVAC control module also illuminates the rear window defogger indicator. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger grid.

Description and Operation

Rear Window Defogger Description and Operation

Electrical Information Reference

- **Testing for Intermittent Conditions and Poor Connections**
- **Circuit Testing**
- **Wiring Repairs**
- **Connector Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, verify the scan tool Rear Defrost State parameter changes between On and Off while pressing the rear window defogger switch.
    - If the parameter does not change, replace the HVAC control module.
2. Verify the rear defogger indicator turns ON and OFF while commanding the Rear Defog LED On and Off with a scan tool.
    - If the indicator does not turn ON or OFF, replace the HVAC control module.
3. Verify the rear window defogger grid turns ON and OFF while commanding the Rear Defog Request On and Off with a scan tool.

Circuit/System Testing

1. Ignition OFF, disconnect the REAR DEFOG relay.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify a test lamp does not illuminate between the control circuit terminal 87 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
    - If the test lamp does not illuminate, replace the underhood fuse block.
5. Ignition OFF, disconnect the X2 harness connector at the rear window defogger grid.
6. Test for less than 10 Ω between the ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the X2 harness connector at the rear window defogger grid.
8. Ignition ON, connect a 40A fused jumper wire between the B+ circuit terminal 30 and the control circuit

terminal 87. Verify the rear window defogger grid is activated.

- If the rear window defogger grid does not activate, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, refer to **Defogger Grid Lines Diagnosis**.

9. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
10. Engine running, command the Rear Defog Request ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the HVAC control module.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
11. If all circuits test normal, test or replace the REAR DEFOG relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the REAR DEFOG relay.
2. Test for 60-180 Ω between terminals 85 and 86.
    - If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - If not the specified value, replace the relay.
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
    - If greater than the specified range, replace the relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Rear Window Replacement**
- **Front Compartment Fuse Block Fuse Replacement (MIDI-Fuse)**
- **Control Module References** for HVAC control module replacement, setup and programming

POWER WINDOWS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Window Switch Ignition	4	1, 3	-	-
Driver Window Switch Ground	-	4	-	-
Passenger Window Switch Ignition	4	2	-	-

Rear Window Switch Signal	4	3	3	-
Driver Window Motor Control	4	1	1	-
Lockout Switch Control	4	3	3	-
Passenger Window Motor Control	4	2	2	-
Rear Window Motor Control	4	3	3	-
1. Driver Window Malfunction 2. Passenger Window Malfunction 3. Rear Windows Malfunction 4. All Windows Inoperative				

Circuit/System Description

The driver power window switch contains individual window switches for each of power windows. All windows may be controlled up and down from the driver power window switch. The individual passenger power window switches will only control the up and down operation of their respective power window.

Each power window contains a reversible power window motor. The direction the window travels is dependent upon the polarity of the supply voltage. By reversing polarity of the supply voltage the window motor will move up or down. Each power window motor is internally circuit breaker protected.

Battery voltage is supplied to the power window switch through the accessory voltage supply circuit. The power window switch also receives a constant ground source. The power window motor control circuits are connected to ground through the normally closed up and down contacts of the power window switch. When the power switch is placed in the down position, the power window motor down control circuit is switched to 12 volts and is applied to the down side of the power window motor. Since the other side of the power motor is connected to ground through the normally closed contacts of the up switch, the window travels down. By placing the power window switch in the up position, the polarity of the power window motor is reversed and the window travels up.

Description and Operation

Power Windows Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Ignition ON.
2. Verify the driver window performs the UP and DOWN functions.
    - **If the driver window does not perform the UP or DOWN functions**

      Refer to Circuit/System Testing - Driver Window Inoperative

    - **If the driver window performs the UP and DOWN functions**
3. Verify the passenger window performs the UP and DOWN functions at both the driver and passenger door switches.
    - **If the passenger window is inoperative from both the driver and passenger window switches**

      Refer to Circuit/System Testing - Passenger Window Inoperative From Both Switches.

    - **If the passenger window is inoperative from the passenger window switch only**

      Refer to Circuit/System Testing - Passenger Window Switch Inoperative.

    - **If the passenger window is inoperative from the driver window switch only**

      Test or replace the S79D Window Switch - Driver.

    - **If the passenger window performs the UP and DOWN functions at both switches**
4. Verify the left rear and right rear window performs the UP and DOWN functions at both the driver and each of the rear door switches.
    - **If a rear window is inoperative from both the driver and rear window switch**

      Refer to Circuit/System Testing - Rear Window Inoperative From Both Switches

    - **If a rear window is inoperative from the rear window switch only**

      Refer to Circuit/System Testing - Rear Window Lockout Malfunction

    - **If a rear window is inoperative from the driver window switch only**

Test or replace the S79D Window Switch - Driver.

- **If the rear window performs the UP and DOWN functions at both the driver and rear window switch**

5. Lock out the rear window switches by pressing the lockout switch on the driver window switch.
6. Verify the left rear and right rear windows are inoperative at both of the rear door switches .
    - **If both rear windows continue to function from the rear door switches**

      Refer to Circuit/System Testing - Rear Window Lockout Malfunction

    - **If both rear windows are inoperative from the rear window switches**
7. All OK.

Circuit/System Testing

Driver Window Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the S79D Window Switch-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal B and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal E and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Retained Accessory Power Malfunction** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the control circuits listed below and ground:
        - Control circuit terminal A X2
        - Control circuit terminal B X2
        - Control circuit terminal C X1

- Control circuit terminal C X2
- Control circuit terminal D X1
- Control circuit terminal E X2
- Control circuit terminal F X1
- Control circuit terminal G X1
- Control circuit terminal H X1
- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the S79D Window Switch-Driver.

- **If the test lamp illuminates**

5. Ignition OFF and all vehicle systems OFF, X1 connect the harness connector at the S79D Window Switch-Driver and disconnect the harness connector at the M74D Window Motor-Driver. It may take up to 2 minutes for all vehicle systems to power down
6. Test for less than 10 Ω between the control circuit terminal A and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the S79D Window Switch-Driver.
   - **If less than 10 Ω**
7. Test for less than 10 Ω between the control circuit terminal B and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the S79D Window Switch-Driver.
   - **If less than 10 Ω**
8. Connect a test lamp between control circuit terminal A and control circuit terminal B, Ignition ON.
9. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79D Window Switch-Driver.
   - **If the test lamp remains OFF during either of the commands**
   1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for infinite resistance between each control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the S79D Window Switch-Driver.
   - **If the test lamp is always ON**
   1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79D Window Switch-Driver, Ignition ON.
   2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the S79D Window Switch-Driver.

- **If the test lamp turns ON and OFF**

10. Test or replace the M74D Window Motor-Driver.

Passenger Window Inoperative From Both Switches

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S79P Window Switch-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the control circuit terminal D and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the S79D Window Switch-Driver.
   - **If less than 10 Ω**
3. Test for less than 10 Ω between the control circuit terminal D and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the S79D Window Switch-Driver.
   - **If less than 10 Ω**
4. Connect a test lamp between the control circuit terminal D and control circuit terminal H, Ignition ON.
5. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79D Window Switch-Driver.
   - **If the test lamp remains OFF during either of the commands**
   1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79D Window Switch-Driver.
   2. Test for infinite resistance between each control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the S79D Window Switch-Driver.
   - **If the test lamp is always ON**
   1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79D Window Switch-Driver, Ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the S79D Window Switch-Driver.
   - **If the test lamp turns ON and OFF**
6. Ignition OFF and all vehicle systems OFF, connect the harness connector at the S79P Window Switch-

Passenger and disconnect the harness connector at the M74P Window Motor-Passenger. It may take up to 2 minutes for all vehicle systems to power down.

7. Test for less than 10 Ω between the control circuit terminal A and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S79P Window Switch-Passenger.
    - **If less than 10 Ω**
8. Test for less than 10 Ω between the control circuit terminal B and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S79P Window Switch-Passenger.
    - **If less than 10 Ω**
9. Connect a test lamp between control circuit terminal A and control circuit terminal B, Ignition ON.
10. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79P Window Switch-Passenger.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the S79P Window Switch-Passenger.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the S79P Window Switch-Passenger.
    - **If the test lamp turns ON and OFF**
11. Test or replace the M74P Window Motor-Passenger.

Passenger Window Switch Inoperative

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON
2. Verify a test lamp illuminates between the ignition circuit terminal A and ground.
    - **If the test lamp does not illuminate**
    1. Ignition OFF.

2. Test for less than 2 Ω in the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
- **If the test lamp illuminates**

3. Test or replace the S79P Window Switch-Passenger.

Rear Window Inoperative From Both Switches

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate rear S79 Window Switch. it may take up to 2 minutes for all vehicle systems to power down
2. Test for less than 10 Ω between the control circuit terminal C and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the S79D Window Switch-Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S79D Window Switch-Driver.
    - **If less than 10 Ω**
3. Test for less than 10 Ω between the control circuit terminal H and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the S79D Window Switch-Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S79D Window Switch-Driver.
    - **If less than 10 Ω**
4. Connect a test lamp between the control circuit terminal C and control circuit terminal H, Ignition ON.
5. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79D Window Switch-Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the S79D Window Switch-Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the S79D Window Switch-Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the S79D Window Switch-Driver, Ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the S79D Window Switch-Driver.
    - **If the test lamp turns ON and OFF**

6. Ignition OFF and all vehicle systems OFF, connect the harness connector at the rear S79 Window Switch and disconnect the harness connector at the rear M74 Window Motor. It may take up to 2 minutes for all vehicle systems to power down.
7. Test for less than 10 Ω between the control circuit terminal listed below and ground:
    - Control terminal A
    - Control terminal B
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the rear S79 Window Switch.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the rear S79 Window Switch.
    - **If less than 10 Ω**
8. Connect a test lamp between the control circuit terminal A and the control circuit terminal B, Ignition ON.
9. Verify the test lamp turns ON when commanding the UP and DOWN states with the rear S79 Window Switch.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the rear S79 Window Switch.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the rear S79 Window Switch.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the rear S79 Window Switch, Ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the rear S79 Window Switch.
    - **If the test lamp turns ON and OFF**
10. Test or replace the rear M74 Window Motor.

Rear Window Lockout Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate rear S79 Window Switch.
2. Ignition ON, connect a test lamp between the control circuit terminal E and ground.
3. Verify the test lamp turns ON and OFF when pressing the rear window lockout switch ON and OFF on the S79D Window Switch-Driver.
    - **If the test lamp is always OFF**
    1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the S79D Window Switch-Driver.
    2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the S79D Window Switch-Driver.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the S79D Window Switch-Driver, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the S79D Window Switch-Driver.

- **If the test lamp turns ON and OFF**

4. Test or replace the rear S79 Window Switch.

Component Testing

Window Motor

1. Ignition OFF, disconnect the harness connector at the appropriate M74 Window Motor.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M74 Window Motor should perform the UP and DOWN functions.
    - **If the M74 Window Motor does not perform the UP and DOWN functions**

      Replace the M74 Window Motor.

    - **If the M74 Window Motor performs the UP and DOWN functions**
3. All OK

Driver Window Switch

1. Ignition OFF, disconnect the X1 and X2 harness connectors at the S79D Window Switch-Driver.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
    - Ignition terminal E X1 and control terminal A X2
    - Ignition terminal E X1 and control terminal B X2
    - Ignition terminal E X1 and control terminal C X1
    - Ignition terminal E X1 and control terminal C X2
    - Ignition terminal E X1 and control terminal D X1
    - Ignition terminal E X1 and control terminal E X2
    - Ignition terminal E X1 and control terminal F X1
    - Ignition terminal E X1 and control terminal G X1
    - Ignition terminal E X1 and control terminal H X1
    - **If less than infinite resistance**

Replace the S79D Window Switch-Driver.

- **If infinite resistance**

3. Test for less than 3 Ω between the terminals listed below with the switch in the open position:
   - Ground terminal B X1 and control terminal A X2
   - Ground terminal B X1 and control terminal B X2
   - Ground terminal B X1 and control terminal C X1
   - Ground terminal B X1 and control terminal C X2
   - Ground terminal B X1 and control terminal D X1
   - Ground terminal B X1 and control terminal E X2
   - Ground terminal B X1 and control terminal F X1
   - Ground terminal B X1 and control terminal G X1
   - Ground terminal B X1 and control terminal H X1
   - **If 3 Ω or greater**

     Replace the S79D Window Switch-Driver.

   - **If less than 3 Ω**
4. Test for less than 3 Ω between the terminals listed below with the switch in the Up position.
   - Ignition terminal E X1 and control terminal B X2
   - Ignition terminal E X1 and control terminal D X1
   - Ignition terminal E X1 and control terminal E X2
   - Ignition terminal E X1 and control terminal G X1
   - Ignition terminal E X1 and control terminal H X1
   - **If 3 Ω or greater**

     Replace the S79D Window Switch-Driver.

   - **If less than 3 Ω**
5. Test for less than 3 Ω between the terminals listed below with the switch in the Down position:
   - Ignition terminal E X1 and control terminal A X2
   - Ignition terminal E X1 and control terminal C X1
   - Ignition terminal E X1 and control terminal C X2
   - Ignition terminal E X1 and control terminal H X1
   - **If 3 Ω or greater**

     Replace the S79D Window Switch-Driver.

   - **If less than 3 Ω**
6. All OK

Passenger Window Switch

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
    - Ignition terminal A and control terminal F
    - Ignition terminal A and control terminal G
    - **If less than infinite resistance**

      Replace the S79P Window Switch-Passenger.

    - **If infinite resistance**
3. Test for less than 3 Ω between the control terminals listed below with the switch in the open position:
    - Control terminal G and control terminal H
    - Control terminal D and control terminal F
    - **If 3 Ω or greater**

      Replace the S79P Window Switch-Passenger.

    - **If less than 3 Ω**
4. Test for less than 3 Ω between the ignition terminal A and the control terminal G with the switch in the Up position.
    - **If 3 Ω or greater**

      Replace the S79P Window Switch-Passenger.

    - **If less than 3 Ω**
5. Test for less than 3 Ω between the ignition terminal A and the control terminal F with the switch in the Down position.
    - **If 3 Ω or greater**

      Replace the S79P Window Switch-Passenger.

    - **If less than 3 Ω**
6. All OK

Rear Window Switch

1. Ignition OFF, disconnect the harness connector at the appropriate rear S79 Window Switch.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
    - Control terminal E and control terminal A
    - Control terminal E and control terminal D
    - **If less than infinite resistance**

      Replace the rear S79 Window Switch.

    - **If infinite resistance**
3. Test for less than 3 Ω between the control terminals listed below with the switch in the open position:

- Control terminal C and control terminal D
- Control terminal A and control terminal H
- **If 3 Ω or greater**

  Replace the rear S79 Window Switch.

- **If less than 3 Ω**

4. Test for less than 3 Ω between the control terminal E and the control terminal D with the switch in the Up position.
   - **If 3 Ω or greater**

     Replace the rear S79 Window Switch.

   - **If less than 3 Ω**
5. Test for less than 3 Ω between the control terminal E and the control terminal A with the switch in the Down position.
   - **If 3 Ω or greater**

     Replace the rear S79 Window Switch.

   - **If less than 3 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Switch Replacement (Impala)**
- **Front Side Door Window Regulator Motor Replacement**
- **Rear Side Door Window Regulator Motor Replacement**
- **Rear Side Door Window Switch Replacement**

SIDE DOOR WINDOW MECHANICAL DIAGNOSIS

Cause	Correction
DEFINITION: A mechanical condition that requires a correction for proper operation of the side door window. Refer to **Symptoms - Fixed and Moveable Windows** prior to beginning this table.	
Intermittent Operation	Check proper glass alignment/attachment and door seal installation.
	Check switch and switch bezel to see if sticking.
	Check wire harness for pinched/shorted wire.
	THIS STEP APPLIES TO ALL TWO PIN MOTOR CONNECTORS ONLY. Perform electrical diagnostics, by first applying 12 volt power supply to the regulator motor to verify motor function.
Glass Binds	Check proper glass alignment/attachment.
	Check for defective seal and/or proper seal installation.

Cause	Correction
	Check for debris in glass run channel.
	Check for glass run channel position.
Regulator/Glass Rattles	Check for loose fasteners and retorque if required.
	Check that the glass is in the channel and reinstall if not positioned correctly.
Noisy Operation	Check for other components in the glass path such as wire harness, impact foam, lock rods, or cables.
	Check for proper glass alignment/attachment and door seal installation.
Windnoise	Check seals, mirror patch, and glass alignment.
False glass reversal, the glass goes down unexpectedly.	Check seals, reinitialize the glass and/or realign the glass.
	Check for debris in the glass run channel.

REPAIR INSTRUCTIONS

WINDSHIELD REPLACEMENT

Special Tools

- **J-24402-A** Glass Sealant Remover (Cold Knife)
- **J-39032** Stationary Glass Removal Tool
- Use a urethane adhesive systems which meet GM Specification GM 3651G

Removal Procedure

NOTE: **Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and the interior trim.**

1. Open the hood.
2. Remove the windshield wiper arms and blades. Refer to **Windshield Wiper Arm Replacement** .
3. Remove the air inlet grille. Refer to **Air Inlet Grille Panel Replacement** .
4. Remove the windshield garnish moldings. Refer to **Windshield Pillar Garnish Molding Replacement** .
5. Remove the rearview mirror. Refer to **Inside Rearview Mirror Replacement** .

WARNING: **If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.**

6. Cover to protect the following parts from broken glass:
    1. Upper dash pad
    2. Defroster outlets and A/C outlets
    3. Seats and carpeting

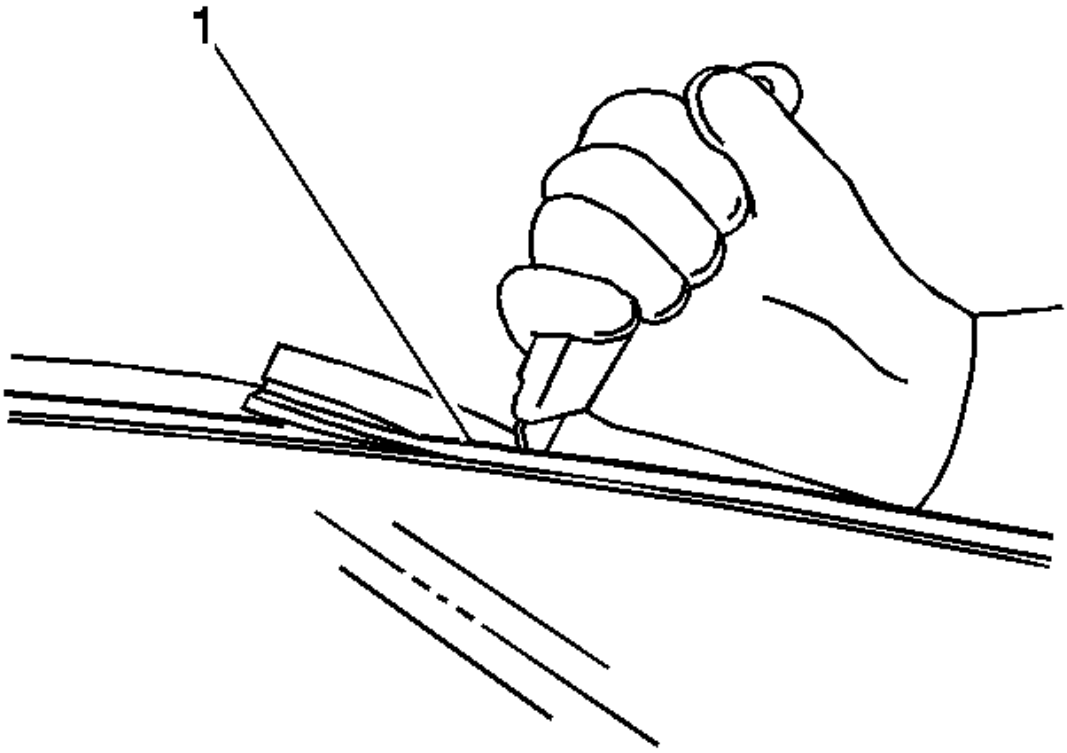

Fig. 3: Using Utility Knife To Remove Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Glass and Sheet Metal Handling Warning .

7. Remove the windshield lace molding (1).

   Use a utility knife in order to cut around the windshield in order to remove the windshield lace.

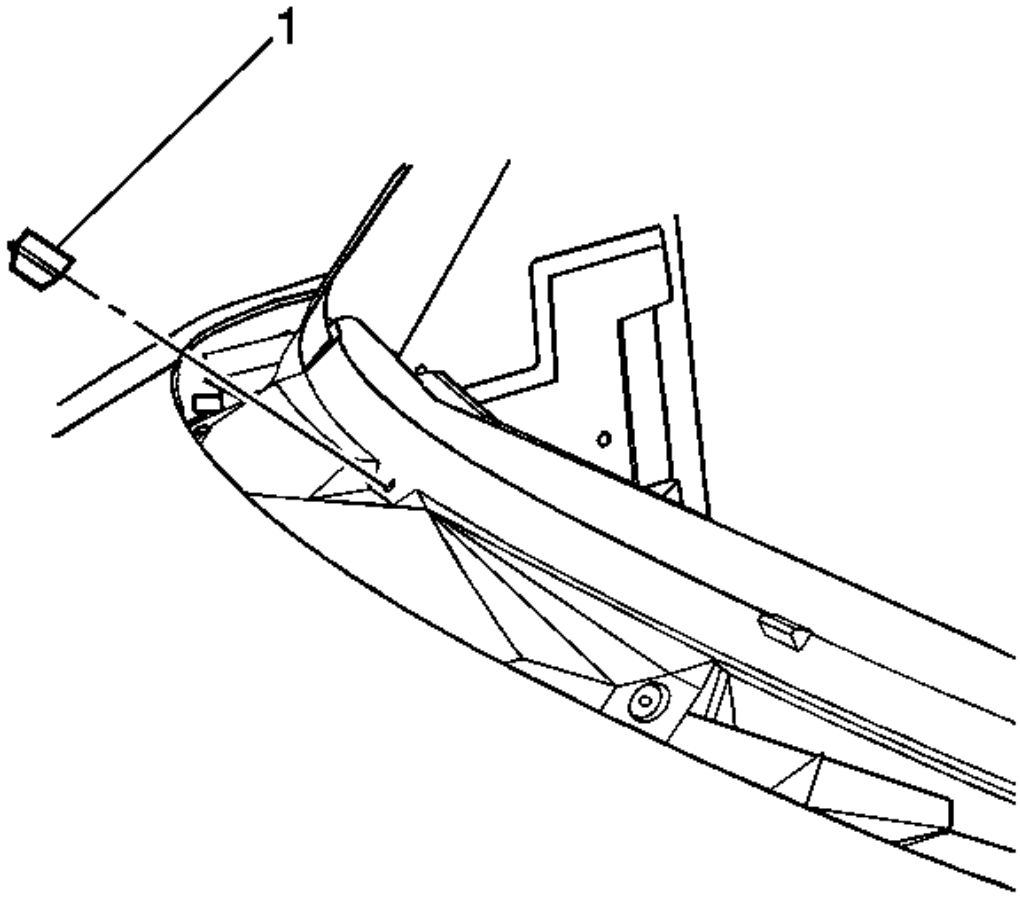

Fig. 4: Identifying Lower Windshield Supports
Courtesy of GENERAL MOTORS COMPANY

8. Remove the lower windshield supports (1) from the cowl panel, if equipped.

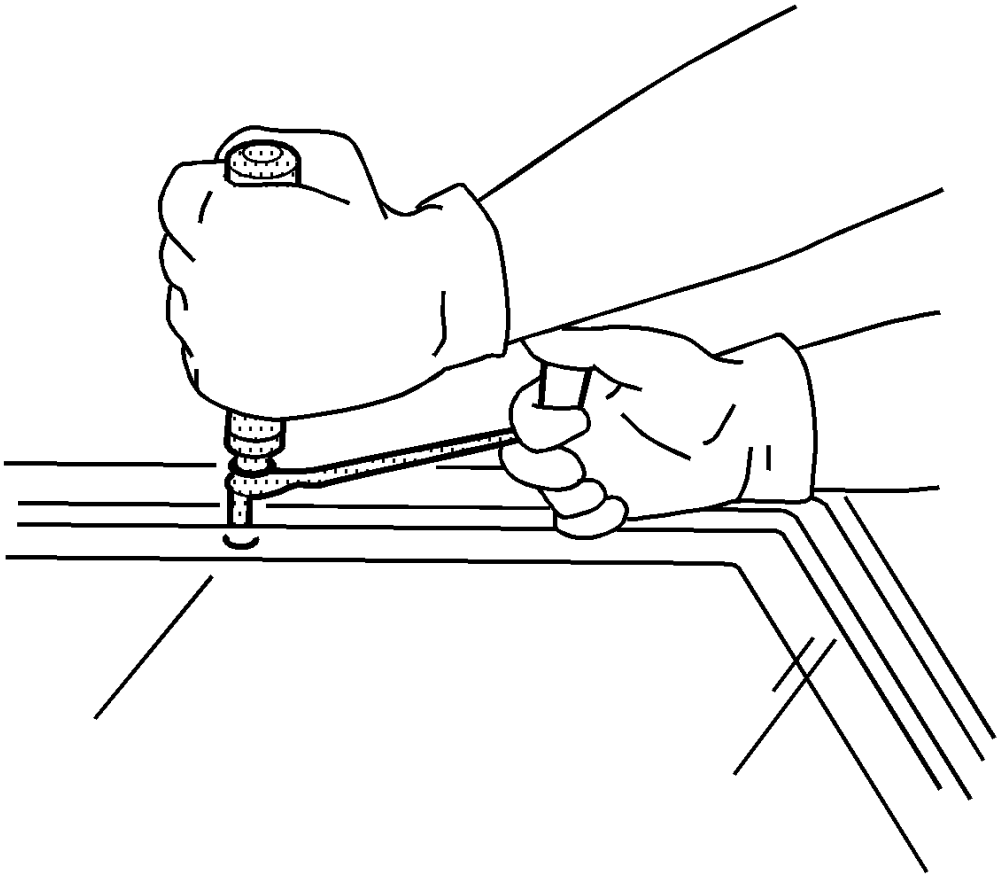

Fig. 5: Separating Urethane Adhesive From Window
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Keep the cutting edge of the tool against the window.**

9. This will allow the urethane adhesive to be separated from the window.
    - Leave a base of urethane on the pinch-weld flange.
    - The only suitable lubrication is clear water.
    - Use **J-24402-A** glass sealant remover , **J-39032** stationary glass removal tool or equivalent in order to remove the window.

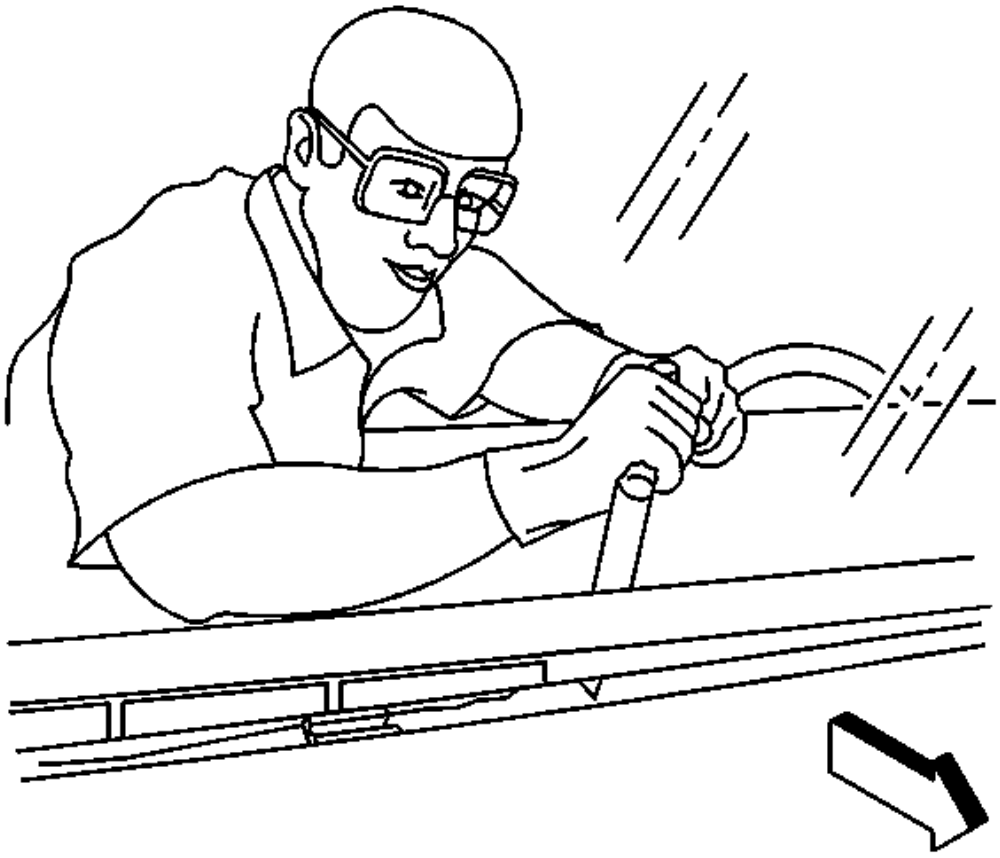

Fig. 6: Separating Bottom Of Window
Courtesy of GENERAL MOTORS COMPANY

10. Remove the bottom of the window from the urethane adhesive using a long utility knife or similar tool. Keep the cutting edge of the utility knife against the glass. Do this from inside the vehicle.

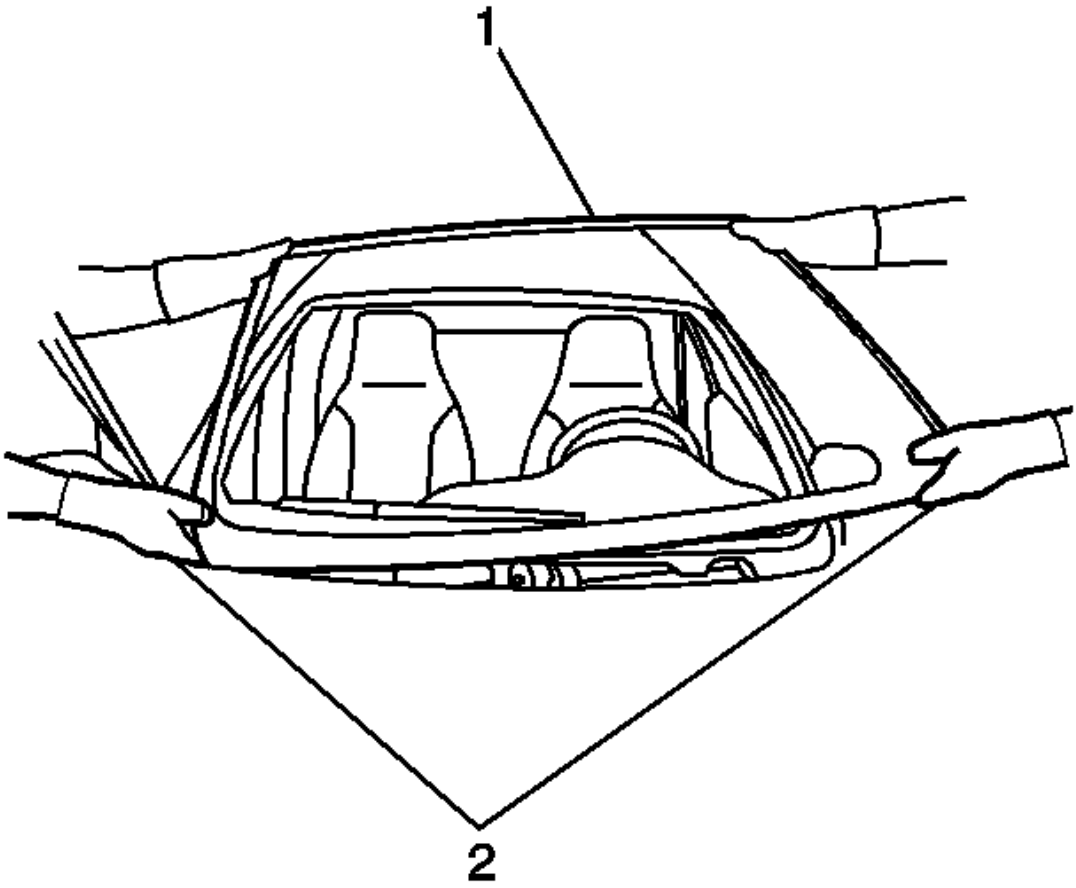

Fig. 7: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

11. Remove the windshield (1) from the vehicle with the aid of an assistant (2).

Installation Procedure

1. Install a stationary window into the opening. Refer to **Adhesive Installation of Stationary Windows**.
2. Install the rearview mirror. Refer to **Inside Rearview Mirror Replacement** .
3. Install the windshield garnish molding . Refer to **Windshield Pillar Garnish Molding Replacement** .
4. Install the air inlet grille. Refer to **Air Inlet Grille Panel Replacement** .
5. Install the windshield wipers arms and blades. Refer to **Windshield Wiper Arm Replacement** .
6. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.
7. Close the hood.

FRONT SIDE DOOR WINDOW REPLACEMENT

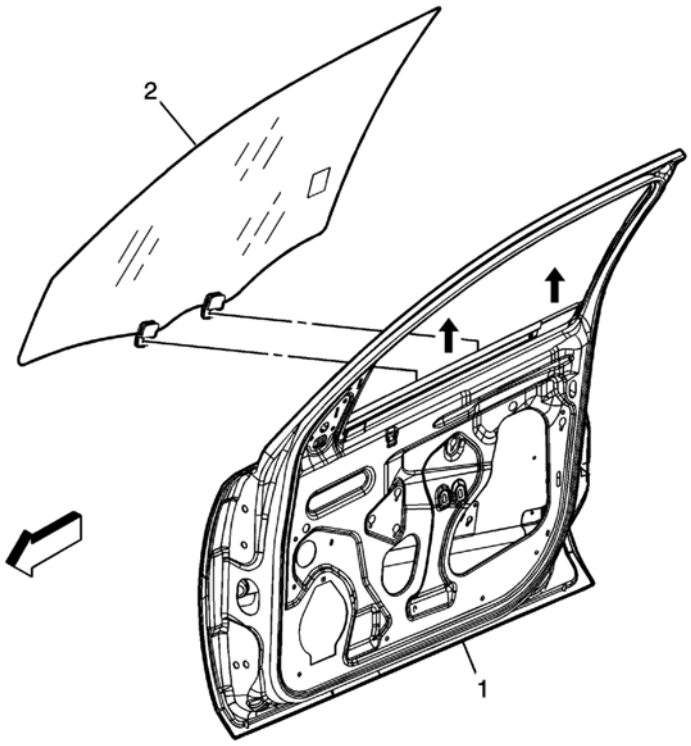

Fig. 8: Front Door Window
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Position window approximately half way down in the door. 2. Remove the interior trim panel. Refer to **Front Side Door Trim Panel Replacement** . 3. Remove the water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** . 4. Tape the window to door frame to prevent it from moving. 5. Remove the inside sealing strip. Refer to **Front Side Door Window Belt Inner Sealing Strip Replacement**.	
1	Front Side Door Window to Regulator Bolts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Front Side Door Window **TIP:** Remove the window from the outside of the door, tape the frame as needed.

REAR SIDE DOOR WINDOW REPLACEMENT

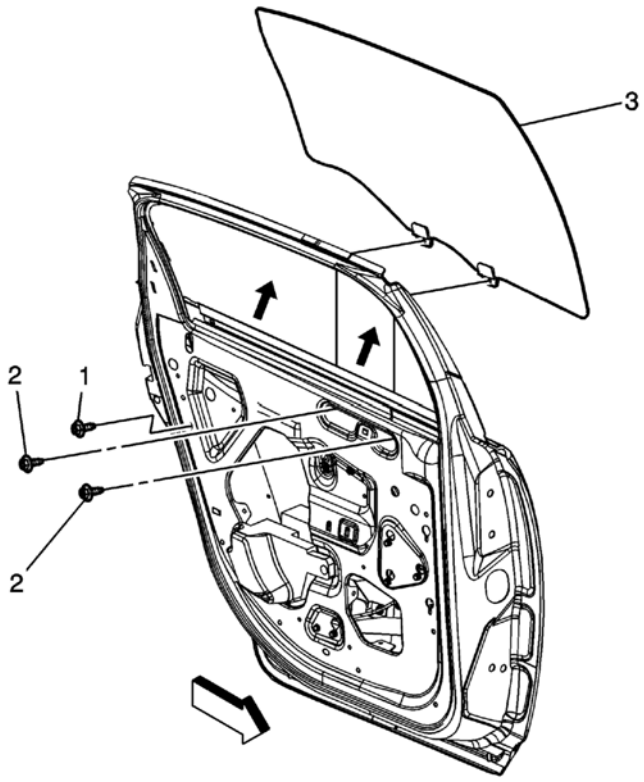

Fig. 9: Rear Side Door Window
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear side door trim panel. Refer to **Rear Side Door Trim Panel Replacement** . 2. Remove the water deflector. Refer to **Rear Side Door Water Deflector Replacement** . 3. Remove the rear side door inner sealing strip. Refer to **Rear Side Door Window Inner Sealing Strip Replacement**. 4. Remove the rear side door outer sealing strip. Refer to **Rear Side Door Window Outer Sealing Strip Replacement** 5. Do Not remove the rear side door window channel retainer from the door just the lower bolt (1). Refer to **Rear Side Door Window Channel Replacement**.	
1	Rear Side Door Window to Channel Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedures**

Callout	Component Name
	1. Remove the rear side door window frame rear applique, using a suitable tool to release the clips. 2. Position window approximately half way down in the door. 3. Tape the window to door frame to prevent it from moving. 4. Tape the rear side door window frame front applique. 5. Place tape around the outer edge of the rear door frame after removing the applique, this will protect the window when removing. 6. It maybe necessary to partially remove the rear side door window weatherstrip from the door frame. **Tighten** 10 N.m (89 lb in)
2	Rear Side Door Window to Window Regulator Guide Bolts (Qty: 2) **Procedure** 1. Remove the tape from the door frame. 2. Remove the door window from the door frame. Pull upward then slide the window rearward to release it from rear side door window channel retainer. **Tighten** 10 N.m (89 lb in)
3	Rear Side Door Window

QUARTER WINDOW REPLACEMENT (IMPALA) Special

Tools

- **J 24402-A** Glass Sealant Remover (Cold Knife)
- **J 39032** Stationary Glass Removal Tool
- Use a urethane adhesive systems which meet GM Specification GM 3651G

Removal Procedure

WARNING: **If a window is cracked but still intact, crisscross the window with masking tape in order to reduce the risk of damage or personal injury.**

NOTE: **Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and inner trim of the window.**

1. Remove the rear quarter upper trim. Refer to **Quarter Upper Trim Panel Replacement** .
2. Remove the rear quarter lower trim. Refer to **Quarter Lower Rear Trim Panel Replacement (Impala)** .

WARNING: **If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.**

3. Cover to protect the following parts from broken glass:
   - Upper dash pad
   - Defroster outlets and A/C outlets
   - Seats and carpeting

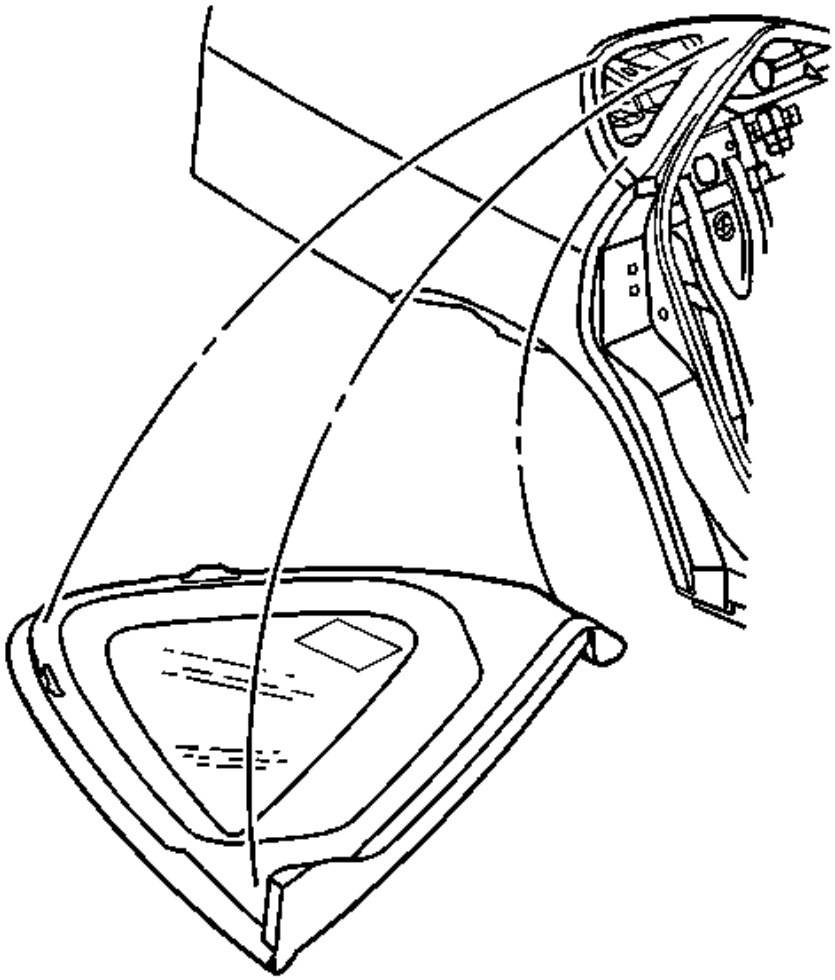

Fig. 10: Quarter Panel (Impala) Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

NOTE: **Keep the cutting edge of the tool against the window. Do this from inside the vehicle to protect the outer painted surface.**

4. This will allow the urethane adhesive to be separated from the window.
   - Leave a base of urethane on the pinch-weld flange.
   - The only suitable lubrication is clear water.

- Use **J 39032** stationary glass removal tool or equivalent in order to remove the window.
- Remove the quarter modular window from the pinch-weld flange.

Installation Procedure

1. Install a stationary window into the opening. Refer to **Adhesive Installation of Stationary Windows**.
2. Install the rear quarter lower trim. Refer to **Quarter Lower Rear Trim Panel Replacement (Impala)** .
3. Install the rear quarter upper trim panel. Refer to **Quarter Upper Trim Panel Replacement** .
4. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.

REAR WINDOW REPLACEMENT

Special Tools

- **J 24402-A** Glass Sealant Remover (Cold Knife)
- **J 39032** Stationary Glass Removal Tool
- Use a urethane adhesive systems which meet GM Specification GM 3651G

Removal Procedure

WARNING: **If a window is cracked but still intact, crisscross the window with masking tape in order to reduce the risk of damage or personal injury.**

NOTE: **Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and the interior trim.**

1. Open the rear compartment lid in order to access the reveal molding.
2. Disconnect the rear window defogger electrical connectors.
3. Disconnect the rear window radio antenna connector. If equipped.

WARNING: **If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.**

4. Cover to protect the following parts from broken glass:
   - Upper dash pad
   - Defroster outlets and A/C outlets
   - Seats and carpeting

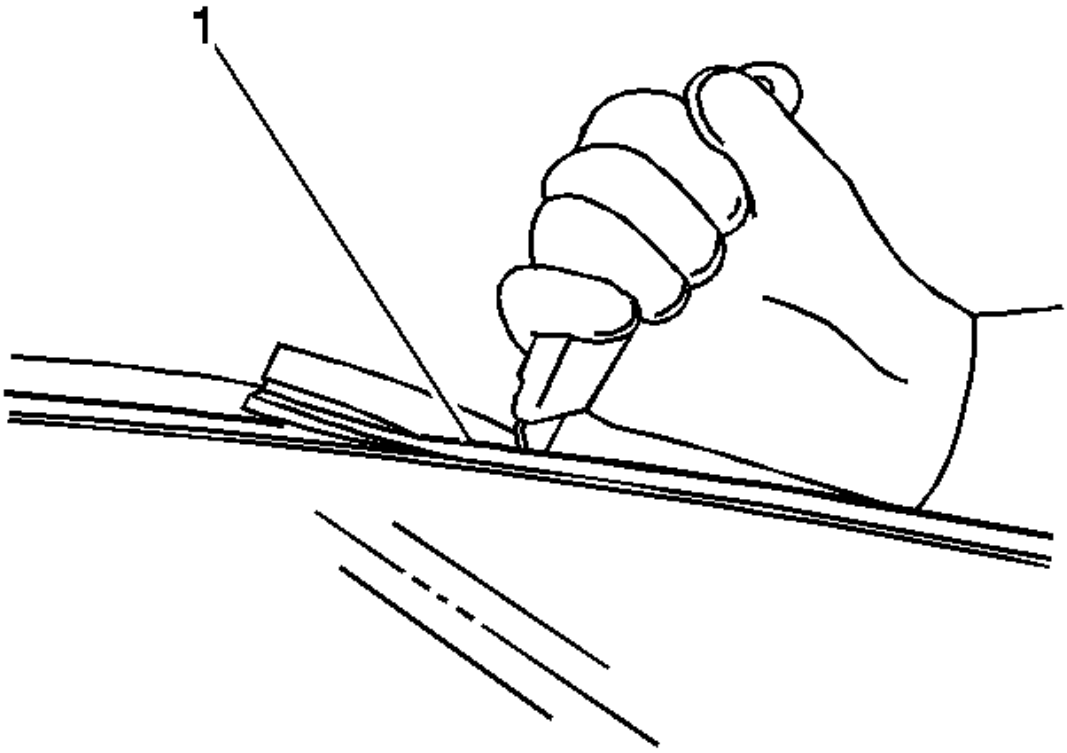

Fig. 11: Using Utility Knife To Remove Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Glass and Sheet Metal Handling Warning .

5. Using a utility knife, carefully cut the rear window lace molding (1) in order to access the urethane adhesive bead.

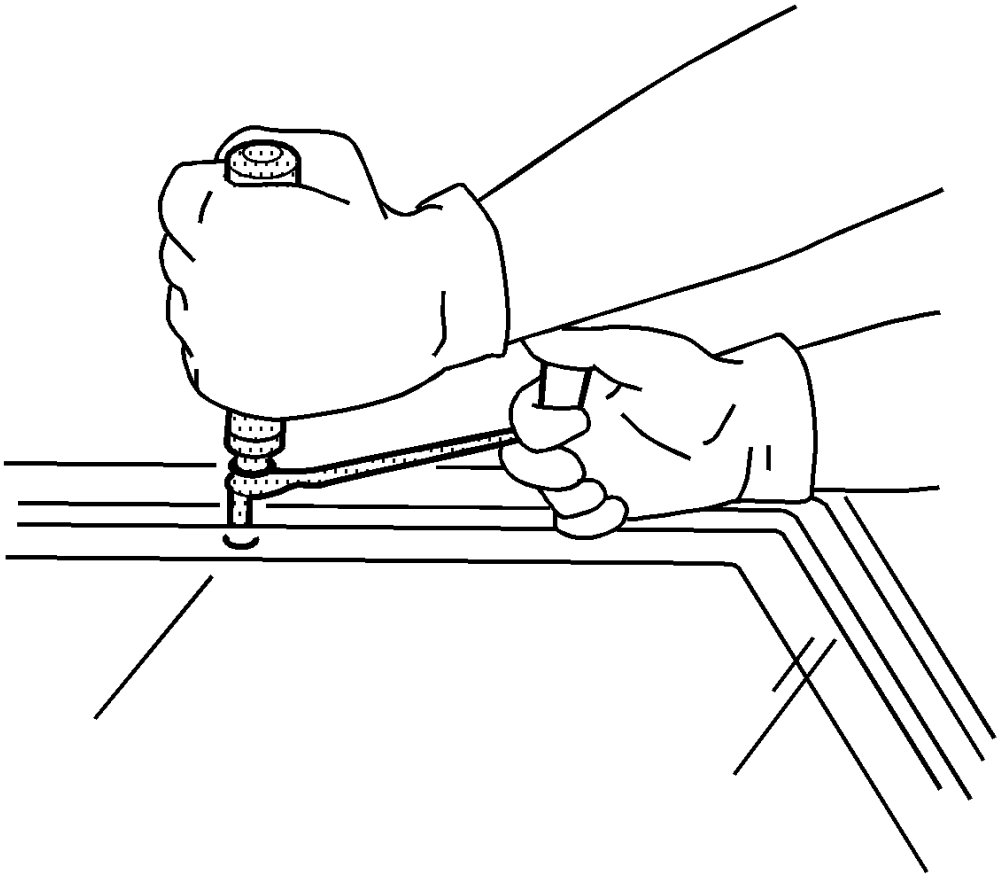

Fig. 12: Separating Urethane Adhesive From Window
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Keep the cutting edge of the tool against the window.**

6. This will allow the urethane adhesive to be separated from the window.
    - Leave a base of urethane on the pinchweld flange.
    - The only suitable lubrication is clean water.
    - Use **J 24402-A** glass sealant remover (cold knife) , **J 39032** stationary glass removal tool or equivalent in order to remove the window.

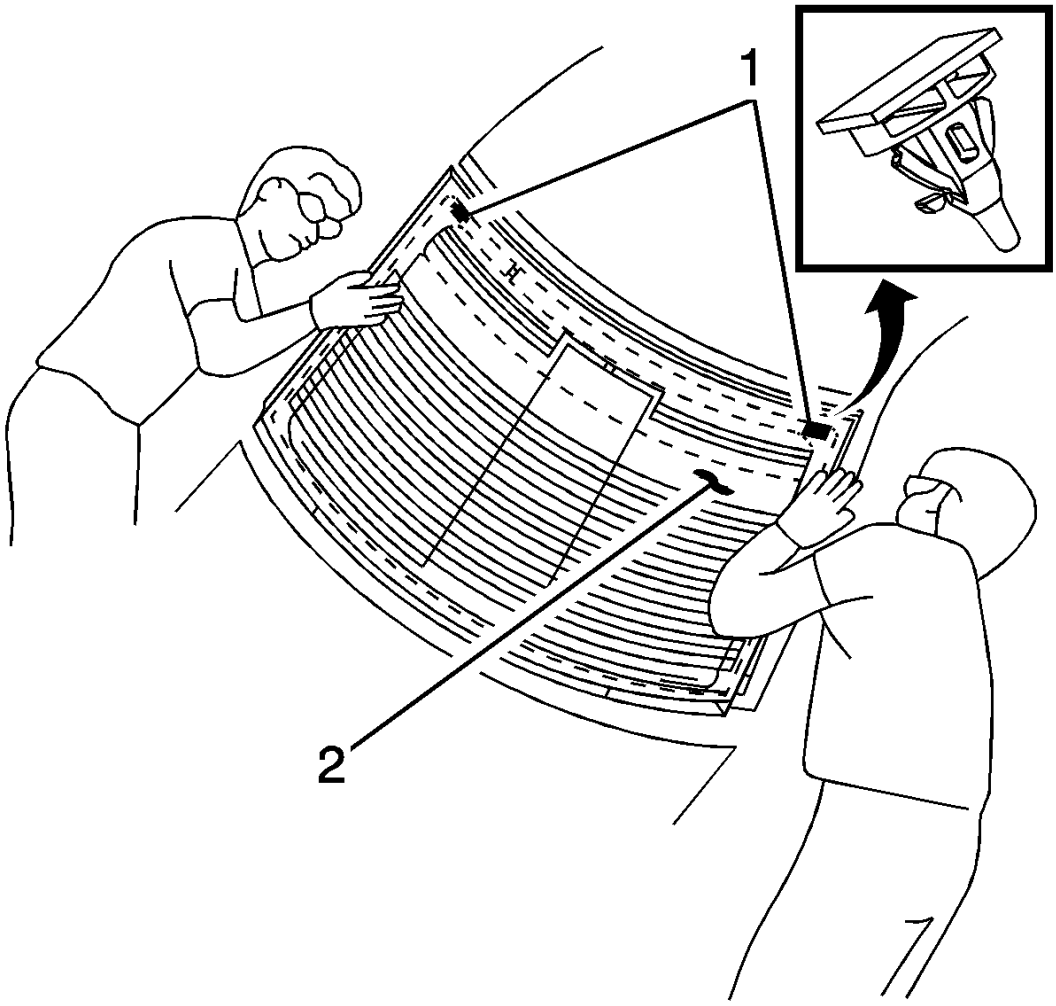

Fig. 13: View Of Window & Locator Pins
Courtesy of GENERAL MOTORS COMPANY

7. Remove the rear window (1) with the an assistant (2) from the vehicle .

Installation Procedure

1. Install the rear window into the opening. Refer to **Adhesive Installation of Stationary Windows**.
2. Connect the rear window defogger electrical connectors. If equipped.
3. Install the rear window radio antenna connector.
4. Connect the OnStarÂ® antenna, if equipped.

   Check the radio and OnStarÂ® system to verify reception.

5. Close the rear compartment lid.
6. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.

REAR SIDE DOOR WINDOW CHANNEL REPLACEMENT

Removal Procedure

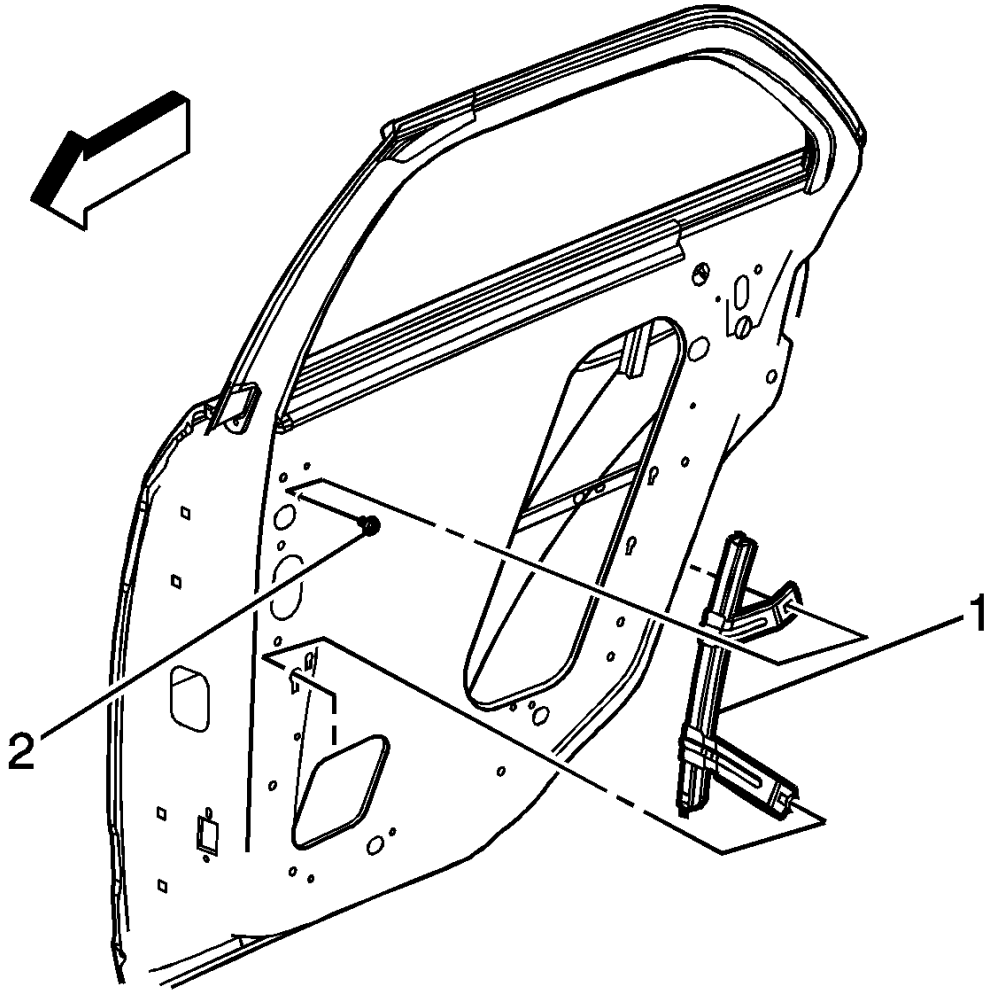

Fig. 14: Identifying Rear Door Window Run Channel
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Apply masking tape to the door frame and applique.
2. Remove the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .
3. Remove the rear door water deflector. Refer to **Rear Side Door Water Deflector Replacement** .
4. Position the window in the full down position.
5. Remove the window channel bolt (2).
6. Remove the window channel from the door.

Installation Procedure

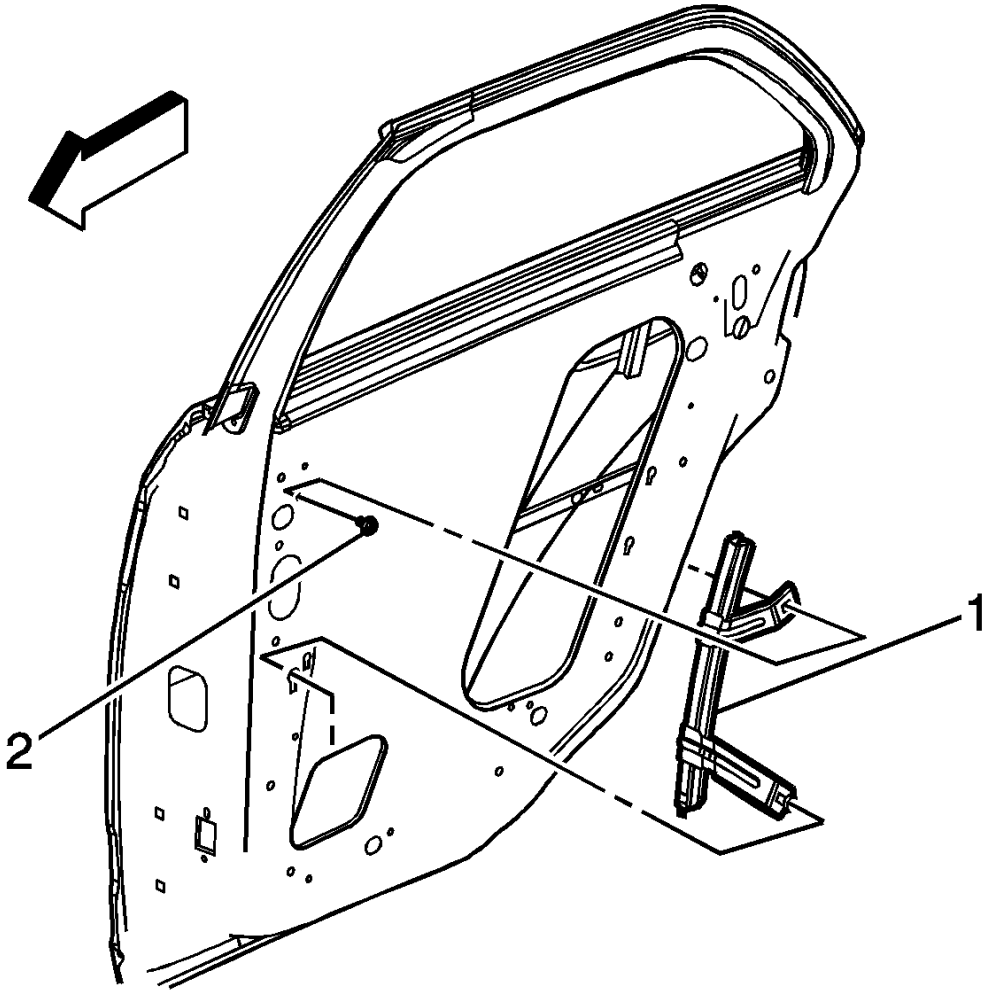

Fig. 15: Identifying Rear Door Window Run Channel
Courtesy of GENERAL MOTORS COMPANY

1. Install the window channel (1) in the door.

CAUTION: **Refer to Fastener Caution .**

2. Install the window run channel bolts (2).

Tighten

Tighten the bolts to 10 N.m (89 lb in).

3. Inspect the window for proper operation.
4. Remove the masking tape from the frame and applique.
5. Install the rear door water deflector. Refer to **Rear Side Door Water Deflector Replacement** .
6. Install the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .

FRONT SIDE DOOR WINDOW SWITCH REPLACEMENT (IMPALA)

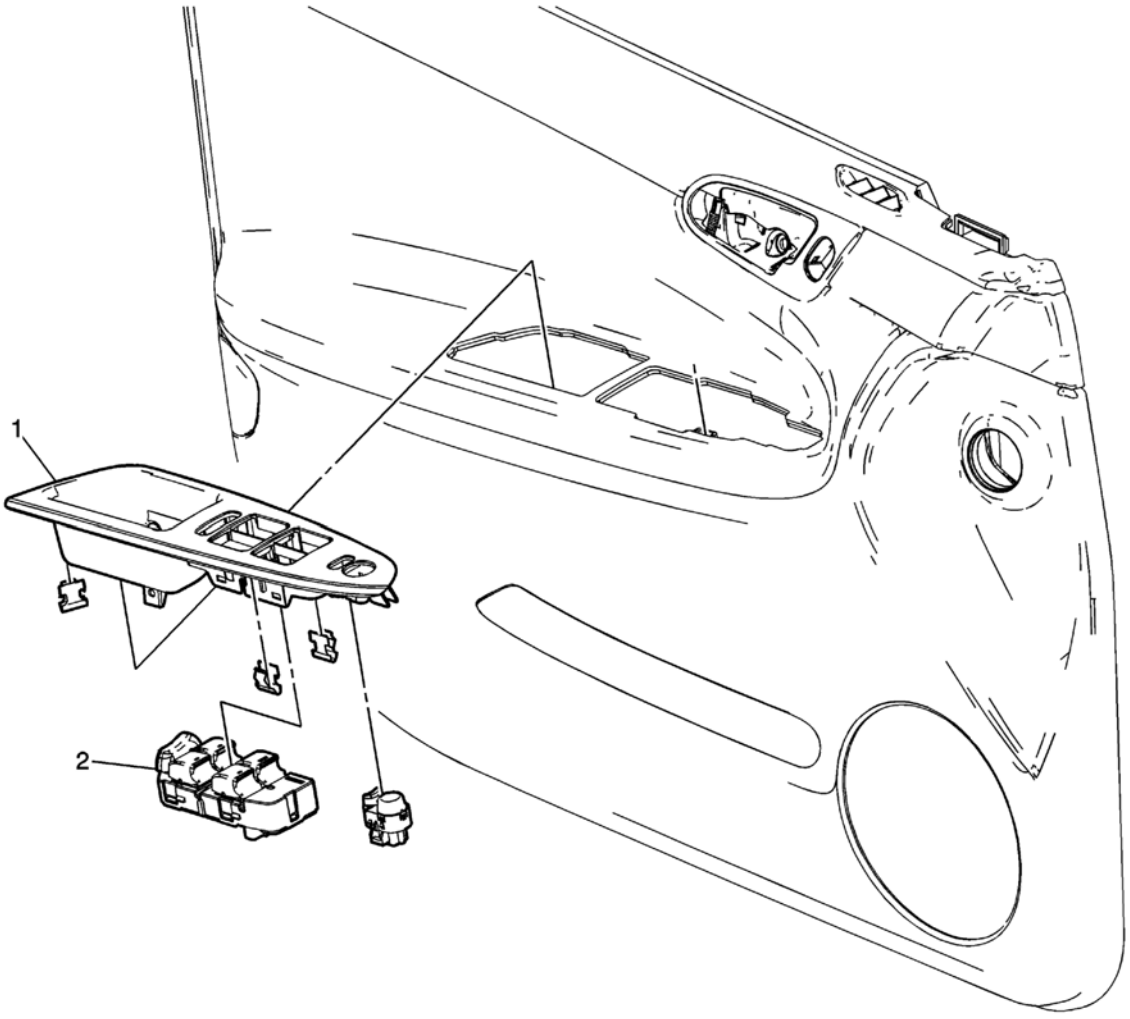

Fig. 16: View Of Power Mirror Switch (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Side Window Switch Bezel Refer to **Front Side Door Window Switch Bezel Replacement** .
2	Front Side Door Window and Rear Side Door Window Switch **TIP:** Use a flat bladed tool to help disengage the switch from the bezel.

REAR SIDE DOOR WINDOW SWITCH REPLACEMENT

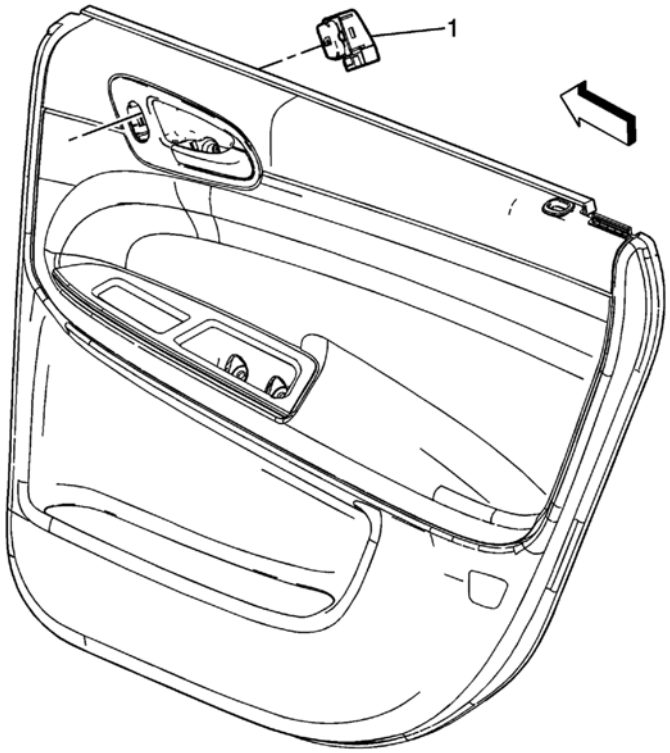

Fig. 17: View Of Rear Side Door Window Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Remove the rear side door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .	
1	Rear Side Door Window Switch Assembly **TIP:** Disconnect the electrical connector.

FRONT SIDE DOOR WINDOW REGULATOR REPLACEMENT

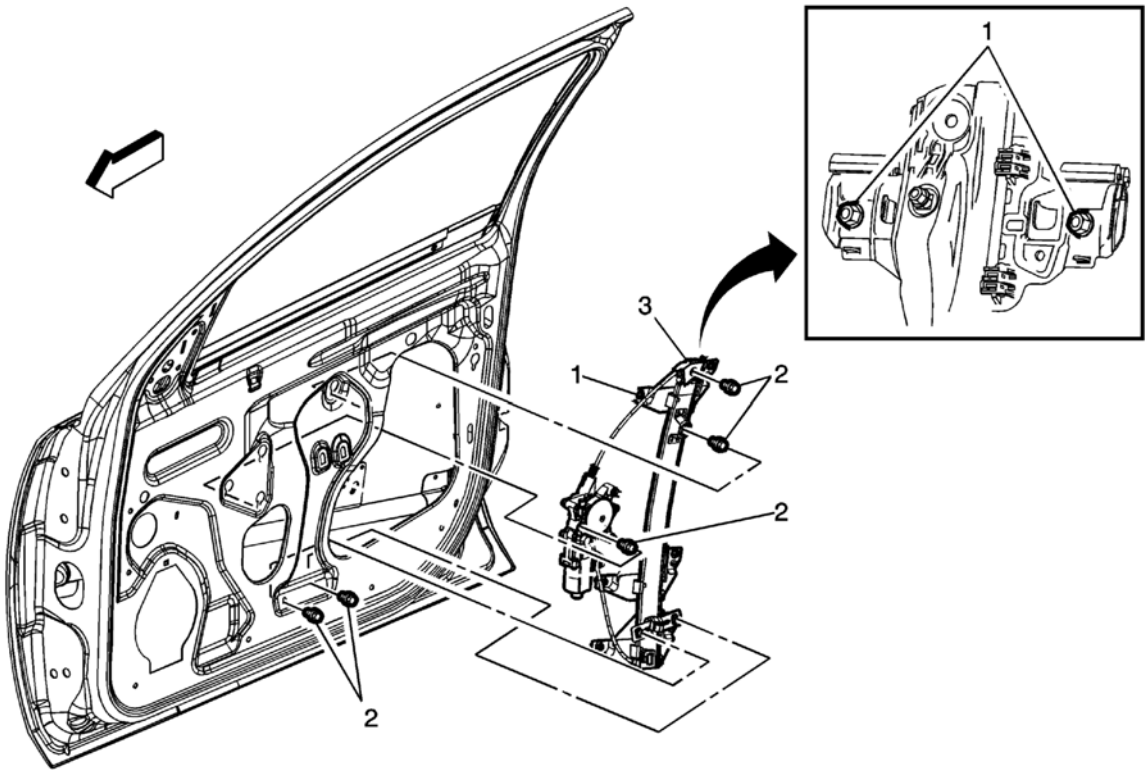

Fig. 18: Front Door Window Regulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door window from the regulator guide bolts. Do Not remove the window from the vehicle, raise the window to the fully up position, tape in place. Refer to **Front Side Door Window Replacement**.	
1	Front Side Door Window Regulator to Guide Bolts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Remove the front side door water deflector. 2. Disconnect the electrical connector from the window regulator motor. **Tighten** 5 N.m (44 lb in)
2	Front Side Door Window Regulator Screw (Qty: 5) **Tighten** 10 N.m (89 lb in)

Callout	Component Name
3	Front Side Door Window Regulator **Procedure** 1. Transfer parts as necessary. 2. Inspect the door window for proper operation before installing the door trim panel.

FRONT SIDE DOOR WINDOW REGULATOR MOTOR REPLACEMENT

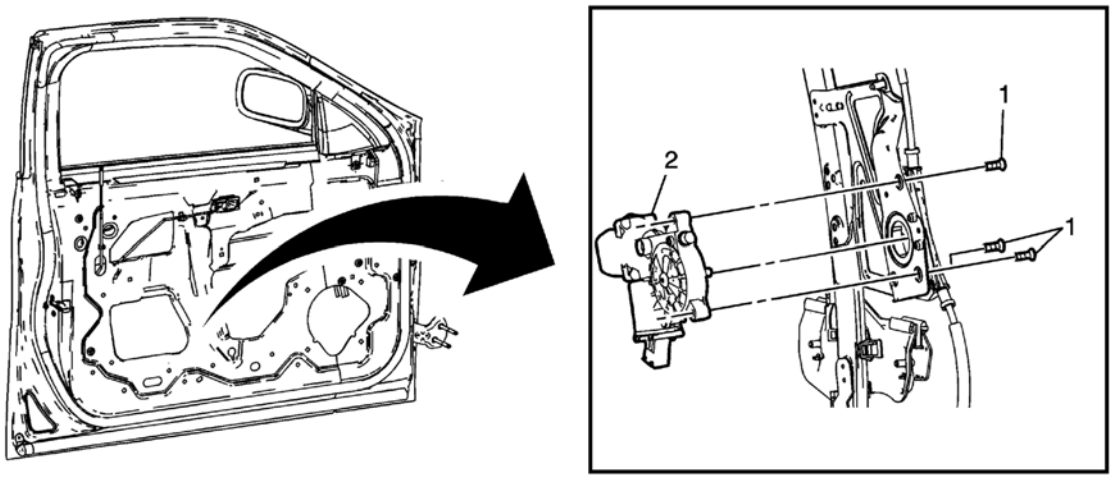

Fig. 19: Front Side Door Window Regulator Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door window regulator. Refer to **Front Side Door Window Regulator Replacement**.	
1	Front Side Door Window Regulator Motor Screw (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Remove the front side door water deflector. 2. Disconnect the electrical connector from the window regulator motor. **Tighten** 4.6 N.m (41 lb in)

Callout	Component Name
2	Front Side Door Window Regulator Motor **Procedure** Inspect the door window for proper operation before installing the door trim panel.

REAR SIDE DOOR WINDOW REGULATOR REPLACEMENT

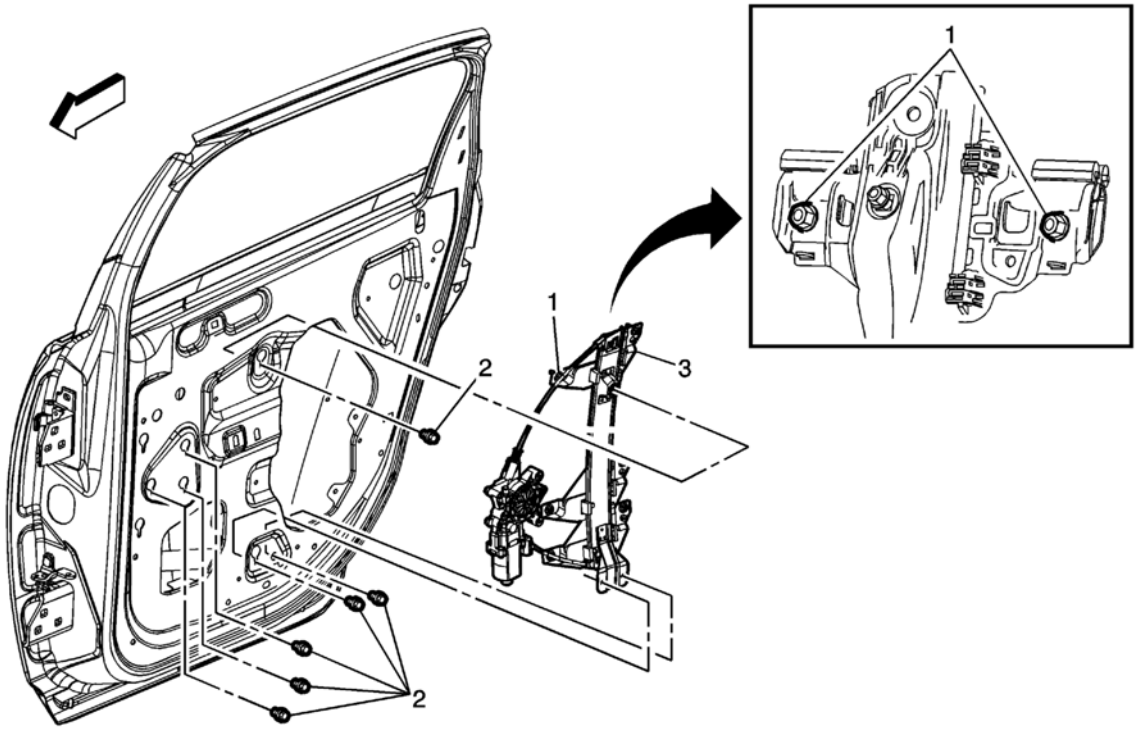

Fig. 20: Rear Door Window Regulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door window from the regulator guide bolts. Do Not remove the window from the vehicle, raise the window to the fully up position, tape in place. Refer to **Rear Side Door Window Replacement**.	
1	Rear Side Door Window Regulator to Guide Bolts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Remove the rear side door water deflector. 2. Disconnect the electrical connector from the window regulator motor.

Callout	Component Name
	Tighten 5 N.m (44 lb in)
2	Rear Side Door Window Regulator Bolt (Qty: 6) **Tighten** 10 N.m (89 lb in)
3	Rear Side Door Window Regulator

REAR SIDE DOOR WINDOW REGULATOR MOTOR REPLACEMENT

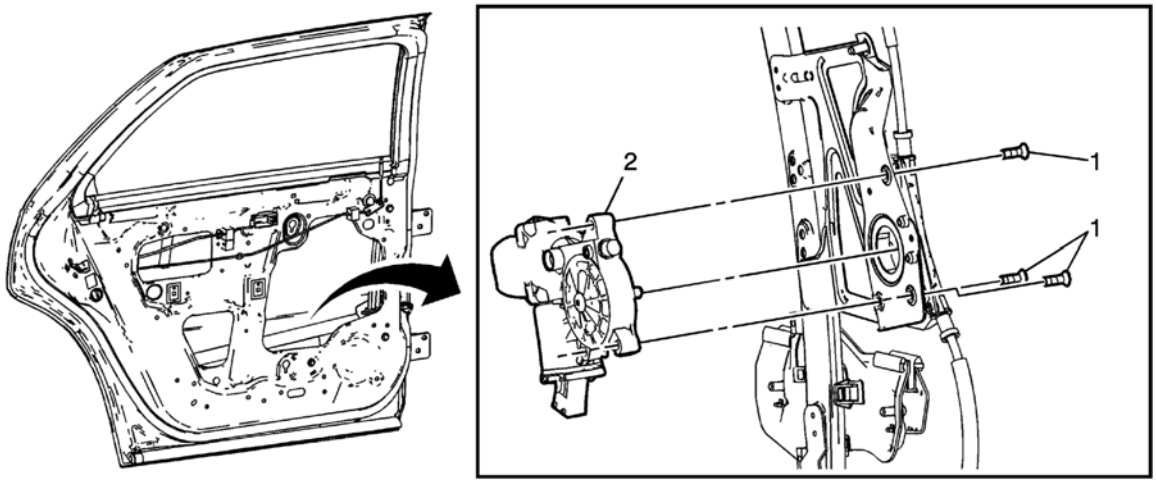

Fig. 21: Rear Door Window Regulator Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door window regulator. Do Not remove the window from the vehicle, raise the window to the fully up position, tape in place. Refer to **Rear Side Door Window Regulator Replacement**.	
1	Rear Side Door Window Regulator Motor Screw (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Remove the rear side door water deflector. 2. Disconnect the electrical connector from the window regulator motor. **Tighten**

Callout	Component Name
	4.6 N.m (41 lb in)
2	Rear Side Door Window Regulator Motor

FRONT SIDE DOOR WINDOW CHANNEL RETAINER REPLACEMENT (IMPALA)

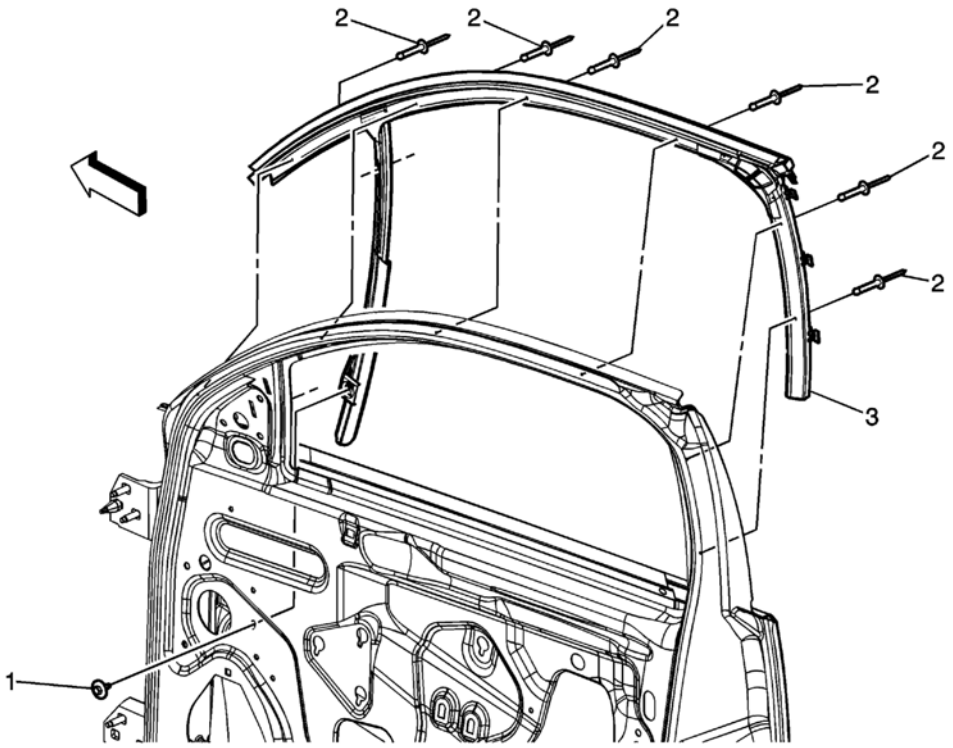

Fig. 22: Front Door Window Channel Retainer
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the interior trim panel. Refer to **Front Side Door Trim Panel Replacement** . 2. Remove the water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** . 3. Remove the inside sealing strip. Refer to **Front Side Door Window Belt Inner Sealing Strip Replacement**.	
1	Front Door Weatherstrip Seal Retainer Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)

Callout	Component Name
2	Front Door Weatherstrip Seal Retainer Rivets (Qty: 7) **TIP:** Drill out the rivets from around the upper door frame.
3	Front Door Weatherstrip Seal Retainer **TIP:** Pull the weatherstrip retainer upward, slightly twisting weatherstrip retainer to clear the outer sealing strip.

REAR SIDE DOOR WINDOW CHANNEL RETAINER REPLACEMENT

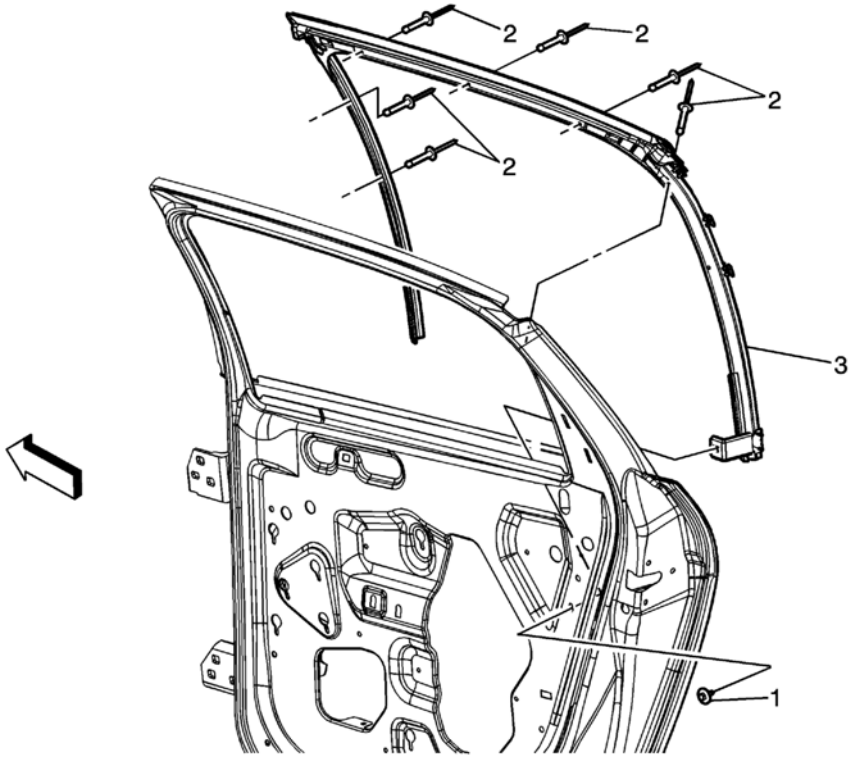

Fig. 23: Rear Door Window Channel Retainer
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the interior trim panel. Refer to **Rear Side Door Trim Panel Replacement** . 2. Remove the water deflector. Refer to **Rear Side Door Water Deflector Replacement** . 3. Remove the inside sealing strip. Refer to **Rear Side Door Window Inner Sealing Strip Replacement**.	
1	Rear Door Weatherstrip Seal Retainer Bolt **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Tighten 10 N.m (89 lb in)
2	Rear Door Weatherstrip Seal Retainer Rivets (Qty: 6) **TIP:** Drill out the rivets from around the upper door frame.
3	Rear Door Weatherstrip Seal Retainer **TIP:** Pull the weatherstrip retainer upward, slightly twisting weatherstrip retainer to clear the outer sealing strip.

FRONT SIDE DOOR WINDOW BELT OUTER SEALING STRIP REPLACEMENT (IMPALA)

Removal Procedure

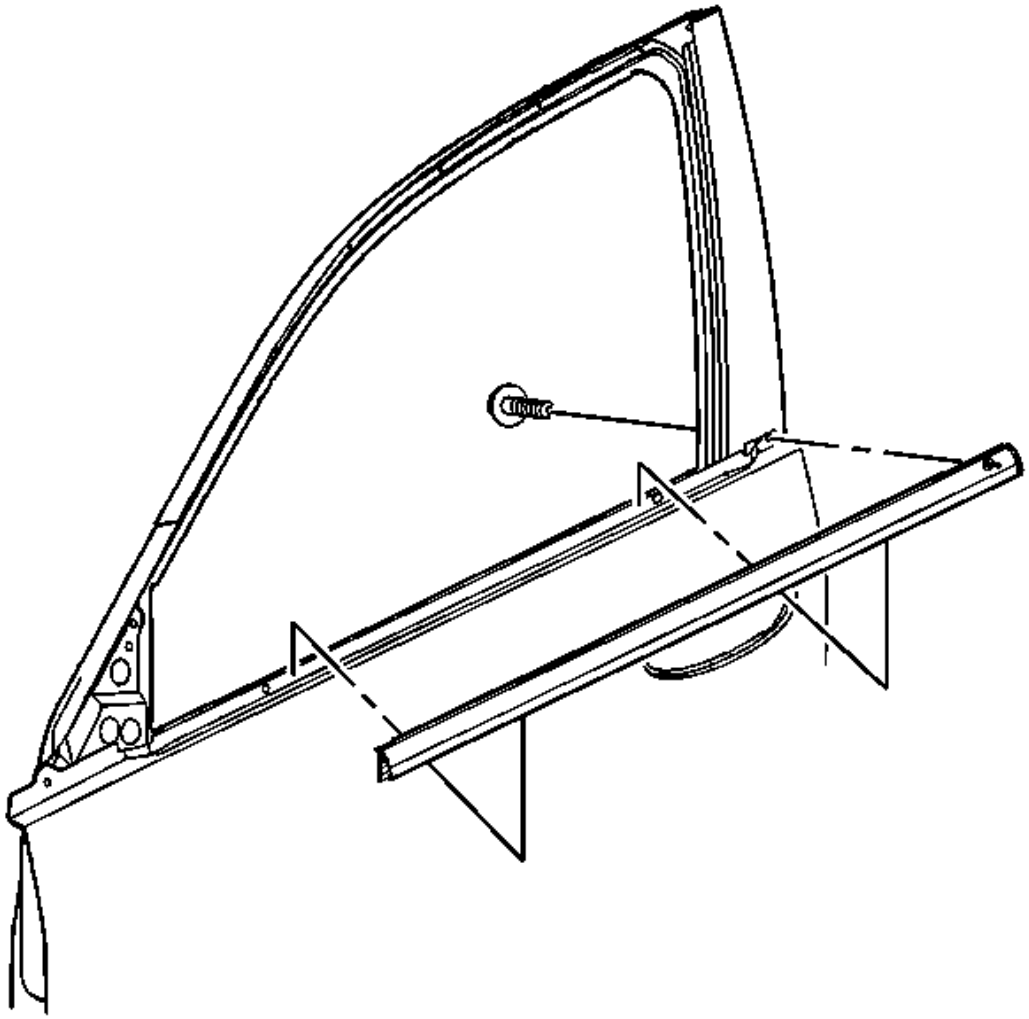

Fig. 24: Front Door Sealing Strip (Impala)
Courtesy of GENERAL MOTORS COMPANY

1. Remove the outside rearview mirror. Refer to **Power Mirror Replacement** .

2. Remove the rear screw from the front door outer belt sealing strip.
3. Remove the front door outer belt sealing strip.

Installation Procedure

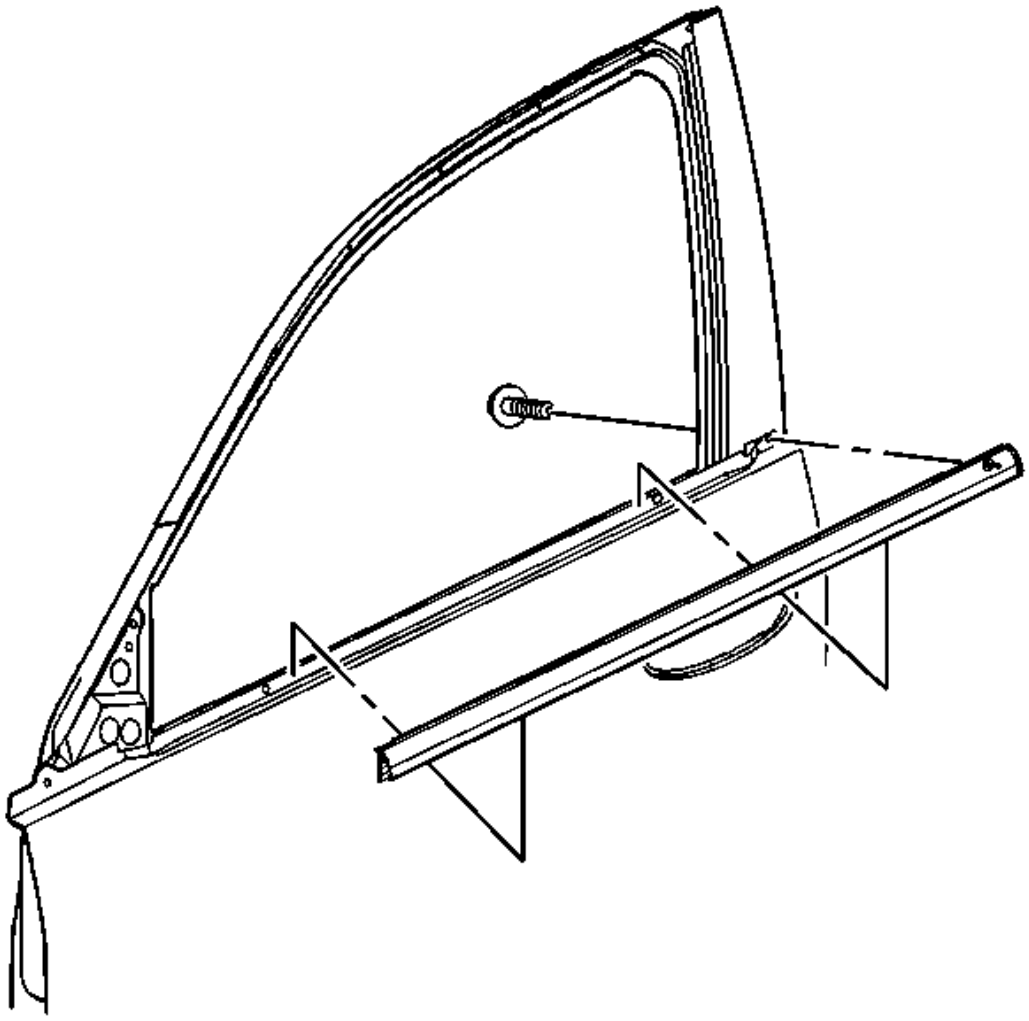

Fig. 25: Front Door Sealing Strip (Impala)
Courtesy of GENERAL MOTORS COMPANY

1. Position the front door outer belt sealing strip to the front door pinch-weld flange.
2. Install the front door outer belt sealing strip to the front door pinch-weld flange pressing into place until fully seated.

CAUTION: Refer to Fastener Caution .

3. Install the screw to the rear of the front door outer belt sealing strip.

Tighten

Tighten the outer belt sealing strip screw to 2 N.m (18 lb in).

4. Install the outside rearview mirror. Refer to **Power Mirror Replacement** .

FRONT SIDE DOOR WINDOW BELT INNER SEALING STRIP REPLACEMENT

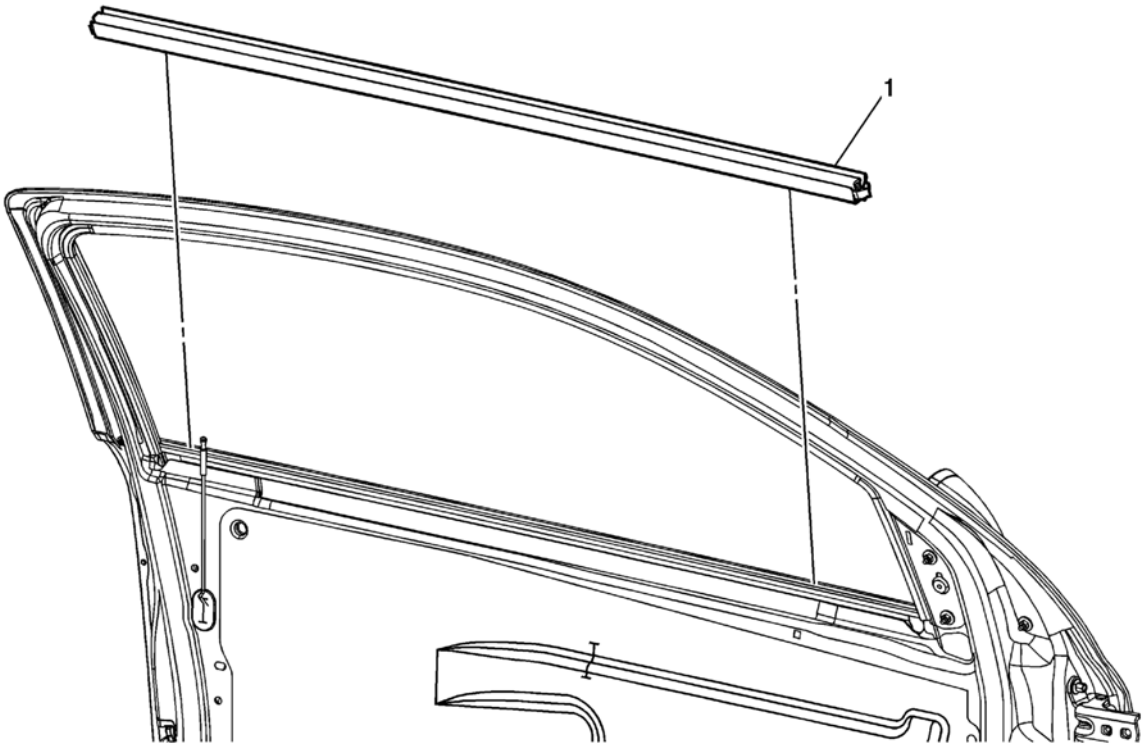

Fig. 26: Identifying Front Door Window Belt Inner Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** Remove the interior trim panel. Refer to **Front Side Door Trim Panel Replacement** .	
1	Sealing Strip, Front Side Door Window Inner **TIP:** Pull up and away from inner panel to remove from the door.

REAR SIDE DOOR WINDOW INNER SEALING STRIP REPLACEMENT

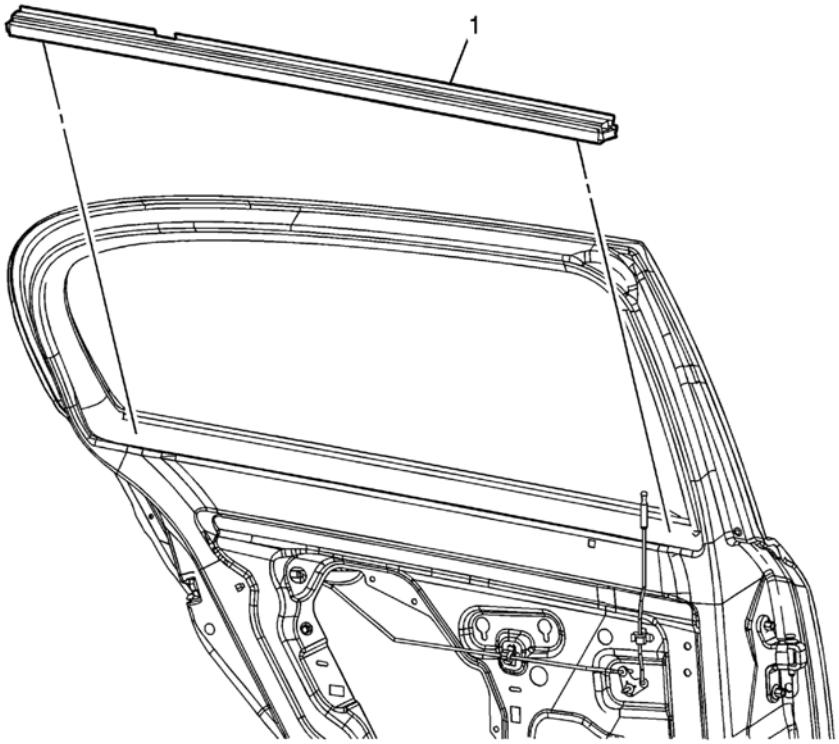

Fig. 27: View Of Rear Door Window Belt Inner Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** Remove the interior trim panel. Refer to **Rear Side Door Trim Panel Replacement** .	
1	Sealing Strip, Front Side Door Window Inner **TIP:** Pull up and away from inner panel to remove from the door.

REAR SIDE DOOR WINDOW OUTER SEALING STRIP REPLACEMENT

Removal Procedure

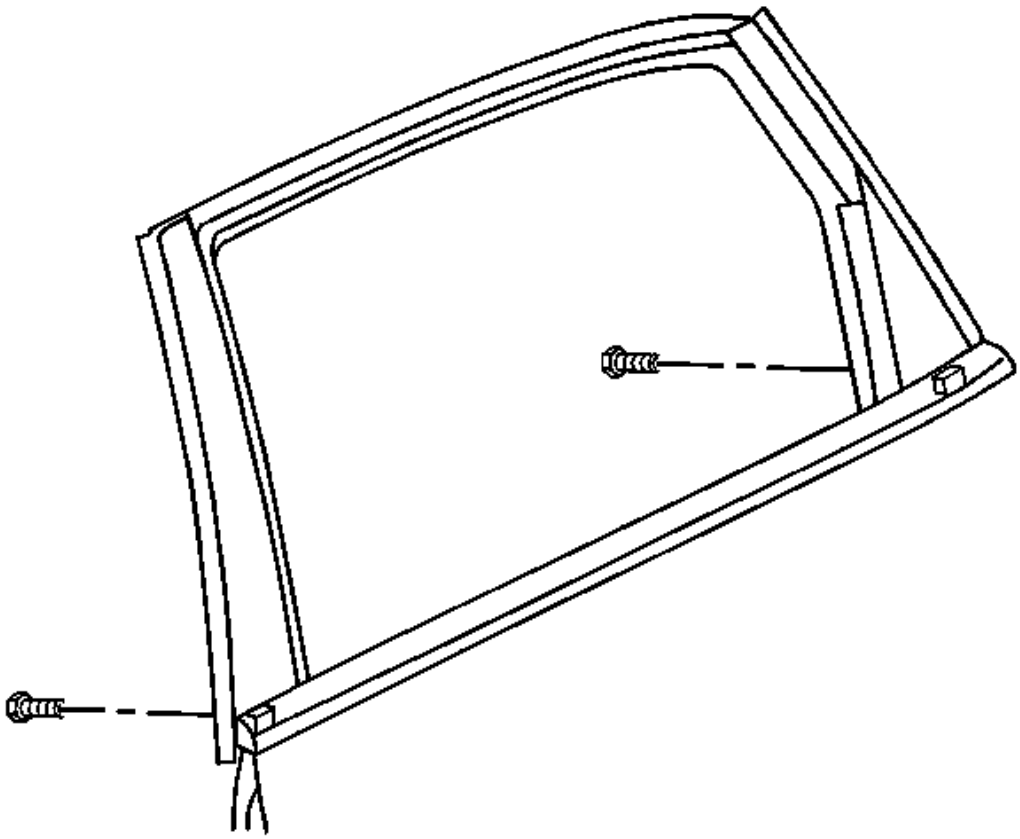

Fig. 28: Rear Door Sealing Strip Screws
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear window all the way down.

NOTE: **Pull rearward on the rear door frame applique to release clips from the door frame.**

2. Remove the rear door inner door frame applique to access the rear screws.

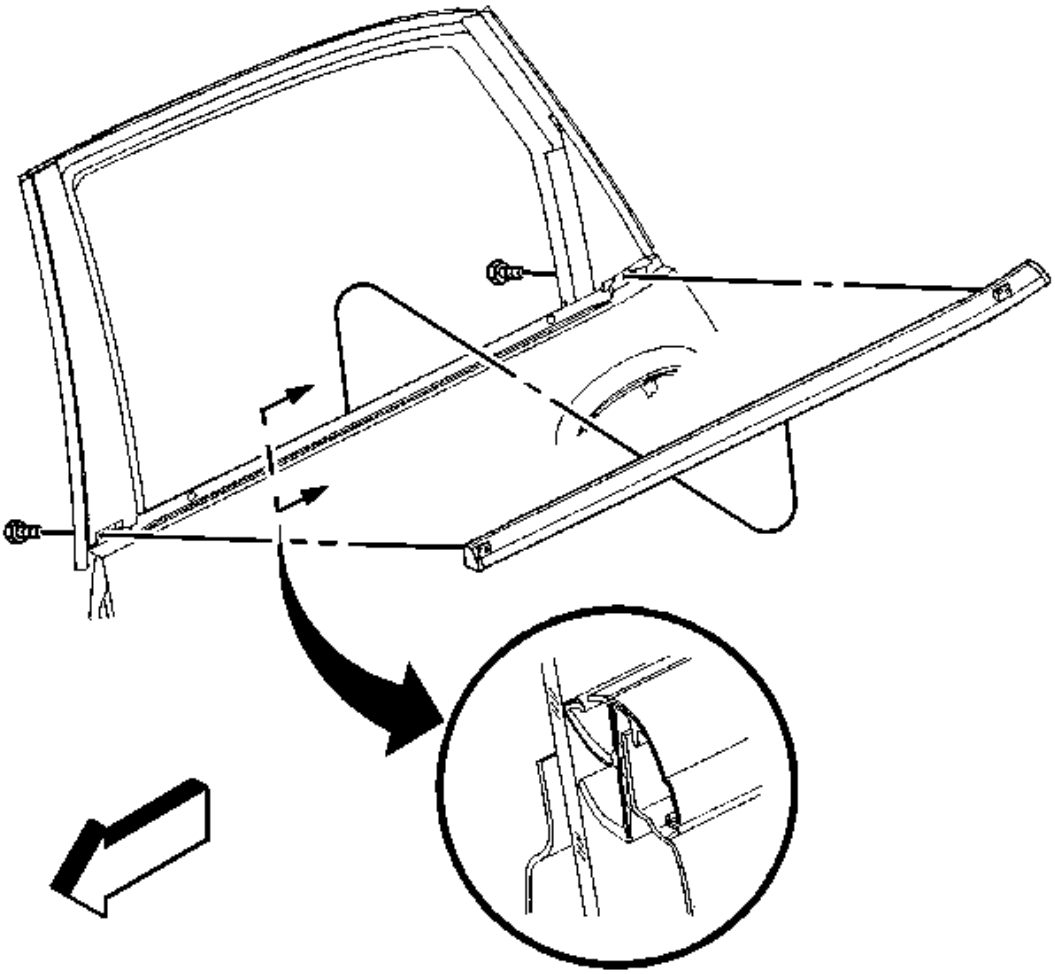

Fig. 29: Rear Door Window Outer Belt Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

3. Remove the rear door outer belt sealing strip screws.

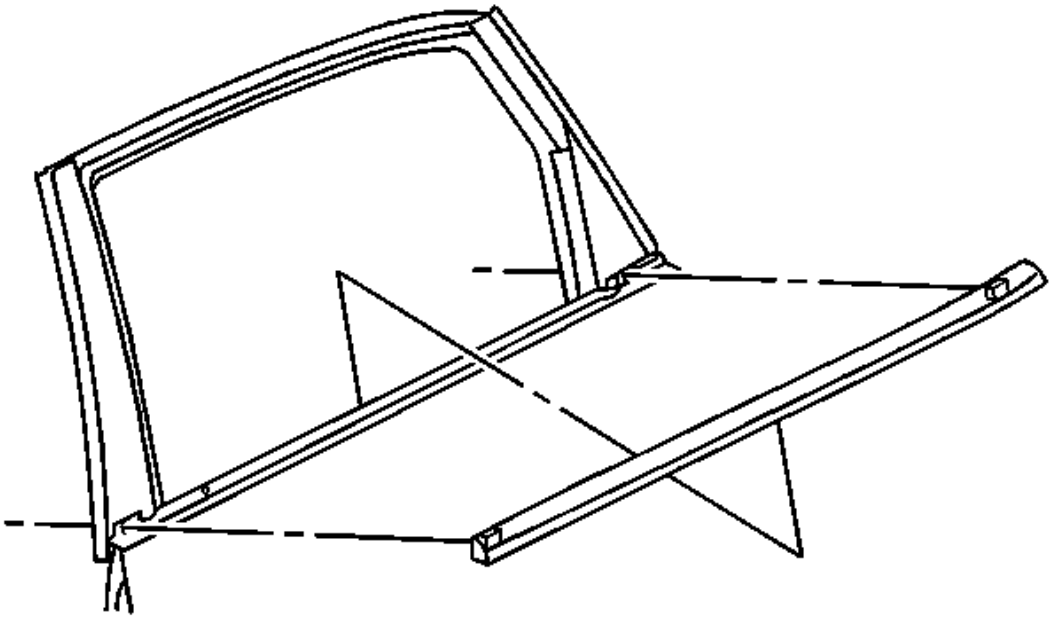

Fig. 30: Rear Door Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

4. Remove the rear window outer belt sealing strip by pulling the sealing strip from the rear door pinch-weld flange.

Installation Procedure

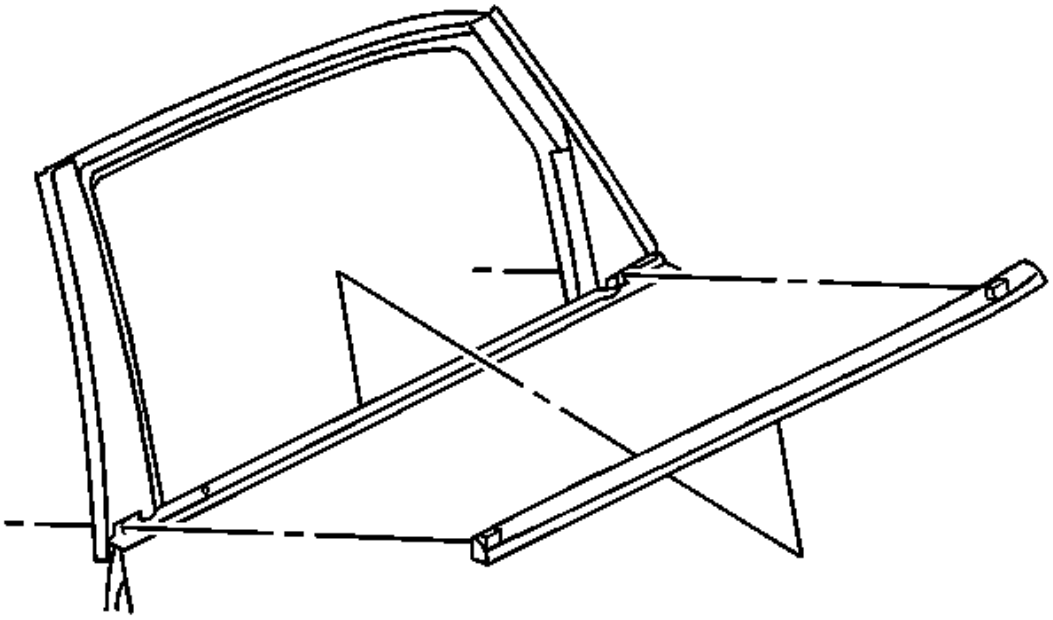

Fig. 31: Rear Door Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear door outer belt sealing strip to the rear door pinch-weld flange.

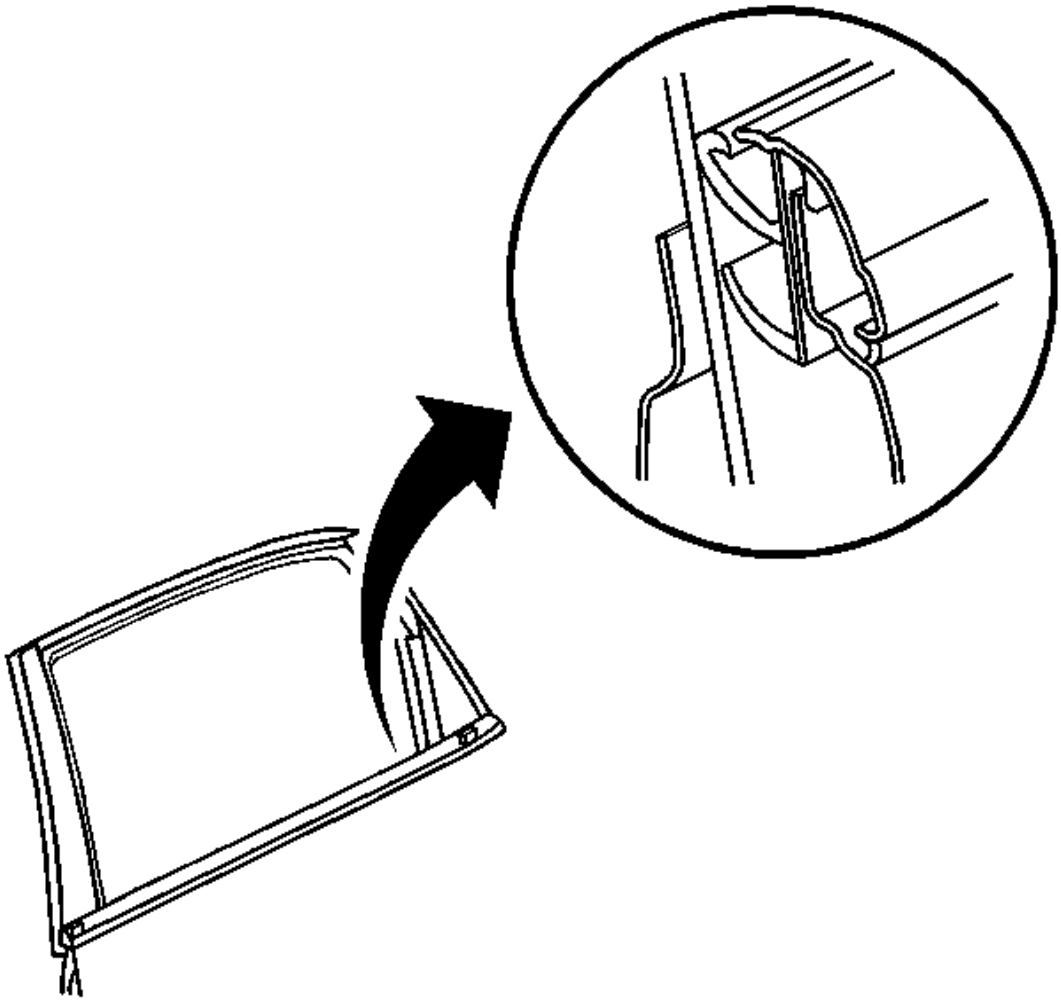

Fig. 32: Rear Door Pinch-Weld Flange
Courtesy of GENERAL MOTORS COMPANY

2. Install the rear door outer belt sealing strip to the pinch-weld flange, pressing into place until full seated.

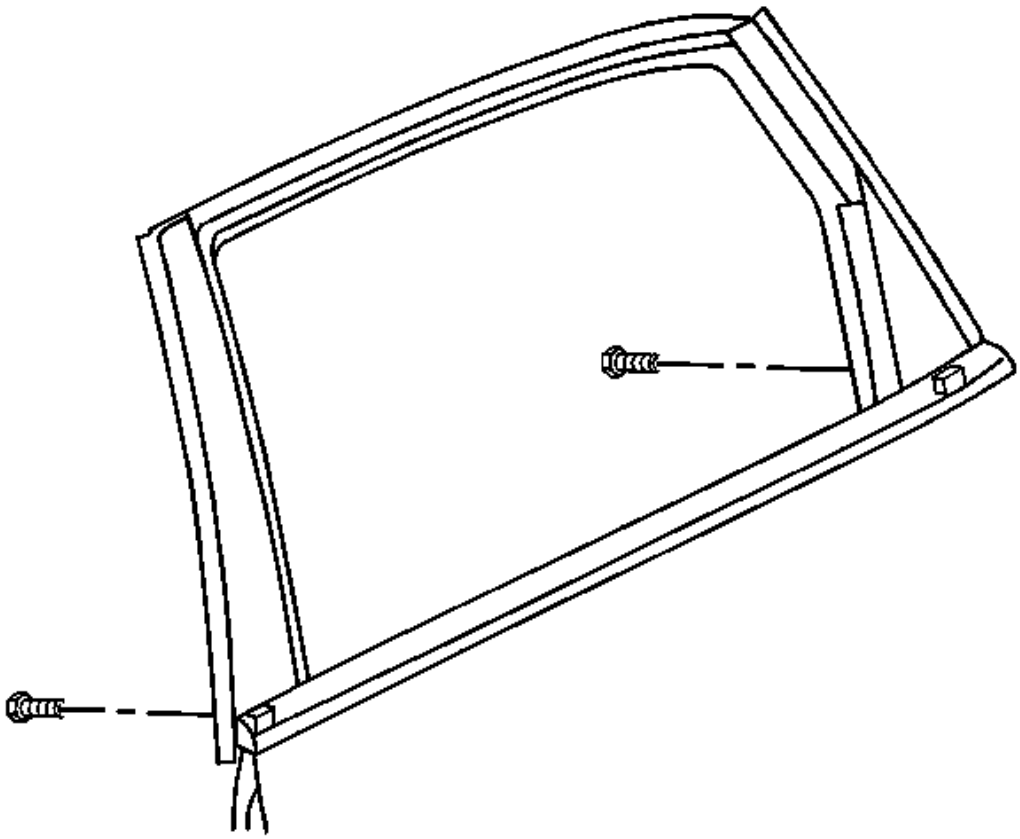

Fig. 33: Rear Door Sealing Strip Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the rear door outer belt sealing strip screws.

   Tighten

   Tighten the rear door outer belt sealing strip screws to 2 N.m (18 lb in).

4. Install the rear door frame applique, align the clips to the door frame and push in place.

FRONT SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

Removal Procedure

1. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .
2. Remove the front door water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** .
3. Remove the front door outer belt sealing strip. Refer to **Front Side Door Window Belt Outer Sealing**

Strip Replacement (Impala).

4. Remove the front door window. Refer to **Front Side Door Window Replacement**.

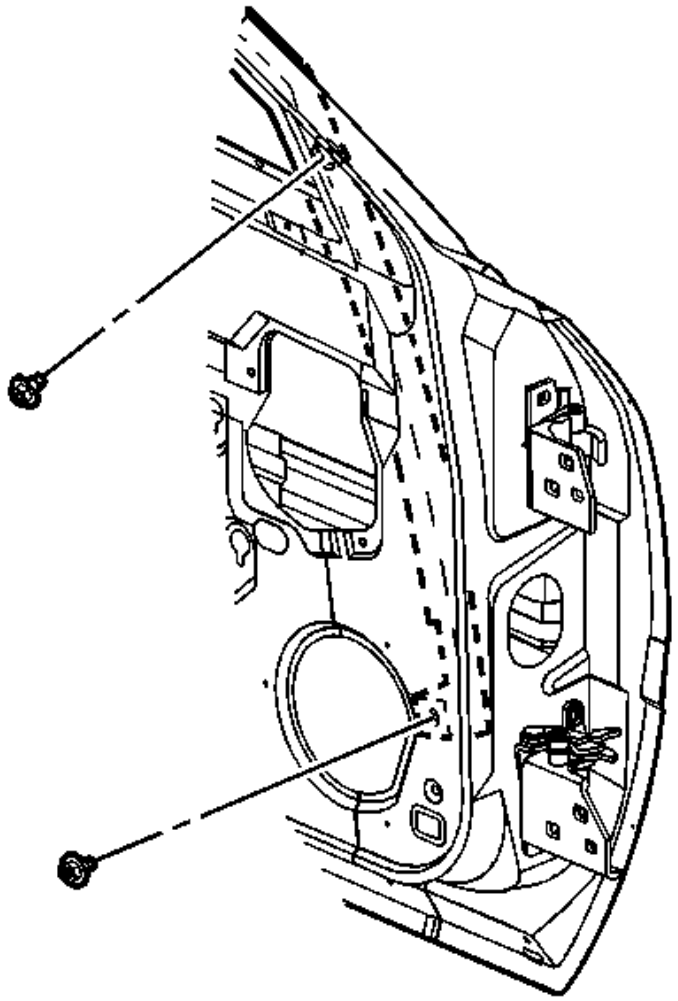

Fig. 34: Front Door Window Channel Screws (Impala)
Courtesy of GENERAL MOTORS COMPANY

5. Remove the screws from the front door window channel.

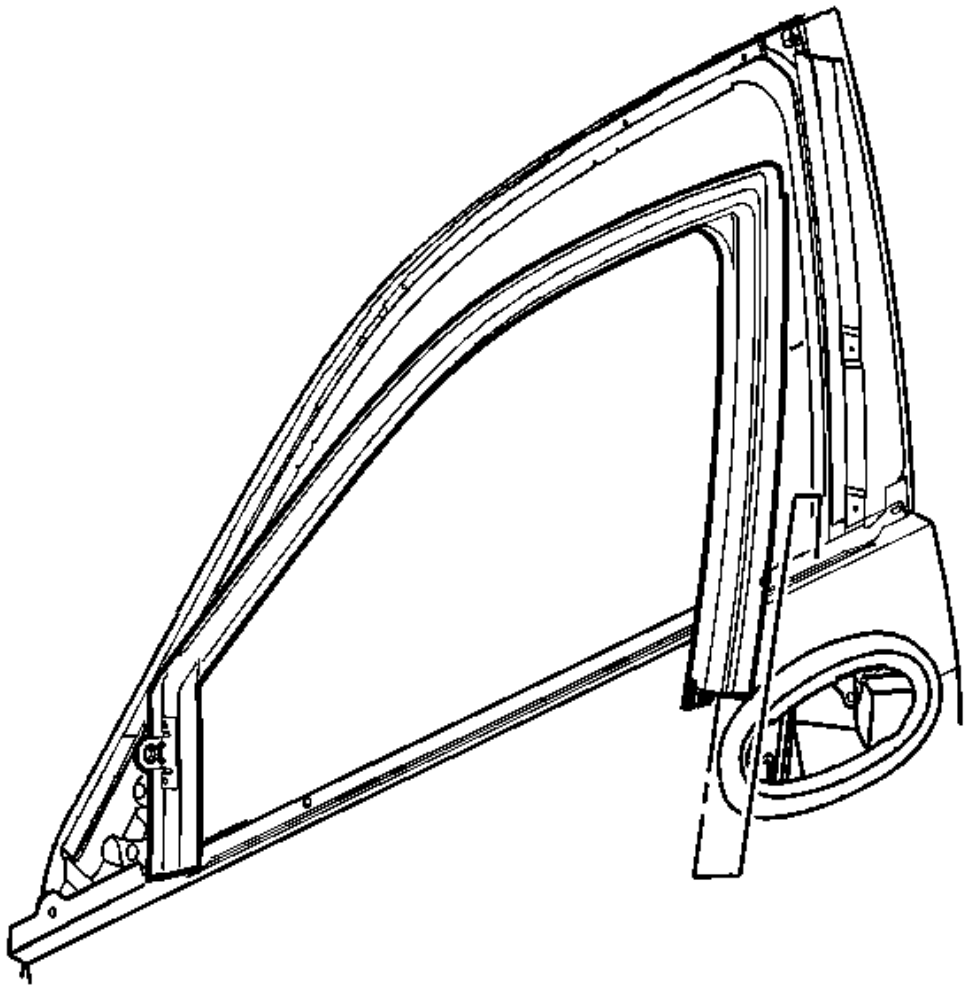

Fig. 35: Front Door Window Channel And Front Door Frame (Impala)
Courtesy of GENERAL MOTORS COMPANY

6. Remove the front door window channel from the front door frame.

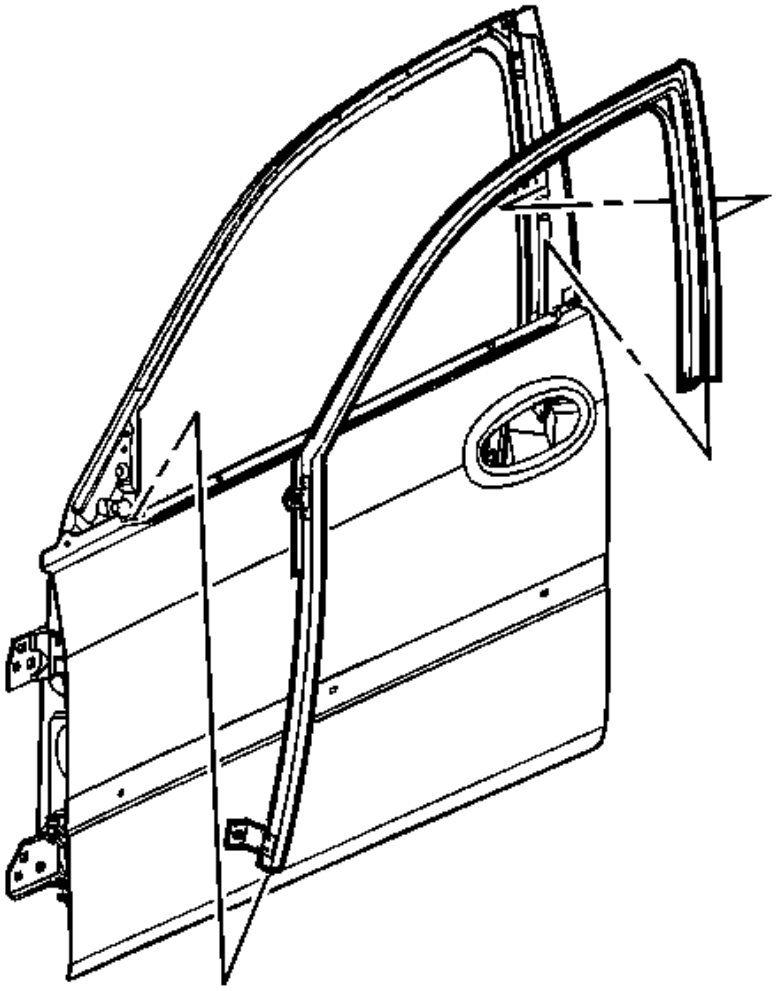

Fig. 36: Front Door Window Channel (Impala)
Courtesy of GENERAL MOTORS COMPANY

7. Remove the front door window channel from the front door.

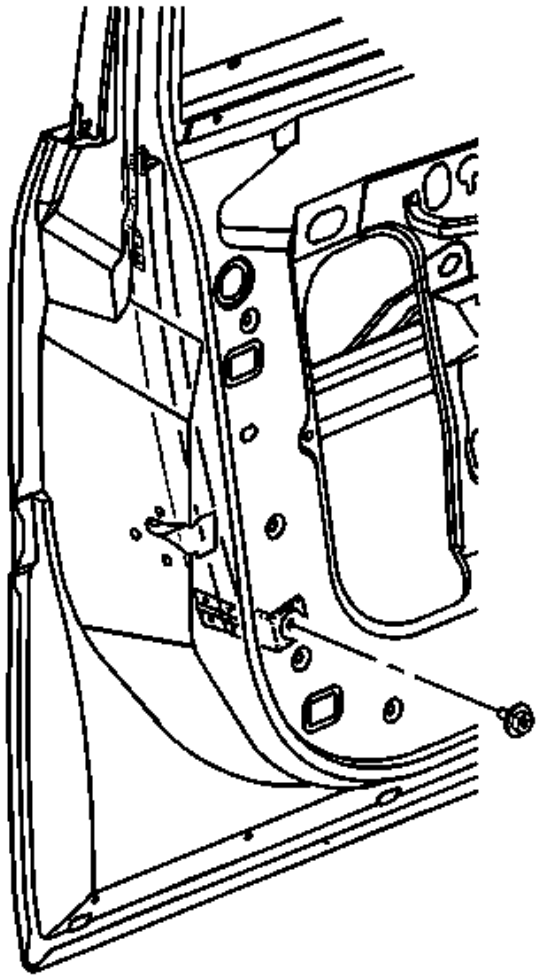

Fig. 37: Front Door Rear Window Channel Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Remove the screw from the front door rear window channel.

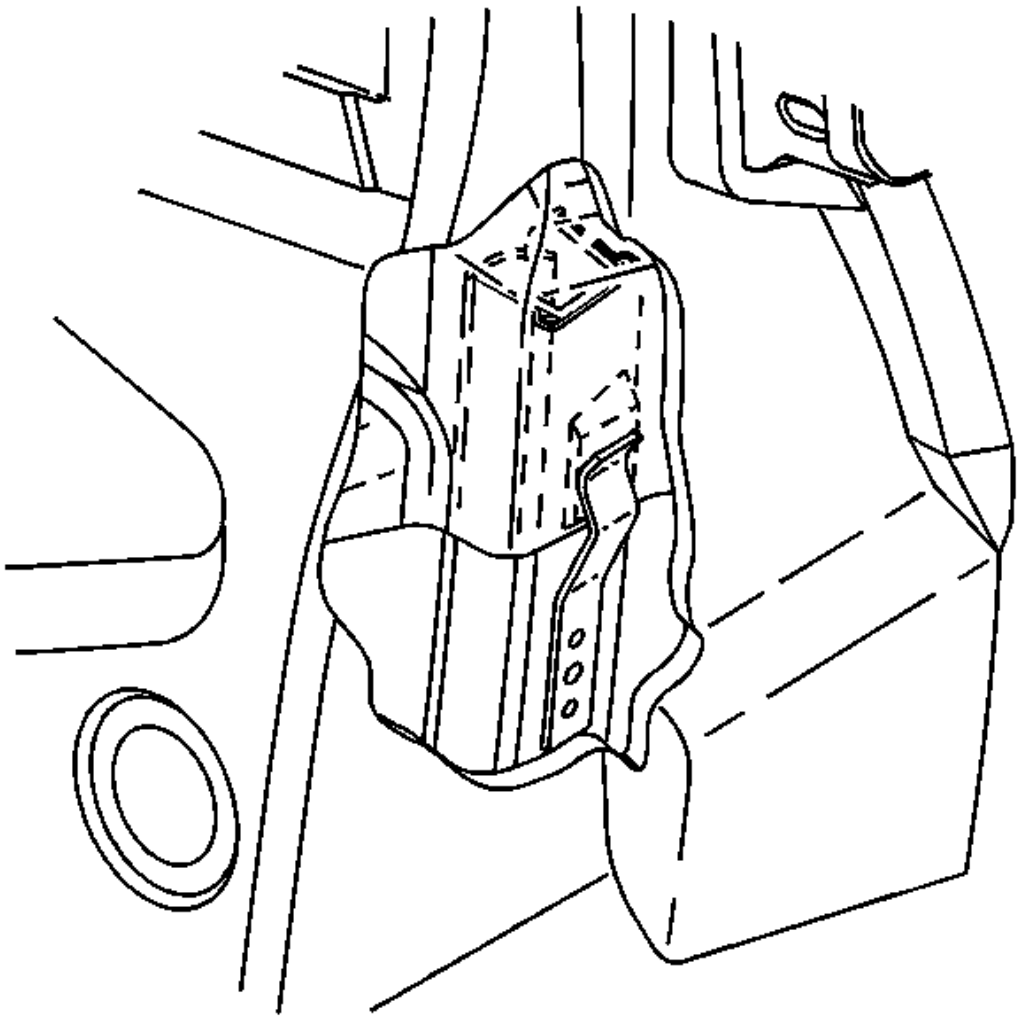

Fig. 38: Front Door Rear Window Channel
Courtesy of GENERAL MOTORS COMPANY

9. Remove the front door rear window channel from the front door slot by pulling down to disengage the retainer clip.

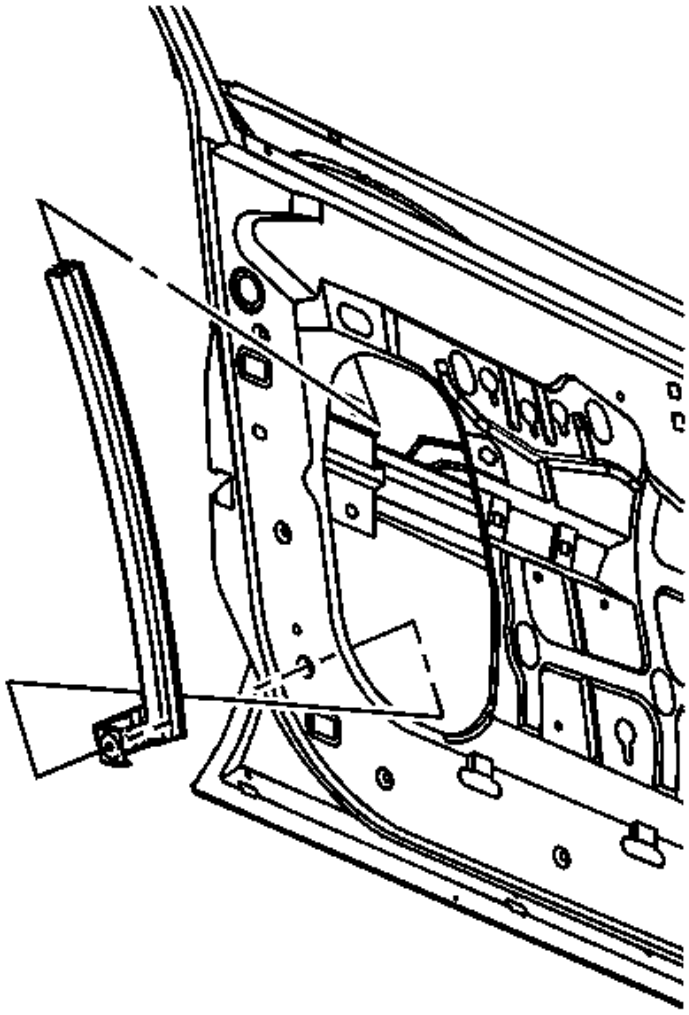

Fig. 39: Front Door Rear Window Channel (Impala)
Courtesy of GENERAL MOTORS COMPANY

10. Remove the front door rear window channel from the front door through the access hole in the inner front door panel.

Installation Procedure

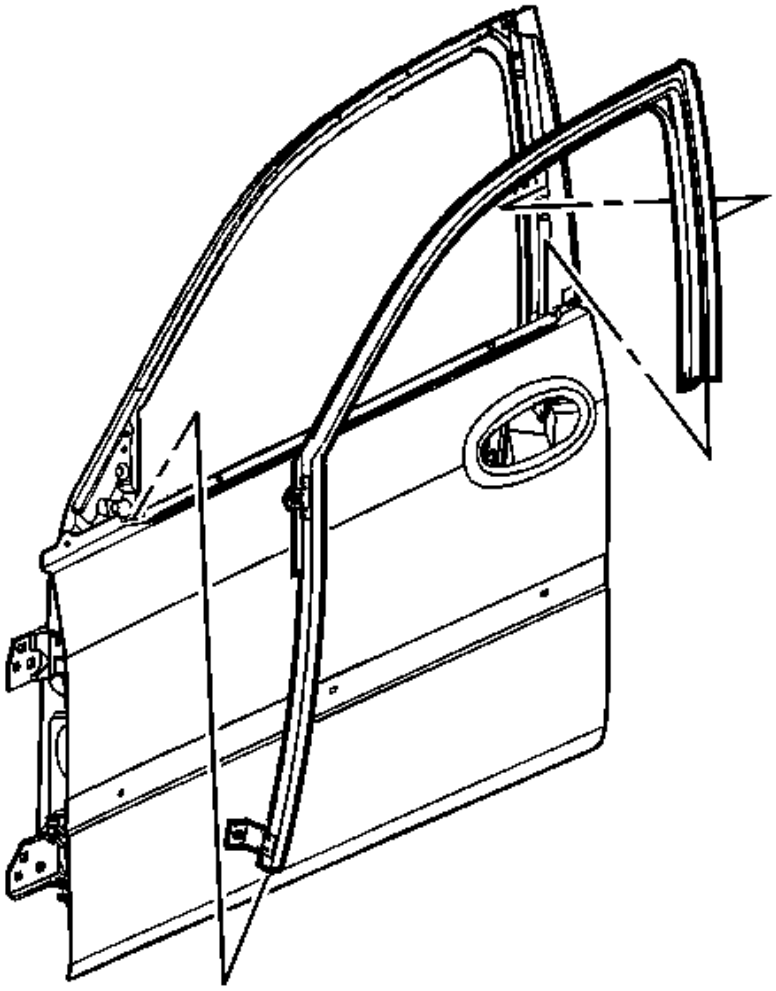

Fig. 40: Front Door Window Channel (Impala)
Courtesy of GENERAL MOTORS COMPANY

1. Position the front door window channel front channel into the front door.

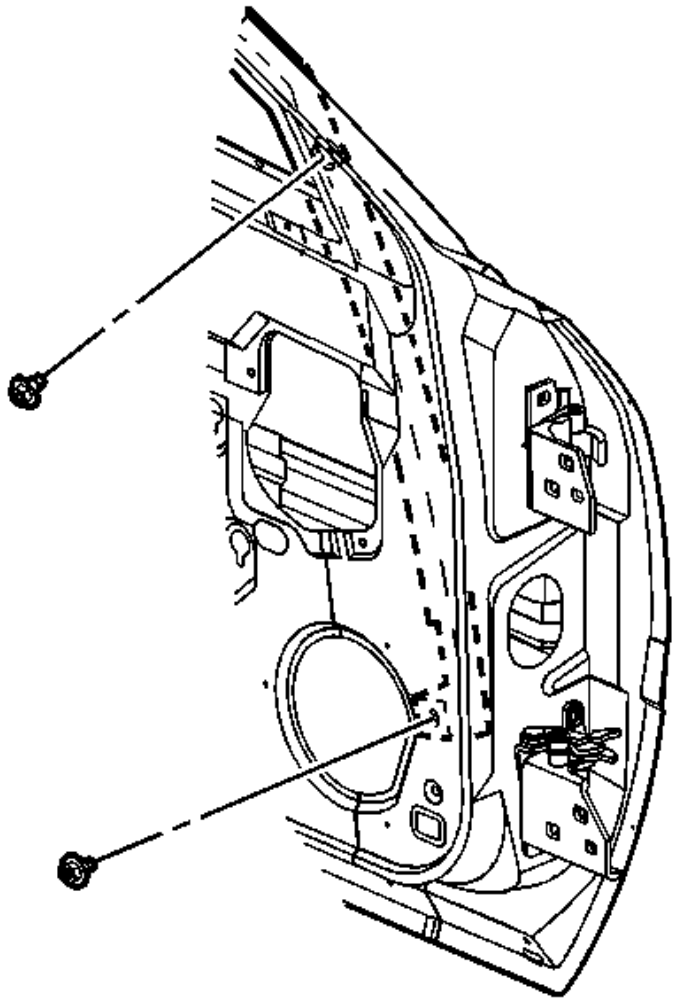

Fig. 41: Front Door Window Channel Screws (Impala)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the front door window channel screws.

Tighten

Tighten the front door window channel screws to 10 N.m (89 lb in).

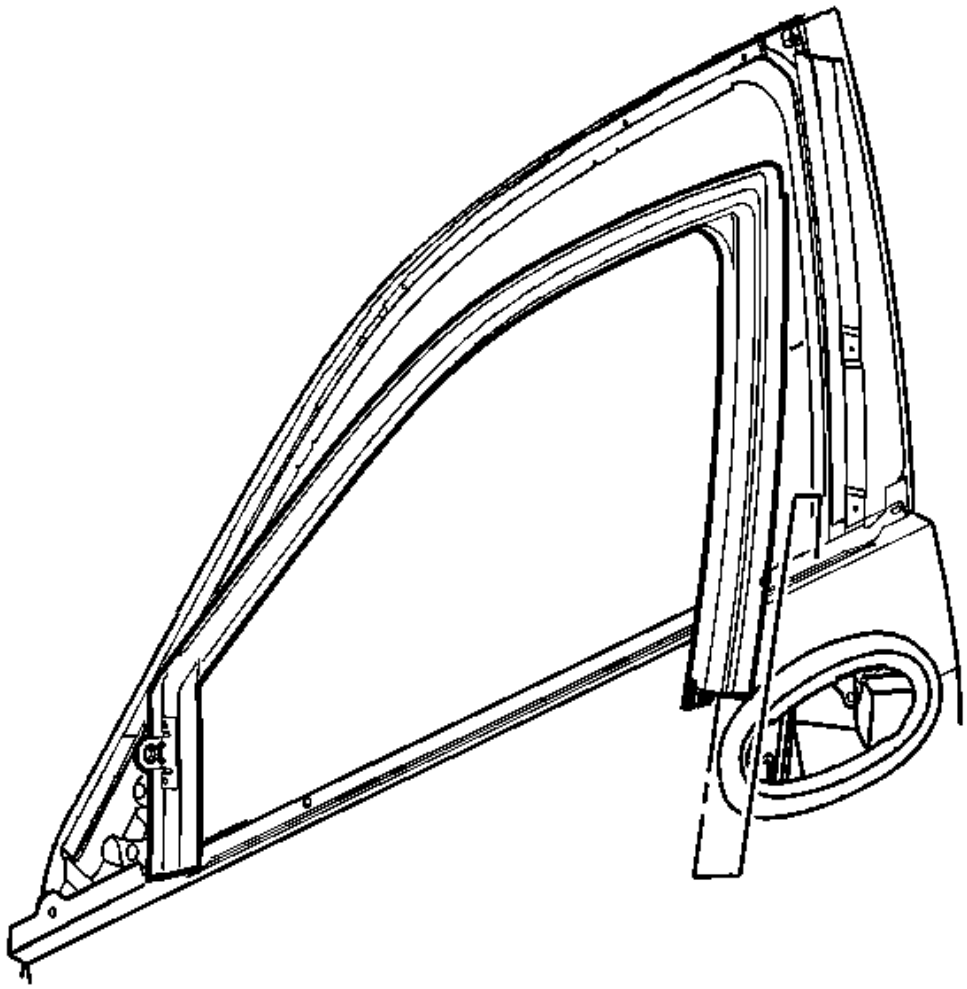

Fig. 42: Front Door Window Channel From Front Door Frame (Impala)
Courtesy of GENERAL MOTORS COMPANY

3. Install the front door window channel to the front door starting in the top corner working out in both directions.

   Firmly seat the front door window channel to the front door.

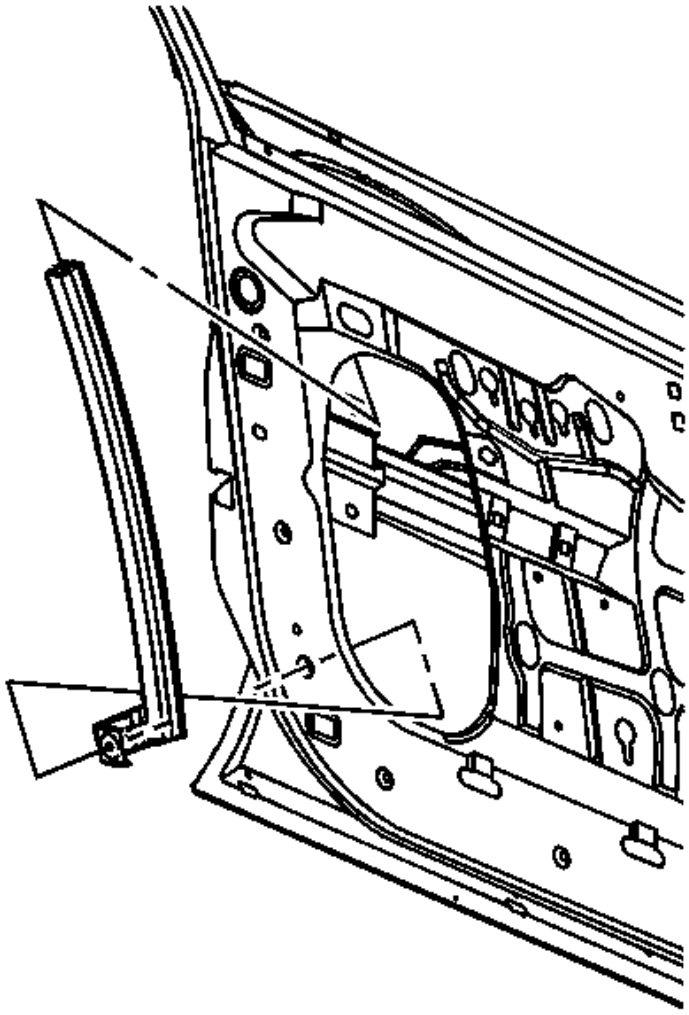

Fig. 43: Front Door Rear Window Channel (Impala)
Courtesy of GENERAL MOTORS COMPANY

4. Install the front door rear window channel to the front door through the access hole in the inner front door panel.

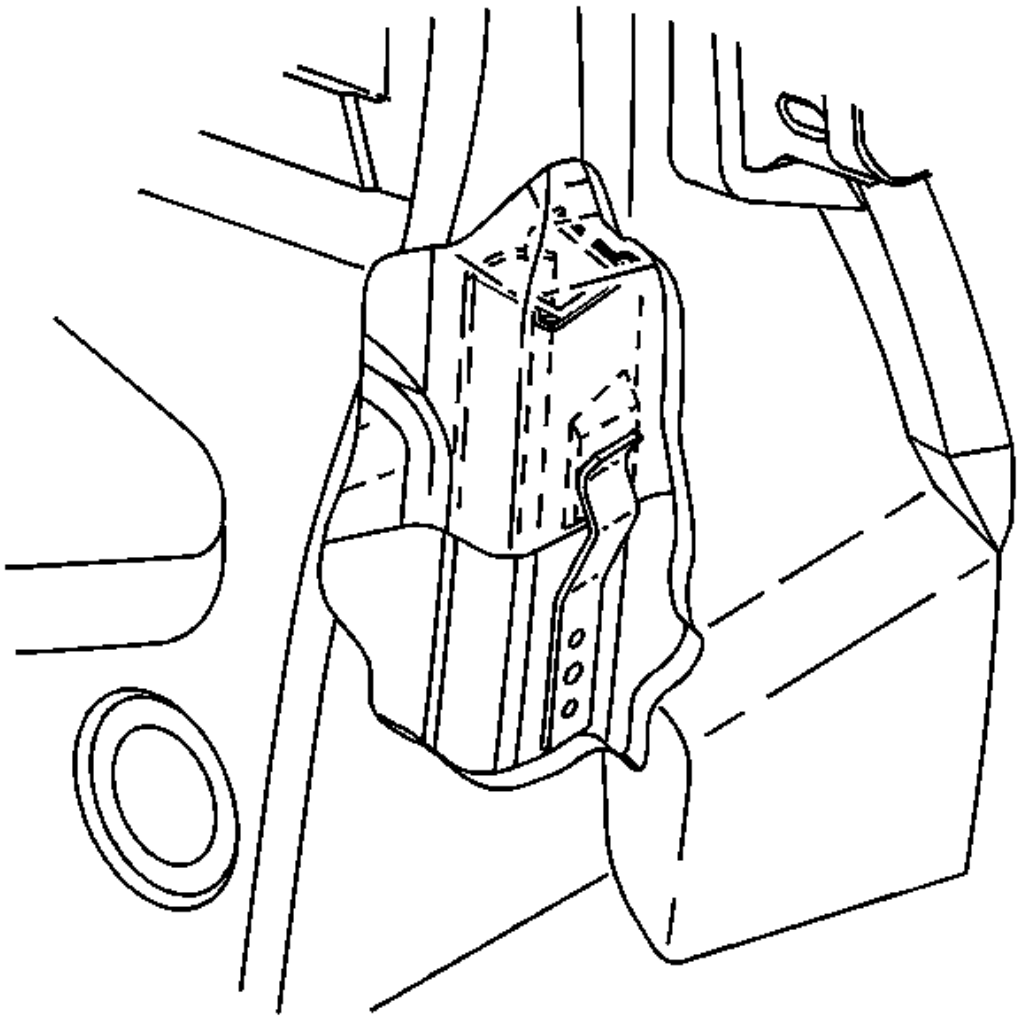

Fig. 44: Front Door Rear Window Channel
Courtesy of GENERAL MOTORS COMPANY

5. Install the front door rear window channel to the front door slot by pushing up to engage the retainer clip.

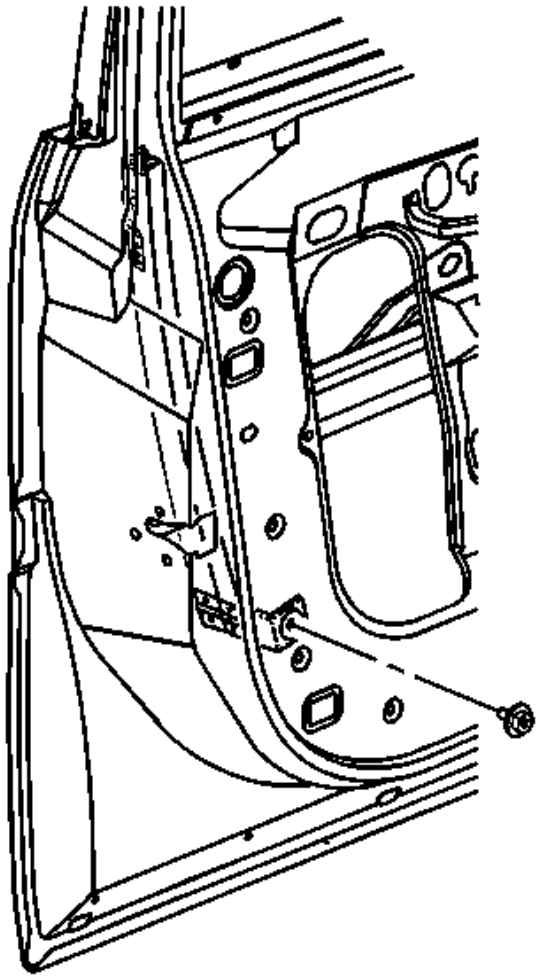

Fig. 45: Front Door Rear Window Channel Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Install the screw to the front door rear window channel.

   Tighten

   Tighten the front door weatherstrip channel screws to 10 N.m (89 lb in).

7. Install the front door window. Refer to **Front Side Door Window Replacement**.
8. Inspect the front door window for proper operation.
9. Install the front door outer belt sealing strip. Refer to **Front Side Door Window Belt Outer Sealing Strip Replacement (Impala)**.
10. Install the front door water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** .
11. Install the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .

REAR SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

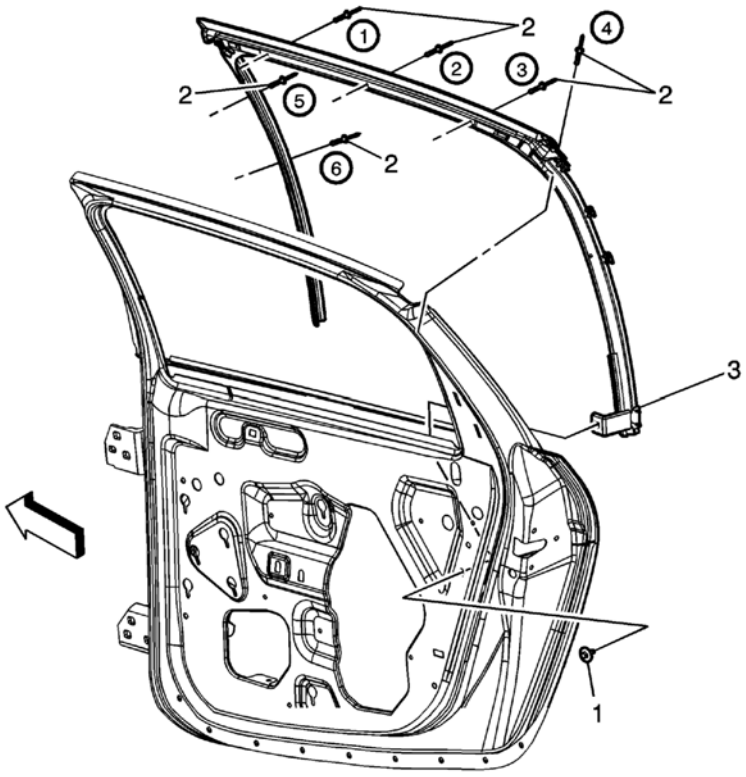

Fig. 46: Rear Side Door Window Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** . 2. Remove the rear door inner belt sealing strip. Refer to **Rear Side Door Window Inner Sealing Strip Replacement**. 3. Remove the rear door outer belt sealing strip. Refer to **Rear Side Door Window Outer Sealing Strip Replacement**.	
1	Rear Side Door Window Weatherstrip Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Apply masking tape to the door frame and applique. 2. Remove the rear door water deflector. 3. Position the window to the full down position.

Callout	Component Name
	Tighten 10 N.m (89 lb in)
2	Rear Side Door Window Weatherstrip Rivet (Qty: 6) **Procedure** 1. Remove the window weatherstrip by grasping the center and pulling downward to expose the rivets. 2. Drill out the 4 mm (5/32 in) rivets (1) along the inside edge of the rear side door window weatherstrip (3) retainer.
3	Rear Side Door Window Weatherstrip **Procedure** 1. Removing the weatherstrip starting at the rear lower end, pull the inner window weatherstrip away from the door frame. 2. Install the weatherstrip at the upper, rear corner, install the inner window weatherstrip to the door pinchweld flange. 3. Install the window channel weatherstrip by working it around the door frame. Ensure that the weatherstrip is fully seated into the window channel retainer. 4. Inspect the window for proper operation.

ADHESIVE INSTALLATION OF STATIONARY WINDOWS

1. Use a urethane adhesive systems which meet GM Specification GM 3651G

   WARNING: Refer to Glass and Sheet Metal Handling Warning .

2. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
3. If the original window is being reused, remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinch-weld flange surface by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
   - High weld
   - Solder spots on the pinch-weld
   - Hardened sealer
   - Any other obstruction or irregularity in the pinch-weld flange

   NOTE: If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15Â®,

DuPont 2610Â®, Sherwin-Williams PSE 4600 and NP70Â® and Martin-Semour 5120 and 5130Â® PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.

5. After repairing the opening as indicated, perform the following steps:
    1. Remove all traces of broken window from the outer cowl panel, seats, floor and defroster ducts.
    2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint-free cloth.

WARNING: Refer to Window Retention Warning .

6. Verify all primers and urethane adhesive are within expiration dates.

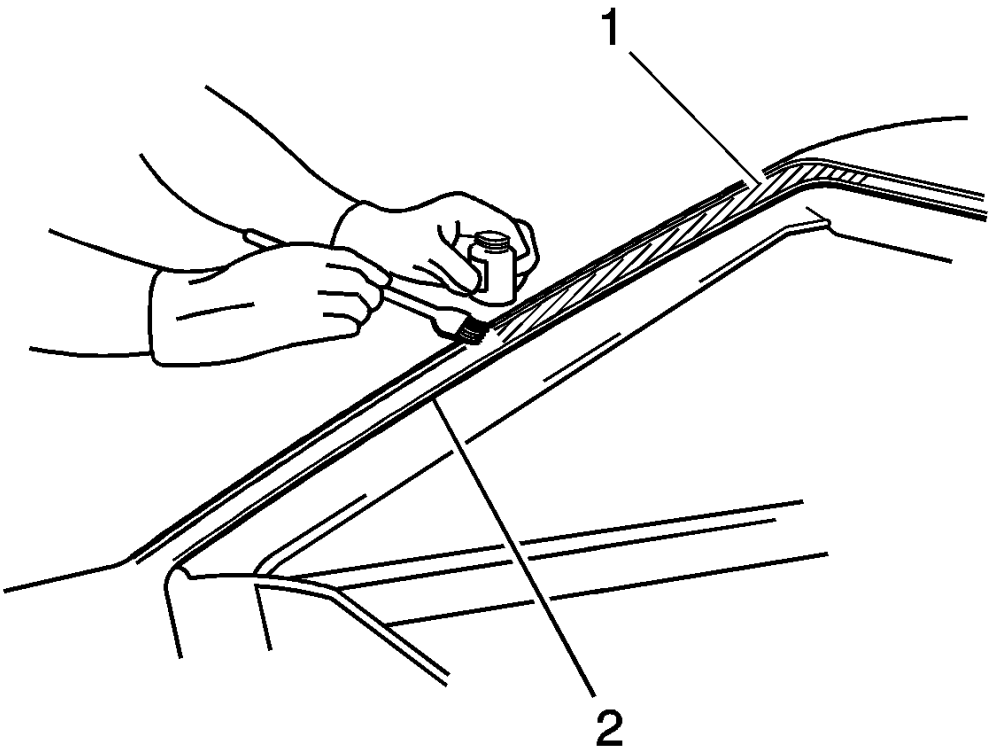

Fig. 47: Applying Pinch-Weld Primer
Courtesy of GENERAL MOTORS COMPANY

WARNING: Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from

the vehicle resulting in personal injury.

WARNING: **Refer to Window Retention Warning .**

NOTE: **Do not apply the black #3 primer to the existing bead (1) of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.**

7. Shake the pinch-weld primer black #3 for at least 1 minute.
8. Use a new dauber in order to apply the primer to the surface of the pinch-weld flange (2).
9. Allow the pinch-weld primer to dry for approximately 10 minutes.

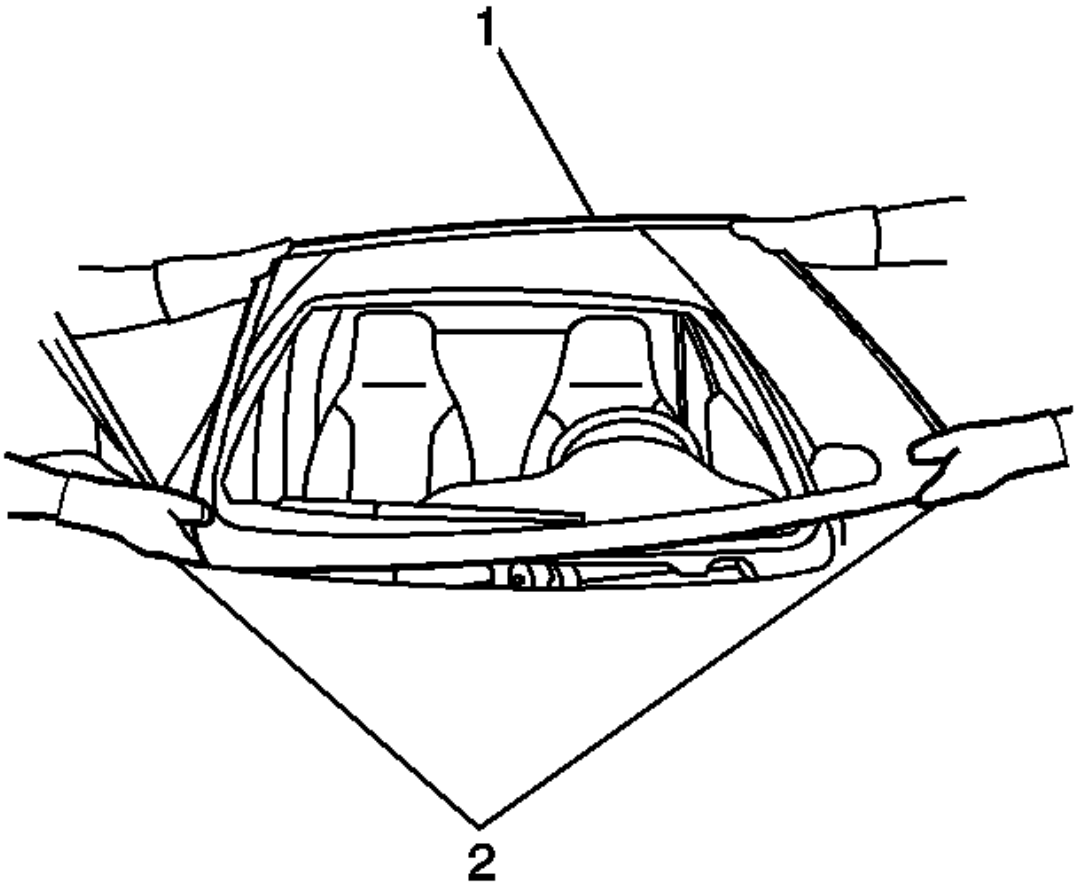

Fig. 48: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

10. With the aid of an assistant, dry fit the window (1) to the opening in order to determine the correct position.

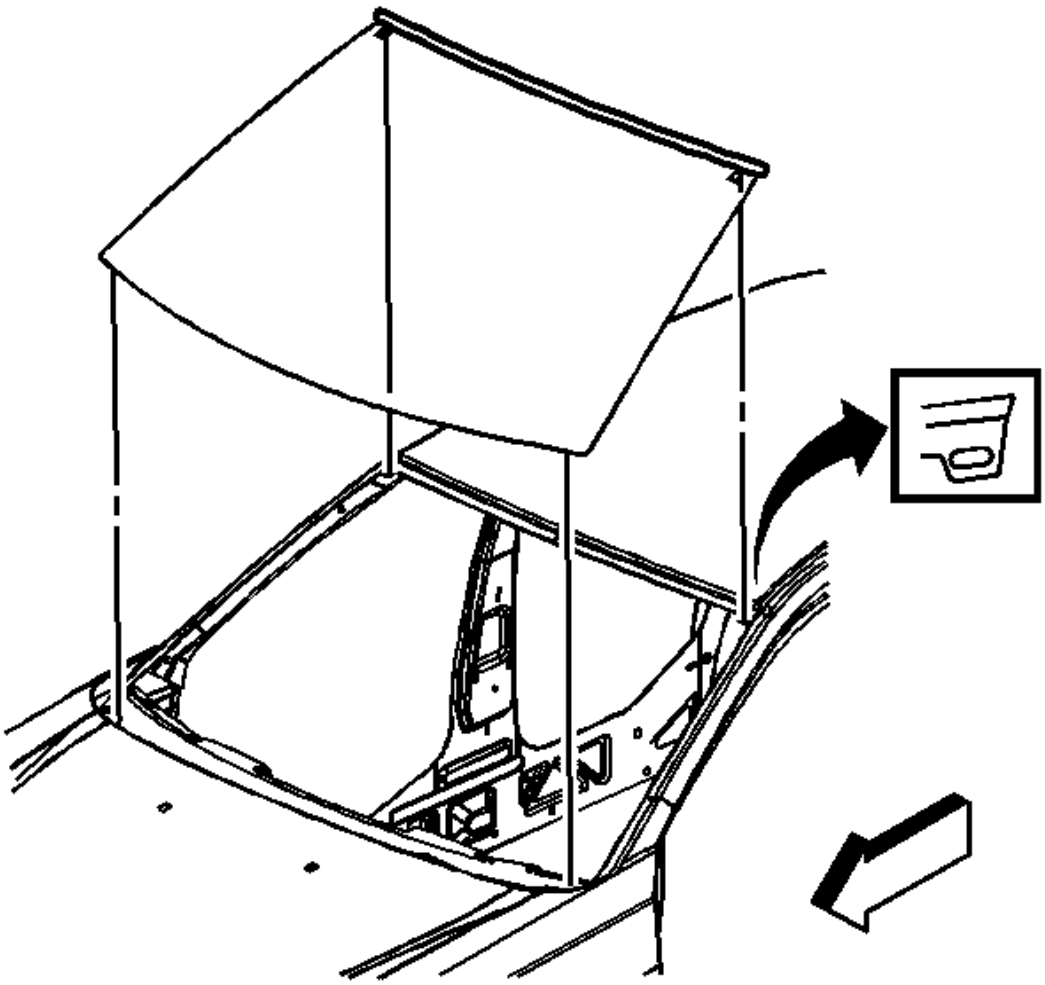

Fig. 49: Identifying Locator Slots On Upper Pinch-Weld Flange
Courtesy of GENERAL MOTORS COMPANY

11. Position the locator pins on the window into the upper sheet metal slots in order to hold the window in place.

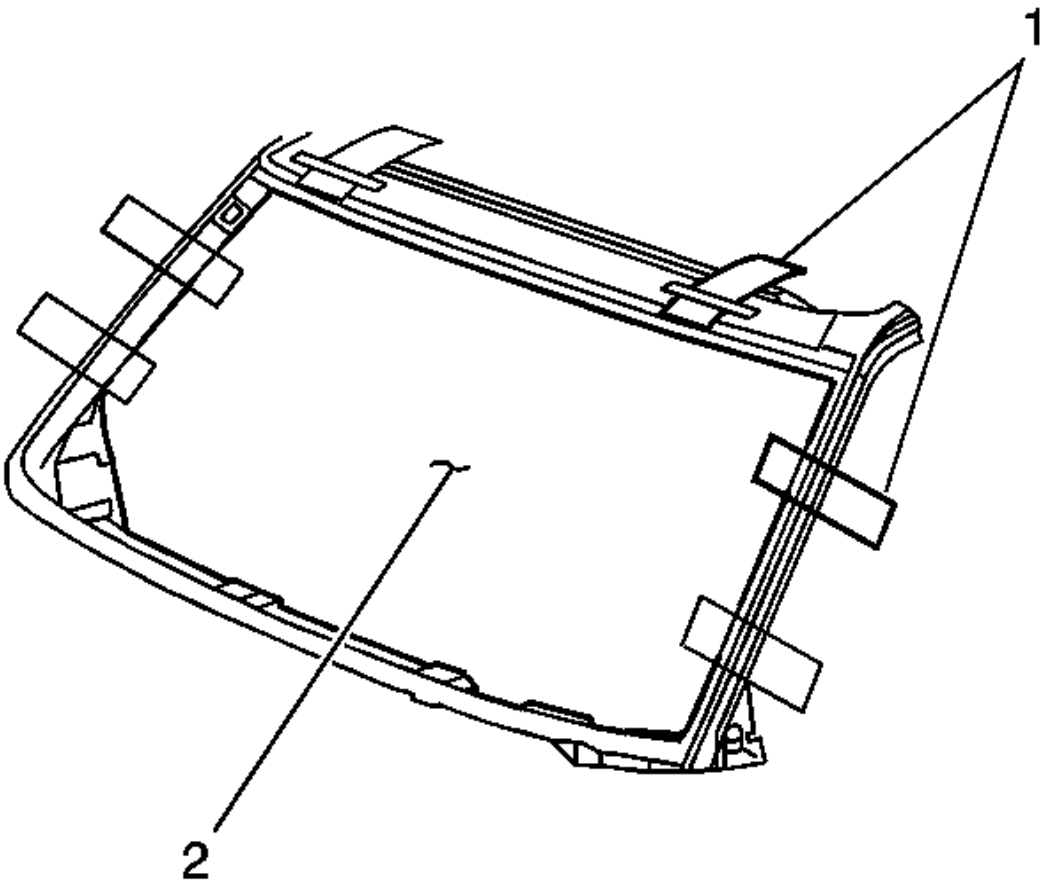

Fig. 50: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

12. Use masking tape in order to mark the locations (1) of the window (2) in the opening.
13. Cut the masking tape in the center and remove the window from the opening.

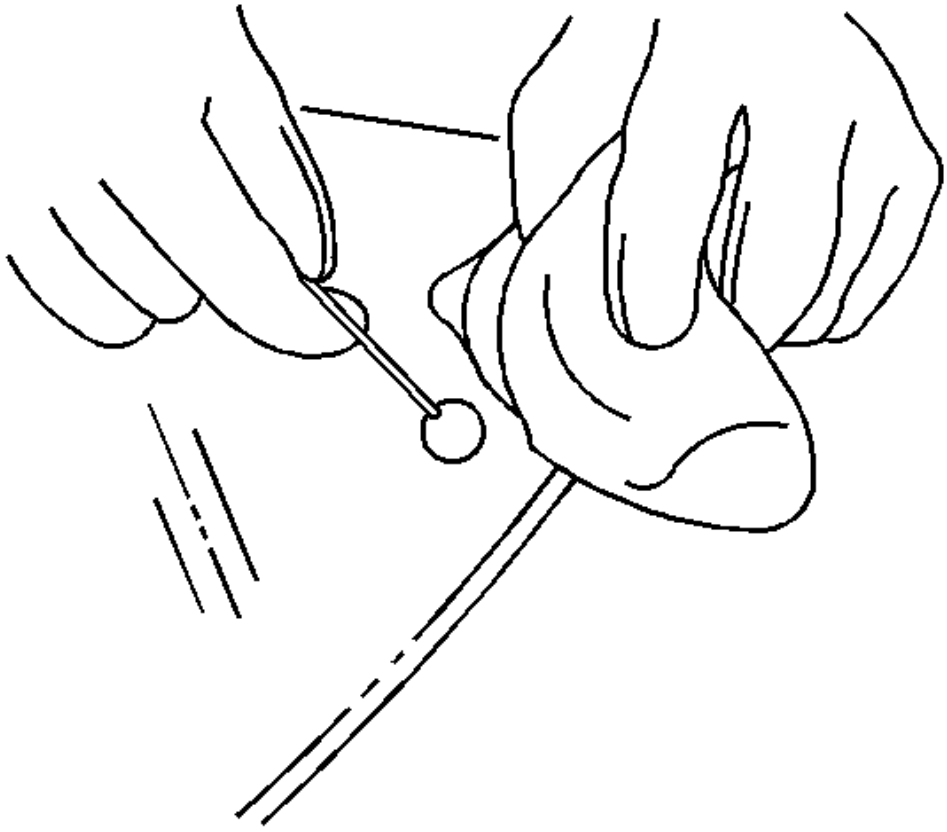

Fig. 51: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use care when applying window prep clear #1 on the window. This primer dries almost instantly, and may stain the viewing area of the window if not applied evenly.**

14. Use a new dauber in order to apply window prep clear #1 to the area approximately 10-16 mm (3/8-5/8 in) around the entire perimeter of the window inner surface.

    Immediately wipe the window primed area using a clean, lint-free cloth.

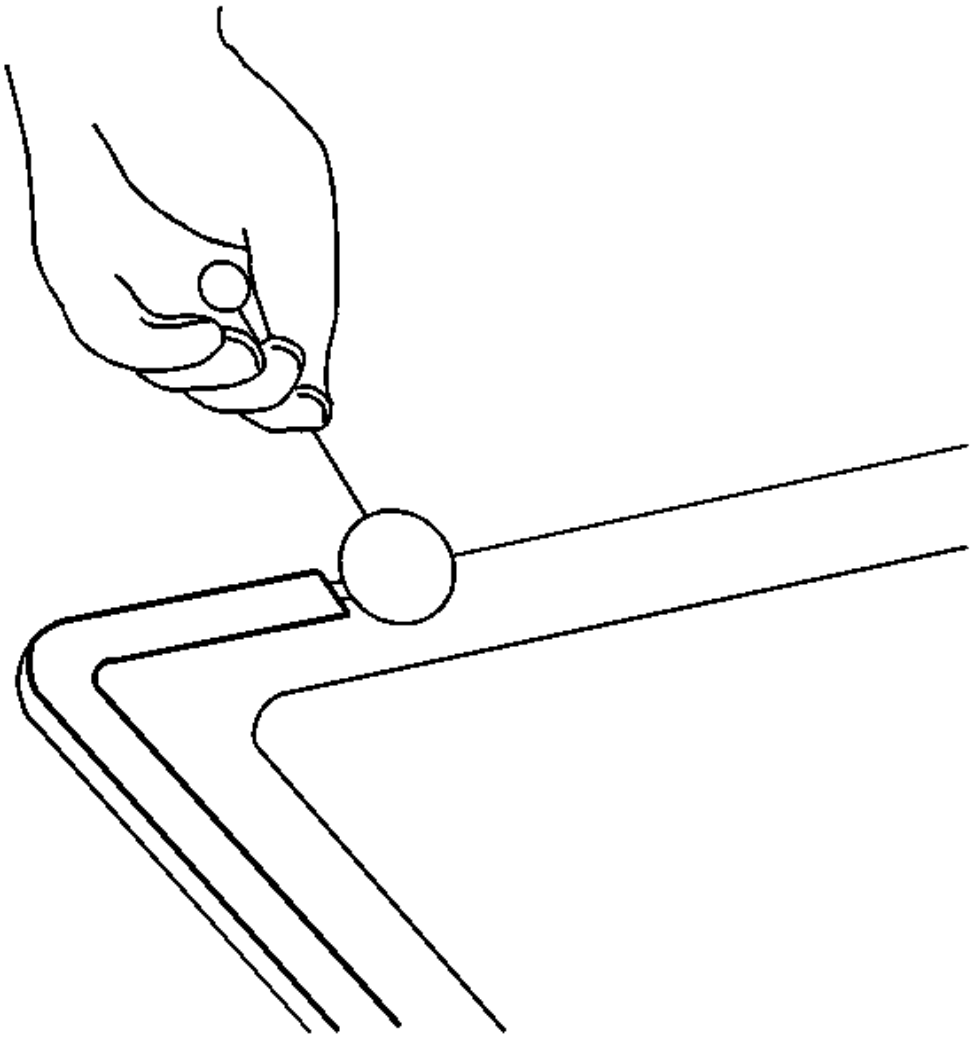

Fig. 52: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

15. Apply a second coat of the window prep clear #1 to the same area of the window.

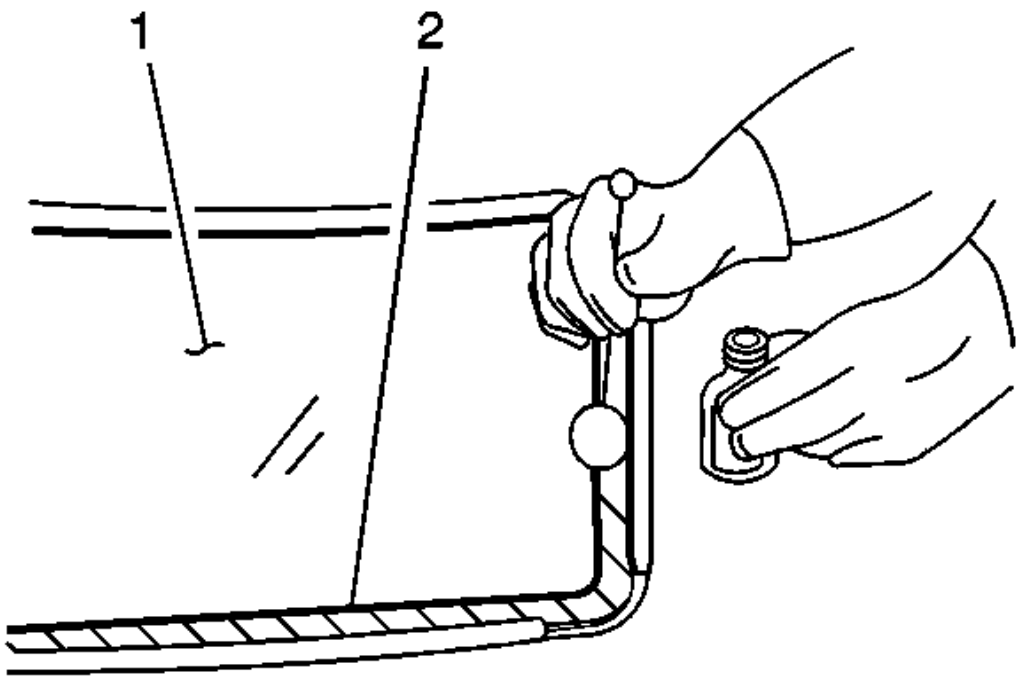

Fig. 53: Applying Glass Primer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The window primer black #2 is effective up to 8 hours after applying it to the window. The primed surface of the window must be kept clean.**

16. Shake the window primer black #2 for at least 1 minute.
17. Use a new dauber in order to apply the window primer black #2 to the same areas (2) that window prep clear #1 was applied.
18. Allow the window primer to dry for approximately 10 minutes.

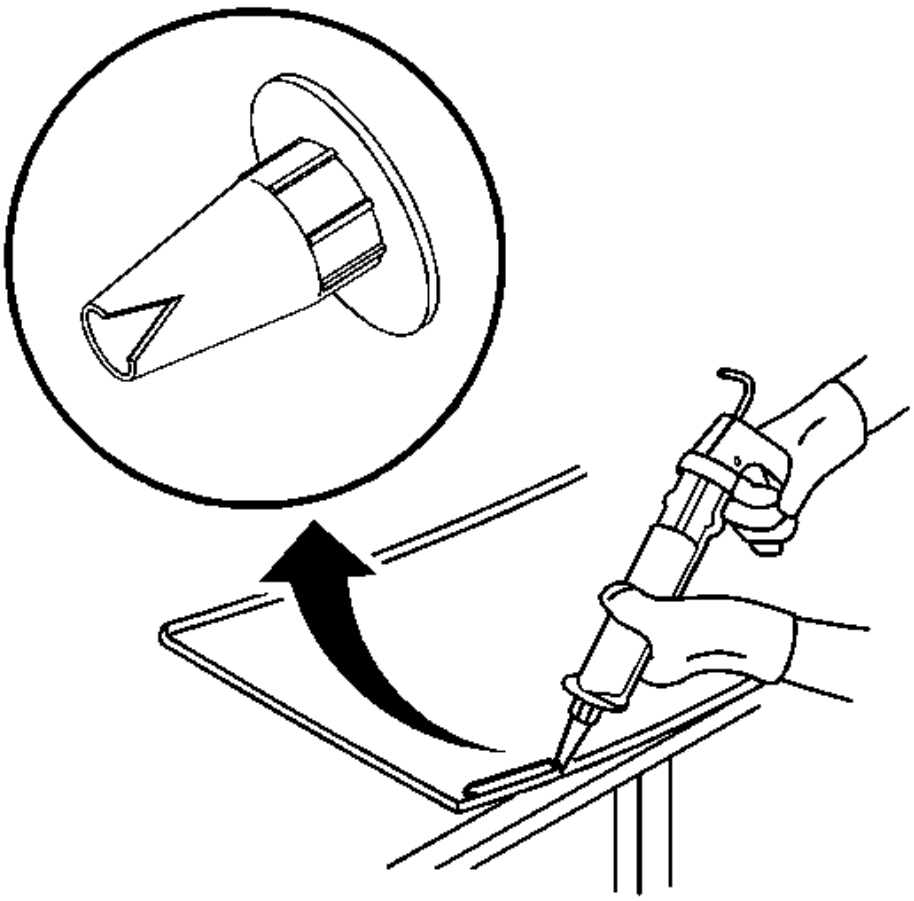

Fig. 54: View Of Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

19. Cut the applicator nozzle in order to provide a bead of 13 mm (1/2 in) wide and 13 mm (1/2 in) high.

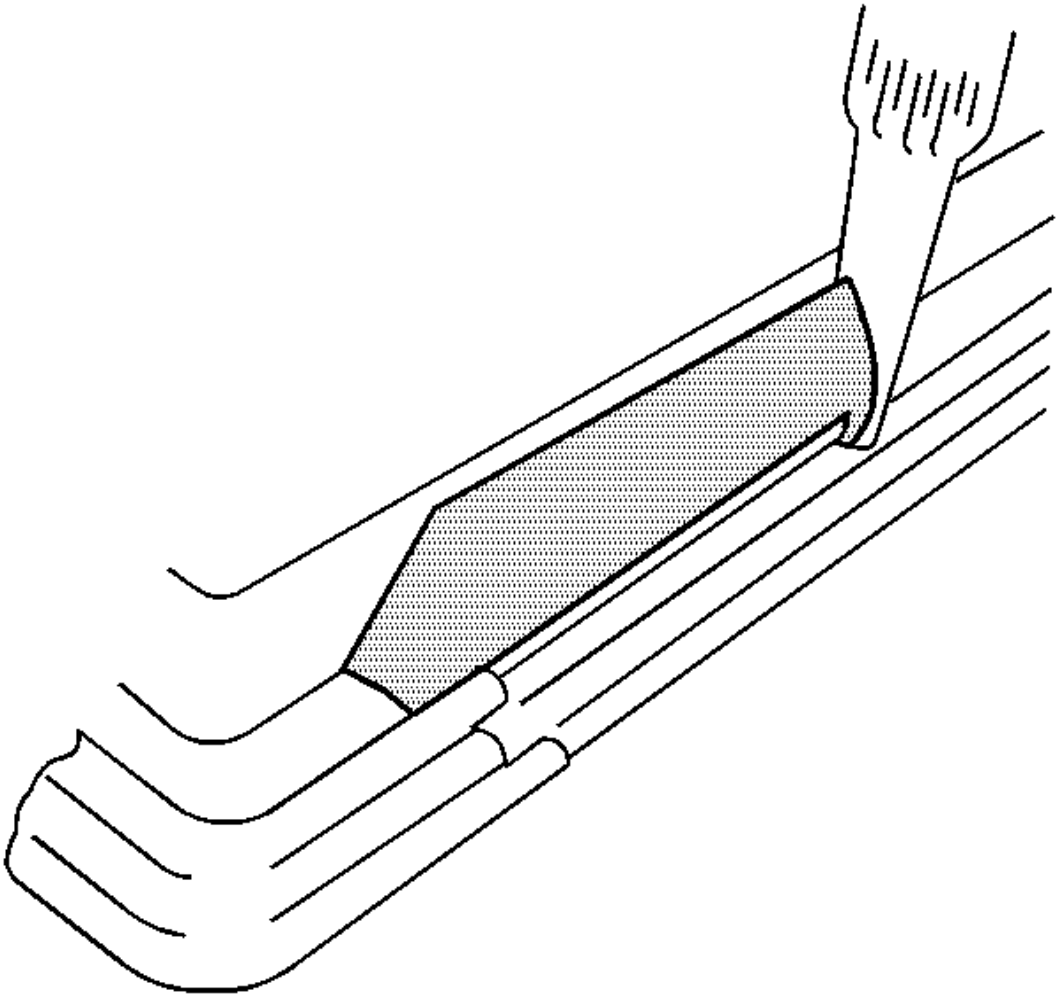

Fig. 55: Applying Continuous Bead Of Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

20. Use a cartridge-type caulking gun in order to apply a smooth, continuous bead of urethane adhesive.

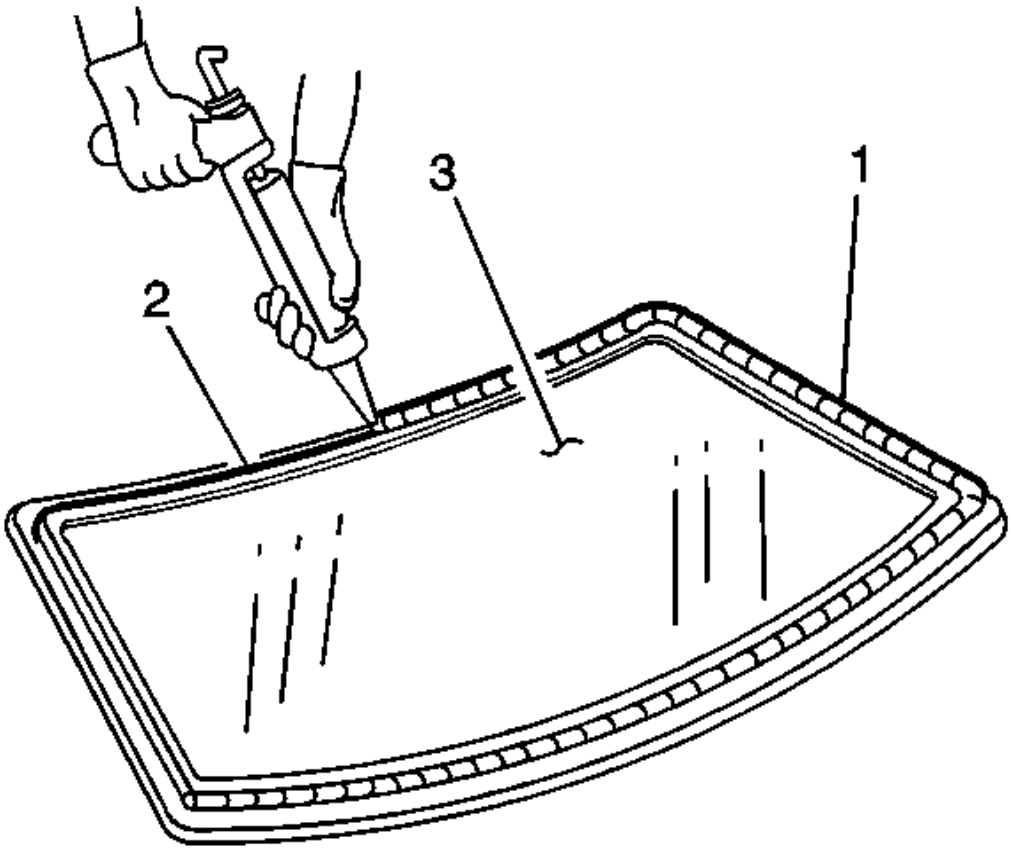

Fig. 56: Applying Urethane Adhesive To Inner Surface Of Window
Courtesy of GENERAL MOTORS COMPANY

21. Use the edge of the window (3) as a guide for the nozzle in order to apply the urethane adhesive (2) to the inner surface of the window (3).

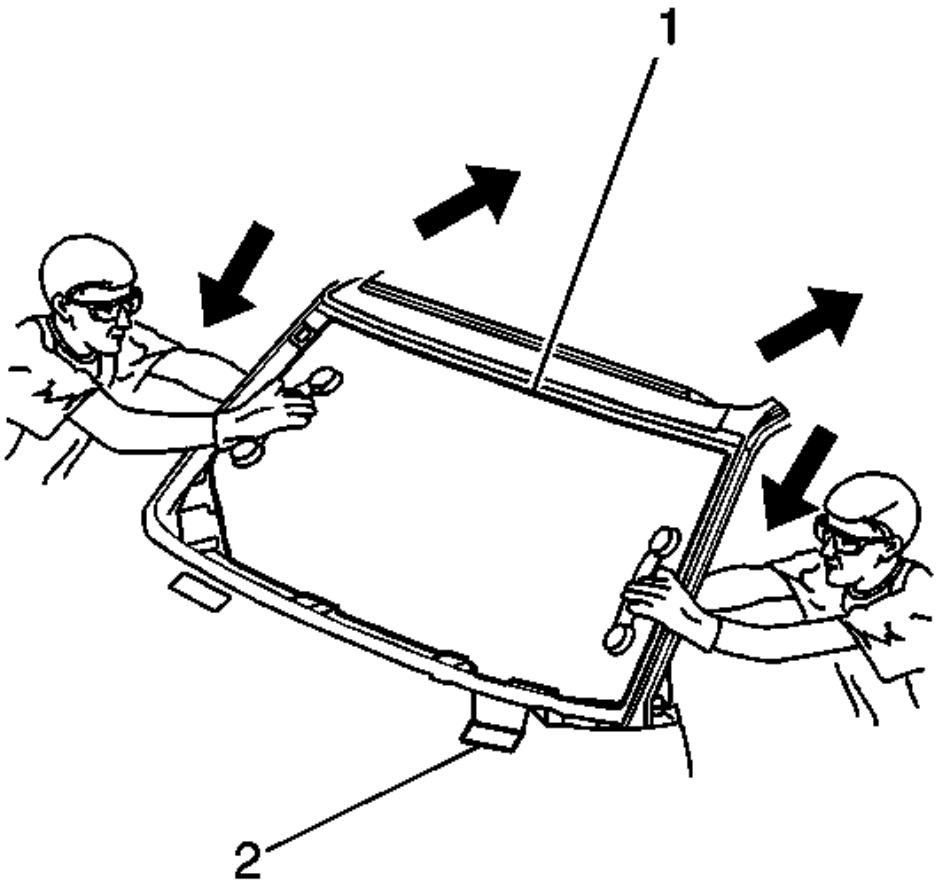

Fig. 57: Windshield
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the locator pins were damage when removing it will be necessary to tape the window in place until chemical-curing for the type of urethane adhesive used.**

22. Place the window on the lower supports (2), if equipped with the aid of an assistant, place the window in the opening ensuring that the locator pins on the window align with the upper sheet metal slots in order to hold the window in place.

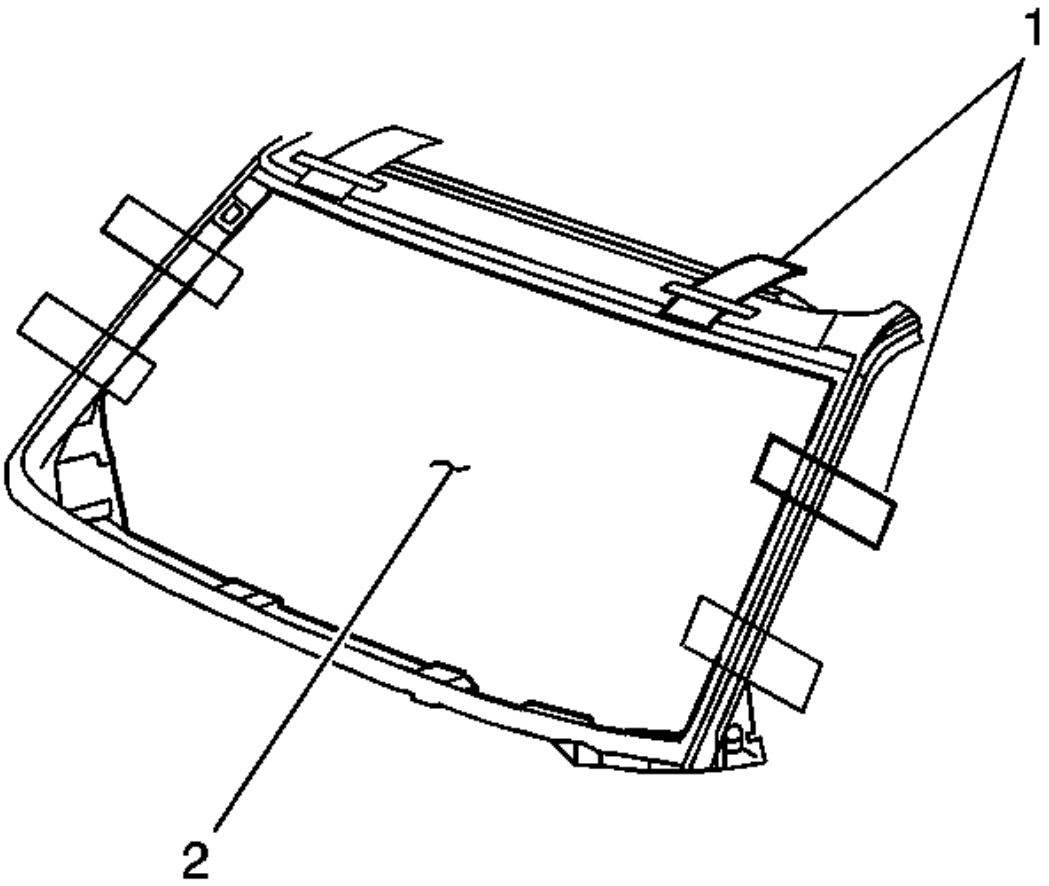

Fig. 58: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

23. Align the masking tape (1) lines on the window (2) and the body.

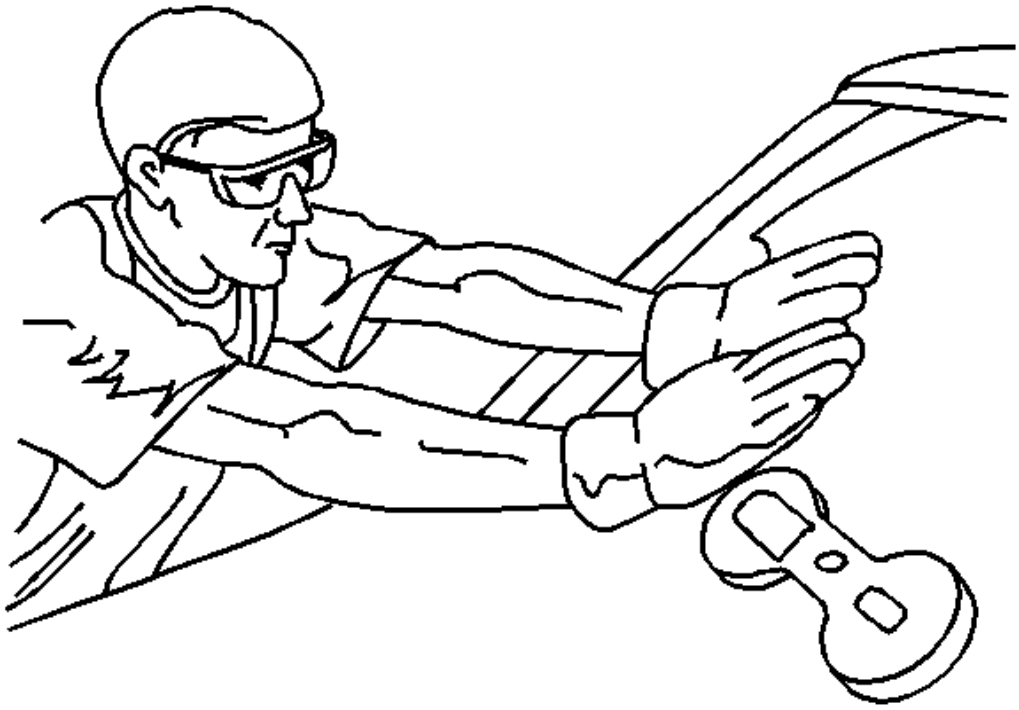

Fig. 59: Pressing Window Into Place
Courtesy of GENERAL MOTORS COMPANY

24. Press the window firmly into place.
25. Tape the window to the body in order to minimize movement until the urethane adhesive cures.

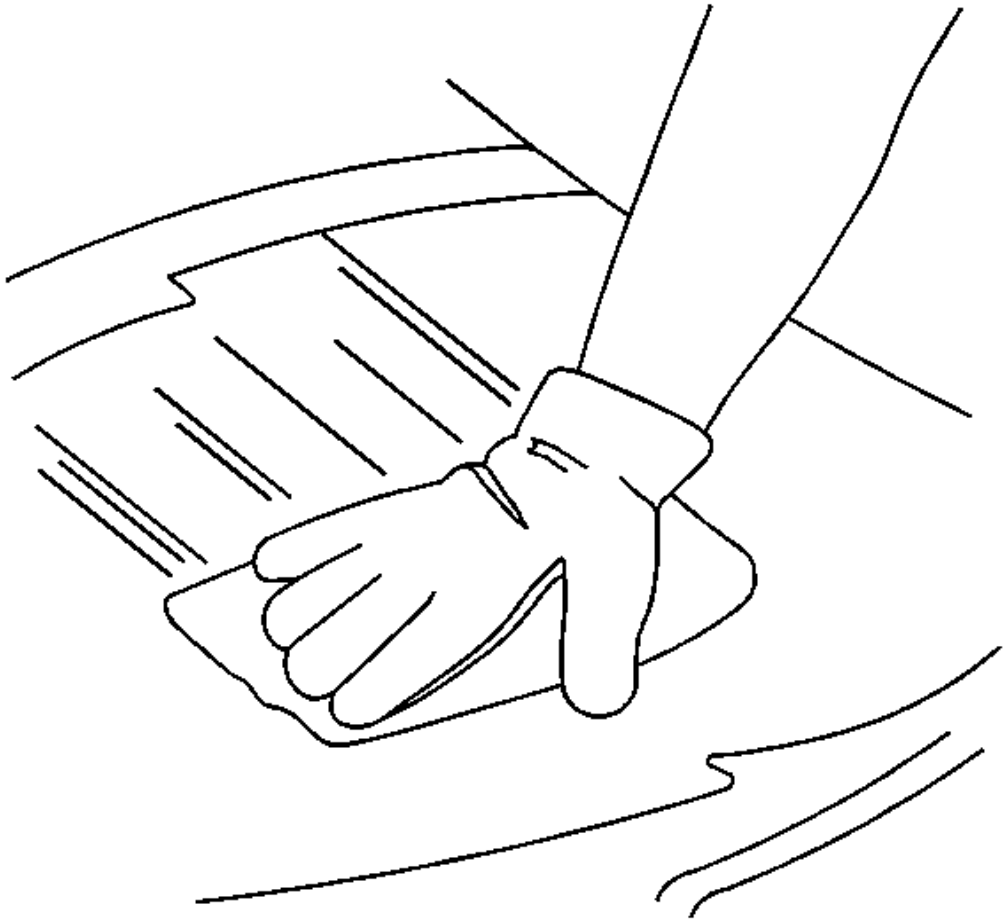

Fig. 60: Cleaning Excess Urethane Adhesive From Body
Courtesy of GENERAL MOTORS COMPANY

26. Clean any excess urethane adhesive from the body.

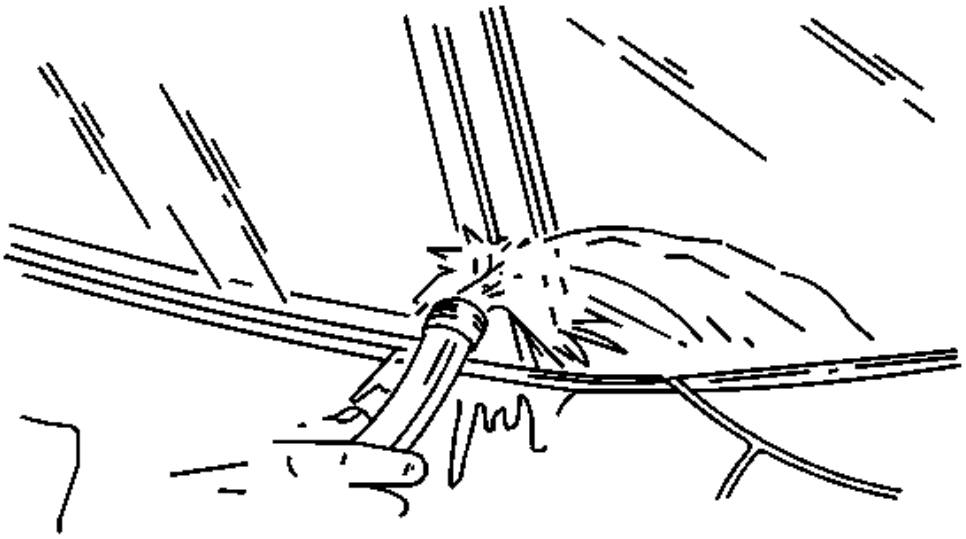

Fig. 61: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.**

27. Use a soft spray of warm water in order to immediately water test the window.
28. Inspect the window for leaks.
29. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
30. Retest the window for leaks.

WARNING: **Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

- **For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21Â°C (70Â°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.**

- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour .**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

31. Maintain the following conditions in order to properly cure the urethane adhesive:
    - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
    - Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.
    - Do not use compressed air in order to dry the urethane adhesive.
32. Complete the window installation.

ADHESIVE INSTALLATION OF ENCAPSULATED STATIONARY WINDOWS

1. Use a urethane adhesive systems which meet GM Specification GM 3651G

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

2. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
3. If the original window is being reused, remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinch-weld flange surface by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
    - High weld
    - Solder spots on the pinch-weld
    - Hardened sealer
    - Any other obstruction or irregularity in the pinch-weld flange

NOTE: **If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacement are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15, Dupont 2610, Sherwin-Williams PSE 4600 and NP70, Martin-Semour 5120, PPG DP90LF, Spies/Hecker 3688/8590 3688/5150 4070/5090, and Standox 11158/13320 14653/14980 are approved for this application.**

5. After repairing the opening as indicated, perform the following steps:
    1. Remove all traces of broken window from the outer cowl panel, seats, floor and defroster ducts.
    2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint-free cloth.
6. Verify all primers an urethane adhesives are within expiration dates.

WARNING: **Refer to Window Retention Warning .**

WARNING: **Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

NOTE: **Do not apply the black #3 primer to the existing bead of urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.**

7. Shake the black #3 primer for at least 1 minute.
8. Use a dauber in order to apply the primer to the surface of the pinch-weld flange.
9. Allow the pinch-weld primer to dry for approximately 10 minutes.
10. With an assistant, dry fit the window assembly into the opening to determine correct position.
11. Using masking tape, mark the location of the window assembly to the opening.
12. Apply Glass Prep #1 followed by Glass Primer #2 on the encapsulation material. Allow to dry for 6-10 minutes.

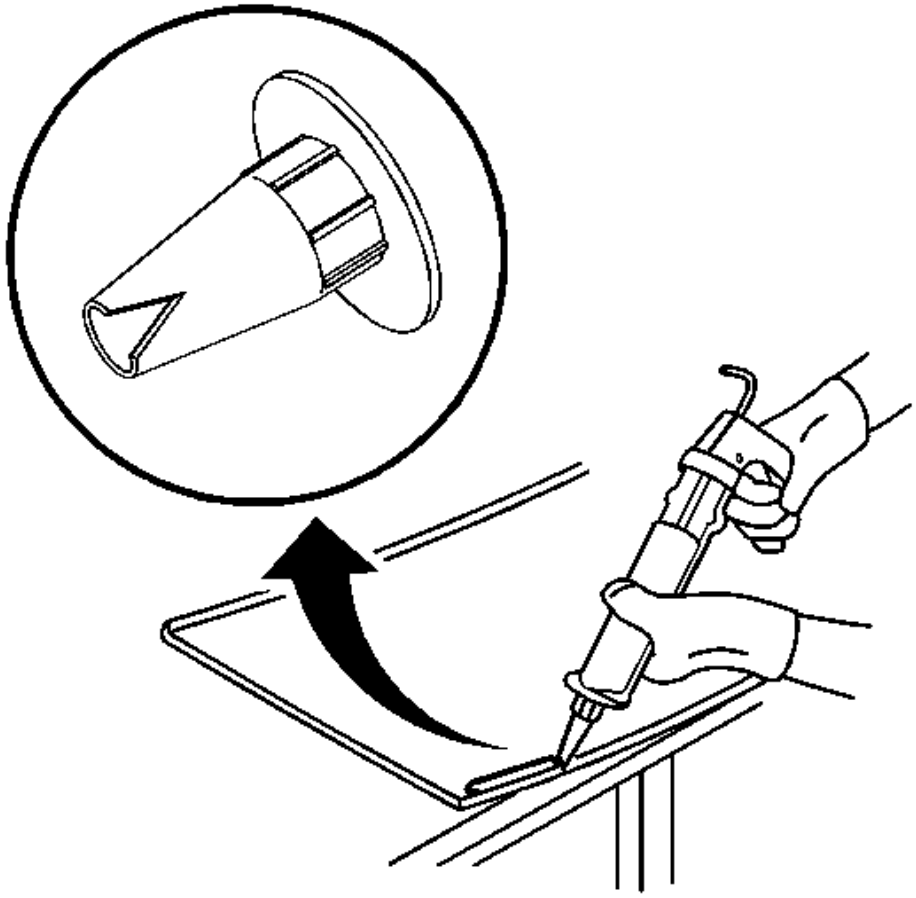

Fig. 62: View Of Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

13. Using a cartridge-type caulking gun in order to apply a smooth continuous bead of urethane adhesive.

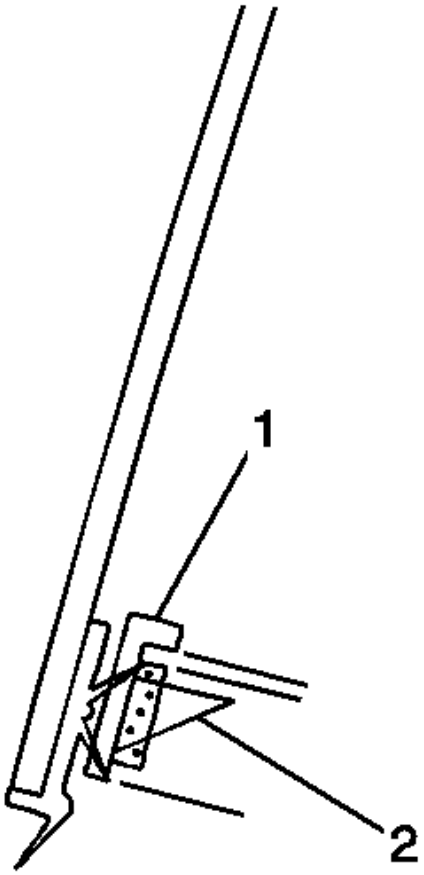

Fig. 63: Window Frame And Urethane Adhesive Bead
Courtesy of GENERAL MOTORS COMPANY

14. Use the inside edge of the window frame (1) as a guide for the nozzle in order to apply the urethane adhesive bead (2) to the window frame bonding surface.
15. With the aid of an assistant, place the window assembly into the opening. Make sure window frame alignment pins are properly located.
16. Press the window firmly into place.
17. Tape to window to the body in order to minimize movement until the urethane adhesive cures.
18. Clean any excess urethane adhesive from the body.

NOTE: **Do not direct a stream of high pressure water to the freshly applied urethane adhesive.**

19. Use a soft spray of warm water in order to immediately water test the window.
20. Inspect the window for leaks.
21. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.

22. Retest the window for leaks.

WARNING: **Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

- **For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21Â°C (70Â°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.**
- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour .**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

23. Maintain the following conditions in order to properly cure the urethane adhesive.
    - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane cures.
    - Do not drive the vehicle until the urethane adhesive is cured. Refer to above curing times.
    - Do not use compressed air in order to dry urethane adhesive.

DESCRIPTION AND OPERATION

FULL-CUT METHOD DESCRIPTION

- If corrosion of the pinch-weld flange is present, or if sheet metal repairs or replacements are required, refinish the pinch-weld flange in order to present a clean, primer-only surface.
- If paint repairs are required, mask the flange bonding area, prior to applying the color coat, in order to provide a clean, primer-only surface.

IMPORTANT:

- Appropriate materials for these primer applications are typically 2 component catalyzed products. Use materials such as BASF DE15Â®, DuPont 2610Â®, Sherwin-Williams PSE 4600 and NP70Â® and Martin-Semour 5120 ,5130Â® , PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application. Follow the manufacturer's directions for the mix, the application, and the drying times.
- After repairing the opening as indicated, use adhesive systems which meet GM Specification GM 3651G.

Use only the full cut method, also known in the field as full strip method, when installing windows.

This method includes the following:

- The replacement of a majority of the adhesive bead. Remove all but approximately 2 mm (3/64 in) of the existing bead of adhesive from the pinch-weld flange.
- Apply pinch-weld primer to any exposed painted areas on the pinch-weld flange.

No mounds or loose pieces of adhesive should remain on the pinch-weld flange. Do not remove all traces of adhesive.

POWER WINDOWS DESCRIPTION AND OPERATION

Power Window System Components

The power window system consists of the following components:

- Driver window switch
- Front passenger window switch
- Left rear window switch
- Right rear window switch
- Window regulator motors in each of the doors
- PWR WDO Circuit Breaker 25 amp

Power Window System Controls

The power window system can be controlled by a power window up or down switch activation.

Window Operation and the Driver Window Switch

When the ignition switch is in the RUN or ACCY position, or Retained Accessory Power (RAP) is enabled, battery positive voltage is supplied to the driver window switch. Ground for the switch is provided by a ground circuit connected to a ground stake. When the driver window switch is pressed in the down position, the voltage is applied to the driver window motor down circuit and ground is applied to the driver window motor up circuit causing the window to open. When the driver window switch is pressed in the up position, the polarity is reversed, voltage and ground are applied to the opposite circuits and the window closes. In order to control the passenger windows from the driver door, the driver window switch assembly contains a separate window switch for each passenger door window. These window switches operate in the same way as the driver window switch, except that the applied voltage and ground must also pass through the remote passenger window switch to get to the respective window motor.

The driver window switch also provides power and ground for the remote rear window switches. Battery positive voltage is supplied, through the power window master switch lockout signal circuit, to each remote rear window switch. The remote front passenger door window switch has a separate battery positive voltage circuit, however, this circuit is spliced into the driver window switch voltage supply circuit within the IP Fuse Block. Ground for all three of the passenger door switches, is also supplied by the driver window switch.

Express Down Feature

The driver window will travel to the fully down position when the driver window switch is pressed past the first detent. Pressing the driver window switch to the up position will cancel the express down feature.

Lockout Switch Feature

The driver window switch contains a rear window lockout switch which disconnects the battery positive voltage supply to the remote rear passenger door window switches, disabling them. The remote front passenger door window switch cannot be locked out.

Window Operation and the Passenger Window Switches

When the ignition switch is in the RUN or ACCY position, or Retained Accessory Power (RAP) is enabled, battery positive voltage is supplied to each of the remote passenger door window switches. When a remote window switch is pressed in the down position, voltage is applied to the window motor down circuit and ground is applied to the window motor up circuit, causing the window to open. When the window switch is pressed in the up position, the polarity is reversed, voltage and ground are applied to the opposite circuits, and the window closes.

REAR WINDOW DEFOGGER DESCRIPTION AND OPERATION

Rear Window Defogger System Components

The rear window defogger system consists of the following components:

- HVAC control module
- Rear defogger relay
- Rear defogger grid
- Driver outside rearview mirror
- Passenger outside rearview mirror
- 40A Fuse

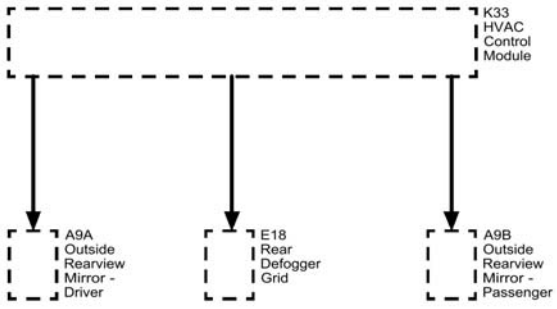

Fig. 64: Rear Window Defogger Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
A9B	A9B Outside Rearview Mirror - Passenger
E18	E18 Rear Defogger Grid
A9A	A9A Outside Rearview Mirror - Driver
K33	K33 HVAC Control Module

Rear Window Defogger Operation

The rear defog control system utilizes a single zone backlight design, driven with a single relay configuration. Additionally, up to two outside rear view mirrors can be heated if equipped. A switch for the customer to control the system is provided within the HVAC control module, also included in the HVAC control module is an indicator to inform the customer with the current state of the system. The system is only operational when engine is running or during remote start.

Pressing the heated rear window switch on the HVAC control module causes the HVAC control module to provide voltage to the coil side of the rear defogger relay, this will energize the relay causing the relay switch contacts to close allowing B+ voltage to flow through the rear defogger grid control circuit to the rear defogger grid.

When the rear heated window switch is pressed and the engine is running, the rear window defog will be active for 10 minutes with the first switch press and 5 minutes for each subsequent switch press. The rear window defog timer would be suspended when the vehicle speed has exceeded a value of 44.7 MPH (72KPH). When the vehicle is being driven at speeds greater than 72 KPH for an extended period of time and the rear heated window switch is pressed, then the customer would have the rear window defog to be active for 20 minutes or greater.

Heated Mirrors

The heated mirrors are also controlled through the rear defogger relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

STATIONARY WINDOW DESCRIPTION

Most stationary windows, specifically windshields, are retained to the body with adhesive which adheres the window to the body, increasing structural integrity. The reinstallation of the windows with adhesive requires complete replacement of the adhesive bead, and is known as the full cut method. All stationary windows must use a adhesive systems which meet GM Specification GMW-15672.

URETHANE ADHESIVE DESCRIPTION

For replacement of any adhesive-installed window, use the full cut method only.

Use an adhesive that is approved by GM, Specification GMW-15672.

Use these materials based on specific manufacturer. Do NOT intermix primers or adhesives from one manufacturer to another.

Always follow the system manufacturers instructions for application, handling, and curing.

INTRODUCTION

ARROWS AND SYMBOLS

This service manual uses various symbols in order to describe different service operations.

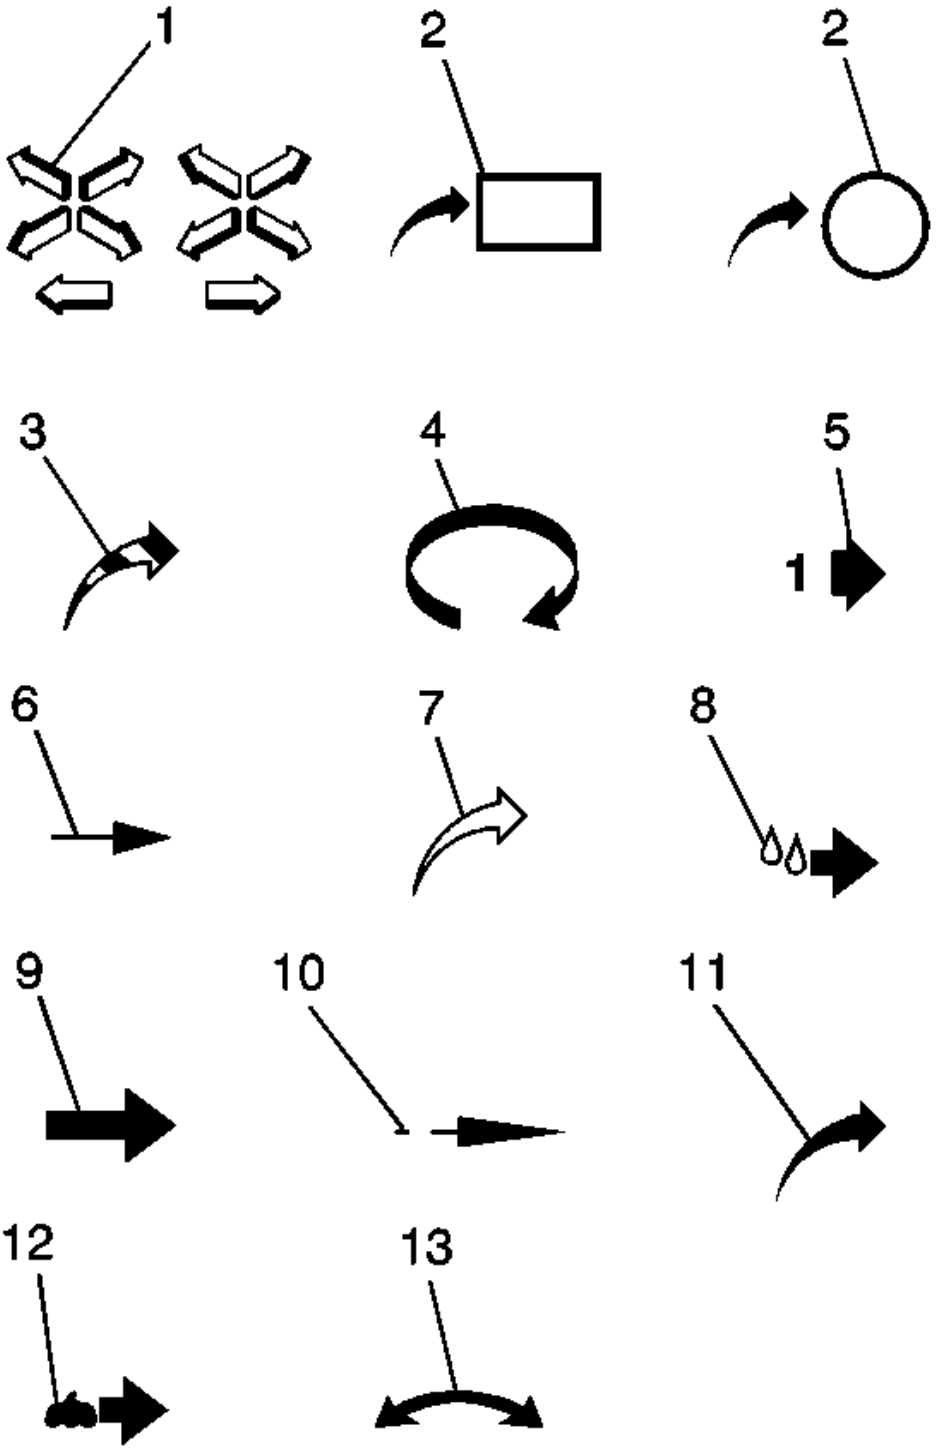

Fig. 1: Identifying Different Service Operations Symbols
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front of Vehicle
2	View Detail

Callout	Component Name
2	View Detail
3	Ambient Air Mixed with Another Gas or Indicate Temperature Change
4	Motion or Direction
5	View Angle
6	Dimension (1:2)
7	Ambient/Clean Air Flow or Cool Air Flow
8	Lubrication Point- Oil or Fluid
9	Task Related
10	Sectioning (1:3)
11	Gas Other Than Ambient Air or Hot Air Flow
12	Lubrication Point- Grease or Jelly
13	Multidirectional Arrow

ACRONYMS AND UNITS

Acronyms

Acronym	Meaning	Definition
2WD	Two-Wheel Drive	Indicates that a vehicle has 2 driven wheels OR that a 4WD vehicle uses only 2 wheels for propulsion. So it can be the description of a vehicle configuration OR the operational mode of the drivetrain.
4WD	Four-Wheel Drive	Four-wheeled vehicle with a drivetrain that allows all four wheels to receive power from the engine simultaneously which provides better control on various surfaces. Can be used to describe the configuration of the vehicle OR as the operational mode of the drivetrain. 4WD vehicles usually can turn 2 wheels off to be in a 2WD mode. See also AWD.
A/C	Air Conditioning	The cooling and dehumidification of indoor air for thermal comfort.
A/D	Analog to Digital	Used in context of converting electrical analog signals to digital signals.
ABS	Antilock Braking System	System on motor vehicles which prevents the wheels from locking while braking which helps the driver maintain control in heavy braking conditions.
AC	Alternating Current	An electrical current whose magnitude and direction vary cyclically.
AM	Amplitude Modulation	Method of impressing data onto an alternating-current (AC) carrier waveform.
APP	Accelerator Pedal Position	A pedal that controls the throttle valve.
AWD	All-Wheel Drive	All-wheel-drive systems are designed to function on all types of surfaces, both on- and off-road, and most of them cannot be switched off. This can also be called full-time four wheel drive. See also 4WD.

Acronym	Meaning	Definition
AWG	American Wire Gauge	American wire gauge is a standardized wire gauge system used since 1857 predominantly in the United States for the diameters of round, solid, nonferrous, electrically conducting wire. E.g. a wire of AWG10 has a diameter of 2.588mm, AWG20 corresponds to a diameter of 0.812mm.
B+	Battery Positive Voltage	The electrical potential on the positive terminal of the battery.
BARO	Barometric Pressure	Atmospheric pressure as measured by a barometer.
BCM	Body Control Module	This module supplies vehicle occupants with visual and audible information and controls various vehicle functions,
BECM	Battery Energy Control Module	Control module used to regulate the battery voltage.
BPP	Brake Pedal Position	Position of the foot pedal that moves a piston in the master brake cylinder.
CAN	Controller Area Network	Serial data connection between control modules by Bosch
CCM	Chassis Control Module	The module that controls various vehicle functions on the Chassis, like Engine/Trans Mount, Active Grille Air Shutter, Load Leveling, etc•••
CD	Compact Disc	A small optical disk on which data such as music, text, or graphic images is digitally encoded.
CNG	Compressed Natural Gas	This a substitute for gasoline or diesel fuel. It is made by compressing natural gas (which is mainly composed by methane (CH4), in a percentage range of 70% to 98%)
CO	Carbon Monoxide	This is a product of the incomplete combustion of carbon-containing compounds, at room temperature this is a gas. It consists of one carbon atom covalently bonded to one oxygen atom.
CO2	Carbon Dioxide	Chemical compound composed of two oxygen atoms covalently bonded to a single carbon atom.
CPA	Connector Position Assurance	Part of an electrical connector that prevents the connector from moving out of its socket. Usually needs to be pressed to unlock the connector when disconnecting it.
CPP	Clutch Pedal Position	A lever operated with the foot that controls the coupling that connects or disconnects driving and driven parts of a driving mechanism.
CV	Constant Velocity	Used in conjunction with CV joints, which connect two shafts at an angle while both shafts always have the same rotational speed without variations.
CVT	Continuously Variable Transmission	A transmission in which the ratio of the rotational speeds of two shafts, as the input shaft and output

Acronym	Meaning	Definition
		shaft of a vehicle or other machine, can be varied continuously within a given range, providing an infinite number of possible ratios which improves fuel economy.
D	Drive	D on the transmission gear selector lever.
DAB	Digital Audio Broadcast	Technology for broadcasting of audio using digital radio (carries information via digital signal) transmission.
DC	Direct Current	Continuous current, constant flow of electric charge.
DLC	Data Link Connector	This is an electronic connector typically located underneath the driver's side dashboard, just above the pedals. The connector has 16 pins.
DMM	Digital Multimeter	Electronic measuring instrument that combines several functions in one unit. The most basic instruments include an ammeter, voltmeter, and ohmmeter.
DOHC	Dual Overhead Camshaft	Dual overhead camshafts (DOHC) are higher performance engines, they produce more power, and can run at higher speeds because they allow an engine to have four valves per cylinder. Each camshaft operates two of the valves, one camshaft handles the intake valves, and one handles the exhaust valves
DPF	Diesel Particulate Filter	Device designed to remove diesel particulate matter or soot from the exhaust gas of a diesel engine.
DRL	Daytime Running Lamps	White lights mounted on the front of an automobile that automatically switch on when the key is turned and are intended for daytime use, to increase the visibility of the automobile.
DSCC	Distance Sensing Cruise Control	A type of cruise control that automatically maintains the distance between vehicles.
DSP	Digital Signal Processor	A specialized microprocessor designed specifically for digital signal processing, generally in real-time computing.
DTC	Diagnostic Trouble Code	An electronic signal stored in an automotive computer, indicating the presence of a fault detected by that computer.
DVD	DVD	A popular optical disc storage media format the size of a CD. Used mainly for movies but also for data. DVD has no spelled out version (officially it does not mean Digital Video Disc or Digital Versatile Disc, it just means DVD).
EBCM	Electronic Brake Control Module	This module contains a microprocessor and software for antilock braking system operation.

Acronym	Meaning	Definition
ECM	Engine Control Module	This electronic module works with a vehicle's sensors and engine control devices to insure that the engine operates at maximum efficiency and performance. It performs three vital functions. Receives electronic signals from engine sensors. Analyzes the data and makes an engine performance decision (based on the pre-set parameters within the unit). Sends an "output command" to an actuator that adjusts engine performance.
ECT	Engine Coolant Temperature	A measure of how hot or cold the fluid which flows through the engine in order to prevent its overheating, transferring the heat produced by the device to other devices that utilize or dissipate it.
EEPROM	Electrically Erasable Programmable Read-Only Memory	A non-volatile storage chip used in computers and other devices to store small amounts of volatile data, e.g. calibration tables or device configuration.
EGR	Exhaust Gas Recirculation	Is an NOx (nitrogen oxide and nitrogen dioxide) reduction technique used in most gasoline and diesel engines. EGR works by recirculating a portion of an engine's exhaust gas back to the engine cylinders.
EMI	Electromagnetic Interference	Electromagnetic interference (also called radio frequency interference) is a disturbance that affects an electrical circuit due to either electromagnetic conduction or electromagnetic radiation emitted from an external source.
ESD	Electrostatic Discharge	The sudden and momentary electric current that flows between two objects at different electrical potentials.
EV	Electric Vehicle	A category of vehicles that only have an electric drive system.
EVAP	Evaporative Emission	A system that controls the fuel fumes in the fuel tank.
FM	Frequency Modulation	In telecommunication this is a way to convey information over a carrier wave by varying its frequency.
FWD	Front-Wheel Drive	A form of engine/transmission layout used in motor vehicles, where the engine drives the front wheels only.
GMLAN	General Motors Local Area Network	A local-area network is a computer network covering a small geographic area, like a home or vehicle. This specific type of LAN connects several controllers inside the vehicle and was developed by General Motors.
GPS	Global Positioning System	Satellite-based navigation system made up of a network of 24 satellites placed into orbit by the U.S. Department of Defense.

Acronym	Meaning	Definition
GSM	Global System for Mobile Communications	Globally accepted standard for digital cellular communication.
GVW	Gross Vehicle Weight	Maximum total weight of a road vehicle or trailer that is loaded, including the weight of the vehicle itself plus fuel, passengers, cargo, and trailer tongue weight.
HD	Heavy Duty	Robust design to accommodate large work loads.
HID	High Intensity Discharge	A type of light that produces a bright light by using gas filled bulbs. (gas is usually mercury, metal halide, and high-pressure sodium) Uses very little battery power and is a very "cool" light.
HO2S	Heated Oxygen Sensor	Heated oxygen sensors have an internal heater circuit that brings the sensor up to operating temperature more quickly than an unheated sensor. An oxygen sensor must be hot (about 600-650Â°F) before it will generate a voltage signal. The hot exhaust from the engine will provide enough heat to bring an O2 sensor up to operating temperature.
HVAC	Heating Ventilation Air Conditioning	This system is sometimes referred to as climate control. Ventilation air ducts installed throughout a vehicle that supply conditioned air to a room through rectangular or round outlet vents.
I^2C	Inter-Integrated Circuit	Serial data connection between Integrated Circuits (microchips) inside a control module invented by Phillips
IAT	Intake Air Temperature	Temperature of the air entering intake air flow system of the engine.
ICE	Internal Combustion Engine	An engine in which the combustion of fuel and an oxidizer (typically air) occurs in a confined space called a combustion chamber.
ID	Identification	Number or Code that identifies a component or control module. Can be written on the part or be transmitted on a bus or via radio.
ISP	Internet Service Provider	A company that furnishes corporations and individual consumers with various services, mainly access to the Internet.
ISS	Input Shaft Speed	Rotational speed of the input shaft of a transmission.
LAN	Local Area Network	Standard network connection PC's.
LCD	Liquid Crystal Display	A thin, flat display device made up of any number of color or monochrome pixels arrayed in front of a light source or reflector.
LED	Light Emitting Diode	Small light bulbs that fit easily into an electrical circuit they do not have a filament that will burn out, and they do not get especially hot. They are

Acronym	Meaning	Definition
		illuminated solely by the movement of electrons in a semiconductor material.
LIN	Local Interconnect Network	Computer networking bus system used within automotive network architectures. Similar to CAN, but cheaper and less powerful.
LPG	Liquefied Petroleum Gas	A mixture of mainly propane and butane, produced commercially and stored under pressure to keep it in a liquid state.
MAF	Mass Air Flow	The amount of air drawn into the engine
MAP	Manifold Absolute Pressure	Pressure in the engine intake system after the throttle valve referenced to a perfect vacuum.
MDI	Multiple Diagnostics Interface	A device used by GM dealers that enables a PC to communicate with the control modules in a vehicle.
MIL	Malfunction Indicator Lamp	An indicator of the internal status of a car engine.
MOST	Media Oriented Systems Transport	Serial communication bus to transmit audio and video information.
N	Neutral	A state of the transmission in which it is not engaged.
NiMH	Nickel Metal Hydride	A type of rechargeable battery that uses a hydrogen absorbing alloy for the negative electrode.
NOx	Nitrogen Oxides	Refers to any of the following oxygen compounds of nitrogen or a mixture of them. Nitric Oxide, Nitrogen dioxide, Nitrous Oxide, Dinitrogen trioxide, Dinitrogen tetroxide, Dinitrogen pentoxide.
O2	Oxygen	A colorless, odorless, tasteless, gaseous chemical element with the chemical symbol O and atomic number 8.
O2S	Oxygen Sensor	An electronic device that measures the proportion of oxygen (O2) in the gas or liquid being analyzed.
OBD	On-Board Diagnostic	A generic term referring to a vehicle's self-diagnostic and reporting capability.
OEM	Original Equipment Manufacturer	A producer that provides a product to its customers, who proceed to modify or bundle it before distributing it to their customers.
OSS	Output Shaft Speed	Rotational speed of the output shaft of a transmission.
P	Park	A state in which the transmission is set so one can leave the vehicle.
PCB	Printed Circuit Board	A thin plate on which chips and other electronic components are placed.
PCM	Powertrain Control Module	A control module that features the functions of both, the engine and the transmission control module.
PCMCIA	Personal Computer Memory Card Industry Association	An international standards body and trade association with over 100 member companies that was founded in 1989 to establish standards for Integrated Circuit cards and to promote interchangeability among

Acronym	Meaning	Definition
		mobile computers where ruggedness, low power, and small size were critical.
PIN	Personal Identification Number	A secret numeric password shared between a user and a system that can be used to authenticate the user to the system.
PPE	Personal Protective Equipment	Protective clothing, helmets, goggles, or other garment designed to protect the wearer's body from injury.
PRNDL	Park, Reverse, Neutral, Drive, Low	Park, Reverse, Neutral, Drive, Low (automatic transmission positions).
PTC	Positive Temperature Coefficient	Refers to materials that experience an increase in electrical resistance when their temperature is raised.
PTO	Power Take-Off	A splined driveshaft, usually on a tractor or truck that can be used to provide power to an attachment or separate machine. This mechanism allows implements to draw energy from the tractor's engine.
PVC	Polyvinyl Chloride	A thermoplastic copolymer.
PWM	Pulse Width Modulation	Square shaped type of signal that carries the information in the ratio between on and off times.
R	Reverse	Rearward: directed or moving toward the rear;
RAM	Random Access Memory	A type of computer data storage. It today takes the form of integrated circuits that allow the stored data to be accessed in any order.
RCT	Radiator Coolant Temperature	This is the heat intensity of the radiator coolant measured in degrees. The radiator is a part of the cooling system that removes the engine heat. Coolant is a mixture of water and antifreeze (ethylene glycol) which lowers the freezing point of the water in the coolant system, this fluid also picks up heat from the engine and transfers it to the air.
RDS	Radio Data System	A standard from the European Broadcasting Union for sending small amounts of digital information using conventional FM radio broadcasts.
RF	Radio Frequency	A frequency or rate of oscillation within the range of about 3 Hz and 300 GHz. This range corresponds to frequency of alternating current electrical signals used to produce and detect radio waves.
ROM	Read-Only Memory	A class of storage media used in computers and other electronic devices. Data stored in ROM cannot be modified.
RPO	Regular Production Option	A three digit/letter code given to parts, assemblies, and systems originally installed on the vehicle. These RPO codes designate options and are assigned by General Motors.

Acronym	Meaning	Definition
RSA	Rear Seat Audio	An auxiliary set of controls that operate the main audio system from the rear seat. Rear passengers can also operate a different media source than the front passengers.
RWD	Rear-Wheel Drive	A common engine/transmission layout in which the engine is in the front of the vehicle, but the front mid-engine, rear mid-engine and rear engine layouts are also used.
SCV	Speed Controlled Volume	The volume control is set for a desired sound level in the vehicle as the vehicle increases its speed, the sound level is adjusted.
SDM	Sensing and Diagnostic Module	The name given to air bag modules used in General Motors vehicles.
SIM	Subscriber Identity Module	Part of a removable smart card Integrated Circuit Card. This is used for mobile cellular telephone devices such as mobile computers and mobile phones. SIM cards securely store the service-subscriber key used to identify a subscriber. The SIM card allows users to change phones by simply removing the SIM card from one mobile phone and inserting it into another mobile phone or broadband telephony device.
SIR	Supplemental Inflatable Restraint	Technical term for the air bag. Air bag is a stretchable membrane, which inflates during an automobile accident to provide cushioning to the passenger's head and torso to prevent injury to the passengers.
SPI	Serial Peripheral Interface	This is an interface that enables the serial (one bit at a time) exchange of data between two devices. An SPI operates in full duplex mode. This means that data can be transferred in both directions at the same time. It is a standard bus technology like CAN or I2C.
SPS	Service Programming System	System that enables repair facilities to update the software in control modules.
SUV	Sport Utility Vehicle	A passenger vehicle which combines the towing capacity of a pickup truck with the passenger-carrying space of a minivan.
SVS	Service Vehicle Soon	Indicator lamp or symbol for a malfunction related to a vehicle component or system.
TA	Traffic Announcement	Message spoken on radio regarding the movement of vehicles or pedestrians through an area or along a route. The buttons on radios that enable this announcements are also often labeled TA.
TAC	Throttle Actuator Control	A motor which moves the engine throttle plate or valve, controlled by the engine control module. A throttle plate limits the amount of air entering a internal combustion gasoline engine.

Acronym	Meaning	Definition
TAP	Transmission Adaptive Pressure	The transmission control module learns each component's characteristics and adjusts fluid pressure accordingly.
TCC	Torque Converter Clutch	Resides in a torque converter to connect an engine to an automatic transmission. The clutch is applied when conditions are correct to achieve a 1:1 ratio of engine crankshaft to transmission input shaft.
TCM	Transmission Control Module	A module that controls electronic automatic transmissions. It uses sensors from the vehicle as well as data provided by the Engine Control Module to calculate how and when to change gears in the vehicle for optimum performance, fuel economy and shift quality.
TDC	Top Dead Center	The piston is in its highest position relative to the combustion chamber.
TIS	Techline Information System	The PC-based global dealership diagnostic software that provides the technician the ability to reference the most recent service information via the service department's computer.
TPA	Terminal Position Assurance	An additional locking mechanism inside an electric connector that holds the pins in place.
TV	Television	A telecommunication system for broadcasting and receiving moving pictures and sound over a distance.
USB	Universal Serial Bus	A type of communication bus connection between a computer and a peripheral device.
VCI	Vehicle Communications Interface	A diagnostic tool that communicates to modules of multiple communication protocols in a vehicle by converting vehicle serial data into PC serial data communication.
VIN	Vehicle Identification Number	Used by manufacturers to uniquely identify motor vehicles using 17 characters.
VSCM	Vehicle Stability Control Module	This module uses information from several sensors to detect a loss of vehicle traction, then works with the antilock brake system to apply individual brakes to help keep the vehicle on its intended path.
VSS	Vehicle Speed Sensor	Sends data regarding how fast the car is traveling at the moment of driving. It is designed to be able to record the rate at which the vehicle's crankshaft is spinning.
WOT	Wide Open Throttle	When the throttle blade or valve is at its maximum open position, allowing maximum air to enter an internal combustion gasoline engine.
WLAN	Wireless Local Area Network	Standard to transmit digital data via radio frequency.

Acronym	Meaning	Definition
XM	XM (Satellite Radio)	XM Satellite Radio Holdings (XM) is one of two satellite radio services in the United States and Canada. XM provides pay-for-service radio, analogous to cable television. Its service includes 73 different music channels, 39 news, sports, talk, and entertainment channels, 21 regional traffic and weather channels and 23 play-by-play sports channels (2008).
XML	Extensible Markup Language	A markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable.

Units

Unit	Meaning	Definition
m^2	Square Meter	Area
A	Ampere	Electrical
Ah	Ampere Hour	Electrical
C	Coulomb	Electrical

CUSTOMER CONCERN VERIFICATION SHEETS

The GM Customer Concern Verification Sheets have been designed to improve communications between the service customer and the technician. The more clearly the technician understands the concern and its symptoms, the more likely the concern will be fixed right the first time.

The GM-wide Customer Concern Verification Sheets are available in GM GlobalConnect. The Customer Concern Verification Sheets may be printed and reproduced locally.

TRAINING

Dealers

All U.S. GM Dealers participating in the Center of Learning / GM Service Technical College (STC) Programs can enroll through the Center of Learning website at https://www.centerlearning.com. Within the website, there are individual training paths that are designed to assist in planning the training needs for each individual and their job role. Dealers who have questions about Center of Learning Training should contact the Center of Learning help desk at 1-888-748-2687. The help desk is available Monday through Friday, 8:00 am - 9:00 pm Eastern Standard Time, excluding holidays. For GM Access support, contact the GM Access Help Desk at 1-888-337-1010.

Fleets

GM Fleet customers with GM Warranty In-Shop agreements are able to participate in service technical training through the Center of Learning/GM Service Technical College (STC).

Assistance for GM fleet registered customers using GM STC training is provided by the Center of Learning help desk at 1-888-748-2687. The help desk is available Monday through Friday, 8:00 am-9:00 pm Eastern

Standard Time, excluding holidays. For GM Access support, contact the GM Access Help Desk at 1-888-337-1010.

Most GM STC course materials have associated charges.

To purchase authentic GM STC Training Materials, contact the GM Training Materials Headquarters at 1-800-393-4831.

Non-GM Dealer Technicians

Technician training for non-GM dealers is available through ACDelco. This training is for ACDelco PSC and Fleet program members employed in the automotive or truck service industry.

ACDelco courses are available at approved GM STC Training Centers. Availability and schedules can be obtained by calling 1-800-825-5886 (prompt 1) or contact us via the web at www.acdelcotechconnect.com and select the Training tab. Seminars are also offered through the ACDelco Warehouse Distribution channel. Contact your Local ACDelco representative or distributor directly for more information.

VEHICLE, ENGINE AND TRANSMISSION ID AND VIN LOCATION, DERIVATIVE AND USAGE

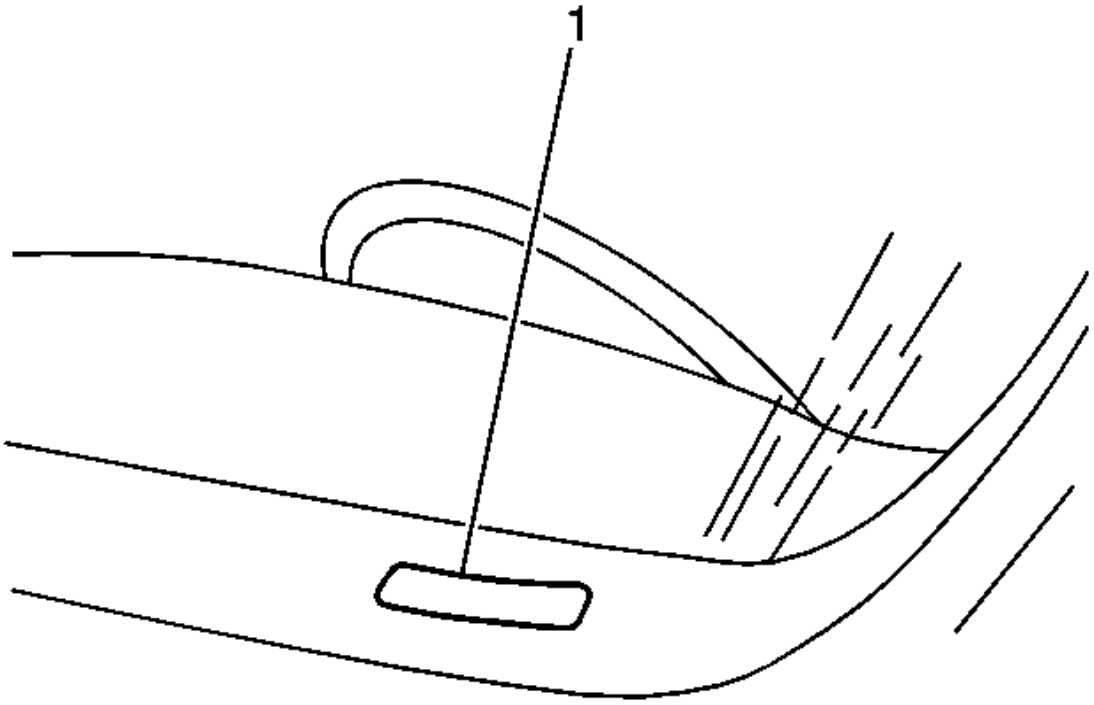

Fig. 2: View Of VIN Plate Location
Courtesy of GENERAL MOTORS COMPANY

Vehicle Identification Number (VIN) System

Position	Definition	Character	Description
The vehicle identification number (VIN) plate (1) is the legal identifier of the vehicle. The VIN plate is located on the upper left corner of the instrument panel (I/P) and can be seen through the windshield from the outside of the vehicle.			
1	Region of Build	2	Canada
2	Manufacturer	G	General Motors
3	Vehicle Brand/Type	1	Chevrolet Passenger Car
4 5	Carline/Series	W/A	Impala LS Fleet
		W/B	Impala LT Fleet
		W/C	Impala LTZ
		W/D	Impala Police Vehicle
6	Body Type	5	Sedan, 4-door, 6 Window, Notchback
7	Restraint System	E	Active Manual Belts, Airbags - Driver and Passenger - Front (1st row), Front Seat Side (1st row), Roof Side (all seating rows)
8	Engine Code	3	RPO LFX Engine - Gas, 6 Cylinder, 3.6L, V6, SIDI, DOHC,VVT, E85 Max, ALUM, GM
9	Check Digit	-	Check Digit
10	Model Year	F	2015
11	Plant Location	1	Oshawa #2, ONT, Canada
12-17	Plant Sequence Number	-	Plant Sequence Number

VIN Derivative Characters

Position	Definition	Character	Description
All engines and transmissions are stamped with a partial vehicle identification number (VIN). This table identifies the different VIN derivative characters and their respective positions.			
1	Division	2	Chevrolet
2	Model Year	F	2015
3	Plant Location	1	Oshawa #2, ONT, Canada
4-9	Plant Sequence Number	-	Plant Sequence Number
A VIN derivative can be used to determine if a vehicle contains the original engine or transmission by matching the VIN derivative positions to their accompanying positions in the complete VIN.			

VIN Positions

VIN Derivative Position	Equivalent VIN Position
1	3
2	10
3	11

VIN Derivative Position	Equivalent VIN Position
4-9	12-17

VEHICLE CERTIFICATION, TIRE PLACARD, ANTI-THEFT, AND SERVICE PARTS ID LABEL

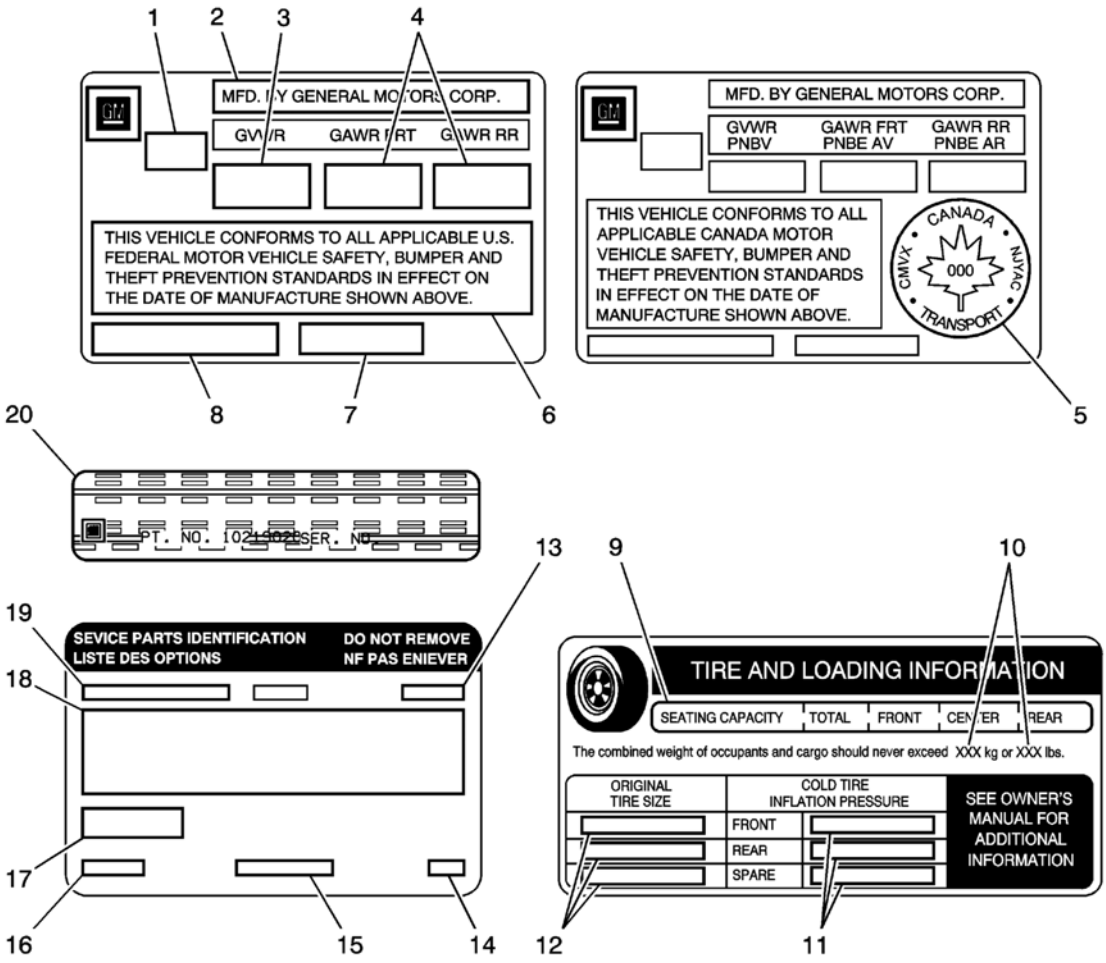

Fig. 3: Identifying Vehicle Certification, Tire Place Card, Anti-Theft & Service Parts ID Labels
Courtesy of GENERAL MOTORS COMPANY

Callout	Description

Vehicle Certification Label
The vehicle certification label is located on the driver door and displays the following assessments:
• Gross vehicle weight rating (GVWR)
• Gross axle weight rating (GAWR), front and rear
• The gross vehicle weight (GVW) is the weight of the vehicle and everything it carries. The gross vehicle weight must not exceed the GVWR. Include the following items when figuring the GVW:
  • The base vehicle weight (factory weight)
  • The weight of all vehicle accessories
  • The weight of the driver and the passengers	

Callout	Description
	• The weight of the cargo
1	Name of Manufacturer
2	Gross Vehicle Weight Rating
3	Gross Axle Weight Rating (Front, Rear)
4	Canadian Safety Mark (w/RPO Z49)
5	Certification Statement
6	Vehicle Class Type (Pass Car, etc.)
7	Vehicle Identification Number
8	Date of Manufacture (Mo/Yr)
Tire Placard The tire placard label is located on the driver side center pillar, below the door latch, and displays the following assessments:	
9	Specified Occupant Seating Positions
10	Maximum Vehicle Capacity Weight
11	Tire Pressure, Front, Rear, and Spare (Cold)
12	Original Equipment Tire Size
Service Parts ID Label The vehicle service parts identification label is located in the instrument panel (I/P) compartment. The label is use to help identify the vehicle original parts and options.	
13	Vehicle Identification Number
14	Engineering Model Number (Vehicle Division, Line and Body Style)
15	Interior Trim Level and Decor
16	Exterior (Paint Color) WA Number
17	Paint Technology
18	Special Order Paint Colors and Numbers
19	Vehicle Option Content
Anti-Theft Label	
20	The Federal law requires that General Motors label certain body parts on this vehicle with the VIN. The purpose of the law is to reduce the number of motor vehicle thefts by helping in the tracing and recovery of parts from stolen vehicles. Labels are permanently affixed to an interior surface of the part. The label on the replacement part contains the letter R, the manufacturer's logo, and the DOT symbol. The anti-theft label must be covered before any painting, and rustproofing procedures, and uncovered after the procedures. Failure to follow the precautionary steps may result in liability for violation of the Federal Vehicle Theft Prevention Standard and possible suspicion to the owner that the part was stolen.

RPO CODE DESCRIPTION

The following table provides the description of the Regular Production Option (RPO) codes that are available on the vehicle. The vehicle's RPO list is printed on the Service Parts Identification Label.

RPO	Description

RPO	Description
17U	PRIMARY COLOR EXTERIOR, SWITCHBLADE SILVER MET (09)
192	TRIM COMBINATION LEATHER, EBONY (02) (00)
19C	TRIM COMBINATION CLOTH, EBONY (C) (00)
19E	TRIM COMBINATION CLOTH, EBONY (C)
19G	TRIM COMBINATION CLOTH, EBONY (G) (04)
19I	INTERIOR TRIM EBONY (I) (00)
41U	PRIMARY COLOR EXTERIOR, BLACK (97)
50U	PRIMARY COLOR EXTERIOR, OLYMPICS WHITE (02)
6A3	COVERING - FLOOR MAT, FRONT AND REAR, HD.
6B2	HANDLE - REAR DOOR, INOPERATIVE
6B7	WIRING PROVISIONS - ROOF PANEL ACCESS HOLE CENTER
6C7	LAMP - DOME PASS
6C8	CABLE - RG58 A/U COAX RADIO ANTENNA
6E2	CYLINDER UNIT - SINGLE KEY SYSTEM, CODED DF81
6E8	CYLINDER UNIT - SINGLE KEY SYSTEM, CODED NU97
6F5	WIRING PROVISIONS - ROOF
6J1	WIRING PROVISIONS - IGNITION AND MAIN POWER SUPPLY
6J3	WIRING PROVISIONS - HEADLAMP FLASHER, GRILLE LAMPS AND SPEAKERS
6J4	WIRING PROVISIONS - HORN/SIREN CIRCUIT
6J5	WIRING PROVISIONS - ROOF PANEL ACCESS HOLE RH SI
6J6	LAMP PACKAGE - EMERGENCY VEHICLE R/WDO PANEL
6J7	FLASHER - HEADLAMP
6N5	HANDLE - INOPERATIVE, REAR WINDOW
6N6	LOCK CONTROL - REAR DOOR, INOPERATIVE
702	TRIM COMBINATION-LEATHER, LT NEUTRAL (2) (05)
70C	TRIM COMBINATION-CLOTH, LT NEUTRAL (C) (05)
70I	PRIMARY COLOR-EXTERIOR, VICTORY RED (9260)
7B3	SUSPENSION SYSTEM - SPECIAL HANDLING
7M9	COOLING SYSTEM - STEERING OIL AND ENGINE OIL
7X6	SPOTLAMP - LEFT, PILLAR MOUNTED, HALOGEN
7X7	SPOTLAMP - LEFT AND RIGHT, PILLAR MOUNTED, HALOGEN
7X8	SPOTLAMP - PROVISIONS, LEFT
7X9	SPOTLAMP - PROVISIONS, LEFT AND RIGHT
7Y6	SWITCH - DOME LAMP, DOOR JAMB INOPERATIVE
832	TRIM COMBINATION LEATHER, TITANIUM (2) (06)
83C	TRIM COMBINATION CLOTH, TITANIUM (C) (06)
83I	INTERIOR TRIM TITANIUM (06)
8X1	VEHICLE LABEL - FASTEN SEAT BELTS
9C1	SEO VEHICLE - POLICE CAR
9C3	SEO VEHICLE - POLICE CAR, CONTENT

RPO	Description
9G8	EQUIPMENT - DAYTIME RUNNING LAMP AND HEADLAMPS CONTROL, DELETE
A75	SEAT CUSHION - BACK FRONT, HD
A76	SEAT CUSHION - BACK REAR, HD
A98	LOCK CONTROL REAR COMPARTMENT - LID, REMOTE CONTROL ELECTRIC RELEASE, IGNITION POWERED
AG1	ADJUSTER FRONT SEAT - POWER, MULTIDIRECTIONAL, DRIVER
AG2	ADJUSTER PASSENGER SEAT - POWER MULTIDIRECTIONAL
AH5	ADJUSTER FRONT SEAT - POWER, 8-WAY, NO MEMORY, DRIVER
AL0	SENSOR INDICATOR - INFLATABLE RESTRAINT, FRONT PASSENGER/CHILD PRESENCE DETECTOR
AM9	SEAT REAR - SPLIT BACK, FOLDING
AMF	LOCK CONTROL - ADDITIONAL, PROGRAMMABLE, REMOTE ENTRY, MULTIPLE UNITS
AN3	SEAT FRONT - INDIVIDUAL (NON BKT)
AP3	LOCK CONTROL, ENTRY - REMOTE, KEYLESS ENTRY, START
AR9	SEAT - FRONT BUCKET, DELUXE
AT8	RESTRAINT PROVISIONS - CHILD, REAR SEAT, REAR FACING
AXJ	VEHICLE TYPE PASSENGER CAR
AY0	RESTRAINT SYSTEM - SEAT, INFLATABLE, DRIVER AND PASS FRT, SEAT SIDE, ROOF SIDE
B34	COVERING FRONT - FLOOR MATS, CARPETED INSERT
B35	COVERING REAR - FLOOR MATS, CARPETED INSERT
B3B	ORNAMENTATION - INTERIOR, SPORT
B3V	TEST - EXTENDED WATER
B42	COVERING - FLOOR MAT, LUGGAGE COMPARTMENT, FITTED
B86	MOLDING BODY SIDE - BODY COLOR
B9V	HANDLING CHARGE - OSHAWA ASSEMBLY TO KERR INDUSTRIES IN OSHAWA, BACK TO OSHAWA ASSEMBLY
BAG	PARTS PACKAGE - EXPORT
BDR	LOCK CYLINDER - RR COMPT
BZP	ORNAMENTATION - INTERIOR, WOODGRAIN
C67	HVAC SYSTEM - AIR CONDITIONER FRONT, ELECTRONIC CONTROLS
CAV	ACCESSORY-TRAY - TRUNK/CARGO AREA
CF5	ROOF - SUN GLASS, SLIDING ELECTRIC
CJ3	HVAC SYSTEM - AIR CONDITIONER FRONT, MANUAL TEMPERATURE CONTROL, AUXILIARY TEMPERATURE CONTROL
CW7	COUNTRY - PUERTO RICO/US VIRGIN ISLANDS
D55	CONSOLE - FRONT COMPARTMENT, FLOOR
D81	SPOILER - REAR, AERO WING
DD6	MIRROR INSIDE REAR VIEW - LIGHT SENSITIVE, DUAL READING LAMPS

RPO	Description
DG7	MIRROR OUTSIDE - LH AND RH, REMOTE CONTROL, ELECTRIC, COLOR
DH6	MIRROR INSIDE FRONT VAN - LH AND RH SUNSHADE, ILLUMINATED
DK2	MIRROR O/S LH & RH, REMOTE CONTROL, ELECTRIC, HEATED, COLOR
EF7	COUNTRY - UNITED STATES OF AMERICA (USA)
EXP	EXPORT

ZFH	TIRE SPARE - COMPACT, T125/70D16

FASTENERS

Metric Fasteners

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A PosidriveÂ® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in PosidriveÂ® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4-20 and 1/4-28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

Fastener Strength Identification

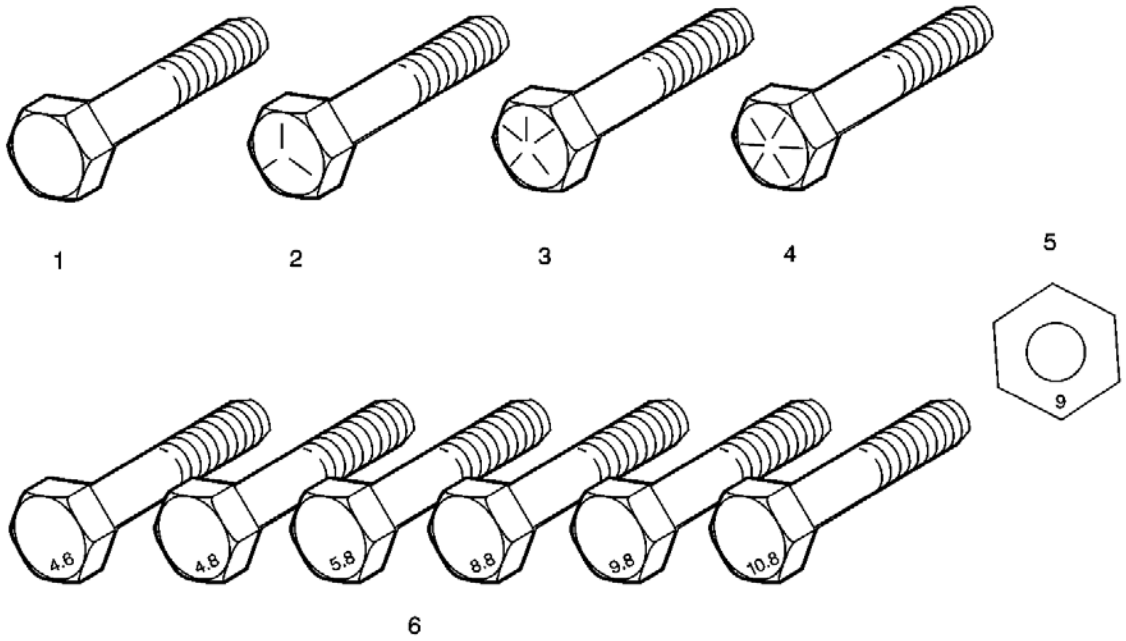

Fig. 4: Identifying Fastener Strength Marks
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	English Bolt, Grade 2 (Strength Class)
2	English Bolt, Grade 5 (Strength Class)
3	English Bolt, Grade 7 (Strength Class)
4	English Bolt, Grade 8 (Strength Class)
5	Metric Nut, Strength Class 9
6	Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 X 1
- M8 X 1.25
- M10 X 1.5
- M12 X 1.75
- M14 X 2.00
- M16 X 2.00

Prevailing Torque Fasteners

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

All Metal Prevailing Torque Fasteners

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

Nylon Interface Prevailing Torque Fasteners

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

Adhesive Coated Fasteners

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

Adhesive Coated Fasteners

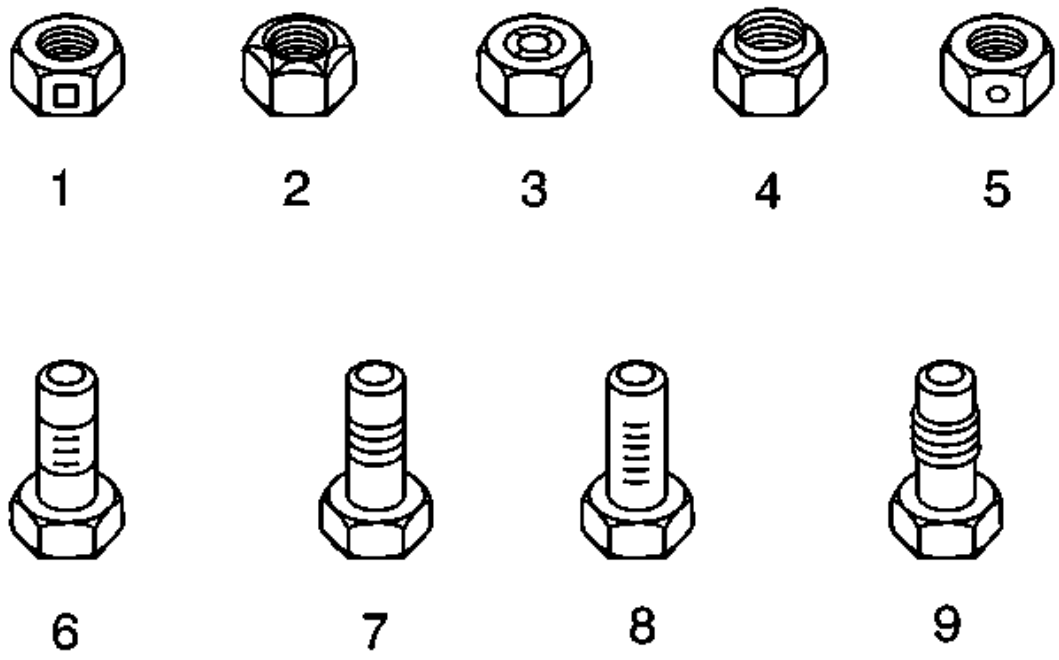

Fig. 5: Identifying Adhesive Coated Fasteners
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Prevailing Torque Nut, Center Lock Type
2	Prevailing Torque Nut, Top Lock Type
3	Prevailing Torque Nut, Nylon Patch Type
4	Prevailing Torque Nut, Nylon Washer Insert Type
5	Prevailing Torque Nut, Nylon Insert Type
6	Prevailing Torque Bolt, Dry Adhesive Coating Type
7	Prevailing Torque Bolt, Thread Profile Deformed Type
8	Prevailing Torque Bolt, Nylon Strip Type

Callout	Component Name
9	Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener
- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating

THREAD INSERTS

General Purpose Thread Repair Kits.

These kits are available commercially.

Repair Procedure

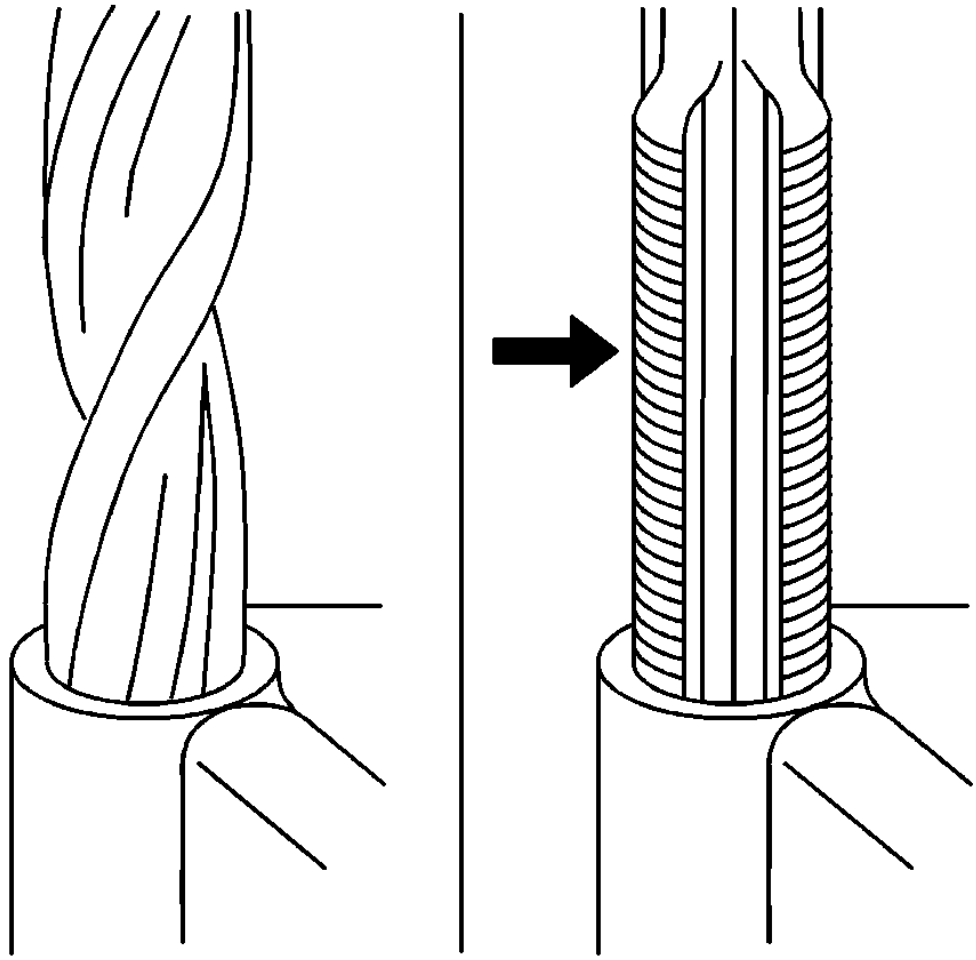

Fig. 6: Drilling & Tapping Damaged Threads
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Safety Glasses Warning .**

NOTE: **Refer to the thread repair kit manufacturer's instructions regarding the size of the drill and tap to use.**

Avoid any buildup of chips. Back out the tap every few turns and remove the chips.

1. Determine the size, the pitch, and the depth of the damaged thread. If necessary, adjust the stop collars on the cutting tool and tap to the required depth.

2. Drill out the damaged threads. Clean out any chips.
3. Lubricate the tap with light engine oil. Tap the hole. Clean the threads.

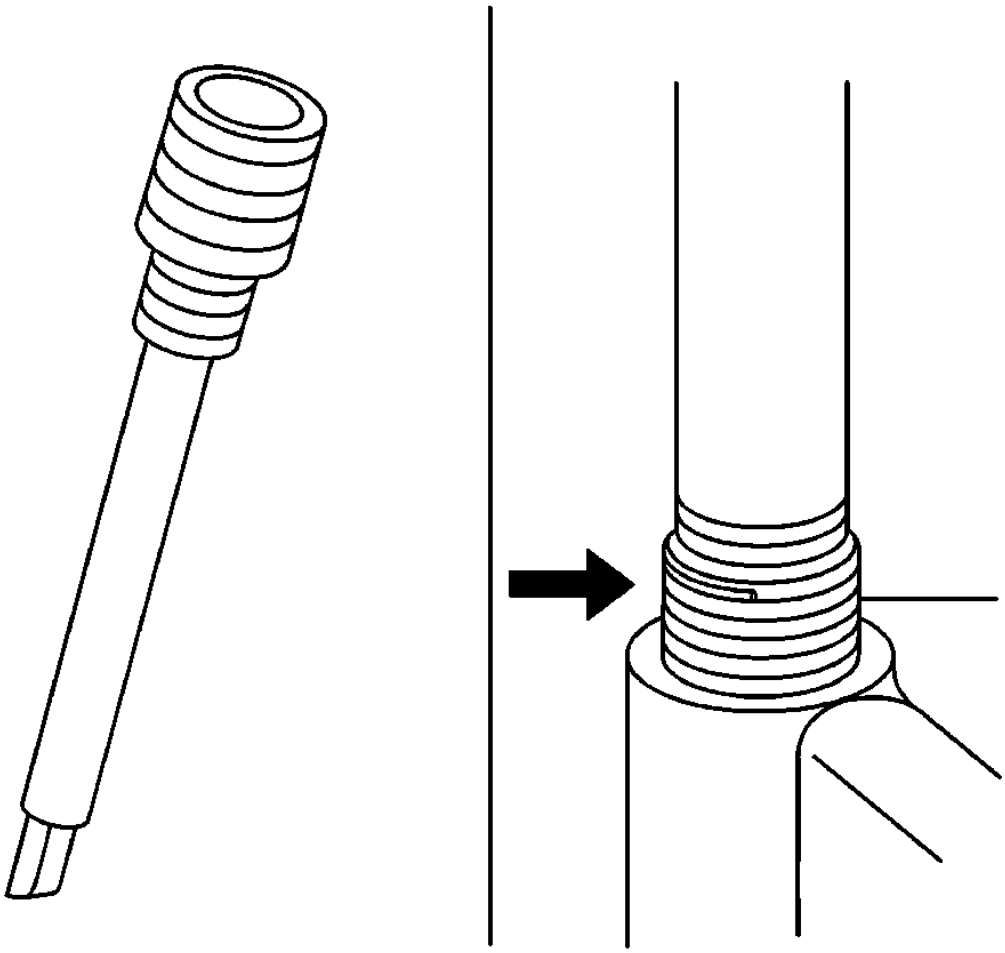

Fig. 7: View Of Thread Insert
Courtesy of GENERAL MOTORS COMPANY

4. Thread the thread insert onto the mandrel of the installer. Engage the tang of the insert onto the end of the mandrel.

NOTE: **The insert should be flush to one turn below the surface.**

5. Lubricate the insert with light engine oil, except when installing in aluminum and install the insert.
6. If the tang of the insert does not break off when backing out the installer, break the tang off with a drift.

KEY AND LOCK CYLINDER CODING

Special Tools

BO-48370 Lock Cylinder Cap Installer

Ignition Lock Cylinder

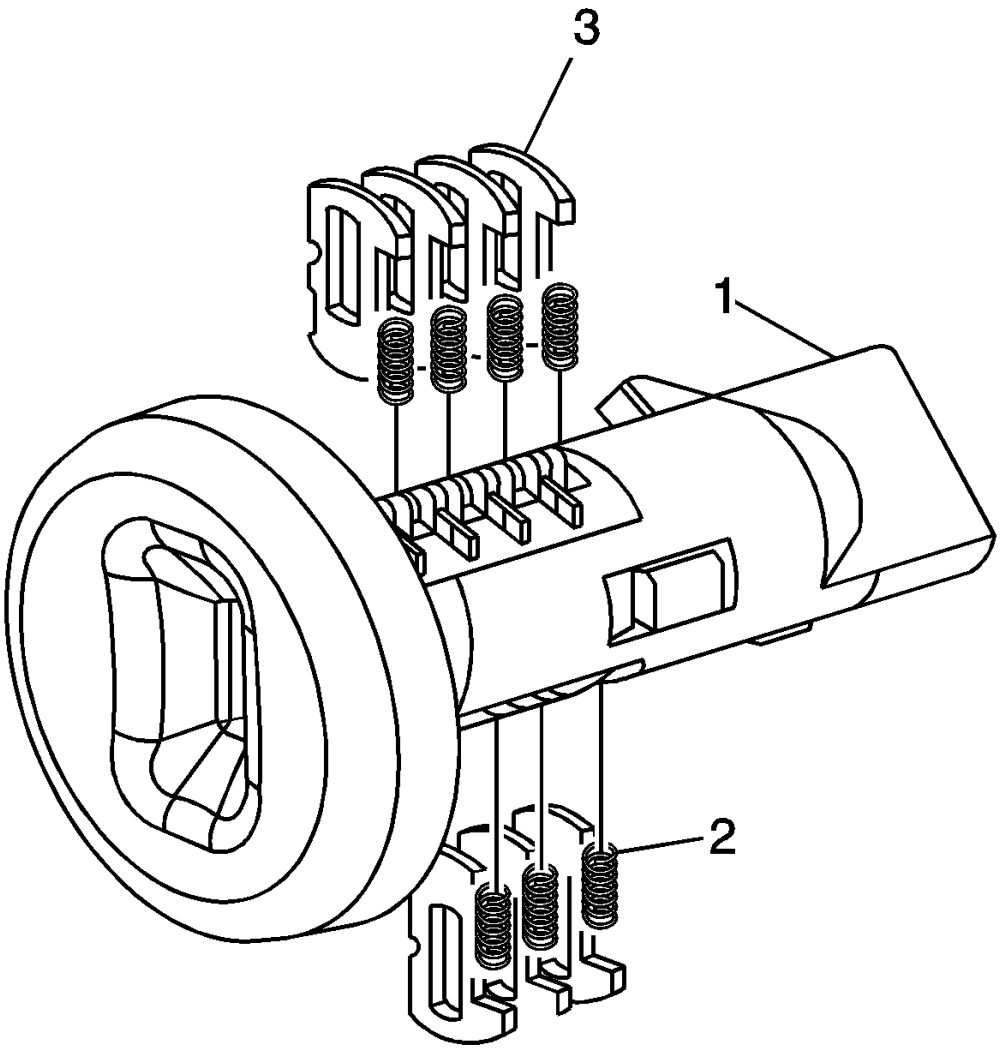

Fig. 8: Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

The ignition lock cylinder uses only 7 of the 10 cut positions, 3 through 9. The ignition cylinder tumblers are all located on alternate sides of the cylinder (1). They are snap-in and self-retaining. It follows the key code with the first tumbler being the first depth of the key code, closest to the head of the key.

1. Hold the ignition cylinder assembly (1) so the side with the 4 tumblers spring pocket of the cylinder is facing up.
2. Insert the tumbler springs (2) into each of the spring pockets of the cylinder assembly.
3. The first tumbler (3) to be loaded will be the third key cut position, the third number in the key code. Install the first tumbler in the slot nearest the head of the lock cylinder. Install the remaining tumblers for cuts 5, 7 and 9 following the key code and same process. Press the tumblers in place until they are secure.
4. Rotate cylinder assembly so the 3 tumblers springs pocket of the cylinder is facing up. Insert tumbler springs (2) into each of the spring pockets of the cylinder assembly.
5. The first tumbler (3) to be loaded will be the fourth key cut position, the fourth number in the key code. Install the first tumbler in the slot nearest the head of the lock cylinder. Install the remaining tumblers for cuts 6 and 8 following the key code and same process. Press the tumblers in place until they are secure.
6. Inspect for correct loading of the tumblers by inserting the key into cylinder. The side bar should drop flush with the lock cylinder body diameter.
7. Lightly lubricate the outside surfaces in the tumbler area of the lock body and down the key slot using the provided grease. Insert and extract the key 5 times to lubricate the keyway.
8. Line-up the lock to the run position. Insert lock in steering column. Rotate lock to key out position and remove key. Insert key and rotate lock 3 times to distribute the grease from the lock to column housing inside diameter.

Front Side Door Lock Cylinder

The front side door lock cylinder uses 8 of the 10 key cut positions, 3 through 10 when counting from the key head. The tumbler orientations alternate in adjacent locations from side to side with 4 on each side.

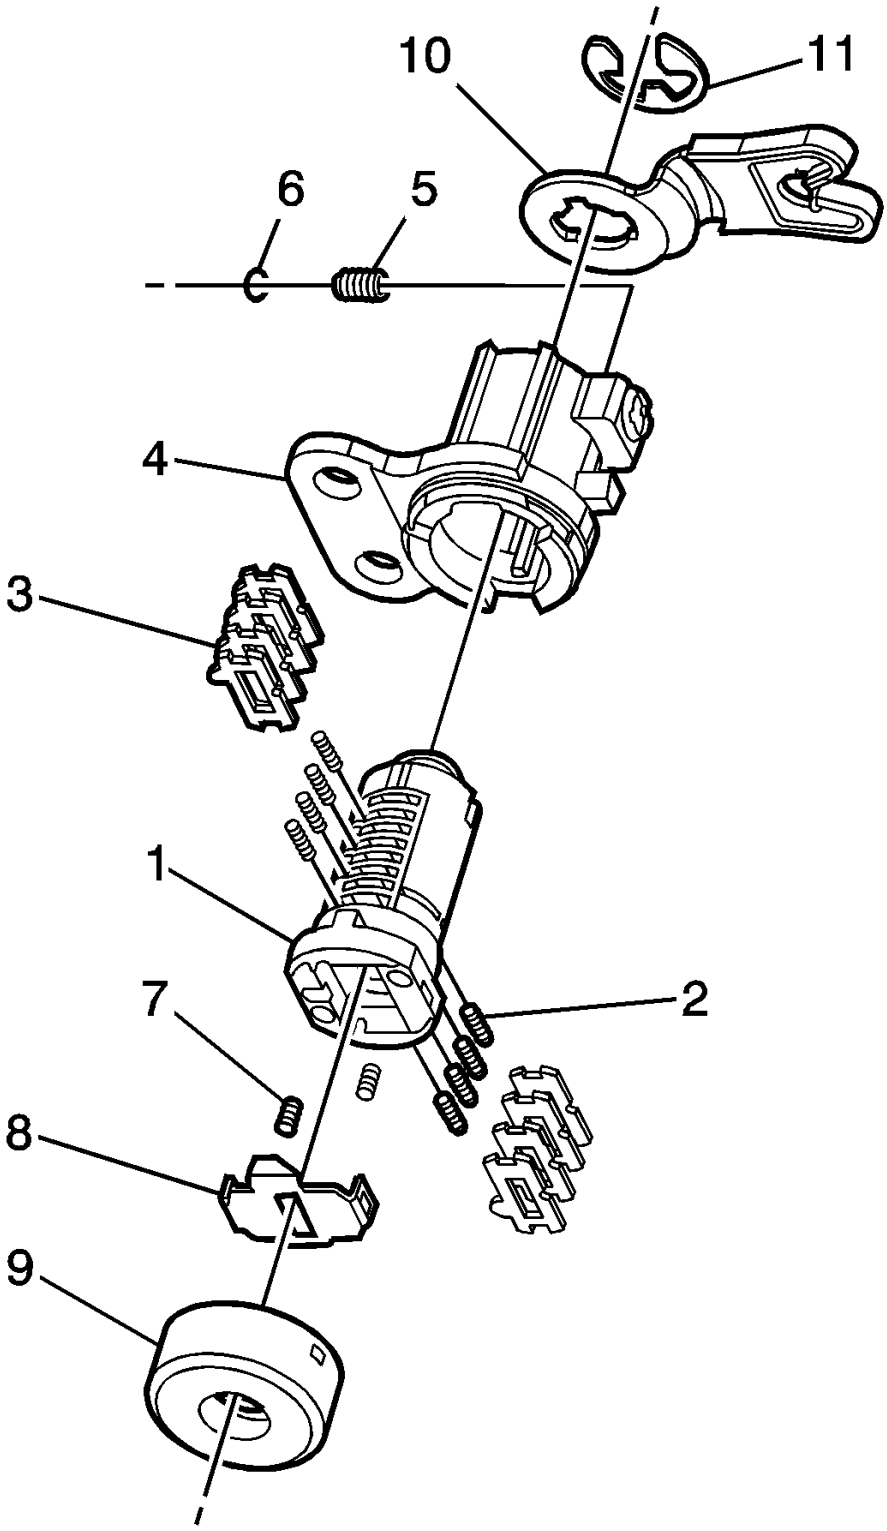

Fig. 9: Front Side Door Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The front side door lock cylinder tumblers (3) are not self-retaining and must be held in place if the key in not fully inserted into the lock cylinder or until the cylinder (1) is assembled into the case assembly (4). Left side shown, right side opposite.**

1. Hold the uncoded cylinder (1) positioned so the side with the rotational stop lug is facing upward, as shown.
2. Insert one tumbler spring (2) each into the 4 tumbler spring holes.
3. The first tumbler to be loaded will be key cut position 3, the third number in the key code. Determine the cut depth at this position and install the corresponding tumbler (3) into the tumbler slot nearest the front of the lock cylinder assembly (1), the end where the key is inserted.
4. In the same manner, determine the cut depth and corresponding tumbler and install the 3 remaining tumblers (3) into the tumbler slots located at key cut positions 5, 7, and 9.
5. Check the correct loading by holding the tumblers (3) in position and fully inserting the matching key into the cylinder (1). All tumblers should be flush with the outside diameter of the cylinder.
6. Rotate the cylinder (1) so the side with the rotational stop lug is facing downward and then remove the matching key. Remember the tumblers (3) are not self-retaining and must be held in place.
7. Insert one tumbler spring (2) each into the 4 tumbler spring holes.
8. The first tumbler to be loaded will be key cut position number 4. Determine the cut depth at this position and install the corresponding tumbler (3) into the tumbler slot nearest the front of the cylinder assembly.
9. In the same manner, determine the cut depth and corresponding tumbler and install the 3 remaining tumblers (3) into the tumbler slots located at key cut positions 6, 8, and 10.
10. Check for correct loading by holding the tumblers (3) in position and fully inserting the matching key into the cylinder (1). All tumblers should be flush with the outside diameter of the cylinder.
11. Lightly lubricate the tumbler (3) surfaces using the lubrication provided.
12. Hold the case assembly (4), left side shown, right side opposite, with the pre-staked detent spring retainer facing downward.
13. First insert one detent spring (5) and then one detent ball (6) into the detent spring hole located to the rear and inside of the cylinder case assembly (4). The detent spring and detent ball are not self-retaining and must be held in place until the coded cylinder is installed into the case assembly.

WARNING: Wear safety glasses in order to avoid eye damage.

14. With the matching key fully inserted into the coded cylinder, install the coded cylinder into the case assembly (4). Make sure the detent spring (5) and detent ball (6) are held in place until the coded cylinder is fully installed. The detent ball should line up with the V-shaped groove on the rear of the cylinder, which will prevent the detent spring and detent ball from falling out of the case assembly.
15. Remove the matching key being careful to keep the coded cylinder (1) fully inserted into the case assembly (4).
16. Insert one shutter spring (7) each into the two shutter spring holes located on the front face of the cylinder (1).
17. Install the shutter assembly (8) into the recessed area on the front face of the cylinder (1). Be sure that the ends of the pin on the shutter assembly are positioned in the pin cavities located in the front face of the cylinder.
18. Install the lock cylinder cap (9) by aligning the drain hole in the cap with the bottom of the case assembly (4). Snap the cap into place with light hand pressure. Be sure the cap is securely retained on the case assembly. Also, be sure that the shutter springs (7) push the shutter assembly (8) up against the inside surface of the cap.

19. Install the lever (10), left side shown, right side opposite, onto the end of the cylinder (1).
20. Install the retaining ring (11) in the groove at the end of the cylinder (1) to secure the lever (10) to the cylinder.

Rear Compartment Lid Lock Cylinder - Police Vehicles 9C1 and 9C3

The rear compartment lid lock cylinder uses 8 of the 10 key cut positions, 3-10 when counting from the key head. The tumbler orientations alternate in adjacent locations from side to side with 4 on each side.

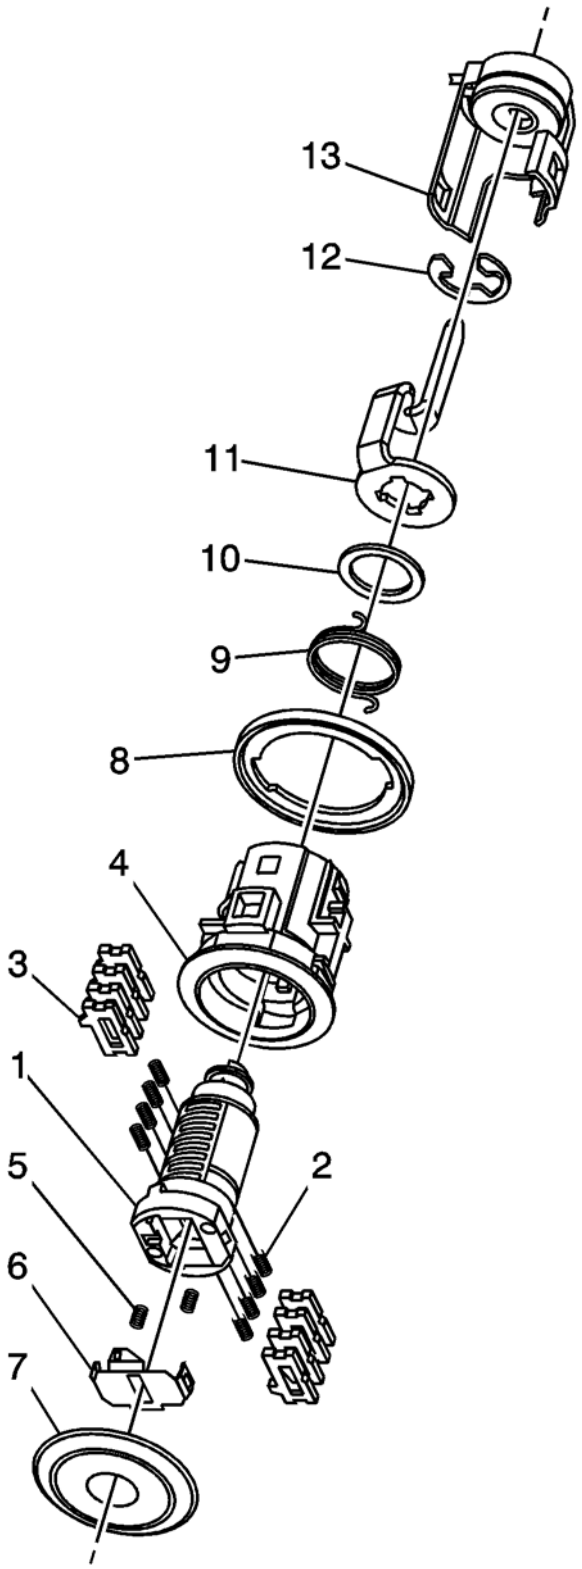

Fig. 10: Identifying Rear Compartment Lid Lock Cylinder Components (1 Of 2)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The rear compartment lid lock cylinder tumblers (3) are not self-retaining and must be held in place if the key is not fully inserted into the lock cylinder or until the cylinder (1) is assembled into the case (4).**

1. Hold the uncoded cylinder (1) positioned so the side with the drain hole is facing downward.
2. Insert one tumbler spring (2) each into the 4 tumbler spring holes.
3. The first tumbler to be loaded will be key cut position number 3, the third number in the key code. Determine the cut depth at this position and install the corresponding tumbler (3) into the tumbler slot nearest the front of the cylinder (1), the end where the key is inserted.
4. In the same manner, determine the cut depth and corresponding tumbler and install the 3 remaining tumblers (3) into the tumbler slots located at key cut positions 5, 7, and 9.
5. Check for correct loading by holding the tumblers (3) in position and fully inserting the matching key into the cylinder (1). All tumblers should be flush with the outside diameter of the cylinder.
6. Rotate the cylinder (1) so that the side with the drain hole is facing upward and then remove the matching key. Remember the tumblers (3) are not self-retaining and must be held in place.
7. Insert one tumbler spring (2) each into the 4 tumbler spring holes.
8. The first tumbler to be loaded will be key cut position number 4. Determine the cut depth at this position and install the corresponding tumbler (3) into the open tumbler slot nearest the front of the cylinder.
9. In the same manner, determine the cut depth and corresponding tumbler and install the 3 remaining tumblers into the tumbler slots located at key cut positions 6, 8, and 10.
10. Check for correct loading by holding the tumblers (3) in position and fully inserting the matching key into the cylinder (1). All tumblers should be flush with the outside diameter of the cylinder.
11. Lightly lubricate tumbler (3) surfaces using the lubrication provided.
12. With the matching key fully inserted into the coded cylinder, install the coded cylinder into the case (4).
13. Remove the matching key being careful to keep the coded cylinder (1) fully inserted into the case (4).
14. Insert one shutter spring (5) each into the 2 shutter spring holes located on the front face of the cylinder (1).
15. Install the shutter assembly (6) into the recessed area on the front face of the cylinder (1). Be sure that the ends of the pin on the shutter assembly are positioned in the pin cavities located in the front face of the cylinder.

NOTE: **Be careful not to scratch or dent the cosmetic surface of the cap or damage the lock cylinder in any way while staking the cap.**

16. Stake the cap (7) onto the head of the case (4) by using the appropriate staking tool **BO-48370** lock cylinder cap installer. Ensure proper orientation and set the cylinder assembly (14), (which includes the case (4), coded cylinder (1), shutter springs (5), and shutter assembly (6)) and the cap (7) into the staking cup (15) and clamp into vise. Remove any debris and install the cleaned staking ram (16) into staking cup (15) and with a dead blow hammer, hit the staking ram (16) with moderate force 2 or 3 times. Check to determine if cap is securely staked to the cylinder assembly (14). Repeat previous step until cap is securely staked to the cylinder assembly. Remove assembly from the staking cup (15). If necessary, insert the removal punch (17) into the opposite end of the staking cup and tap lightly. Confirm that the shutter springs (5) push the shutter assembly (6) up against the inside surface of the cap (7).

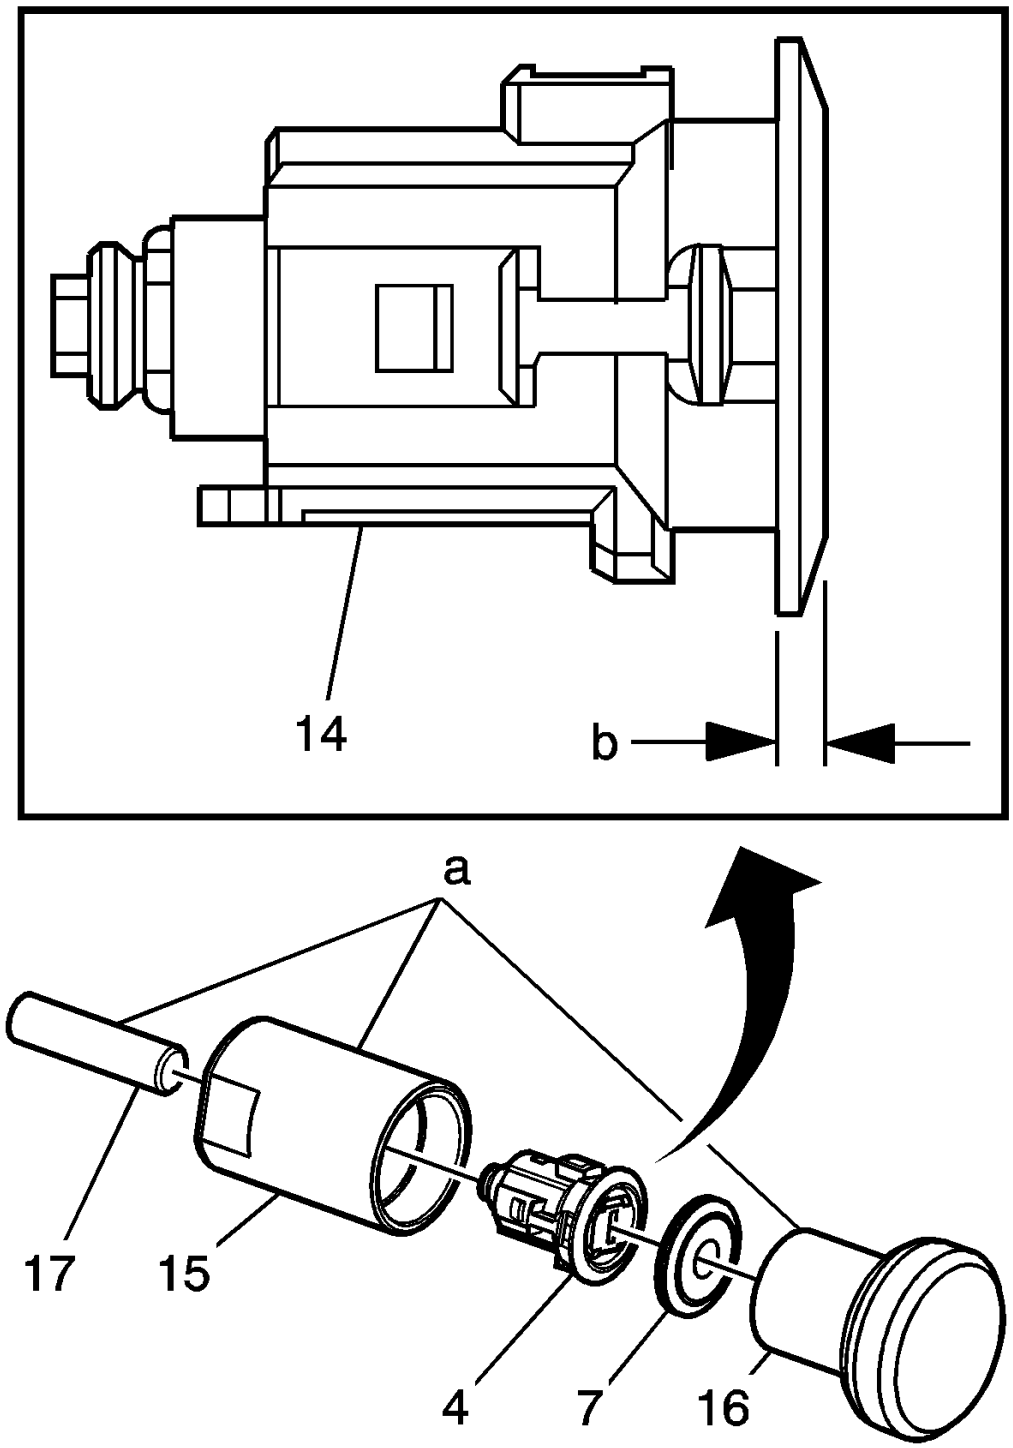

Fig. 11: Identifying Rear Compartment Lid Lock Cylinder Components (2 Of 2)
Courtesy of GENERAL MOTORS COMPANY

17. Install the gasket (8) over the end of the cylinder assembly and slide it all the way up the case (4) until it seats behind the cap (7).
18. Install the return spring (9) over the back end of the cylinder (1) with the straight hook facing the rear of the case (4). Engage the straight hook of the return spring with the hook feature on the rear of the case.

19. Install the spacer (10) and lever (11) onto the end of the cylinder (1).
20. Install the retaining ring (12) in the groove at the end of the cylinder (1) to secure the lever (11) to the cylinder. Engage the bent hook of the return spring (9) with the lever.
21. Install the theft deterrent switch (13) onto the end of the cylinder (1) and snap the switch legs onto the case (4). Be sure the theft deterrent switch is engaged with the end of the cylinder and is securely attached to the case.
22. Check the operation of the lock assembly. The return spring (9) should provide a counterclockwise snap back.

LIFTING AND JACKING THE VEHICLE

WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.

WARNING: To avoid any vehicle damage, serious personal injury or death, always use the jackstands to support the vehicle when lifting the vehicle with a jack.

CAUTION: Perform the following steps before beginning any vehicle lifting or jacking procedure:

- **Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.**
- **The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.**
- **The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.**
- **Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.**
- **Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.**

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

Automotive Lift and Floor Jack Contact Points

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2750: HORN RELAY COIL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2750 00

Horn Relay Coil Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Relay Control	B2750 00	B2750 00	B2750 00	-
Horn Control	2	2	1	-
Horn Switch Ground	-	2	2	-
Horn Ground	-	2	2	-
1. Horn Always On 2. Horn Inoperative				

Circuit/System Description

The body control module (BCM) controls the HORN relay by grounding the control circuit of the horn relay coil energizing the relay. When the HORN relay is energized, the horn relay contacts close applying voltage through the HORN fuse and the horn control circuit to the horns.

Conditions for Running the DTC

When the output is actively being requested by the BCM.

Conditions for Setting the DTC

The BCM detects a short to ground, open, or short to voltage in the horn relay control circuit for approximately 125 milliseconds.

Action Taken When the DTC Sets

The BCM disables the output to the HORN relay until the next ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Verification

Command the horns ON and OFF with the scan tool. The horns should turn ON and OFF when changing between the commanded states.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
2. Connect a test lamp between B+ and the control circuit terminal K3.
3. Press and release the horn switch. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground or a sticking horn switch. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage, an open high resistance, or a horn switch which is not closing. If the circuit tests normal, replace the BCM.
4. If all circuits test normal, replace the underhood fuse block.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Accessory Wiring Junction Block Replacement**
- **Control Module References** for BCM replacement, setup and programming

SYMPTOMS - HORNS

The following steps must be completed before using the symptom tables:

IMPORTANT:

1. Perform **Diagnostic System Check - Vehicle** , before using the symptom tables in order to verify that all of the following are true:

- There are no DTCs set
- The control modules can communicate via the serial data link

2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Horns System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the horn system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Perform the following if a horn buzzes or has a harsh tone.
  - Inspect for debris in the joint where the horn fastens to the vehicle.
  - Test the torque of the horn mounting hardware. The horn mounting hardware should be tightened to a torque of 10 N.m (7 lb ft).

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure **Horns Malfunction** in order to diagnose the symptom.

HORNS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Relay Control	2	1	B2750 00	-
Horn Control	2	2	1	-
Horn Switch Ground	-	2	-	-
Horn Ground	-	2	-	-
1. Horn Always On 2. Horn Inoperative				

Circuit/System Description

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing the horn

switch applies ground through the switch contacts and the horn relay control circuit to the coil side of the relay, energizing the relay. Battery voltage is then applied through the switch side of the relay, the HORN fuse, and the horn control circuit to the horns. The body control module (BCM) may also apply ground to the horn relay control circuit as described above. The horns sound as long as ground is applied to the horn relay control circuit.

Diagnostic Aids

OnStarÂ® RemoteLink™ applications or "apps" downloads are available to owners of certain mobile devices. Unwanted or inadvertent horn activations have been associated with these applications to which the customer may be unaware. Contact the GM Technical Assistance Center regarding information on a remedy for this situation.

A short to ground in the horn relay control circuit or a short to voltage in the horn control circuit will cause the horn to sound continuously until the horn overheats and become inoperative.

Rotate the steering wheel while pressing the horn pad to identify intermittent and poor connections within the steering column.

If diagnosing a Horn- Poor Tone condition, inspect the following:

- Debris or water in the horn assembly.
- Proper horn mounting hardware torque. Refer to **Fastener Specifications**.
- Debris in the joint where the horns attach to the vehicle.
- Debris in direct contact with the horn
- Vehicle components vibrating while the horn is sounding

Description and Operation

Horns System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition OFF, connect a test lamp between the horn fuse test point and ground.
2. Press and release the horn switch. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp does not illuminate or remains illuminated at all times, refer to Horn Switch Circuit Test.
3. Connect a 15 A fused jumper wire between the horn fuse test point and B+. The horns should sound and emit a clear and even tone.
    - If the horns do not sound, refer to Horn Circuit Test.
    - If the sound emitted is not clear and even, refer to Horn - Poor Tone.

Circuit/System Testing

Horn Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the horn switch.
2. Test for less than 1 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for and open/high resistance.
3. Connect the harness connector at the horn switch.
4. Disconnect the X2 harness connector at the underhood fuse block.
5. Connect a test lamp between B+ and the control circuit terminal K3.
6. Press and release the horn switch. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground or a sticking horn switch. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage, an open high resistance, or a horn switch which is not closing.
7. Ignition OFF, connect the X2 harness connector at the underhood fuse block. Disconnect the harness connector at the horn assembly.
8. Verify that a test lamp does not illuminate between the control circuit terminal B and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
9. If all circuits test normal, replace the underhood fuse block.

Horn Circuit Test

1. Ignition OFF, disconnect the harness connector at the horn assembly.
2. Test for less than 1 Ω between the ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for and open/high resistance.
3. Connect a test lamp between the control circuit terminal B and ground.
4. Press and release the horn switch. The test lamp should turn ON and OFF when changing between the

commanded states.

- If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
- If the test lamp is always OFF and the circuit fuse is good, test the control circuit for an open/high resistance. If the circuit tests normal, replace the underhood fuse block.
- If the test lamp is always OFF and the circuit fuse is open, test the control circuit for a short to ground. If the circuit tests normal, test or replace the horn assembly.

5. If all circuit test normal, test or replace the horn assembly.

Horn - Poor Tone

1. Ignition OFF, disconnect the harness connector at the horn assembly.
2. Test for less than 1 Ω between the ground circuit terminal A and ground.
   - If greater than the specified range, test the ground circuit for high resistance.
3. Disconnect the X3 harness connector at the underhood fuse block.
4. Test for less than 1 Ω between the control circuit terminal J3 at the underhood fuse block and the control circuit terminal B at the horn assembly.
   - If greater than the specified range, test the control circuit for high resistance.
5. If all circuits test normal, test or replace the horn assembly.

Component Testing

Horn

1. Ignition OFF, disconnect the harness connector at the horn assembly.
2. Install a 15 A fused jumper wire between the control terminal B and 12 V. Install a jumper wire between the ground terminal A and ground. Verify the horn emits a clear and even tone.
   - If the sound emitted is not clear and even, replace the horn assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Horn Replacement**
- **Steering Wheel Horn Switch Replacement**
- **Instrument Panel Electrical Center or Junction Block Replacement - Right Side (Impala)**
- **Control Module References** for BCM replacement, programming and setup

REPAIR INSTRUCTIONS

HORN REPLACEMENT

Removal Procedure

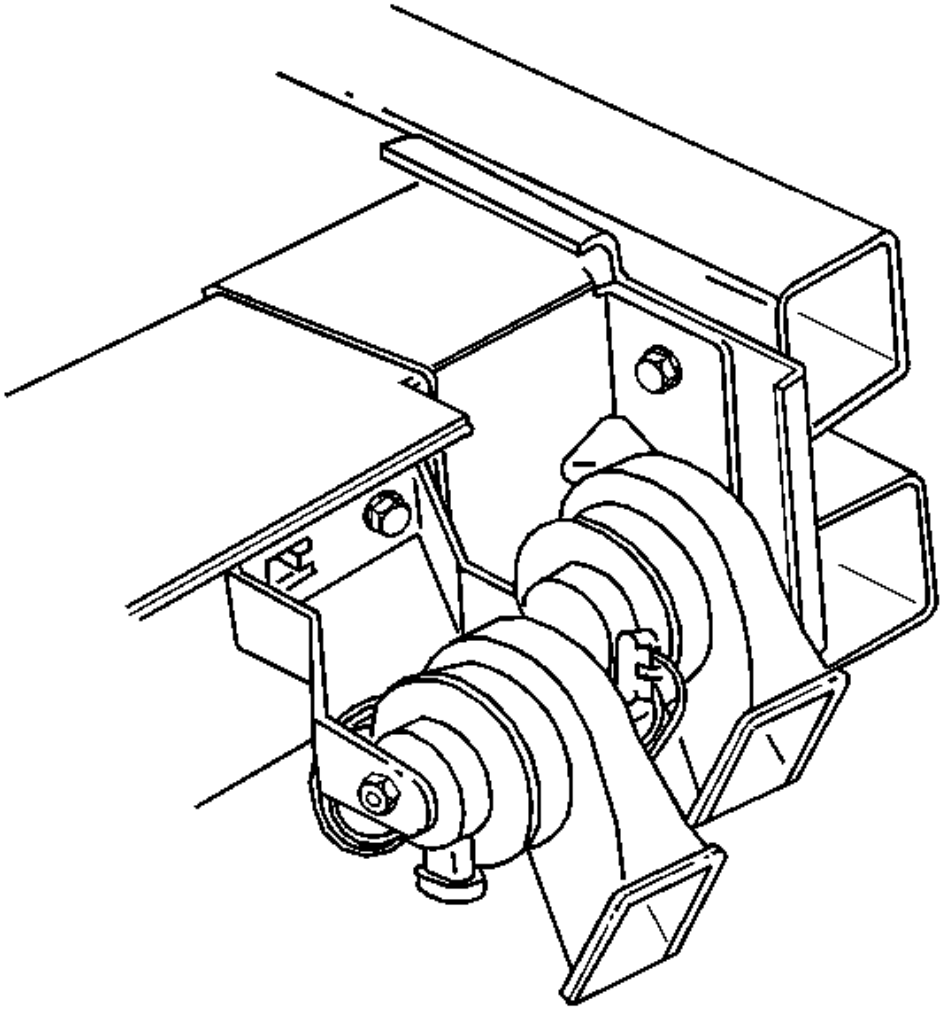

Fig. 2: Vehicle Horn
Courtesy of GENERAL MOTORS COMPANY

1. Open the hood.
2. Remove the right headlamp. Refer to **Headlamp Replacement** .
3. Disconnect the horn electrical connector.

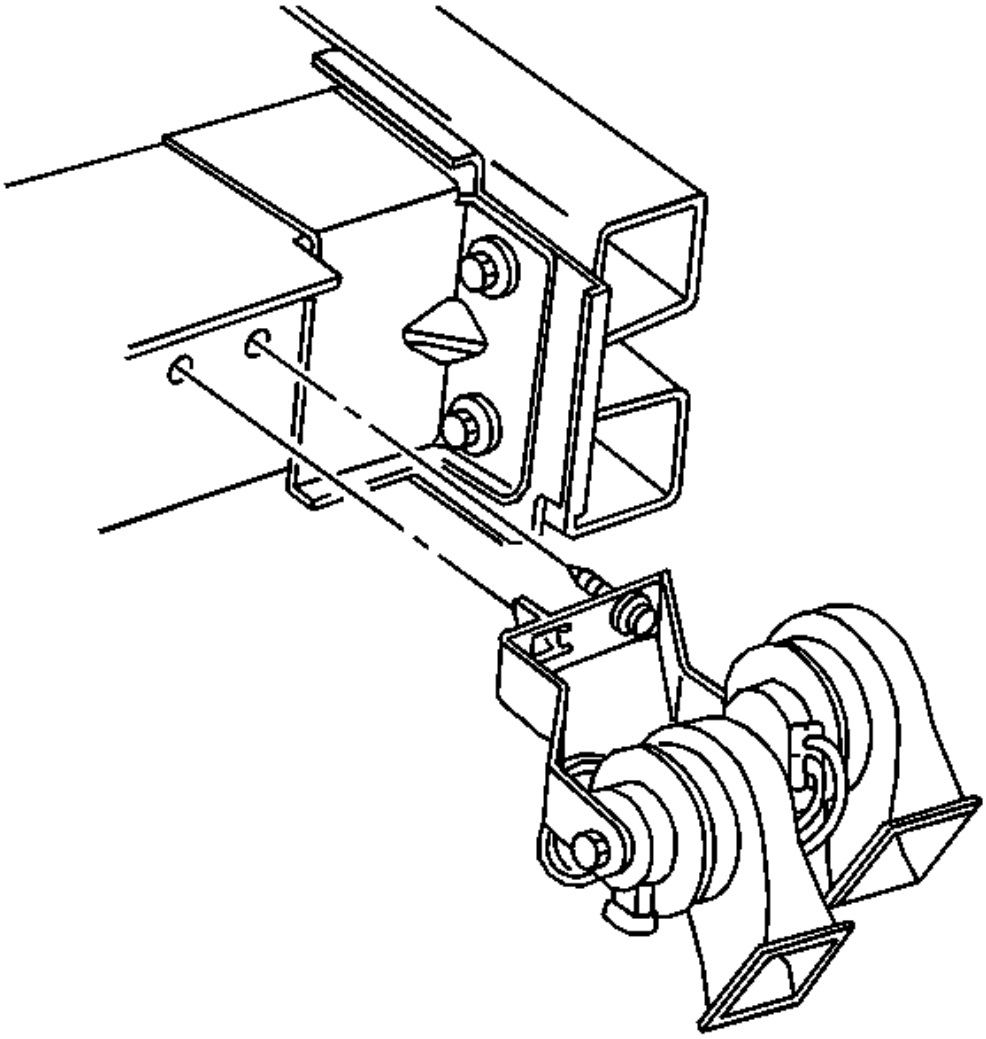

Fig. 3: Horn Bracket & Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the horn bracket bolt.
5. Remove the horn from the frame rail extension.

Installation Procedure

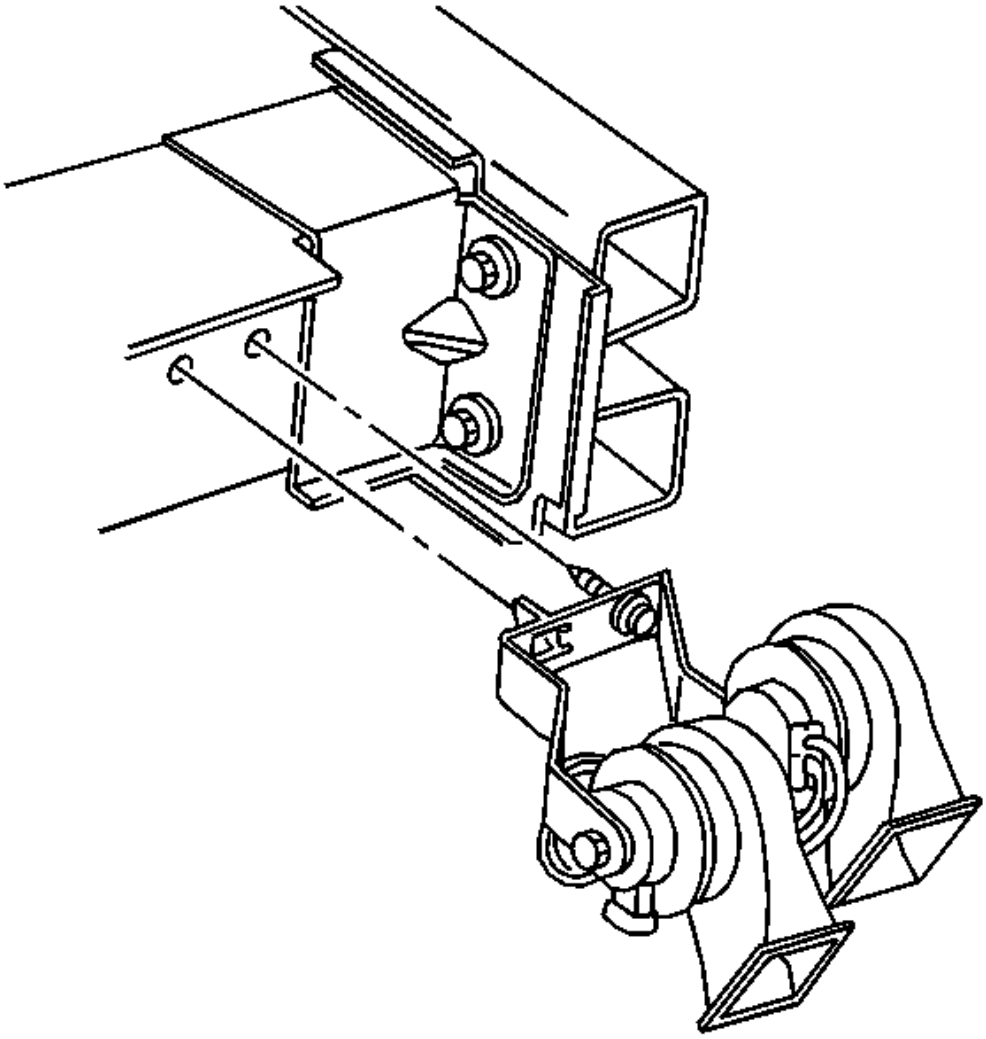

Fig. 4: Horn Bracket & Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the horn to the frame rail extension and insert the horn anti-rotation tab into the slot on the frame rail.

CAUTION: **Refer to Fastener Caution .**

2. Install the horn bracket bolt.

Tighten

Tighten the bolt to 15 N.m (11 lb ft).

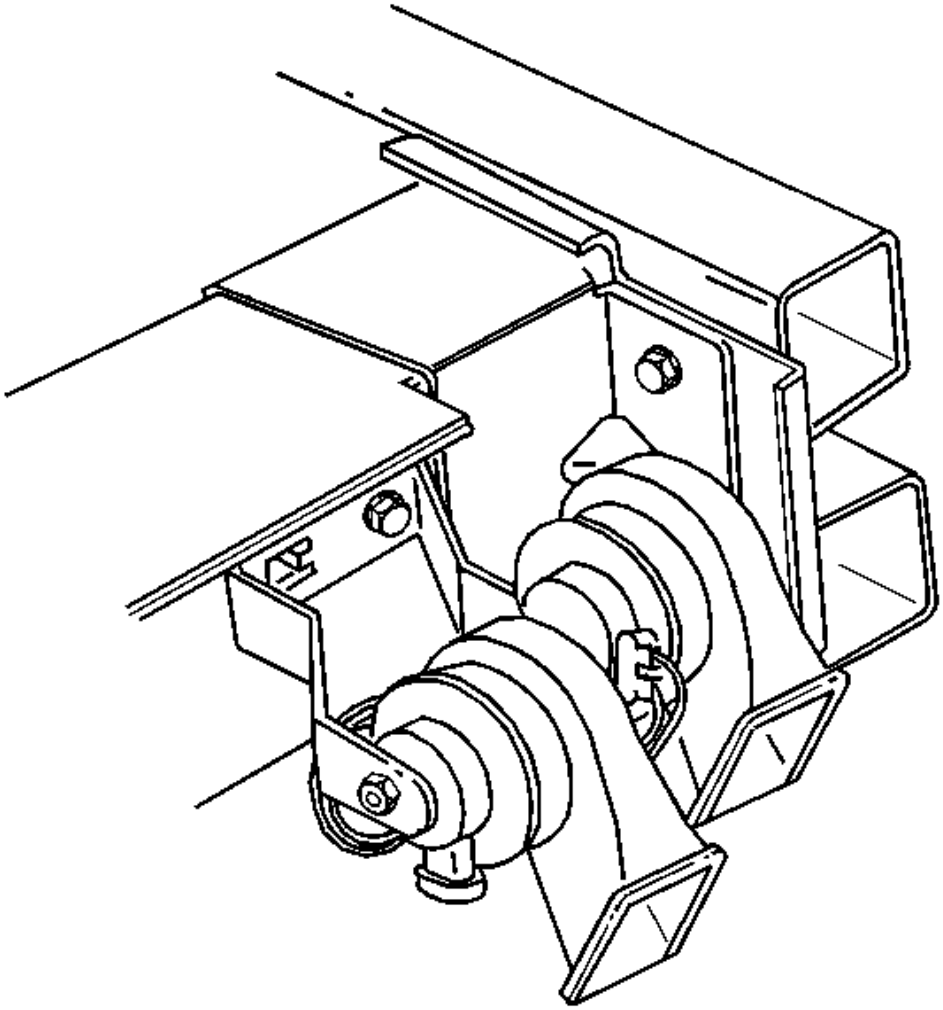

Fig. 5: Vehicle Horn
Courtesy of GENERAL MOTORS COMPANY

3. Connect the horn electrical connector.
4. Install the right headlamp. Refer to **Headlamp Replacement** .
5. Close the hood.

STEERING WHEEL HORN SWITCH REPLACEMENT

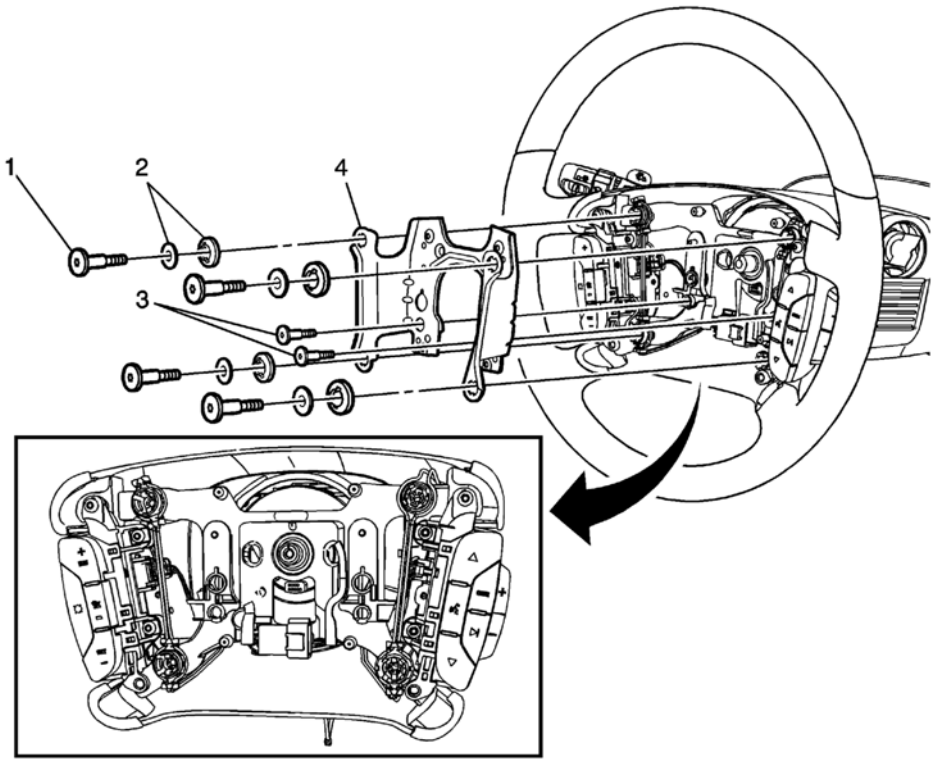

Fig. 6: Horn Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint steering wheel module. Refer to **Airbag Steering Wheel Module Replacement** .	
1	Steering Wheel Horn Switch Bolts (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution** **.** **TIP:** Hand start the bolts on installation to avoid cross threading. **Tighten** 7 N.m (62 lb in)
2	Steering Wheel Horn Switch Washers (Qty: 4)
3	Steering Wheel Horn Switch Screws (Qty: 2) **TIP:** Hand start the screws on installation to avoid cross threading. **Tighten** 5 N.m (44 lb in)
4	Steering Wheel Horn Switch Assembly **TIP:** Disconnect the steering wheel horn switch electrical connector.

DESCRIPTION AND OPERATION

HORNS SYSTEM DESCRIPTION AND OPERATION

System Description

The horn system consists of the following components:

- The HORN fuse
- The Horn PCB relay
- The Horn switch contacts
- The Horn assembly
- Body control module (BCM)

System Operation

- The vehicle horns are activated whenever the horn switch is depressed.
- The BCM commands the horns ON under any of the following conditions:
  - When the panic button is depressed on the remote control door lock transmitter. For further information refer to **Keyless Entry System Description and Operation** .
  - When the content theft deterrent system detects a vehicle intrusion. For further information refer to **Theft Systems Description and Operation** .
  - When the keyless entry system is used to lock the vehicle, a horn chirp may sound to notify the driver that the vehicle has been locked. The notification feature may be enabled or disabled through personalization. For further information refer to **Keyless Entry System Description and Operation** .

Circuit Operation

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing the horn switch applies ground to the horn relay control circuit. When the horn relay control circuit is grounded, the horn relay is energized and battery positive voltage is applied to the horns through the horn control circuit. The horns sound as long as ground is applied to the horn relay control circuit.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B302A: TELEMATIC REQUESTED IMMOBILIZATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B302A 00

Telematic Requested Immobilization

Circuit/System Description

As part of the vehicle telematics enhanced services, a request may be sent to the theft deterrent module (TDM) to disable vehicle starting. If a valid message is received by the TDM requesting that starting be disabled, the start enable message will not be sent to the engine control module (ECM).

Conditions for Running the DTC

The TDM continuously monitors for this DTC.

Conditions for Setting the DTC

A start disable message has been received from the telematics module.

Action Taken When the DTC Sets

Vehicle starting will be suspended and the security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will clear when the telematics start disable request is no longer received.
- A history DTC will clear after 100 ignition cycles in which the telematic start disable request is not seen.

Diagnostic Aids

- DTC B302A is only an indicator that a start disable request has been received from the vehicle telematics system and does not indicate a fault in the immobilizer or telematics system.
- To remove the start disable request, the vehicle account must be updated with the OnStar stolen vehicle team. This will require that a law enforcement agency or the customer contact OnStar to indicate that the vehicle has been successfully and safely recovered.
- If the OnStar system has been disabled or damage during a theft attempt, the system will not be able to communicate and the start disable request will not be removed. OnStar must be functioning properly for the start disable request to be removed.

Description and Operation

Immobilizer Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the OnStar system is not damaged and is functioning properly with no DTCs set.
    - If the OnStar system is damaged, inoperative, or any OnStar DTCs are set, these concerns must be corrected before the start disable can be removed.
2. Press the blue OnStar button and ask the advisor to be transferred to the stolen vehicle team to verify the vehicle account has been updated.
3. Very that OnStar is aware the vehicle has been recovered and that the vehicle account has been updated as such.
    - If OnStar has not been notified that the vehicle has been recovered, contact the customer and advise them that for security purposes, they must contact OnStar and the law enforcement agency to update the vehicle account.
4. After the vehicle account has been updated and the start disable request has been removed, DTC B302A will transition to a history DTC. Clear the history DTC.

DTC B3031: SECURITY SYSTEM CONTROLLER IN LEARN MODE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3031 00

Security System Controller In Learn Mode

Circuit/System Description

When learning a coded key, the theft deterrent module (TDM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the TDM does not exit learn mode, B3031 will remain current and indicate a fault.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

DTC B3031 will set any time the TDM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

IMPORTANT: When performing the 10-Minute Vehicle Key Relearn Procedure, all keys not learned at that time will be erased and not be recognized. Perform the Adding Keys procedure on all keys or instruct the customer how to perform the Adding Keys procedure should all keys not be present at the time of repair.

1. Verify DTC B3055 is not set.
   - If the DTC is set, refer to **DTC B3055**.
2. Verify the scan tool TDM Learn Coded Key parameter displays Yes.
   - If not the specified value, perform the 10 Minute Vehicle Key Relearn procedure. Refer to

Replacing Keys (North America except Canada)Replacing Keys (Canada).

3. Perform the 10 Minute Vehicle Key Relearn procedure. Refer to Replacing Keys (North America except Canada)Replacing Keys (Canada). The TDM should exit the learn coded key state and DTC B3031 should clear.
    - If the TDM does not exit the learn coded key state after the programming attempt, replace the TDM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for TDM replacement, setup and programming

DTC B3055: NO TRANSPONDER MODULATION OR NO TRANSPONDER

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055 00

No Transponder Modulation or No Transponder

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The TDM is unable to measure the ignition key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

In some instances, RF devices attached to a keychain or otherwise in close proximity of the ignition cylinder may cause interference in the immobilizer system and lead to a no-start condition. Some common RF devices that may be attached to a keychain are Speedpass gas station payment device, swipe devices used to gain access locked gates or 24-hour gyms, or other "smart" keys.

These RF devices interfere with the communication between the transponder located in the key and the TDM. The immobilizer systems operates at a frequency of 125 kHz. RF devices that operate in the 120 to 135 kHz range, or a multiplier of these frequencies, are most likely to cause interference. If interference occurs, DTC B3055, B3060, or B3935 may be set.

If interference is suspected, removed the suspect device from the keychain and attempt to start the vehicle. If vehicle starting occurs with the device removed, instruct the customer to remove the device from the keychain to prevent further occurrences. It may also be necessary to inspect all of the customers keychains if the concern is intermittent and doesn't occur with every key.

Circuit/System Verification

IMPORTANT:	• When using this diagnostic, more than one vehicle key is required to ensure proper diagnosis. If more than one key is not available at the time of service, contact the

customer and ask if any other keys can be provided for service. If unavailable, a new second key can be created.

- Interference from an RF device located on the keychain may cause this DTC to set. Remove any RF devices from the keychain before proceeding with the diagnostic.

1. Inspect all available vehicle keys that they are correct vehicle keys .
   - If not a correct vehicle key, replace the key.
2. While viewing the scan tool TDM Transponder Key parameter, turn ON the ignition with each of the available vehicle keys. The parameter should read Present with all available keys.
   - If only one key results in the parameter reading Not Present, replace the appropriate key.
   - If all available keys result in the parameter reading Not Present, replace the TDM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Replacing Keys (North America except Canada)Replacing Keys (Canada)**
- **Control Module References** for TDM replacement, setup, and programming

DTC B3060: UNPROGRAMMED TRANSPONDER IDENTIFICATION CODE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3060 00

Unprogrammed Transponder Identification Code Received

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the transponder value does not match the learned key code or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The transponder value measured by the TDM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.
- The security indicator will flash (Canada only).

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

In some instances, RF devices attached to a keychain or otherwise in close proximity of the ignition cylinder may cause interference in the immobilizer system and lead to a no-start condition. Some common RF devices that may be attached to a keychain are Speedpass gas station payment device, swipe devices used to gain access locked gates or 24-hour gyms, or other "smart" keys.

These RF devices interfere with the communication between the transponder located in the key and the TDM. The immobilizer systems operates at a frequency of 125 kHz. RF devices that operate in the 120 to 135 kHz range, or a multiplier of these frequencies, are most likely to cause interference. If interference occurs, DTC B3055, B3060, or B3935 may be set.

If interference is suspected, removed the suspect device from the keychain and attempt to start the vehicle. If vehicle starting occurs with the device removed, instruct the customer to remove the device from the keychain to prevent further occurrences. It may also be necessary to inspect all of the customers keychains if the concern is intermittent and doesn't occur with every key.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3935 57

Transponder Authentication Error

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the theft deterrent module (TDM). The TDM then compares this value to a value stored in memory. This stored value is the learned key code. If the value is correct, the TDM will send the prerelease password via the serial data circuit to

the engine control module (ECM). If the transponder value does not match the learned key code or a transponder value is not received, the TDM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- A valid transponder value has been read.

Conditions for Setting the DTC

- The transponder value is valid and matches the value stored in the TDM memory.
- The transponder calculation to the challenge from the TDM does not match the TDM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

In some instances, RF devices attached to a keychain or otherwise in close proximity of the ignition cylinder may cause interference in the immobilizer system and lead to a no-start condition. Some common RF devices that may be attached to a keychain are Speedpass gas station payment device, swipe devices used to gain access locked gates or 24-hour gyms, or other "smart" keys.

These RF devices interfere with the communication between the transponder located in the key and the TDM. The immobilizer systems operates at a frequency of 125 kHz. DTC B3976: UNCONFIGURED TRANSPONDER/VEHICLE CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3976 46

Unconfigured Transponder/Vehicle Configuration Not Programmed

Circuit/System Description

When the theft deterrent module (TDM) is in the learn coded key state, the TDM checks the current key to ensure it has been configured as a proper vehicle key.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- The TDM is in the learn coded key state.

Conditions for Setting the DTC

The TDM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- The security indicator will be illuminated.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when the TDM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

DTC P0513: THEFT DETERRENT KEY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0513

Theft Deterrent Key Incorrect

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The calculated response from the TDM does not equal the calculation performed by the ECM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P0513 will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The "key" referenced in the DTC descriptor does not refer to the vehicle key. In this case, "key" is referring to the challenge response.

Circuit/System Verification

1. Verify the following BCM DTCs are not present:
    - U1814
    - U2099
    - B1428
    - B1370
    - B1380
    - B1440
    - B1441
    - If any listed DTC is present, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** to diagnose that DTC prior to this diagnostic.

    IMPORTANT: Because of normal system communications between the TDM and ECM, any theft deterrent B-codes must be diagnosed prior to the diagnosis of P-codes.

2. Perform the 10-Minute Immobilizer Relearn procedure. Refer to **Immobilizer System Component Programming**. The ECM should successfully complete the password learn and the vehicle should start.
    - If the ECM does not complete the learn or vehicle starting remains disabled, replace the ECM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for ECM replacement, setup, and programming

DTC P0633: THEFT DETERRENT KEY NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0633

Theft Deterrent Key Not Programmed

Circuit/System Description

When learning the prerelease password, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the password and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, P0633 will remain current and indicate a fault.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

DTC P0633 will set any time the ECM enters learn mode.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC P0633 will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The "key" referenced in the DTC descriptor does not refer to the vehicle key. In this case, "key" is referring to the challenge response.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Because of normal system communications between the TDM and ECM, any theft deterrent B-codes must be diagnosed prior to the diagnosis of P-codes.

IMPORTANT: DTC P0633 will clear upon a successful engine start. Any malfunction that will cause a no-start condition will prevent DTC P0633 from clearing. Prior to diagnosing DTC P0633, ensure that all power moding and engine control systems are operating properly and all conditions that may cause a no-start have been corrected. Do not replace the ECM. Replacing the ECM will not correct the no-start condition.

1. Ignition in the CRANK position, verify the scan tool Ignition Run/Crank parameter is Active.
   - If not the specified value, refer to **Power Mode Mismatch** .
2. Perform the 10-Minute Immobilizer Relearn procedure. Refer to **Immobilizer System Component Programming**. The ECM should successfully complete the password learn and the vehicle should start.
   - If the ECM does not complete the learn or vehicle starting remains disabled, an undiagnosed no-start condition exists. Refer to the appropriate subsection and diagnostic to correct the no-start condition.

DTC P1629: THEFT DETERRENT FUEL ENABLE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1629

Theft Deterrent Fuel Enable Signal Not Received

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

- Ignition is in the ACCESSORY or RUN position.
- The ECM is not in learn mode.

Conditions for Setting the DTC

The ECM receives does not receive the challenge response from the TDM within the required amount of time.

Action Taken When the DTC Sets

The security indicator will illuminate.

Conditions for Clearing the DTC

- A current DTC P1629 will be cleared when a challenge response is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

DTC P1629 is an indicator that the challenge/response was not received within the required time. This does not necessarily indicate a fault is present with the TDM or ECM. Factors such as a long engine crank, a delay in the serial data communication, or B-codes set in the TDM will cause DTC P1629 to set. This DTC should not be used as a fault indicator, but rather as a symptom to assist in the diagnosis of these other systems.

DTC P162B: REMOTE VEHICLE SPEED LIMITING SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P162B

Remote Vehicle Speed Limiting Signal Message Counter Incorrect

Circuit/System Description

When a remote slow-down request is sent from OnStar, the vehicle communication interface module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Conditions for Running the DTC

- The engine run time is greater than 5 s.
- A remote slow-down request is received by the ECM.

Conditions for Setting the DTC

- The VIN embedded in the slow-down request does not match the VIN stored in the ECM.
- The rolling code counter embedded in the slow-down request does not increment for ten consecutive messages.

Action Taken When the DTC Sets

- ECM ignores all reduced vehicle speed request messages from the vehicle communication interface module.
- The ECM stores DTC P162B in history.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Verify the vehicle is equipped with OnStar (RPO UE1) and DTC P162B is set
   - **If the vehicle is not equipped with OnStar (RPO UE1) and DTC P162B is set**

     Replace the ECM.

   - **If the vehicle is equipped with OnStar (RPO UE1) and DTC P162B is set**
2. Perform the Stolen Vehicle Slow-Down Reset procedure with the scan tool.
3. Verify DTC P162B is not set.
   - **If DTC P162B is set**
   1. Reprogram the ECM. Refer to **Control Module References** .
   2. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
      - If the DTC sets, replace the ECM. If the DTC continues to set after ECM replacement, replace the vehicle communication interface module.
      - If the DTC does not set
   3. All OK.
   - **If DTC P162B is not set**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for vehicle communication interface module and ECM replacement, programming, and setup

DTC P1631: THEFT DETERRENT FUEL ENABLE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1631

Theft Deterrent Fuel Enable Signal Not Correct

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The ECM receives an incorrect prerelease password from the TDM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1631 will be when a correct fuel enable password is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

DTC P1632: THEFT DETERRENT FUEL DISABLE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1632

Theft Deterrent Fuel Disable Signal Received

Circuit/System Description

The theft deterrent module (TDM) sends the prerelease password to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the TDM. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the RUN position.

Conditions for Setting the DTC

A fuel disable signal from the TDM is received by the ECM.

Action Taken When the DTC Sets

- The security indicator will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1632 will be when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The prerelease password sent to the ECM by the TDM is reliant on the communications between the transponder located in the vehicle key and the TDM. Failure to establish communications or an interruption in the communications between the vehicle key and the TDM will cause the fuel disable message to be sent and the setting of DTC B1632. DTC B3055 or B3060 will be set in the TDM. To properly diagnose DTC P1632, DTC B3055 or B3060 must be diagnosed and corrected first.

SYMPTOMS - IMMOBILIZER

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Immobilizer Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **OnStar Stolen Vehicle Slowdown Active** to diagnose the symptom.

ONSTAR STOLEN VEHICLE SLOWDOWN ACTIVE

Diagnostic Instructions

NOTE: **This procedure is not used in Brazil.**

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When a remote slow-down request is sent from OnStar, the vehicle communication interface module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Verify the vehicle is not in the OnStar initiated Stolen Vehicle Slowdown mode. Verify the scan tool ECM Reduced Engine Power History parameter is not Spd Limit Active.

- If the parameter is Spd Limit Active, perform the scan tool VCIM Stolen Vehicle Slowdown Clear. When the Stolen Vehicle Slowdown Clear is complete, press the blue OnStar button and inform the advisor that you need to be transferred to the stolen vehicle team to update the vehicle account.

REPAIR INSTRUCTIONS

THEFT DETERRENT MODULE REPLACEMENT

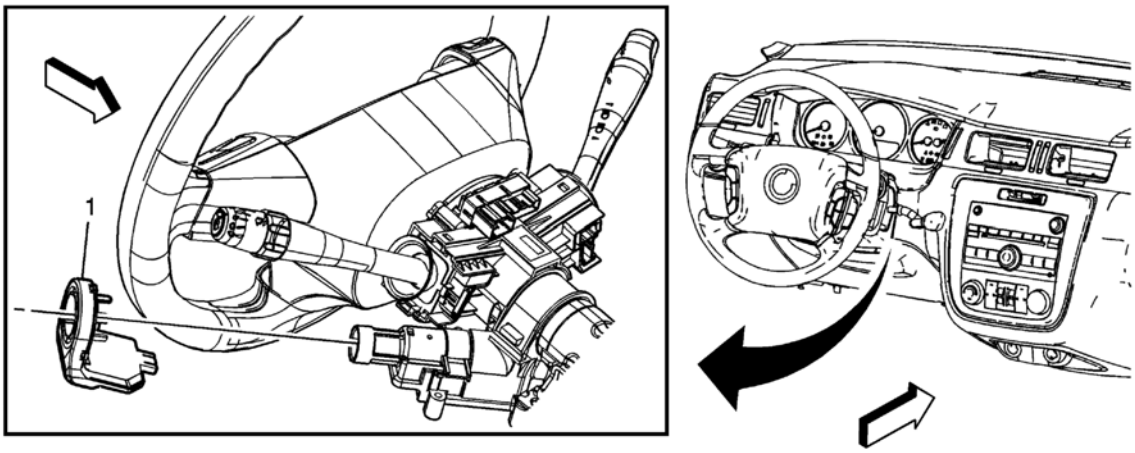

Fig. 2: Theft Deterrent Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** .	
1	Theft Deterrent Module **Procedure** 1. Disconnect the electrical connector. 2. Refer to **Control Module References** for programming and set up procedures.

IMMOBILIZER SYSTEM COMPONENT PROGRAMMING

10-Minute Immobilizer Relearn

This 10-minute relearn procedure will relearn the prerelease password and the challenge/response data between the theft deterrent module (TDM) and the engine control module (ECM).

1. Connect a scan tool to the vehicle and to the TIS terminal.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. On the Techline Terminal, select Service Programming System and follow the Techline Terminal on-screen instructions. Go to TDM Theft Deterrent Module from the controller list and select the appropriate on-screen calibration options.
5. After the programming has completed, turn the ignition OFF for 30 seconds.
6. Turn ON the ignition with the engine OFF.
7. On the TIS terminal, select Service Programming System and follow the TIS terminal on-screen

instructions. Ensure the correct programming selection is chosen based on component being replaced or programmed. For this procedure, go to the V.T.D. Vehicle Theft Deterrent Learn menu and choose the Vehicle Theft Deterrent Learn, ECM, or PK3 Replaced selection.

8. At this point the vehicle must remain connected for the duration of the 10-minute relearn procedure.

IMPORTANT:

- Actual programming time may be as long as 12 Minutes. The first 2 minutes allow the scan tool to initialize the appropriate control module. The remaining 10 minutes is the relearn timer.
- On some vehicles, the security indicator may be illuminated for the duration of the 10-minute relearn procedure.

9. After approximately 10 minutes the TIS terminal will display "Programming Successful, Turn OFF Ignition". The vehicle is now ready to relearn the key information and/or the passwords on the next ignition switch transition from OFF to CRANK.
10. Turn OFF the ignition and wait 2 minutes.
11. With a master vehicle key, turn the ignition to the RUN position for 15 seconds, then start the vehicle. The TDM and ECM have now relearned the pre-release password and the challenge/response data.
12. With a scan tool, clear any DTCs.

ADDING KEYS

North America

NOTE:

- **To initiate, this procedures requires that a learned master key be available.**
- **A total of 10 keys may be programmed to a single vehicle.**
- **This procedure adds keys only. The procedure does not erase previously learned keys.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a learned master key, turn ON the ignition, with the engine OFF.
2. Turn OFF the ignition and remove the key.
3. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key.

Except North America

NOTE:

- **To initiate, this procedures requires that two learned master keys be available.**
- **A total of 10 keys may be programmed to a single vehicle.**
- **This procedure adds keys only. The procedure does not erase previously learned keys.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a learned master key, turn ON the ignition, with the engine OFF.
2. Turn OFF the ignition and remove the key.
3. With a second learned master key, turn ON the ignition, with the engine OFF.
4. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key.

REPLACING KEYS (NORTH AMERICA EXCEPT CANADA)

10-Minute Vehicle Key Relearn

IMPORTANT: This procedure will only relearn the vehicle keys. This procedure will not learn the immobilizer prerelease password or the challenge/response data. Do not use this procedure as a substitute for a 10-minute relearn when replacing or reprogramming a theft deterrent module (TDM) or engine control module (ECM). Doing so will result in a failure to learn the pre-release password and/or the challenge/response data.

This 10-minute learn procedure should be used when all vehicle keys are desired to be replaced or reprogrammed. This procedure will erase all previously learned vehicle keys from the TDM. Once the 10-minute learn procedure has been completed, any remaining vehicle keys may be programmed using the Adding Keys procedure to ensure their continued functionality.

1. Connect a scan tool to the vehicle in the pass-thru arrangement.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. On the Techline Terminal, select Service Programming System and follow the Techline Terminal on-screen instructions, using the Pass-Thru method. Ensure the correct programming selection is chosen based on component being replaced or programmed. For this procedure, go to the V.T.D. Vehicle Theft Deterrent Learn menu and choose the Vehicle Theft Deterrent Learn for Learning Replacement Keys selection.
5. At this point the scan tool must remain connected for the duration of the 10-minute relearn procedure.

IMPORTANT:

- The scan tool will initially display 12 Minutes. The first 2 minutes allow the scan tool to initialize the appropriate control module. The remaining 10 minutes is the relearn timer.
- On some vehicles the security indicator may be illuminated for the duration of the 10-minute relearn procedure.

6. Observe the scan tool, after approximately 10 minutes the scan tool will display "Programming Successful, Turn OFF Ignition". The vehicle is now ready to relearn the key information and/or the passwords on the next ignition switch transition from OFF to CRANK.
7. Turn OFF the ignition and wait 2 minutes.
8. With a master vehicle key, turn the ignition to the RUN position for 15 seconds, then start the vehicle. The TDM has now learned the key transponder information.
9. With a scan tool, clear any DTCs.

30-Minute Vehicle Key Relearn

IMPORTANT: This procedure will only relearn the vehicle keys. This procedure will not learn the immobilizer prerelease password or the challenge/response data. Do not use this procedure as a substitute for a 10-minute relearn when replacing or reprogramming a TDM or ECM. Doing so will result in a failure to learn the prerelease password and/or the challenge/response data.

This 30-minute learn procedure should be used when all vehicle keys are desired to be replaced or reprogrammed. This procedure will erase all previously learned vehicle keys from the TDM. Once the 30-minute learn procedure has been completed, any remaining vehicle keys may be programmed using the Adding Keys procedure to ensure their continued functionality.

1. With an unlearned master vehicle key, turn ON the ignition, with the engine OFF.
2. Observe the security indicator, after approximately 10 minutes the telltale will turn off.
3. Turn OFF the ignition, and wait 5 seconds.
4. Repeat steps 1-3 two more times for a total of 3 cycles or 30 minutes.

IMPORTANT: The TDM learns the key transponder information upon the ignition switch transition from OFF to ON. You must turn the ignition OFF before attempting to start the vehicle.

5. With a master vehicle key, start the vehicle. The vehicle has now learned the key transponder information.
6. If additional keys are required to be learned, refer to **Adding Keys**.
7. With a scan tool, clear any DTCs.

REPLACING KEYS (CANADA)

10-Minute Vehicle Key Relearn

IMPORTANT: This procedure will only relearn the vehicle keys. This procedure will not learn the immobilizer prerelease password or the challenge/response data. Do not use this procedure as a substitute for a 10-minute relearn when replacing or reprogramming a theft deterrent module (TDM) or engine control module (ECM). Doing so will result in a failure to learn the pre-release password and/or the challenge/response data.

This 10-minute learn procedure should be used when all vehicle keys are desired to be replaced or reprogrammed. This procedure will erase all previously learned vehicle keys from the TDM. Once the 10-minute learn procedure has been completed, any remaining vehicle keys may be programmed using the Adding Keys procedure to ensure their continued functionality.

1. Connect a scan tool to the vehicle in the pass-thru arrangement.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. On the Techline Terminal, select Service Programming System and follow the Techline Terminal on-screen instructions, using the Pass-Thru method. Ensure the correct programming selection is chosen based on component being replaced or programmed. For this procedure, go to the VTD Vehicle Theft Deterrent Learn menu and choose the Vehicle Theft Deterrent Learn for Learning Replacement Keys selection.
5. At this point the scan tool must remain connected for the duration of the 10-minute relearn procedure.

IMPORTANT:

- The scan tool will initially display 12 Minutes. The first 2 minutes allow the scan tool to initialize the appropriate control module. The remaining 10 minutes is the relearn timer.
- On some vehicles the security indicator may be illuminated for the duration of the 10-minute relearn procedure.

6. Observe the scan tool, after approximately 10 minutes the scan tool will display "Programming Successful, Turn OFF Ignition". The vehicle is now ready to relearn the key information and/or the passwords on the next ignition switch transition from OFF to RUN.
7. Turn OFF the ignition and wait 2 minutes.
8. With a master vehicle key, turn the ignition to the RUN position for 15 seconds, then start the vehicle. The TDM has now learned the key transponder information.
9. With a scan tool, clear any DTCs.

DESCRIPTION AND OPERATION

IMMOBILIZER DESCRIPTION AND OPERATION

The immobilizer system functions are provided by the theft deterrent module (TDM) and the engine control module (ECM). When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coil surrounding the ignition lock cylinder. This exciter coil is part of the TDM. The energized transponder transmits a signal that contains its unique value, which is received by the TDM. The TDM then compares this value to a value stored in memory. If the values match, the TDM will send the prerelease password via the serial data circuit to the ECM. If the transponders unique value is incorrect, the TDM will send the fuel disable password to the ECM.

When the ECM receives the TDM prerelease password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the serial data circuit. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The components of the theft system are as follows:

- TDM
- ECM
- Ignition key (Transponder)
- Security indicator

Theft Deterrent Module (TDM)

Vehicles with steering column mounted ignition switches have the exciter integral with the theft deterrent module (TDM), which is located within the steering column. The TDM can learn up to 10 keys (transponder values).

The TDM uses the following inputs:

- Battery voltage

- Ignition switched voltage
- Ground circuit

The theft deterrent control module uses the following outputs:

- Password exchange
- Challenge/response with the engine control module (ECM)

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the head of the key is energized by the exciter coils surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the TDM. The TDM then compares this value to the learned key code stored in memory. The TDM then performs one of the following functions:

- If the transponder value matches the values stored in the TDM memory, the TDM will send the prerelease password to the ECM via the serial data circuit.
- If the transponders unique value does not match the value stored in the TDM, the TDM will send the fuel disable message to the ECM via the serial data circuit.
- If the TDM is unable to measure the ignition key transponder value, the TDM will not send any messages to the ECM.

Engine Control Module (ECM)

When the engine control module (ECM) receives the theft deterrent module (TDM) prerelease password, the ECM will challenge the password. The ECM sends this challenge back to the TDM via the serial data circuit. Both the ECM and TDM perform a calculation on this challenge. If the calculated response from the TDM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following conditions occur:

- The prerelease password is invalid.
- The fuel disable password is sent by the TDM.
- No passwords are received. There is no communication with the TDM.
- The TDM calculated response to the challenge does not equal the calculation performed by the ECM.

The Ignition Key (Transponder)

NOTE: **The ignition key will be stamped with a + or a + surrounded by a circle. This symbol only identifies the key as a PassKey III+ transponder key and is not a reliable way to determine if a particular key is the correct key for a vehicle. Service parts may have a different stamped symbol than the production part. The only way to determine the proper key for a vehicle is by referencing the parts catalog.**

The ignition key for PassKey III+ (PK3+) equipped vehicles is a standard ignition key with a transponder located in the plastic head of the key. The transponder value is fixed and unable to be changed. The immobilizer system uses the ignition key transponder value to determine if a valid ignition key is being used to start the vehicle. There are approximately 3 trillion possible transponder values. There are no visible electrical contacts.

The immobilizer system use the following types of ignition keys:

Master Keys

Master keys have a black plastic head for full access operation of the vehicle. Master keys may perform the following functions:

- Start the vehicle.
- Lock/unlock all of the door locks and rear compartment.
- Lock/unlock all of the storage compartments.

Valet Keys

IMPORTANT: Valet keys are NOT standard equipment on all GM vehicle lines.

Valet keys have a gray plastic head and are for restricted operation of the vehicle. Valet keys may perform the following functions:

- Start the vehicle.
- Lock/unlock all of the door locks.

Fleet Keys

IMPORTANT: Fleet keys are NOT standard equipment on all GM vehicle lines.

Fleets keys allow full access to the vehicle just as a master key would. However, unlike a master key which may only learn 10 keys to a particular vehicle, an unlimited number of fleet keys may be learned to the vehicle. Fleet keys are only used in vehicles configured for fleet use with RPO 6E2 or 6E8.

- Start the vehicle.
- Lock/unlock all of the door locks and rear compartment.
- Lock/unlock all of the storage compartments.

Security Indicator

The theft deterrent module (TDM) can command the instrument panel cluster (IPC) to illuminate the security indicator only when the ignition key is in the ON position. The TDM will command the security indicator be illuminated any time a fault is noted in the immobilizer system and when the engine starting is disabled.

REMOTE VEHICLE SPEED LIMITING DESCRIPTION AND OPERATION

Certain vehicles equipped with OnStarÂ® now have an additional feature that allows for remote limiting of the vehicle's speed. This OnStarÂ® feature is called Stolen Vehicle Slow-Down and is now part of the OnStarÂ® Stolen Vehicle Assistance service. This feature, when used in conjunction with local law enforcement and strict guidelines at the OnStarÂ® Call Center, will slow the vehicle by interacting with the engine control system.

When the engine control system receives a valid request from the OnStarÂ® telematics communications interface module, it will enter into a reduced engine power/vehicle speed limiting mode, which will decelerate the vehicle. Once the request is active the engine control module begins reducing engine torque to match

requested vehicle speed and a REDUCED ENGINE POWER indication is displayed. No DTCs will be set during this process.

Article GUID: A00737203

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2976: DRIVER DOOR AJAR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2976 00

Driver Door Ajar Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2976 00	1	1	-
Ground	-	1	-	-
1. Door Ajar Indicator Inoperative When Driver Door Is Open				

Circuit/System Description

The body control module (BCM) provides a 12V signal to each of the door ajar switch signal circuit. The door ajar switches are normally open when the door is fully closed. When a door is opened, the door ajar switch contacts close providing a path to ground. The driver information center (DIC) displays ajar icon when the BCM detects that one or more of the doors are open. The instrument panel cluster (IPC) receives a serial data message from the BCM indicating the door ajar status.

Conditions for Running the DTC

The system voltage is 9-16 volts.

Conditions for Setting the DTC

The BCM detects a short to ground in the driver door ajar circuit for longer than 10 minutes.

Action Taken When the DTC Sets

The ajar indicator is on at all times.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will become a history DTC.
- A history DTC will clear after 50 ignition cycles.

Description and Operation

Door Ajar Indicator Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Driver Door Ajar Sw parameter changes between Door Closed and Door Open when opening and closing the driver door.
    - **If the parameter does not change**

      Refer to Circuit/System Testing

    - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the driver door lock. It may take up to 2 minutes for all vehicle systems to power down
2. Test for less than 10 Ω between the ground circuit terminal listed below and ground:
    - Ground circuit terminal 6 (Without UA6)
    - Ground circuit terminal 8 (With UA6)
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Driver Door Ajar Sw parameter is Door Closed.
    - **If not Door Closed**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal listed below and ground:
        - Signal circuit terminal 4 (Without UA6)
        - Signal circuit terminal 6 (With UA6)
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Door Closed**
5. Install a 3 A fused jumper wire between the signal circuit terminal listed below and ground:
    - Signal circuit terminal 4 (Without UA6)
    - Signal circuit terminal 6 (With UA6)
6. Verify the scan tool Driver Door Ajar Sw parameter is Door Open.
    - **If not Door Open**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 Body Control Module.
- **If Door Open**

7. Test or replace the driver door lock.

Component Testing

1. Ignition OFF, disconnect the harness connector at the driver door lock.
2. Test for infinite resistance between the signal terminal and the ground terminal listed below with the switch in the open position:
    - Signal terminal 4 and ground terminal 6 (Without UA6)
    - Signal terminal 6 and ground terminal 8 (With UA6)
    - **If less than infinite resistance**

      Replace the driver door lock.

    - **If infinite resistance**
3. Test for less than 3 Ω between the signal terminal and the ground terminal listed below with the switch in the closed position.
    - Signal terminal 4 and ground terminal 6 (Without UA6)
    - Signal terminal 6 and ground terminal 8 (With UA6)
    - **If 3 Ω or greater**

      Replace the driver door lock.

    - **If less than 3 Ω**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Lock Replacement**
- **Control Module References** for BCM replacement, setup, and programming

DTC B3125, B3130, OR B3135: FRONT/DRIVER DOOR ONLY UNLOCK/ALL DOOR LOCK/UNLOCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3125 00

Left Front/Driver Door Only Unlock Circuit

DTC B3130 00

All Door Unlock Circuit

DTC B3135 00

All Door Lock Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Door Unlock Relay Control	2	2	B3130 00	-
Driver Door Unlock Relay Control	1	1	B3125 00	-
Door Lock Relay Control	B3135 00	3	3	-
1. Driver Door Unlock Malfunction 2. Passenger Door Unlock Malfunction 3. All Door Lock Malfunction				

Circuit/System Description

The body control module (BCM), upon receipt of a lock switch lock signal, will switch the Door Lock Relay Control circuit to battery positive voltage. This will energize the LOCK relay. The remaining unlock relays receive voltage from the underhood fuse block, the BCM upon receipt of a unlock signal or driver door unlock signal will switch the appropriate unlock relay to ground. This will energize the appropriate unlock relay unlocking the appropriate doors.

Conditions for Running the DTC

When the relay is being actively commanded by the BCM.

Conditions for Setting the DTC

B3125 00

The BCM detects a short to voltage in the driver door unlock control circuit while commanding the DRIVER UNLOCK relay.

B3130 00

The BCM detects short to voltage in the door unlock control circuit while commanding the UNLOCK relay.

B3135 00

The BCM detects a short to ground in the door lock control circuit while commanding the LOCK relay.

Action Taken When the DTC Sets

The power door locks will malfunction

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify the driver door will Unlock when commanding the Driver Door Unlock with a scan tool.
    - **If the driver door Unlock function does not work**

      Refer to Circuit/System Testing - Driver Door Unlock Malfunction.
3. Verify the passenger, left rear and right rear door will Unlock when commanding the Unlock Rear Doors with a scan tool.
    - **If the passenger, left rear and right rear door Unlock function does not work**

      Refer to Circuit/System Testing - Passenger Door Unlock Malfunction.
4. Verify the driver, passenger, left rear and right rear door will Lock when commanding the Lock Rear

Doors with a scan tool.

- **If the door Lock function does not work**

  Refer to Circuit/System Testing - Door Lock Malfunction.

- **If the Lock and Unlock function for all doors works**

5. All OK.

Circuit/System Testing

Driver Door Unlock Malfunction

1. Ignition OFF, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel, ignition ON.
2. Verify that a test lamp does not illuminate between the control circuit terminal K6 and ground.
   - **If the test lamp illuminates**
   1. Ignition OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for less than 1 V between the X51A Fuse Block-Instrument Panel control circuit terminal K6 X1 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp is not illuminated**
3. Ignition OFF, connect the X1 harness connector at the X51A Fuse Block-Instrument Panel and disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
4. Connect a 3A fused jumper wire between the control circuit terminal 6 and ground.
5. Listen for an audible click from the X51A Fuse Block-Instrument Panel as the Driver Door Unlock Relay activates.
   - **If the Driver Door Unlock Relay does not activate**
   1. Ignition OFF, remove the fused jumper wire, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel.
   2. Test for infinite resistance between the K9 Body Control Module control circuit terminal 6 X7 and ground.
      - If less than Infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the X51A Fuse Block-Instrument Panel.
   - **If the Driver Door Unlock Relay activates**
6. Replace the K9 Body Control Module.

Passenger Door Unlock Malfunction

1. Ignition OFF, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel, ignition

ON.

2. Verify that a test lamp does not illuminate between the control circuit terminal K5 and ground.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module.
    2. Test for less than 1 V between the X51A Fuse Block-Instrument Panel control circuit terminal K5 X1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp is not illuminated**
3. Ignition OFF, connect the X1 harness connector at the X51A Fuse Block-Instrument Panel and disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
4. Connect a 3A fused jumper wire between the control circuit terminal 9 and ground.
5. Listen for an audible click from the X51A Fuse Block-Instrument Panel as the Door Unlock Relay activates.
    - **If the Door Unlock Relay does not activate**
    1. Ignition OFF, remove the fused jumper wire, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel.
    2. Test for infinite resistance between the K9 Body Control Module control circuit terminal 9 X7 and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the X51A Fuse Block-Instrument Panel.
    - **If the Door Unlock Relay activates**
6. Replace the K9 Body Control Module.

Door Lock Malfunction

1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
2. Verify that a test lamp does not illuminate between the control circuit terminal 7 and ground.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel.
    2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 7 X7 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X51A Fuse Block-Instrument Panel.
    - **If the test lamp is not illuminated**
3. Connect a 3A fused jumper wire between the control circuit terminal 7 and B+.

4. Listen for an audible click from the X51A Fuse Block-Instrument Panel as the Door Lock Relay activates.
    - **If the Door Lock Relay does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the X1 harness connector at the X51A Fuse Block-Instrument Panel.
    2. Test for infinite resistance between the K9 Body Control Module control circuit terminal 7 X7 and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the X51A Fuse Block-Instrument Panel.
    - **If the Door Lock Relay activates**
5. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Electrical Center or Junction Block Replacement - Right Side (Impala) Control**
- **Module References** for BCM replacement, setup, and programming

DTC B3265: TRUNK RELEASE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3265 00

Trunk Release Output Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Control	B3265 00	1	1	-
Relay Ground	-	1	-	-
1. Trunk release is inoperative from both the release switch and keyless entry transmitter				

Circuit/System Description

The body control module (BCM) applies battery positive voltage to the trunk release relay control circuit, which

energizes the coil side of the trunk relay. The switch side of the trunk relay then closes, supplying battery positive voltage through the relay and the relay controlled output circuit to the rear compartment lid latch. The rear compartment lid latch then releases the rear compartment lid so that it may be manually raised to an open position.

Conditions for Running the DTC

When the BCM is actively commanding the relay.

Conditions for Setting the DTC

The BCM detects a short to ground in the relay control circuit.

Action Taken When the DTC Sets

The BCM will command the relay, but the rear compartment lid release actuator will be inoperative

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

Ignition ON, command the Trunk Release with a scan tool. The rear compartment lid release actuator should

release the trunk lid.

Circuit/System Testing

1. Ignition OFF, disconnect the TRUNK relay.
2. Test for less than 1 Ω between the ground circuit terminal 85 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
4. Ignition ON, command the Trunk Release with a scan tool. The test lamp should turn briefly illuminate during the RELEASE command.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the TRUNK relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the TRUNK relay.
2. Test for 60-180 Ω between terminals 85 and 86.
    - If not within the specified range, replace the TRUNK relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - If not the specified value, replace the TRUNK relay.
4. Install a 5A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
    - If greater than the specified range, replace the TRUNK relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Control Module References** for BCM replacement, setup, and programming

SYMPTOMS - VEHICLE ACCESS

Power Door Locks

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions:
    - **Power Door Locks Description and Operation**.
    - **Luggage Compartment Description and Operation**.
    - **Door Ajar Indicator Description and Operation**.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Trunk Release Malfunction**
- **Door Ajar Indicator Malfunction**
- **Power Door Locks Malfunction**
- **Power Door Lock Key Cylinder Switches Malfunction**
- **Trunk Ajar Indicator Malfunction**
- **Door Will Not Open/Close, Door Binding, or Locks, Handles, or Cylinders Do Not Function**

DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Ajar Signal	B2976 00	2	2	-
Passenger Door Ajar Signal	1	3	3	-
Right Rear Door Ajar Signal	1	4	4	-
Left Rear Door Ajar Signal	1	5	5	-
Driver Door Lock Ground	-	2	-	-
Passenger Door Lock Ground	-	3	-	-
Left Rear Door Lock Ground	-	4	-	-
Right Rear Door Lock Ground	-	5	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
1. Door Ajar Indicator Always On 2. Door Ajar Indicator Inoperative When Driver Door Is Open 3. Door Ajar Indicator Inoperative When Passenger Door Is Open 4. Door Ajar Indicator Inoperative When Left Rear Door Is Open 5. Door Ajar Indicator Inoperative When Right Rear Door Is Open				

Circuit/System Description

The body control module (BCM) provides a 12 V signal to each door ajar switch signal circuits. When a door is opened, the normally open ajar switch closes. With the ajar switch closed, a ground path is provided to the ajar switch signal circuit. The BCM interprets this and communicates via serial data with the instrument panel cluster to display the door ajar icon.

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, with all doors closed, observe the scan tool Driver Door Ajar Sw, LR Door Ajar Sw, Passenger Door Ajar Sw, and Right Rear Door Ajar Sw parameters while opening and closing each door. The parameters should change between Door Closed and Door Ajar.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate door lock.
2. Test for less than 1 Ω between ground circuit terminal listed below and ground:

- Driver door lock ground circuit terminal 6 (Without UA6).
- Driver door lock ground circuit terminal 8 (With UA6).
- Passenger door lock ground circuit terminal 3.
- Right rear door lock ground circuit terminal 3.
- Left rear door lock ground circuit terminal 6.
- If greater than the specified range, test the ground circuit for an open/high resistance.

3. Ignition ON, verify the scan tool Door Ajar Sw parameter is Door Closed.
    - If not the specified value, test the signal circuit terminal listed below for a short to ground. If the circuit tests normal, replace the BCM.
    - Driver door lock signal circuit terminal 6 (With UA6).
    - Driver door lock signal circuit terminal 4 (Without UA6).
    - Passenger door lock signal circuit terminal 1.
    - Right rear door lock signal circuit terminal 1.
    - Left rear door lock signal circuit terminal 4.
4. Install a 3A fused jumper wire between the signal circuit terminal below and ground. Verify the scan tool Door Ajar Switch parameter is Door Ajar.
    - Driver door lock signal circuit terminal 6 (With UA6).
    - Driver door lock signal circuit terminal 4 (Without UA6).
    - Passenger door lock signal circuit terminal 1.
    - Right rear door lock signal circuit terminal 1.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the door lock.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate door lock.
2. With the switch in the open position, test for infinite resistance between the signal terminal and the ground terminal listed below:
    - Driver door lock signal terminal 6 and ground terminal 8 (With UA6).
    - Driver door lock signal terminal 4 and ground terminal 6 (Without UA6).
    - Passenger door lock signal terminal 1 and ground terminal 3.
    - Right rear door lock signal terminal 1 and ground terminal 3.
    - Left rear door lock signal terminal 4 and ground terminal 6.
    - If not the specified value, replace the door lock.
3. With the switch in the closed position, test for less than 3 Ω between the signal and the ground terminals listed below:
    - Driver door lock signal terminal 6 and ground terminal 8 (With UA6).
    - Driver door lock signal terminal 4 and ground terminal 6 (Without UA6).
    - Passenger door lock signal terminal 1 and ground terminal 3.

- Right rear door lock signal terminal 1 and ground terminal 3.
- Left rear door lock signal terminal 4 and ground terminal 6.
- If greater than the specified range, replace the door lock.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- **Front Side Door Lock Replacement**
- **Rear Side Door Lock Replacement**
- **Control Module References** for BCM replacement, setup, and programming

POWER DOOR LOCK KEY CYLINDER SWITCHES MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Key Switch Unlock Signal	1	1	1	-
Driver Door Lock Ground	-	1	1	-
1. Key Cylinder Switch Malfunction				

Circuit/System Description

The key cylinder unlock feature will unlock all of the doors when the body control module (BCM) receives a Door Lock Key Switch Unlock signal for greater than 1 second and will unlock all of the doors.

Circuit/System Verification

Ignition ON, insert the key into the driver door lock cylinder, turn the key the unlock position and hold for greater than 1 second while observing the scan tool Door Key Cyl Unlock Switch parameter. The parameter should change between Active and Inactive.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the driver door lock.
2. Test for less than 1 ohm between the ground circuit terminal 8 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Door Key Cyl Unlock Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal 9 for a short to ground. If the circuit tests normal, replace the BCM.
4. Install a 3-amp fused jumper wire between the signal circuit terminal 9 and ground. Verify the scan tool Door Key Cyl Unlock Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the driver door lock.

Component Testing

1. Ignition OFF, disconnect the harness connector at the driver door lock.
2. Test for infinite resistance between the signal terminal 9 and the ground terminal 8 with the switch in the open position.
    - If not the specified value, replace the driver door lock.
3. Test for less than 2 ohms between the signal terminal 9 and the ground terminal 8 with the switch in the Unlock position.
    - If greater than the specified range, replace the driver door lock.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Door Lock Cylinder Replacement (Impala)**

Driver Door Relay Unlock Control	B3125 00	B3125 00	B3125 00	-
Door Lock Relay Control	B3135 00	B3135 00	B3135 00	-
Door Lock Switch Ground	-	1	-	-
I/P Fuse Block Ground	-	2	-	-
1. Door Lock Switch Malfunction 2. Door Latch Malfunction				

Circuit/System Description

The DR/LCK fuse supplies battery positive voltage to the I/P fuse block for the door lock system. The body control module (BCM) supplies and monitors a reference voltage to the door lock switch through the door lock switch lock/unlock signal circuit. The door lock switch also receives a constant ground source. If a door lock switch is placed in the lock position or unlock position, the reference voltage is taken directly to ground and the BCM detects the voltage drop on the signal circuit.

The BCM, upon receipt of a door lock switch lock or unlock signal, will switch the appropriate door lock actuator control circuits to battery positive voltage. The opposing side of the door lock actuators are connected to ground internally within the BCM through the other door lock actuator control circuit and the doors will lock or unlock appropriately.

Diagnostic Aids

Verify the smooth and consistent mechanical operation of each part of the door latch system prior to performing extensive electrical diagnostics

Any door that does not function smoothly or consistently, refer to **Door Will Not Open/Close, Door Binding, or Locks, Handles, or Cylinders Do Not Function**.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Driver Door Lock Sw, Psgr Door Lock Sw, Driver Door Unlock Sw and Psgr Door Unlock Sw parameters while using the driver and passenger door lock switches. The parameters should change between Active and Inactive.
    - If the values are always Active or always Inactive, refer to Door Lock Switch Malfunction.
2. Command the driver door and passenger door lock actuators to LOCK and UNLOCK with the scan tool, the doors should LOCK and UNLOCK when changing between commanded states.
    - If the driver door does not LOCK or UNLOCK, refer to Driver Door Lock Malfunction.
    - If a passenger door does not LOCK or UNLOCK functions, refer to Passenger Door Lock Malfunction.
    - If all doors locks are inoperative, refer to I/P Fuse Block Test.

Circuit/System Testing

Door Lock Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate door lock switch.
2. Test for less than 1 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Door Lock Sw parameter is Inactive.
    - If not the specified value, test the signal circuit terminal D for a short to ground. If the circuit tests normal, replace the BCM.

4. Install a 3A fused jumper wire between the signal circuit terminal D and ground. Verify the scan tool Door Lock Sw parameter is Active
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. Verify the scan tool Door Unlock Sw parameter is Inactive.
    - If not the specified value, test the signal circuit terminal E for a short to ground. If the circuit tests normal, replace the BCM.
6. Install a 3A fused jumper wire between the signal circuit terminal E and ground. Verify the scan tool Door Unlock Sw parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
7. If all circuits test normal, test or replace the door lock switch.

Driver Door Lock Malfunction

1. Ignition OFF, disconnect the harness connector at the driver door latch.
2. Ignition ON, connect a test lamp between the control circuit terminal 3 and control circuit terminal 2.
3. Command the driver door to LOCK and UNLOCK by using the driver door lock switch. The test lamp should briefly illuminate when commanding the LOCK and UNLOCK states.
    - If the test lamp does not illuminate during either of the commands and the B+ circuit fuse is open, test either control circuit for a short to ground. If the circuit tests normal, test or replace the driver door lock.
    - If the test lamp does not illuminate during either of the commands and the B+ circuit fuse is good, test either control circuit for an open/high resistance. If the circuit tests normal, refer to I/P Fuse Block Test.
4. If all circuits test normal, test or replace the driver door latch.

Passenger Door Lock Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate passenger or rear door latch.
2. Ignition ON, connect a test lamp between the control circuit terminals listed below:
    - Terminal 2 and terminal 3 - left rear door latch
    - Terminal 5 and terminal 6 - right rear door latch
    - Terminal 5 and terminal 6 - passenger door latch
3. Command the door to LOCK and UNLOCK by using the driver door lock switch. The test lamp should briefly illuminate when commanding the LOCK and UNLOCK states.
    - If the test lamp does not illuminate during either of the commands and the B+ circuit fuse is open, test either control circuit for a short to ground. If the circuit tests normal, test or replace the passenger or rear door latch.
    - If the test lamp does not illuminate during either of the commands and the B+ circuit fuse is good, test either control circuit for an open/high resistance. If the circuit tests normal, refer to I/P Fuse Block Test.
4. If all circuits test normal, test or replace the passenger or rear door latch.

I/P Fuse Block Test

1. Ignition OFF, disconnect the X1 harness connector at the I/P fuse block.
2. Test for less than 1 Ω between the ground circuit terminal J1 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between control circuit terminal K4 and ground.
4. Ignition ON, command the doors to LOCK with a scan tool. The test lamp should briefly illuminate during the LOCK command.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. Connect a test lamp between control circuit terminal K5 and B+.
6. Command the doors to UNLOCK with a scan tool. The test lamp should briefly illuminate during the UNLOCK command.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
7. Connect a test lamp between control circuit terminal K6 and B+.
8. Command the driver door to UNLOCK with a scan tool. The test lamp should briefly illuminate during the UNLOCK command.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
9. If all circuits test normal, replace the I/P fuse block.

Component Testing

Door Lock Switch

1. Ignition OFF, disconnect the harness connector at the appropriate door lock switch.
2. Test for infinite resistance between the signal terminals D and E and the ground terminal B with the switch in the open position.
    - If not the specified value, replace the door lock switch.
3. Test for less than 2 Ω between the signal terminal D and the ground terminal B with the switch in the lock position.
    - If greater than the specified range, replace the door lock switch.
4. Test for less than 2 Ω between the signal terminal E and the ground terminal B with the switch in the unlock position
    - If greater than the specified range, replace the door lock switch.

Door Lock Assembly

1. Ignition OFF, disconnect the harness connector at the appropriate door lock.
2. Install a 15A fused jumper wire between one of the control terminals and 12V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the door lock should perform the LOCK and UNLOCK functions.
    - If it does not perform as specified, replace the door lock.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Door Lock Switch Replacement (Impala)**
- **Front Side Door Lock Replacement**
- **Rear Side Door Lock Replacement**
- **Accessory Wiring Junction Block Replacement**
- **Control Module References** for BCM replacement, setup, and programming

TRUNK RELEASE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Trunk Relay Switch B+	1	1	-	-
Trunk Release Switch Signal	2	2	2	-
Rear Compartment Lid Release Actuator Control	2	2	2	-
Trunk Relay Control	B3265 00	B3265 00	B3265 00	-
Trunk Relay Coil Ground	1	1	1	-
Headlamp Switch Ground	-	2	2	-
Rear Compartment Lid Release Actuator Ground	-	1	1	-
1. Trunk release is inoperative from both the switch and keyless entry transmitter. 2. Trunk release switch inoperative				

Circuit/System Description

When the ignition is ON, the BCM supplies a reference voltage to the rear compartment lid release switch, which is part of the headlamp switch assembly, through the trunk release switch signal circuit. When the rear compartment lid release switch is operated, the trunk release signal circuit is grounded through the headlamp

switch ground circuit and the reference voltage is pulled low within the BCM. In response, the BCM applies battery positive voltage to the trunk release relay control circuit, which energizes the coil side of the trunk relay. The switch side of the trunk relay then closes, supplying battery positive voltage through the relay and the relay controlled output circuit to the rear compartment lid latch. The rear compartment lid latch, then releases the trunk lid so that it may be manually raised to an open position.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Int. Trunk/Liftglass Sw. parameter while pressing and releasing the trunk release switch. The parameter should change between Active and Inactive.
    - If the value does not change, refer to Trunk Release Switch Malfunction.
2. Command the Trunk Release with a scan tool. The rear compartment lid release actuator should release the trunk lid.
    - If the release actuator does not release the trunk lid, refer to Trunk Release Malfunction.

Circuit/System Testing

Trunk Release Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Test for less than 1 ohm between the ground circuit terminal 8 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Int. Trunk/Liftglass Sw. parameter is Inactive.
    - If not the specified value, test the signal circuit terminal 9 for a short to ground. If the circuit tests

normal, replace the BCM.

4. Install a 3A fused jumper wire between the signal circuit terminal 9 and ground. Verify the scan tool Int. Trunk/Liftglass Sw. parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the headlamp switch.

Trunk Release Malfunction

1. Ignition OFF, disconnect the TRUNK relay.
2. Test for less than 1 ohm between the ground circuit terminal 85 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 30 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
4. Verify that a test lamp illuminates between the B+ circuit terminal 87 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for an open/high resistance.
5. Ignition OFF, disconnect the harness connector at the rear compartment lid release actuator.
6. Test for less than 1 ohm between the ground circuit terminal 3 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the rear compartment lid release actuator.
8. Ignition ON, connect a 10A fused jumper wire between the B+ circuit terminal 87 and the control circuit terminal 30. Verify the rear compartment lid release actuator is activated.
    - If the rear compartment lid release actuator does not activate, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the rear compartment lid release actuator.
9. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
10. Command the Trunk Release with a scan tool, the test lamp should illuminate during the RELEASE command.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
11. If all circuits test normal, test or replace the TRUNK relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the TRUNK relay.
2. Test for 60-180 ohms between terminals 85 and 86.
    - If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87
- If not the specified value, replace the relay.

4. Install a 25A fused jumper wire between relay terminal 85 and 12V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 ohms between terminals 30 and 87.
    - If greater than the specified range, replace the relay.

Rear Compartment Lid Release Actuator

1. Ignition OFF, disconnect the harness connector at the rear compartment release actuator.
2. Install a 10A fused jumper wire between the control terminal 4 and 12V. Install a jumper wire between the ground terminal 3 and ground. Verify the rear compartment release actuator activates.
    - If the latch does not perform as specified, replace the rear compartment release actuator.

Trunk Release Switch

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Test for infinite resistance between the signal terminal 9 and the ground terminal 8 with the switch in the open position.
    - If not the specified value, replace the headlamp switch.
3. Test for less than 2 ohms between the signal terminal 9 and the ground terminal 8 with the switch in the closed position.
    - If greater than the specified range, replace the headlamp switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness) Relay Replacement (Within an Electrical Center)**
- **Headlamp Switch Replacement (Impala)**
- **Rear Compartment Lid Latch Replacement**
- **Control Module References** for BCM replacement, setup, and programming

TRUNK AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal

	Ground	Resistance	Voltage	Performance
Signal	1	2	2	-
Ground	-	3	-	-
1. Ajar Indicator Always Illuminated 2. Ajar Indicator Inoperative 3. Trunk Release Inoperative				

Circuit/System Description

The rear compartment lid can be released by operating the rear compartment lid release switch or by pressing the rear compartment release button on the remote keyless entry transmitter. The gear selector may be in any position, but the vehicle speed must equal 0 for the rear compartment lid to release.

When the ignition is ON, the body control module (BCM) supplies battery positive voltage to the rear compartment lid ajar switch through the rear compartment lid ajar switch signal circuit. When the rear compartment lid is opened, the signal circuit is connected to ground through the rear compartment lid ajar switch ground circuit and the voltage is pulled low within the BCM. In response, the BCM sends a serial data message to the driver information center (DIC) in the instrument panel cluster (IPC) to illuminate the rear compartment lid ajar indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Closure Ajar Sw parameter changes between Inactive and Active when opening and closing the rear compartment lid.

- **If the parameter does not change**

  Refer to Circuit/System Testing.

- **If the parameter changes**

3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the rear compartment lid release actuator. Ignition ON.
2. Verify the scan tool Rear Closure Ajar Sw parameter is Inactive.
   - **If not Inactive**
   1. Ignition OFF, disconnect the harness connector at the body control module.
   2. Test for infinite resistance between the signal circuit terminal 2 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the body control module.
   - **If Inactive**
3. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
4. Verify the scan tool Rear Closure Ajar Sw parameter is Active.
   - **If not Active**
   1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the body control module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the body control module.
   - **If Active**
5. Test or replace the rear compartment lid release actuator.

Component Testing

1. Ignition OFF, disconnect the harness connector at the rear compartment lid release actuator.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 3 with the switch in the open position.
   - **If less than infinite resistance**

     Replace the rear compartment lid release actuator.

   - **If infinite resistance**
3. Test for less than 3 Ω between the signal terminal 2 and the ground terminal 3 with the switch in the closed position.

- **If 3 Ω or greater**

  Replace the rear compartment lid release actuator.

- **If less than 3 Ω**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Compartment Lid Latch Replacement**
- **Control Module References** for BCM replacement, setup, and programming

DOOR WILL NOT OPEN/CLOSE, DOOR BINDING, OR LOCKS, HANDLES, OR CYLINDERS DO NOT FUNCTION

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to address the mechanical diagnosis of the door latching system, which could include the inside and outside handles, latch rods/cables, latches, or latch cylinders.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to **Step 2**	Go to **Diagnostic System Check - Vehicle**
2	Were you sent here from a Vehicle Access Symptom Table?	Go to **Step 3**	Go to **Symptoms - Vehicle Access**
3	Does the door open with the outside handle?	Go to **Step 4**	Go to **Step 10**
4	Does the door open with the inside handle?	Go to **Step 5**	Go to **Step 11**
5	Does the manual latch knob latch and unlatch the latch smoothly without binding?	Go to **Step 6**	Go to **Step 12**
6	Does the door latch switch and/or the keyless entry transmitter latch and unlatch the door latch or door latches?	Go to **Step 7**	Go to **Step 14**
7	Is the outside key cylinder loose or does it rattle or fall out? (if equipped)	Go to **Step 15**	Go to **Step 8**
8	Does the outside key cylinder latch and unlatch the latch and function smoothly without binding? (if equipped)	Go to **Step 9**	Go to **Step 16**
9	Does the door bind, does it take excessive effort to open, or is it misaligned?	Go to **Step 17**	Go to **Step 18**
10	If the door will not open with the outside handle, or the handle is obstructed or loose, check the following: • For cold weather freezing, thaw as necessary. • Check the handle for foreign material. Remove material as necessary. • Check the handle grab bar for looseness or damage. Repair as necessary.	Go to **Step 18**	Go to **Step 11**

Step	Action	Yes	No
	• Check the handle for full travel. If the issue is not resolved, remove the trim panel as necessary to gain access to door hardware and check the following: • Check the handle chassis for loose fasteners, broken chassis inserts, loose or missing spring, or a loose, missing or bent rod lever. • Check for bent rod to the outside handle. • Check that the handle grab bar engages the rod lever properly. • Check for interference of rod and handle to other components in the door. • Check that handle rod is securely attached at both latch and handle. • Check if rod is positioned properly in the clip on the latch. At rest position, the handle should be fully against the down stop and the latch lever should be at the bottom of its travel. Correct by opening clip, repositioning rod in clip and closing clip till it snaps, as necessary. Did you find and correct the condition?		
11	Door will not open with the inside handle: • Check the inside handle for foreign material. Remove material as necessary. • Check that the handle is secure. Correct as necessary. • If rear door, verify child security is not engaged. • Remove the trim panel as necessary to and check the inside handle rod/cable attachments at both the latch and handle. If the cable is kinked or pinched, correct as necessary. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 12**
12	The door will not or is difficult to unlatch with the inside manual latch knob: • For cold weather freezing, thaw as necessary • Check the latch knob for a loose condition. Repair	Go to **Step 18**	Go to **Step 13**

Step	Action	Yes	No
	or replace as necessary. Check the latch knob for binding or dragging using the following procedure: 1. Remove the latch knob. 2. If condition goes away, check for drag/interference of the latch knob against the inner belt seal, or the trim panel. Correct as required. If further action is required, remove the trim panel and check the latch rod and latch knob for interference with the following: • Water deflector/paper • Side impact foam • Rod grommet in sheet metal • Glass run channel • Other rods or cables • Trim panel Did you find and correct the condition?		
13	With a manual lock, if the latch will not function properly do the following: 1. Function the lock/unlatch lever on the latch to unlatch the latch. Check for high internal resistance. 2. With the door open, manually close the latch with a screwdriver. 3. Check the latch for internal binding by actuating the latch with the inside door handle lever. 4. Manually close the latch with a screwdriver again. 5. Check the latch for internal binding by actuating the latch with the outside door handle lever. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 14**
14	If power locks are included in vehicle options and do not function with either the keyless entry transmitter or switch:	Go to **Step 18**	Go to **Step 15**

Step	Action	Yes	No
	1. For cold weather freezing, thaw as necessary. 2. Remove trim pad as required and check the following: • Verify door harness has appropriate power connectors for switches and latch. • Check harness connector pins for corrosion. • Assure wire harness connectors are seated and locked properly at latch and switch. Remove and re-seat if required. • Check door harness for cuts/chafing /corrosion. Correct/replace as required. • Check for 12V at latch and door switch. Correct/proceed accordingly. • Check BCM for trouble codes. Correct/proceed accordingly. 3. If power locks still do not function do the following: 1. Remove latch from door cavity. 2. Connect latch to electrical connector outside the door. 3. Function power lock/unlatch switch in both latch and unlatch directions. Watch for lock/unlatch lever on latch to move completely from one position to the other. 4. If lever does not move, remove connector from old latch and attach to new latch outside of door cavity. 5. Verify new latch is functional, if so, attach rods and install new latch in door. Did you find and correct the condition?		
15	If the key cylinder is loose do the following: • Remove the trim if necessary. • Check that the retaining clip is properly seated. (if equipped) • Check that the fastener is properly torqued. (if equipped) Did you find and correct the condition?	Go to **Step 18**	Go to **Step 16**

Step	Action	Yes	No
16	The outside key cylinder will not latch and unlatch the latch and function smoothly without binding: 1. For cold weather freezing, thaw as necessary 2. Remove trim if required. 3. Check that the key cylinder rod is securely attached both to the key cylinder pawl and the latch. 4. Check that key cylinder lever, rod and latch lever are free of interferences. Remove interferences as required. 5. Check that latch cylinder rod is routed properly. Re-route as required. 6. Remove rod from latch cylinder and actuate cylinder. Check for internal resistance. Lubricate latch cylinder as required 7. Verify Cylinder rotates with vehicle key. If not, code and replace cylinder to match vehicle key. See latch cylinder coding and replacing. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 17**
17	The door is difficult to open: • Check for interference with the fender, adjacent door, body opening or door striker and adjust as necessary. • Check for binding door hinges. Lubricate or align/adjust as necessary. • Check the door check link for binding. Lubricate as necessary. • Adjust the door as necessary. Did you find and correct the condition?	Go to **Step 18**	Go to appropriate Door Lock Striker Adjustment procedure.

18	Verify proper operation of the door closing system.
	• Outside handle
	• Inside handle
	• Manual lock/unlatch
	  • Outside key cylinder
	  • Inside latch knob
	  • Double pull handle
		Go to **Step 1**	System OK

Step	Action	Yes	No

	• Power lock/unlatch
	  • Key fob
	  • Door switches
	• Door opening/closing effort
	
	Is the condition still present?		

REPAIR INSTRUCTIONS

FRONT SIDE DOOR INSIDE HANDLE CABLE REPLACEMENT (IMPALA) Removal

Procedure

1. Raise the door window to the full up position.

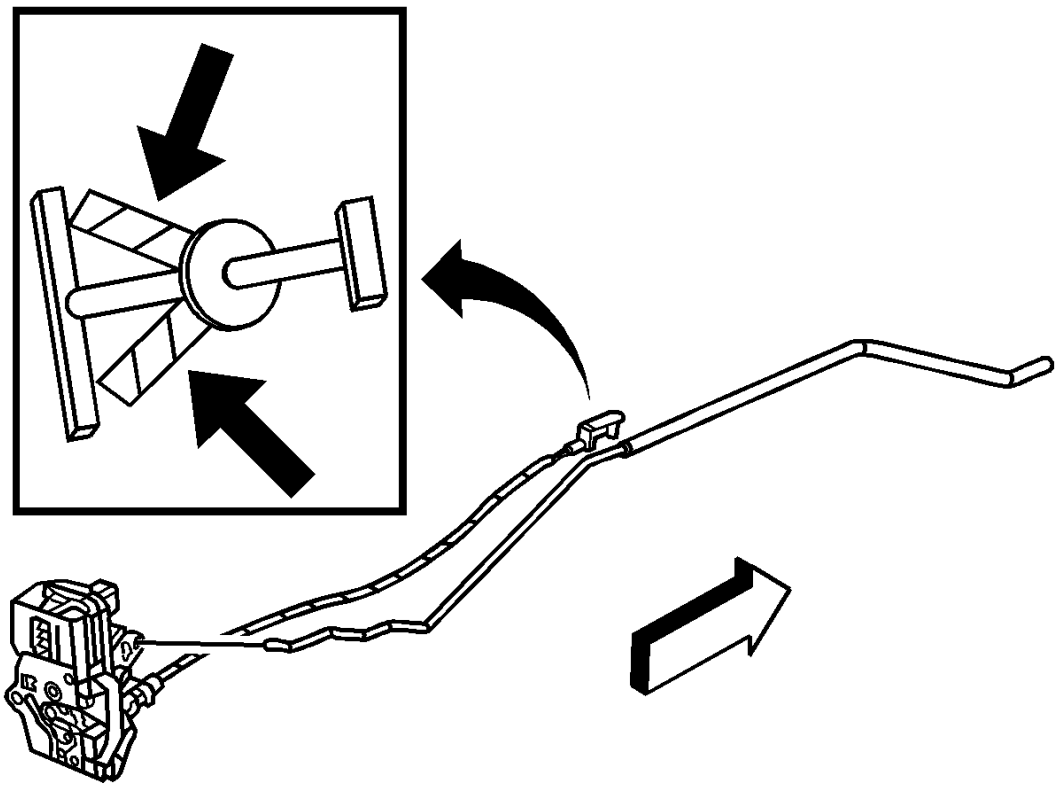

Fig. 5: View Of Inside Door Handle Cable
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: The latch or cable is not serviceable separately. It must be replaced as an assembly.

2. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .
3. Remove the front door water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** .
4. Remove the front door lock. Refer to **Front Side Door Lock Replacement**.
5. Remove the lock and cable through the opening in the inner door panel.

Installation Procedure

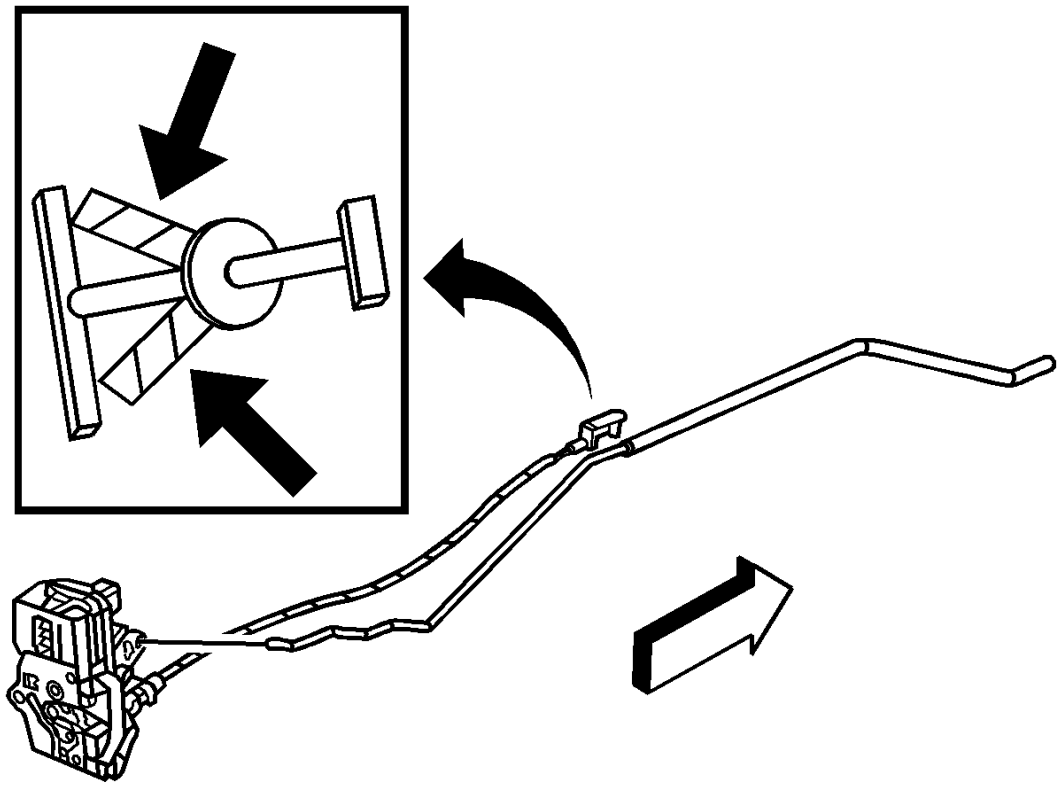

Fig. 6: View Of Inside Door Handle Cable
Courtesy of GENERAL MOTORS COMPANY

1. Install the lock and cable through the opening in the inner door panel.
2. Install the front door lock. Refer to **Front Side Door Lock Replacement**.
3. Inspect the door for proper operation.
4. Install the front door water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** .
5. Install the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .

REAR SIDE DOOR INSIDE HANDLE CABLE REPLACEMENT

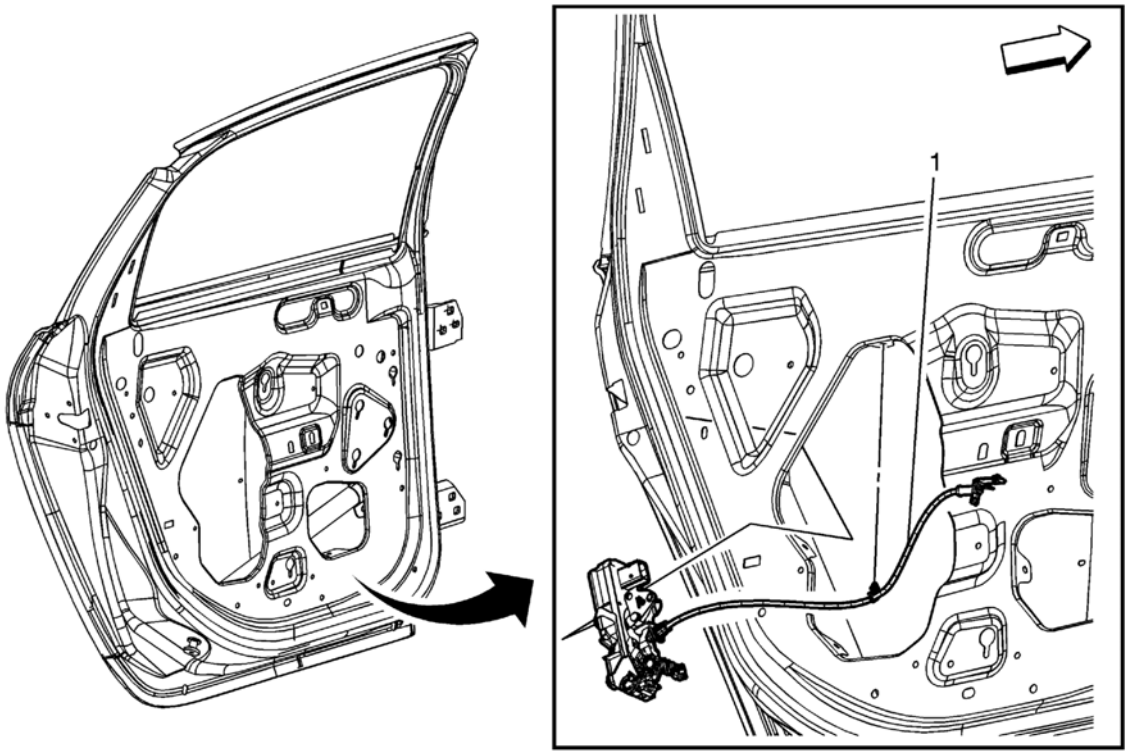

Fig. 7: Rear Side Door Inside Handle Cable
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the interior trim panel. Refer to **Rear Side Door Trim Panel Replacement** . 2. Remove the water deflector. Refer to **Rear Side Door Water Deflector Replacement** . 3. Remove the rear side door lock. Refer to **Rear Side Door Lock Replacement**.	
1	Rear Door Lock Cable **NOTE:** **Use a flat-bladed screwdriver to release the inside door handle from the trim panel.**

DOOR LOCK CYLINDER REPLACEMENT (IMPALA)

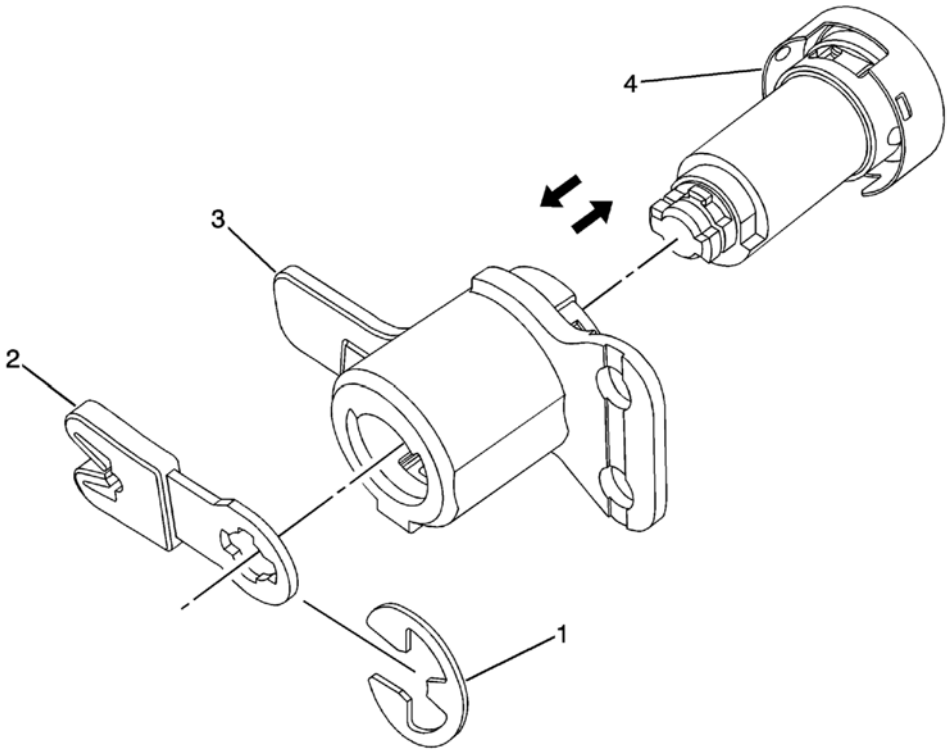

Fig. 8: Door Lock Cylinder Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door outside handle. Refer to **Front Side Door Outside Handle Replacement (Impala)**.	
1	Front Side Door Lock Cylinder C-Clip
2	Front Side Door Lock Cylinder Paw
3	Front Side Door Lock Cylinder Case
4	Front Side Door Lock Cylinder **Procedure** 1. Remove the lock cylinder by sliding it rearward releasing the case. 2. Inspect the door lock for proper operation before installing the door trim panel. **TIP:** Do not attempt repairs in order to correct lock cylinder discrepancies. Replace the lock cylinder.

FROZEN LOCK CYLINDER REPAIR

The frozen lock cylinders due to the cold weather may be repaired using the following procedure:

1. Apply heat to the cylinder area with a heat gun.

2. Hold the shutter door open with a paper clip or similar item and force air into the cylinder using compressed air and a blow gun attachment.
3. While holding the shutter door open inject a small amount of multi-purpose lubricant GM P/N 12346241 or equivalent.
4. Work the key into the cylinder several times and wipe any excess lubrication residue from the key.

REAR COMPARTMENT LID LOCK CYLINDER REPLACEMENT

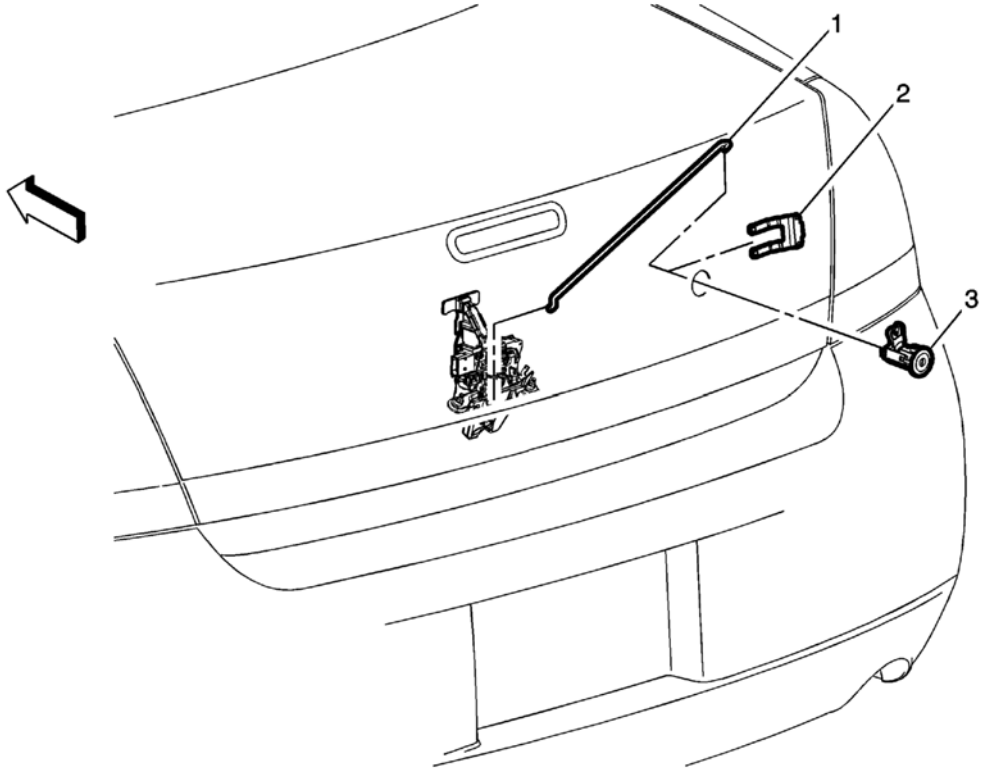

Fig. 9: Rear Compartment Lid Lock Cylinder Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Compartment Lid Lock Cylinder Rod **Procedure** Disconnect the lock cylinder rod from the latch and the lock cylinder.
2	Rear Compartment Lid Lock Cylinder Retainer Clip **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the retainer clip from the lock cylinder.

Callout	Component Name
3	Rear Compartment Lid Lock Cylinder **Procedure** 1. Remove the lock cylinder from the rear compartment. 2. Ensure the lock cylinder rod is installed properly. 3. Inspect the lock cylinder for proper operation by closing and opening the rear compartment.

FRONT SIDE DOOR OUTSIDE HANDLE REPLACEMENT (IMPALA) Removal

Procedure

NOTE: **The outside handles have adjustable outside handle lock rods. This allows for adjustment of the amount of travel needed in order to operate the outside handle.**

When servicing a vehicle with adjustable outside handle lock rods, remove all free play between the outside handle and the lock. Also, do not operate the outside handle before these connections are made.

1. Raise the window to the full up position.
2. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .
3. Remove the front water deflector, as necessary. Refer to **Front Side Door Water Deflector Replacement (Impala)** .

CAUTION: **To avoid paint damage, protect the area surrounding the part which you are removing or installing.**

4. Apply masking tape around the outside handle.

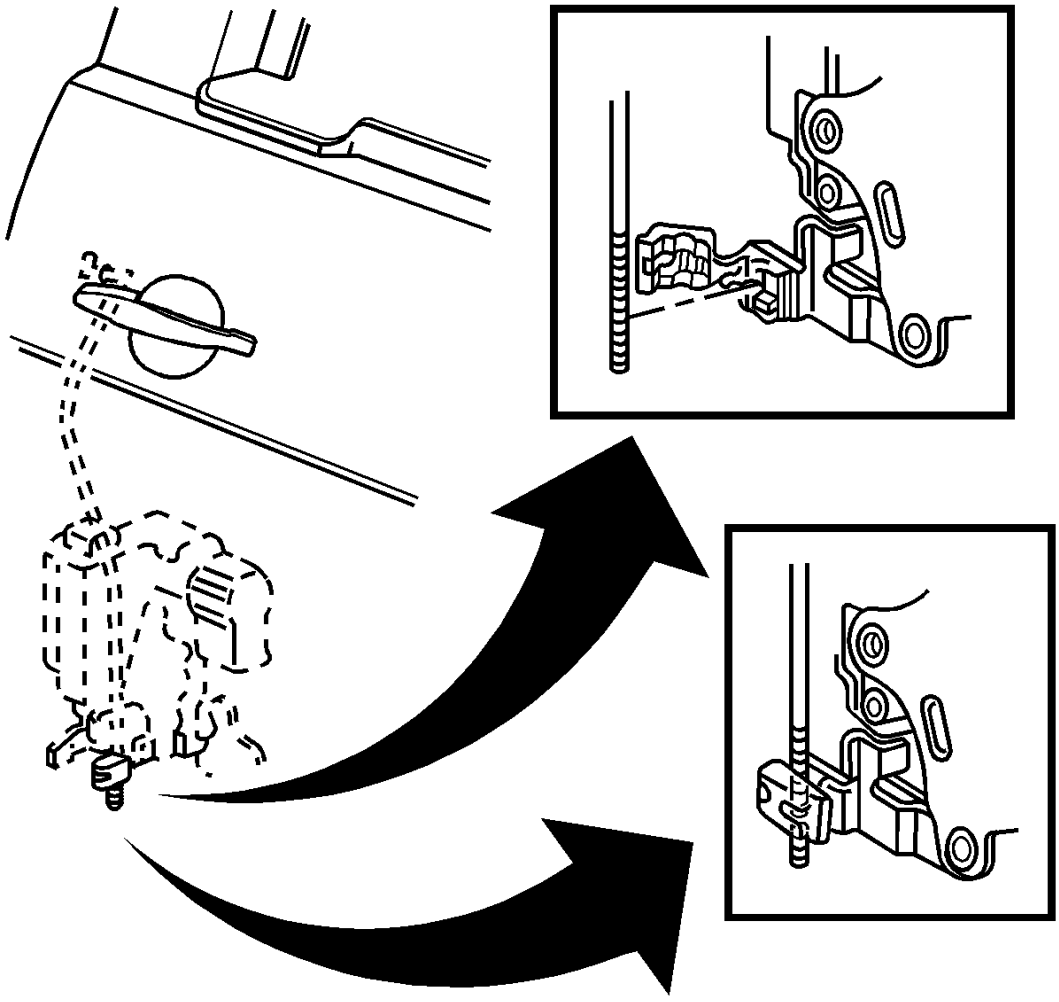

Fig. 10: View Of Handle Rod To Lock Clip
Courtesy of GENERAL MOTORS COMPANY

5. Open the outside door handle rod to lock clip located on the door lock.
6. Remove the front side door window rear run channle bolts.
7. Remove the front side door window rear run channle from the door.

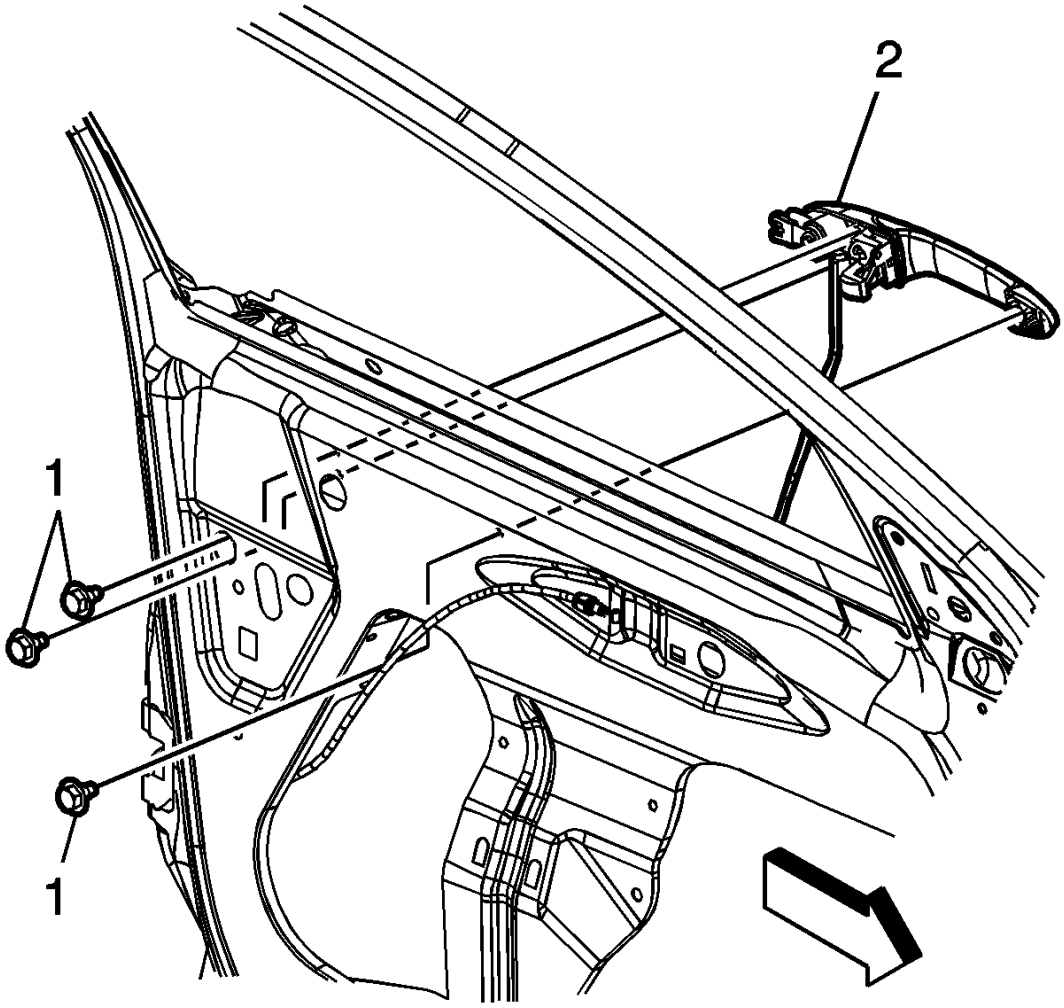

Fig. 11: Identifying Outside Handle Bolts Door
Courtesy of GENERAL MOTORS COMPANY

8. Remove the door handle bolt access tape from the inner door panel.
9. Remove the bolts (1) from the outside handle.

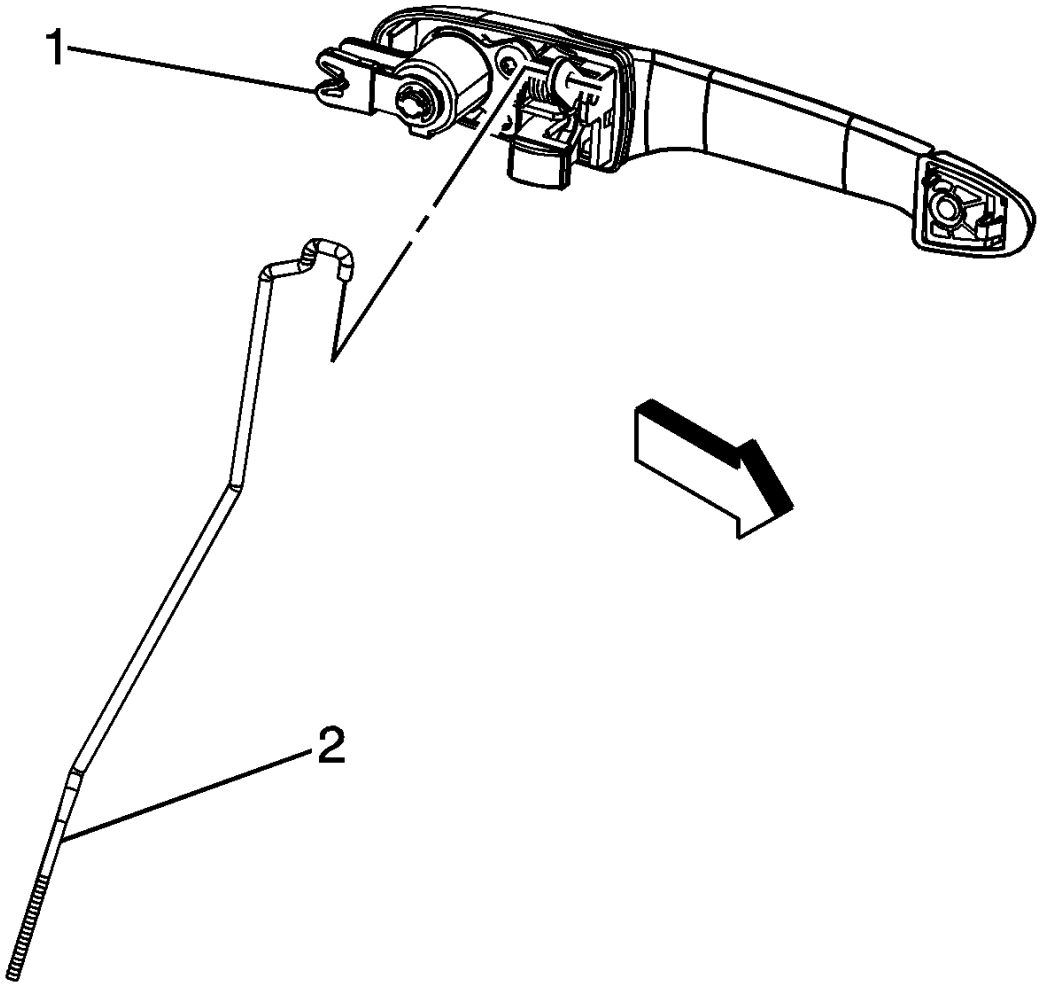

Fig. 12: View Of Outside Handle & Rod
Courtesy of GENERAL MOTORS COMPANY

10. Remove the outside handle (1) and the rod (2) from the door.

Installation Procedure

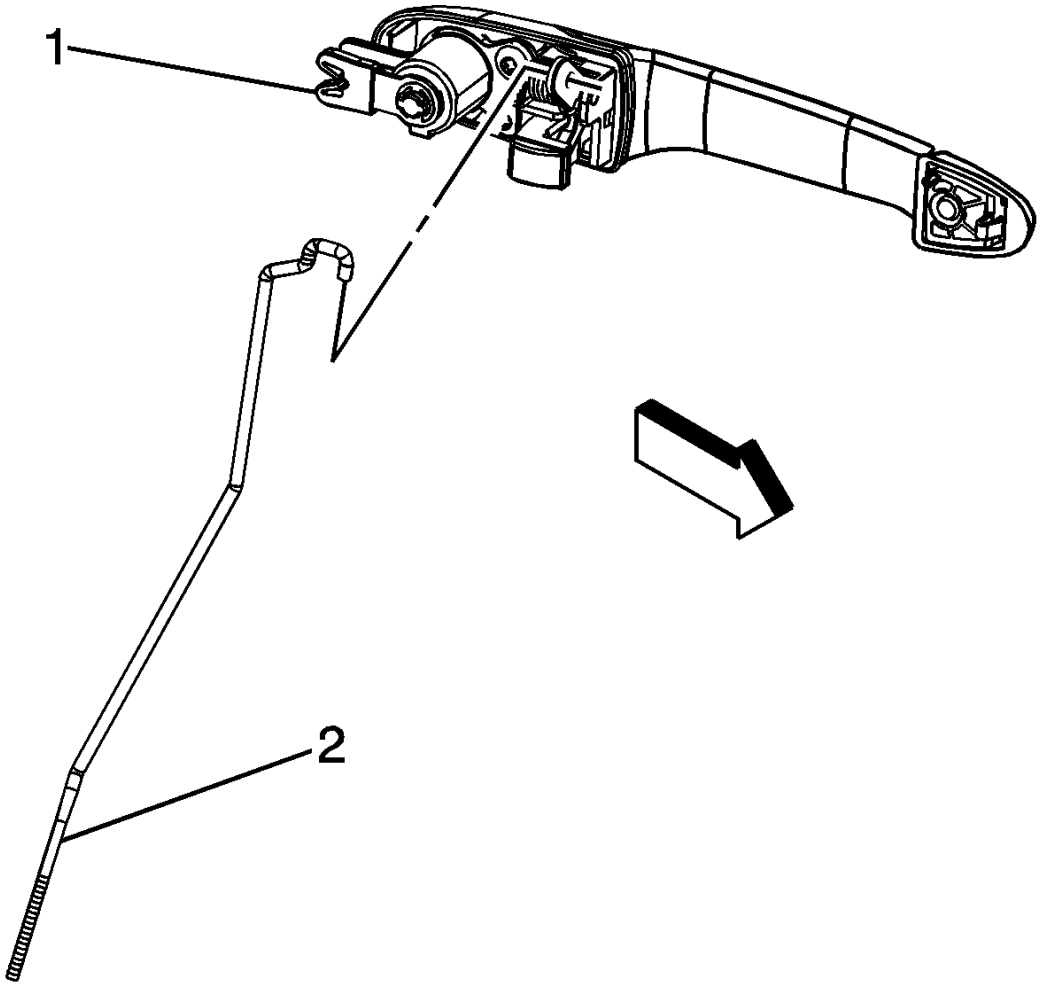

Fig. 13: View Of Outside Handle & Rod
Courtesy of GENERAL MOTORS COMPANY

1. Install the outside handle (1) and the rod (2) to the door.

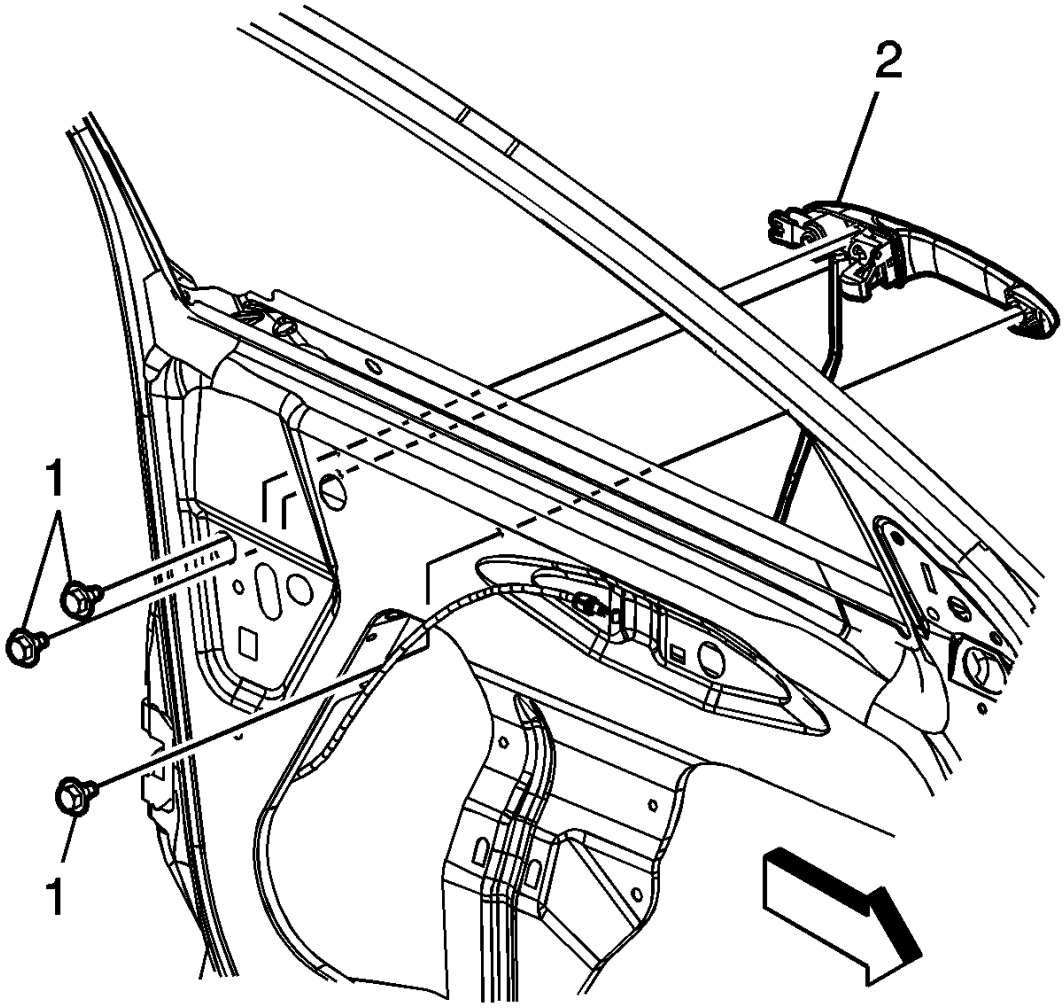

Fig. 14: Identifying Outside Handle Bolts Door
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the outside handle bolts (1) to the door.

Tighten

Tighten the bolts to 10 N.m (89 lb in).

3. Install the outside handle bolt access tape to the inner door panel.
4. Install the front side door window rear run channle to the door.
5. Install the front side door window rear run channle bolts.

Tighten

Tighten the bolts to 10 N.m (89 lb in).

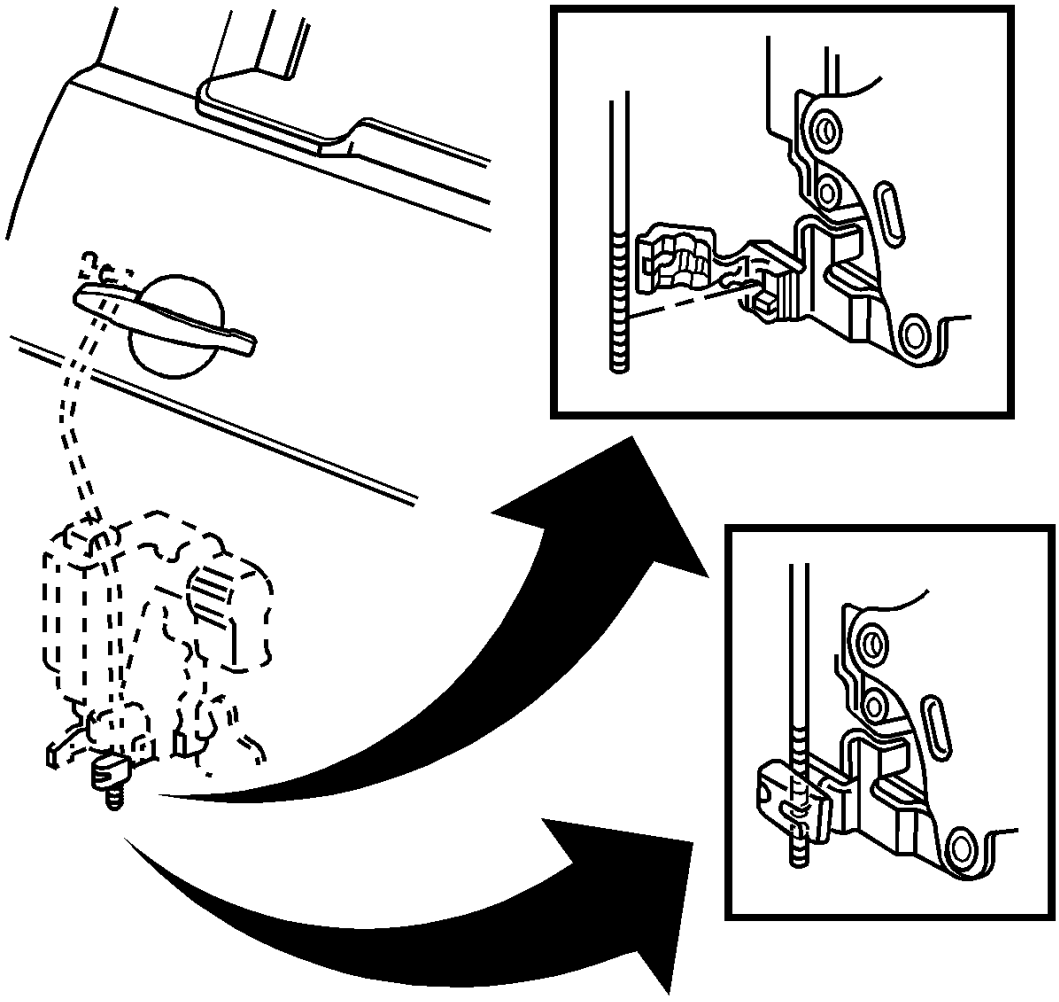

Fig. 15: View Of Handle Rod To Lock Clip
Courtesy of GENERAL MOTORS COMPANY

6. Install the outside handle rod into the clip
7. Close the clip cover over the outside handle rod.
8. Inspect the outside handle for proper operation.
9. Remove the masking tape.
10. Install the front door water deflector. Refer to **Front Side Door Water Deflector Replacement (Impala)** .
11. Install the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .

FRONT AND REAR SIDE DOOR OUTSIDE HANDLE ROD CLIP REPLACEMENT

Removal Procedure

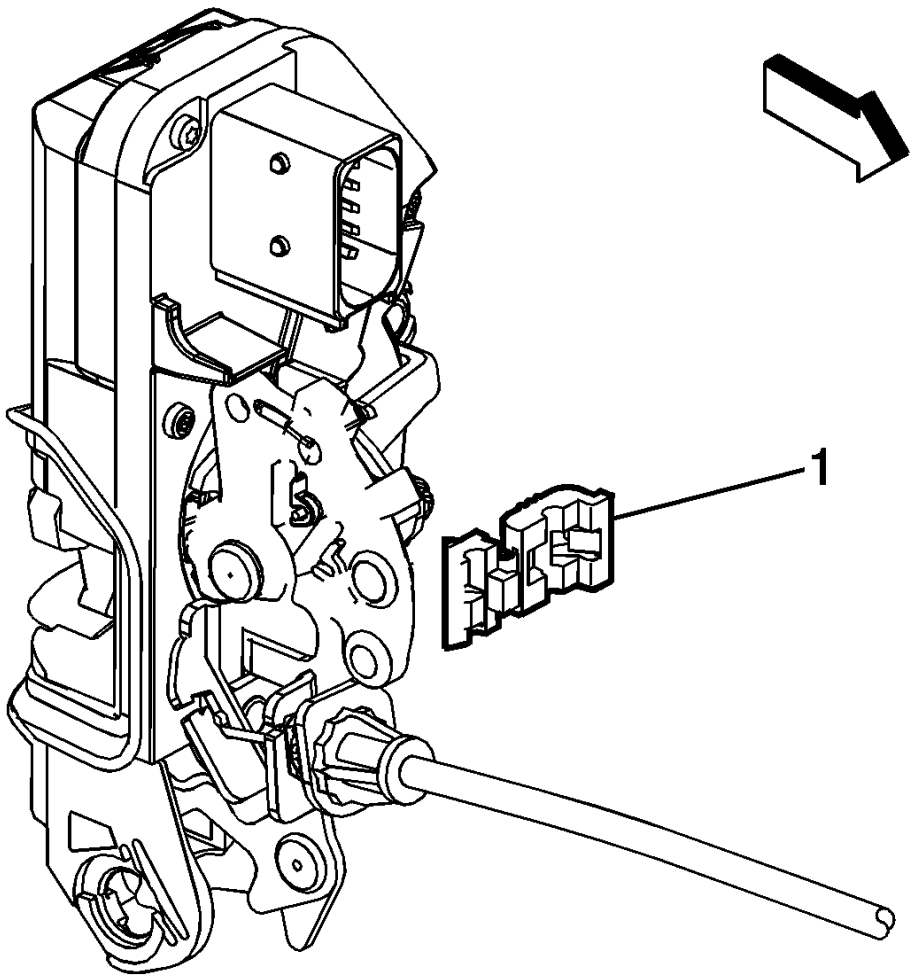

Fig. 16: Outside Door Handle Rod Clip
Courtesy of GENERAL MOTORS COMPANY

NOTE: **It maybe necessary to remove the front or rear side door latch from some of the vehicles to access the rod clip, refer to the appropriate procedure in this sub-section.**

1. Using the appropriate tool, open the outside door handle rod clip (1) on the latch.

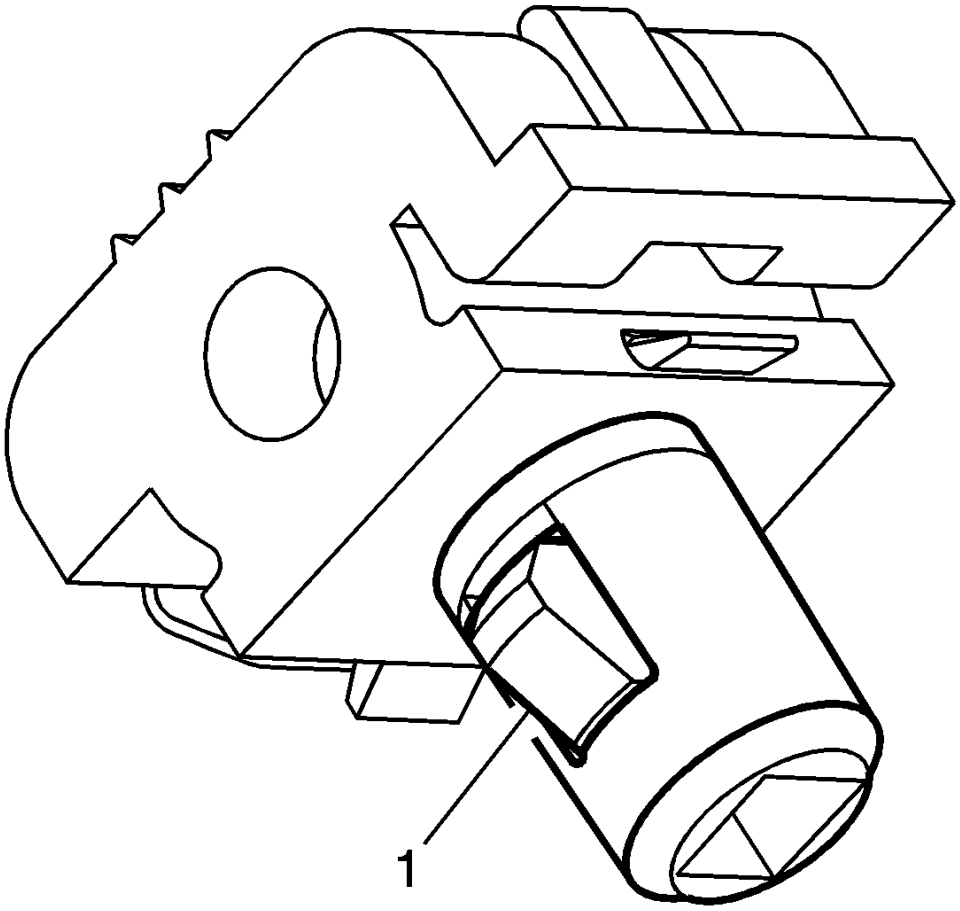

Fig. 17: Outside Door Handle Rod Clip Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The clip for the outside door handle rod is designed for one use only, a new clip Must be installed to the door latch to retain the outside handle rod.**

NOTE: **Use the appropriate tool to push in on the retaining tabs (1) located on each side of the old clip to remove.**

2. Remove the old outside door handle rod clip from the door latch.

Installation Procedure

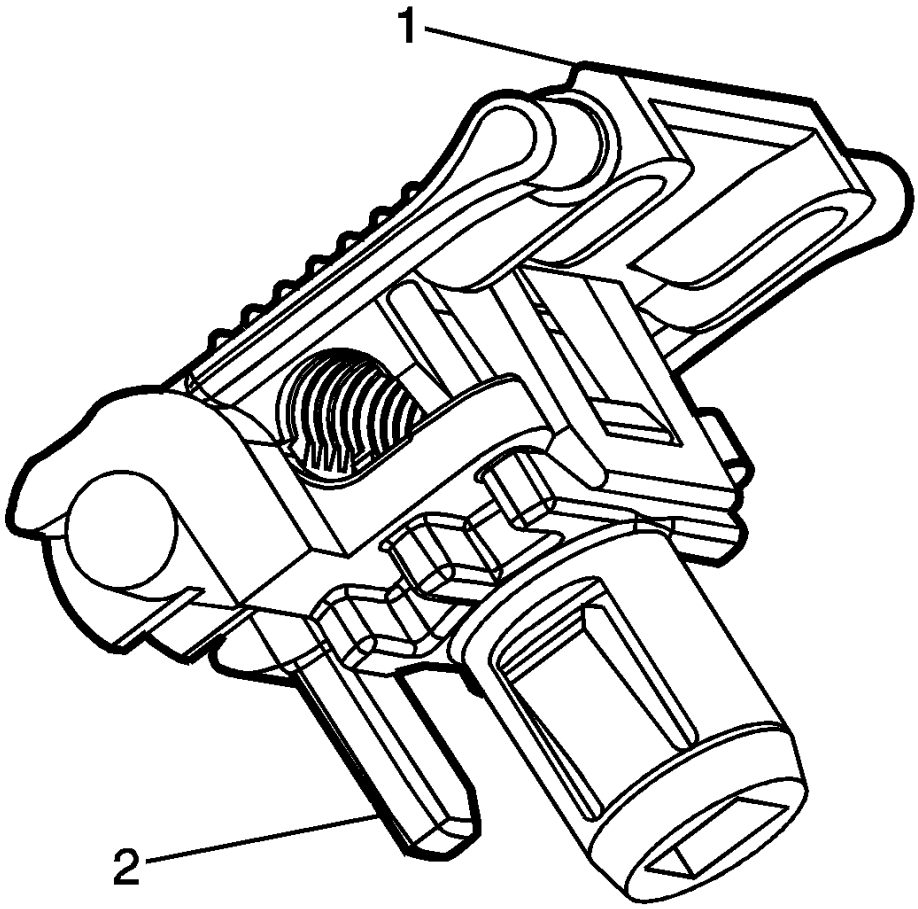

Fig. 18: Outside Door Handle Rod Clip
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When replacing the old designed outside door handle rod clip with the new designed clip (1) the anti rotation tab (2) will need to be removed.**

NOTE: **When installing the outside door handle rod to latch in order to prevent outside handle lever pre-load, the outside handle shall be fully secured to the door prior to securing integral latch clip to outside handle release rod. Push upward at the bottom the rod clip.**

1. Install the new outside door handle rod clip (1) to the latch.
2. Verify the outside door handle will release the door latch.

REAR SIDE DOOR OUTSIDE HANDLE REPLACEMENT

Removal Procedure

NOTE: **The outside handles have adjustable outside handle lock rods. This allows for adjustment of the amount of travel needed in order to operate the**

outside handle.

When servicing a vehicle with adjustable outside handle lock rods, remove all free play between the outside handle and the lock. Also, do not operate the outside handle before these connections are made.

1. Remove the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .
2. Remove the rear door water deflector. Refer to **Rear Side Door Water Deflector Replacement** .
3. Raise the window to the full up position.

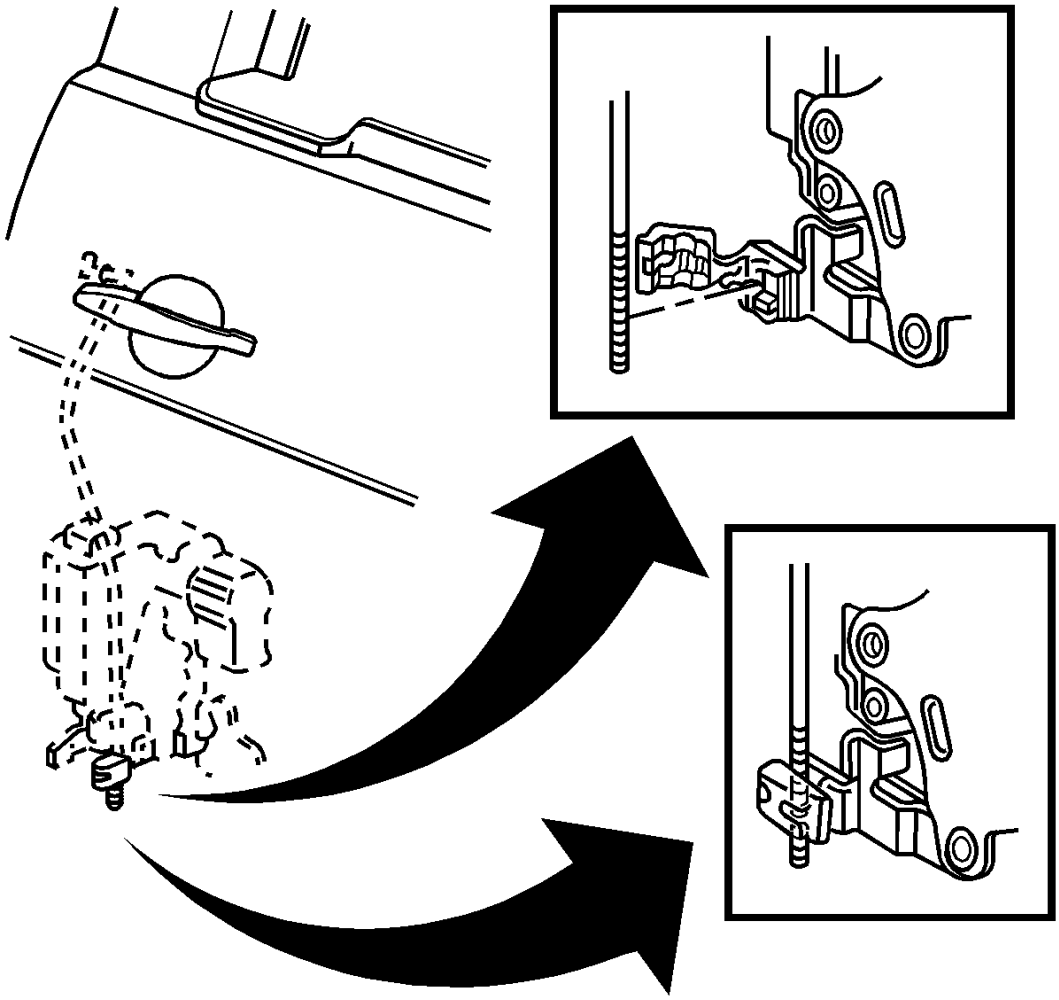

Fig. 19: View Of Handle Rod To Lock Clip
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Paint Damage Caution .

4. Apply masking tape around the outside handle.
5. Open the outside handle rod to lock clip located on the door lock.
6. Remove the rear door lock . Refer to **Rear Side Door Lock Replacement**.

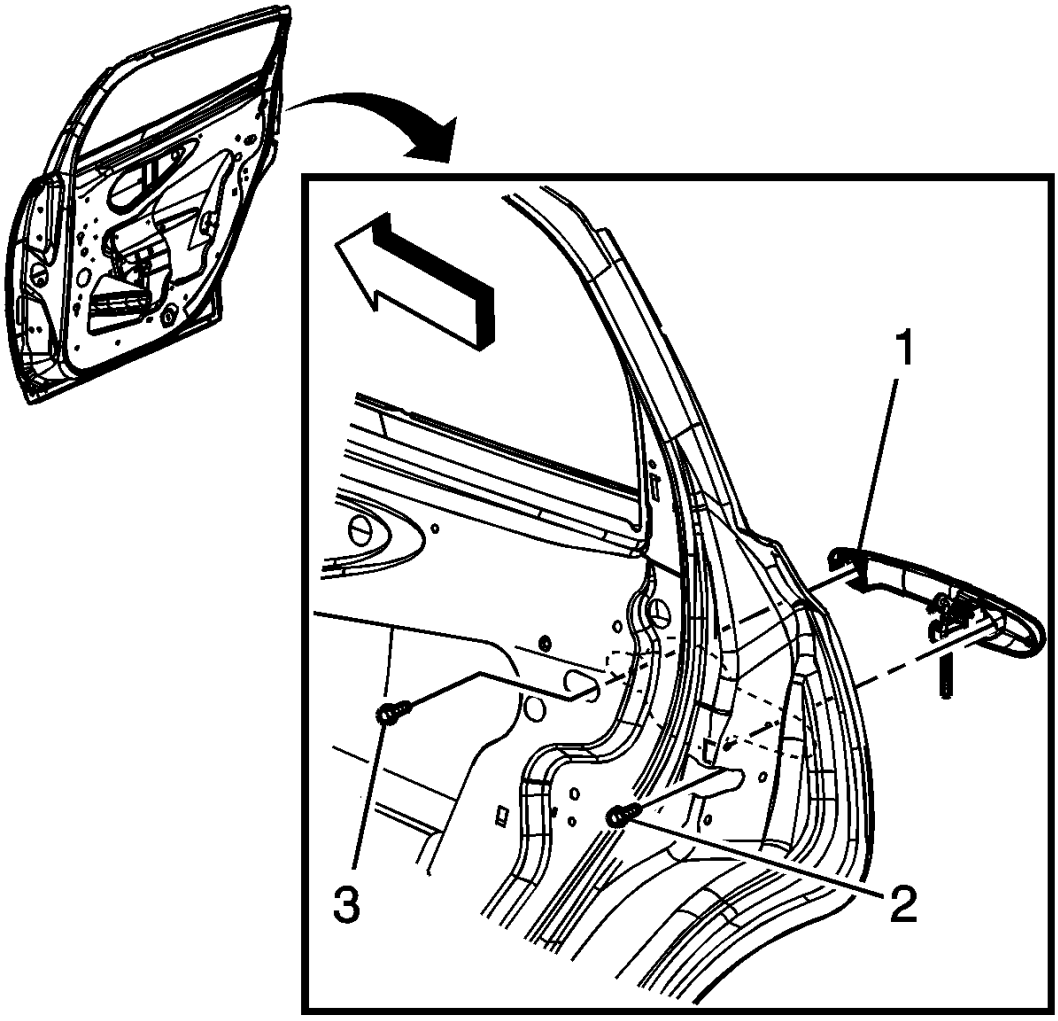

Fig. 20: View Of Rear Door Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the outside door handle bolt access tape.
8. Remove the bolts (3) from the rear door handle.
9. Remove the outside handle bolt (2) through the latch hole.

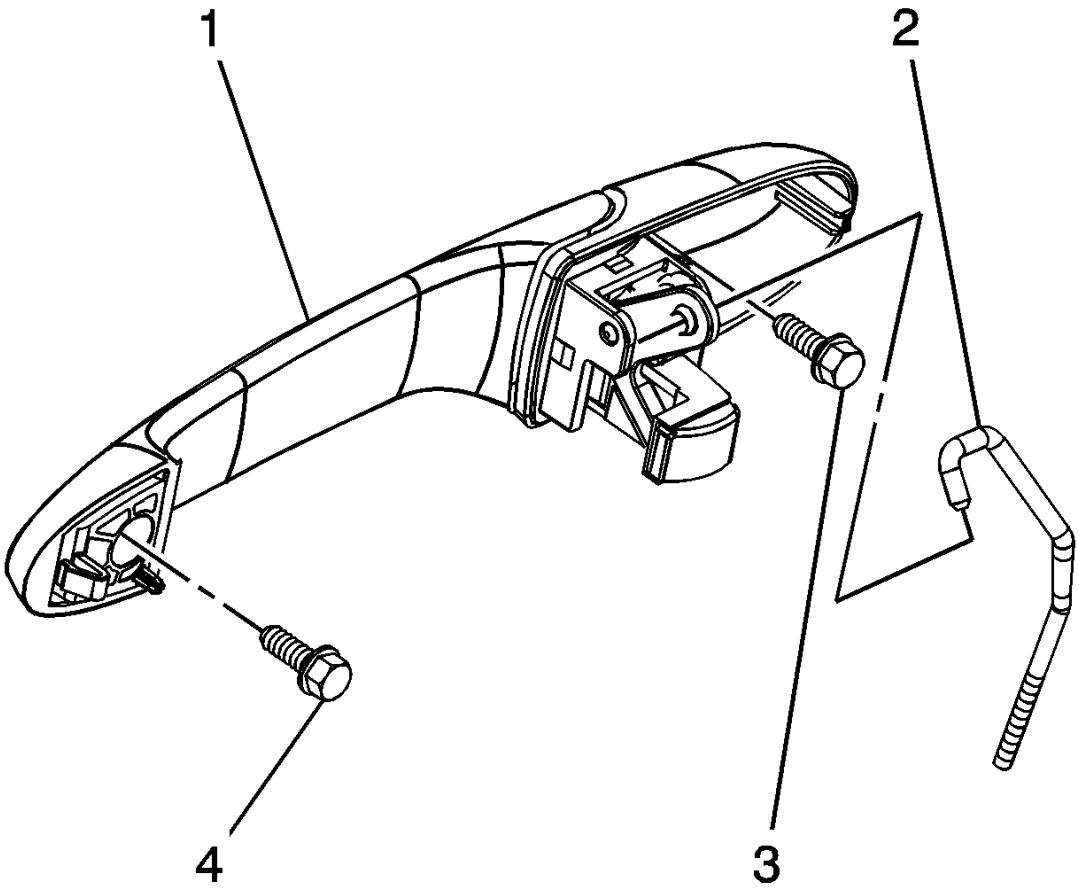

Fig. 21: Outside Door Handle and Rod
Courtesy of GENERAL MOTORS COMPANY

10. Remove the outside handle (1) and the rod (2) from the door.

Installation Procedure

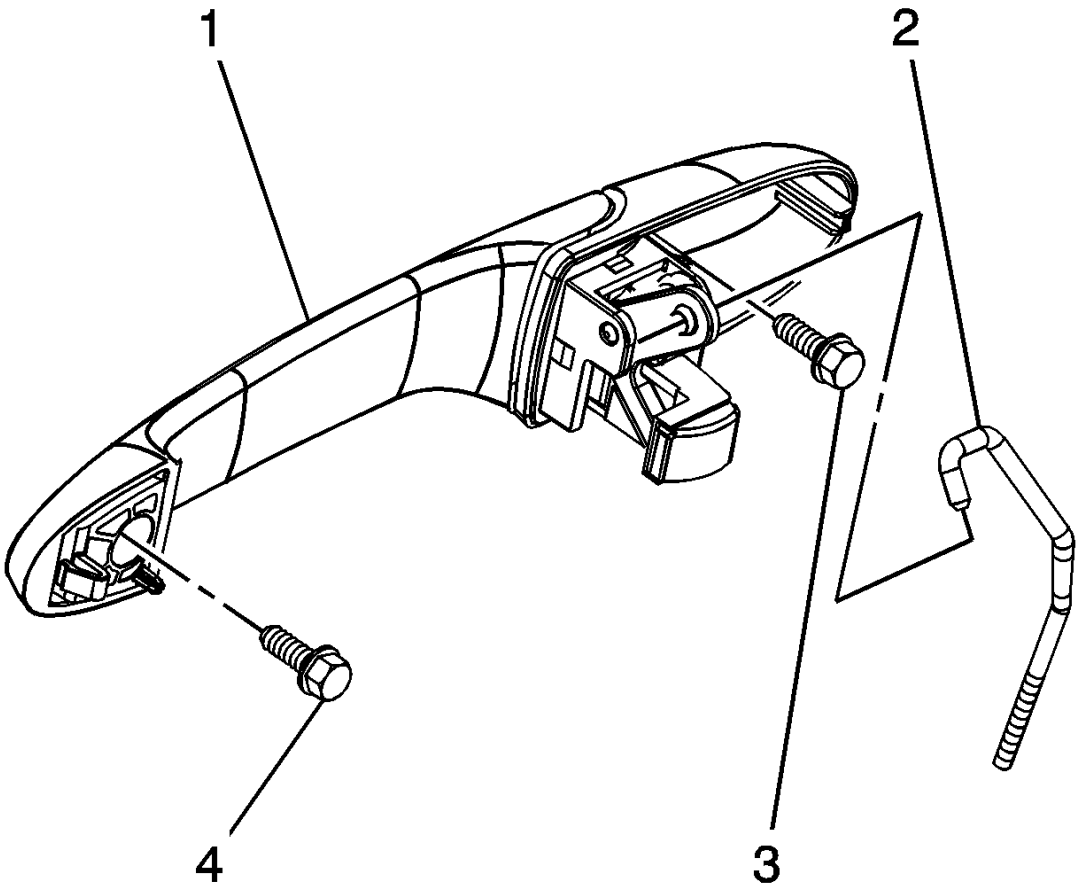

Fig. 22: Outside Door Handle and Rod
Courtesy of GENERAL MOTORS COMPANY

1. Install the outside door handle (1) and the rod (2) to the door.

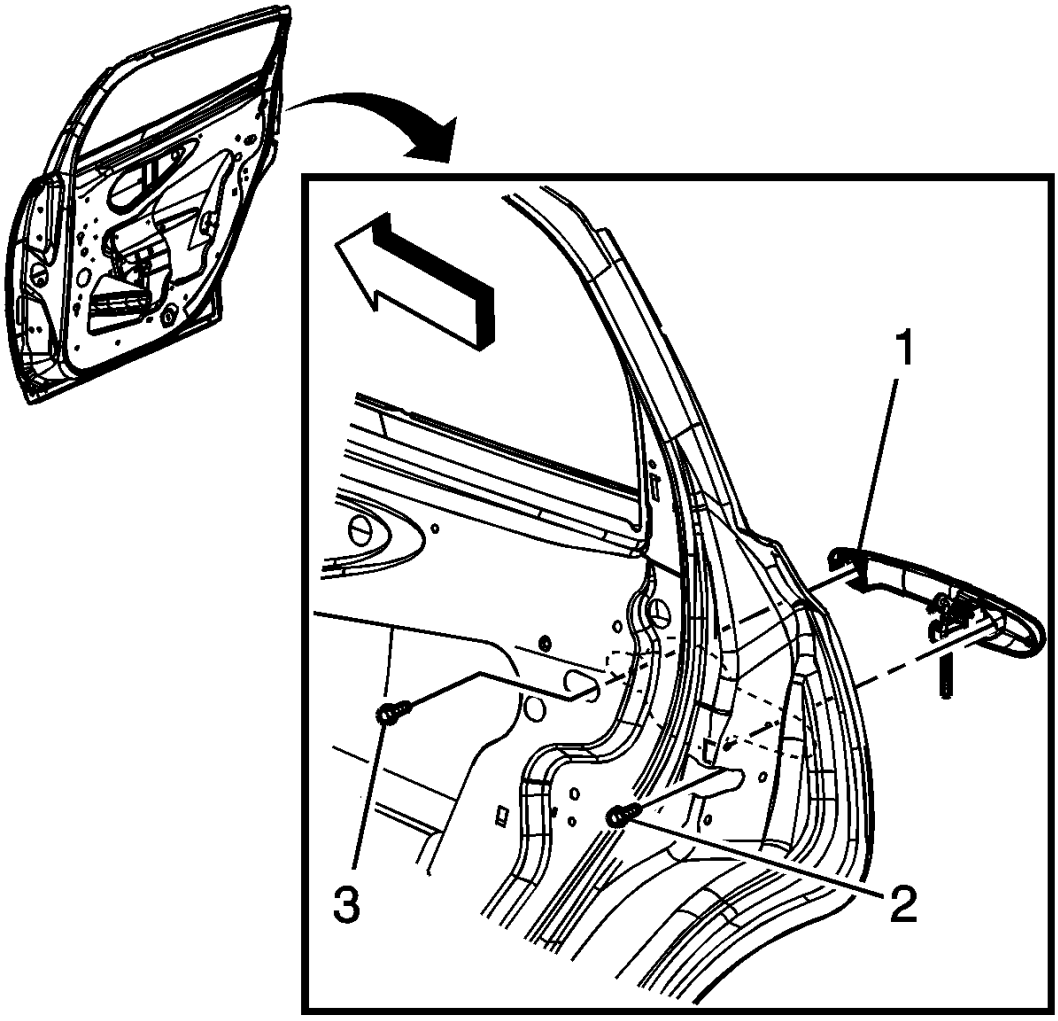

Fig. 23: View Of Rear Door Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the outside handle bolt (2) through the latch hole.

   Tighten

   Tighten the bolt to 10 N.m (89 lb in).

3. Install the bolts (3) to the rear door handle.

   Tighten

   Tighten the bolt to 10 N.m (89 lb in).

4. Install the rear door lock. Refer to **Rear Side Door Lock Replacement**.
5. Install the outside door handle bolt access tape.

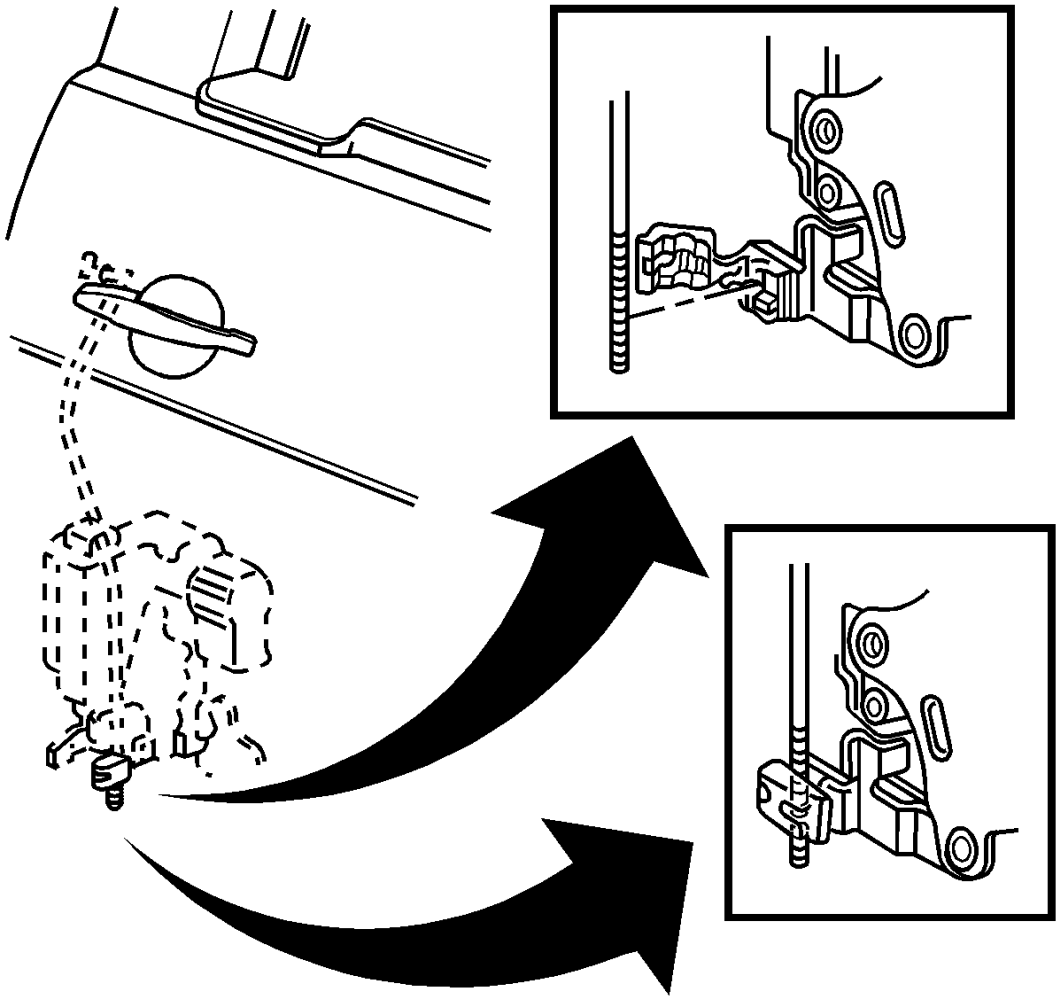

Fig. 24: View Of Handle Rod To Lock Clip
Courtesy of GENERAL MOTORS COMPANY

6. Install the outside handle rod into the clip.
7. Close the clip cover over the outside door handle rod.
8. Inspect the outside door handle for proper operation.
9. Remove the masking tape.
10. Install the rear door water deflector. Refer to **Rear Side Door Water Deflector Replacement** .
11. Install the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .

REAR COMPARTMENT LID LATCH REPLACEMENT

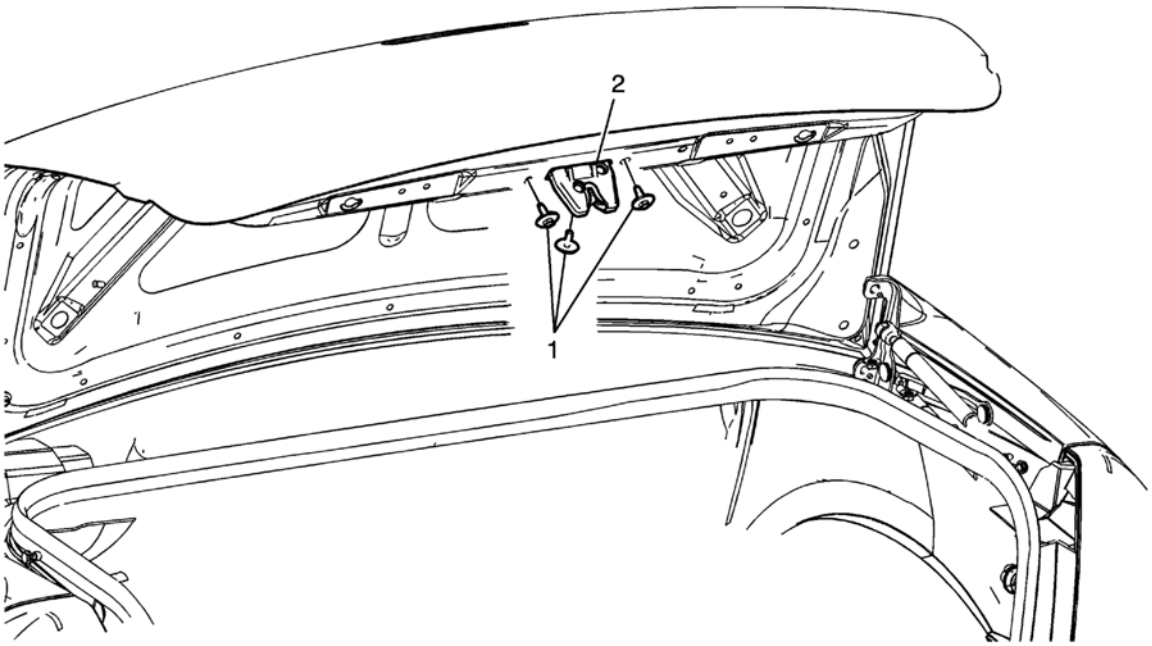

Fig. 25: Rear Compartment Lid Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Compartment Latch Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Rear Compartment Latch **TIP:** Disconnect the electrical connection.

FRONT SIDE DOOR LOCK REPLACEMENT

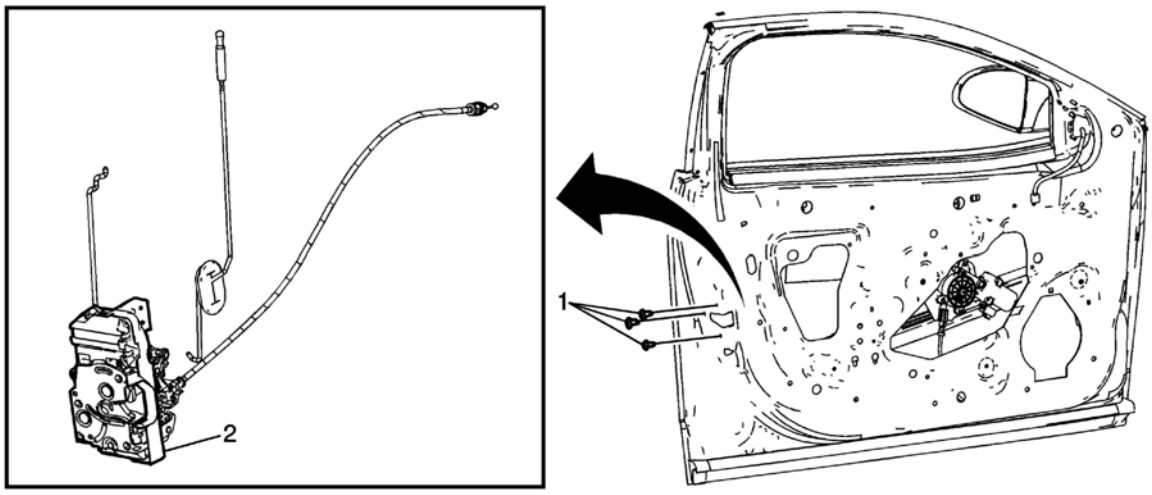

Fig. 26: Front Door Lock
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door trim panel. Refer to **Front Side Door Trim Panel Replacement** .	
1	Front Side Door Lock Screws (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** . **Procedures** 1. Remove the water deflector. 2. Release the front inside door handle cable retainers from the door. 3. Remove the window run channel bolts, slide the channel to the side while removing the lock. 4. Release the door handle rod clip. **Tighten** 10 N.m (89 lb in)
2	Front Side Door Lock Assembly **Procedure** 1. Disconnect the front side door lock electrical connector. 2. Transfer the front side door lock rods.

REAR SIDE DOOR LOCK REPLACEMENT

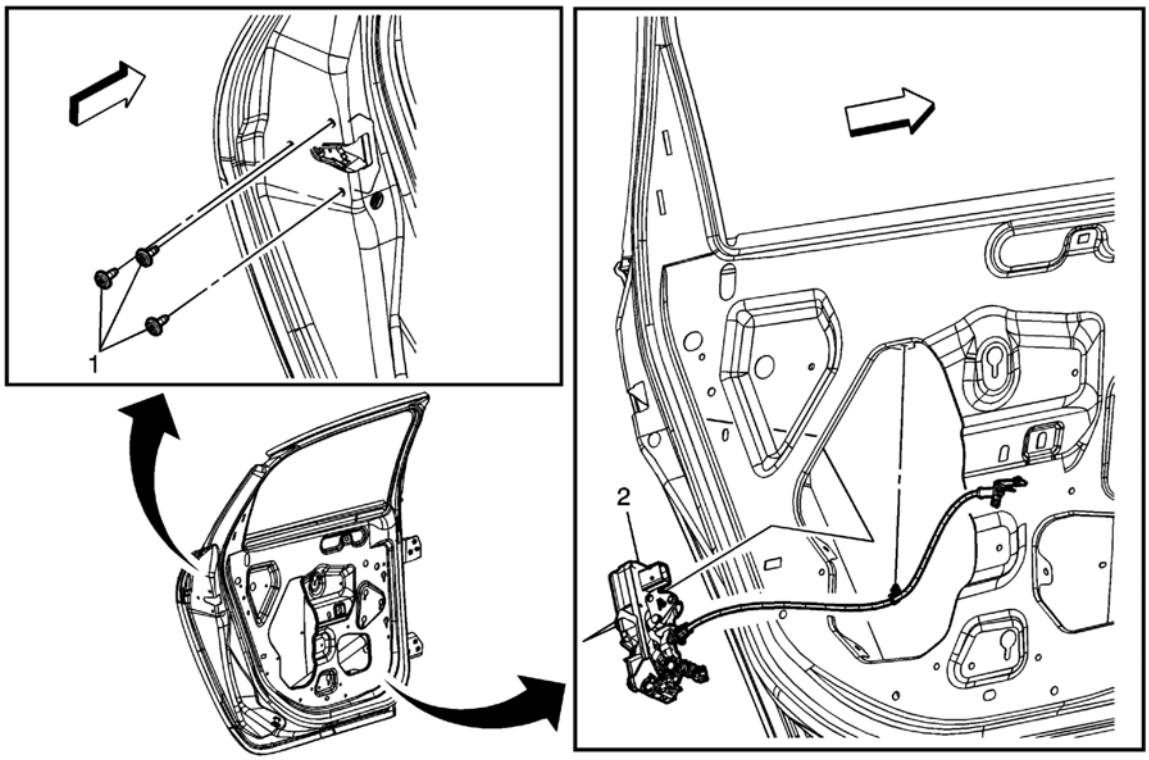

Fig. 27: Rear Door Lock
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .	
1	Rear Side Door Lock Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener** **Caution** **.** **Procedure** 1. Remove the water deflector. 2. Release the inside handle cable retainers before removing the door lock. 3. Disconnect the door lock electrical connector. 4. Remove the window run channel bolts, slide the channel to the side while removing the lock. 5. Release the door handle rod clip. **Tighten** 10 N.m (89 lb in)

Callout	Component Name
2	Rear Side Door Lock Assembly **Procedure** Transfer the lock rods to the new door lock.

FRONT SIDE DOOR LOCKING ROD REPLACEMENT (IMPALA)

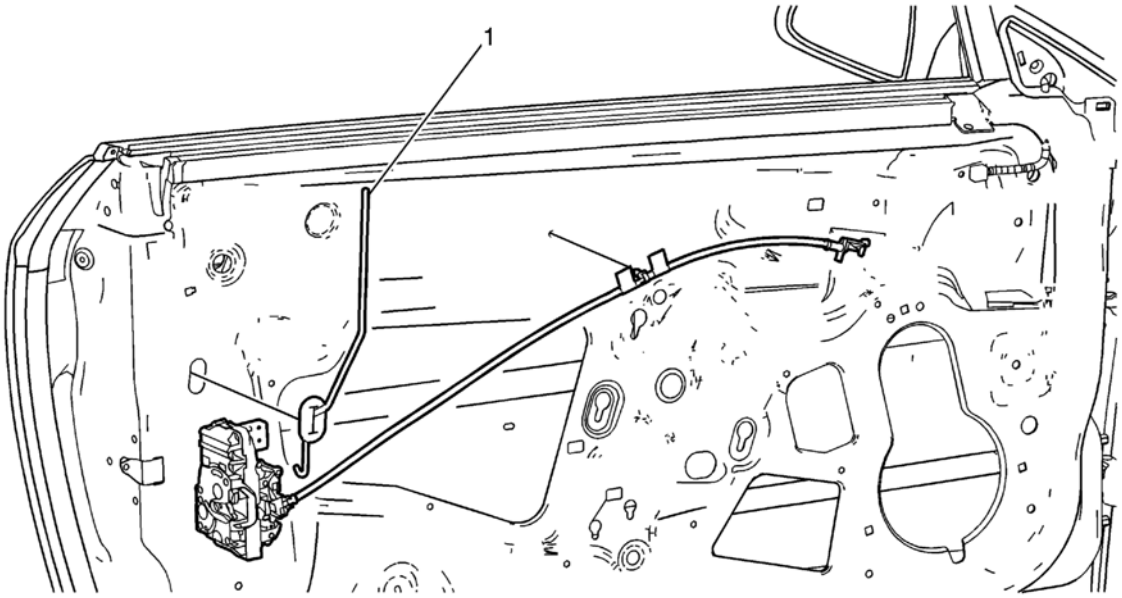

Fig. 28: View Of Front Side Door Locking Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door lock. Refer to **Front Side Door Lock Replacement**.	
1	Front Side Door Lock Rod

FRONT SIDE DOOR OUTSIDE HANDLE ROD ADJUSTMENT

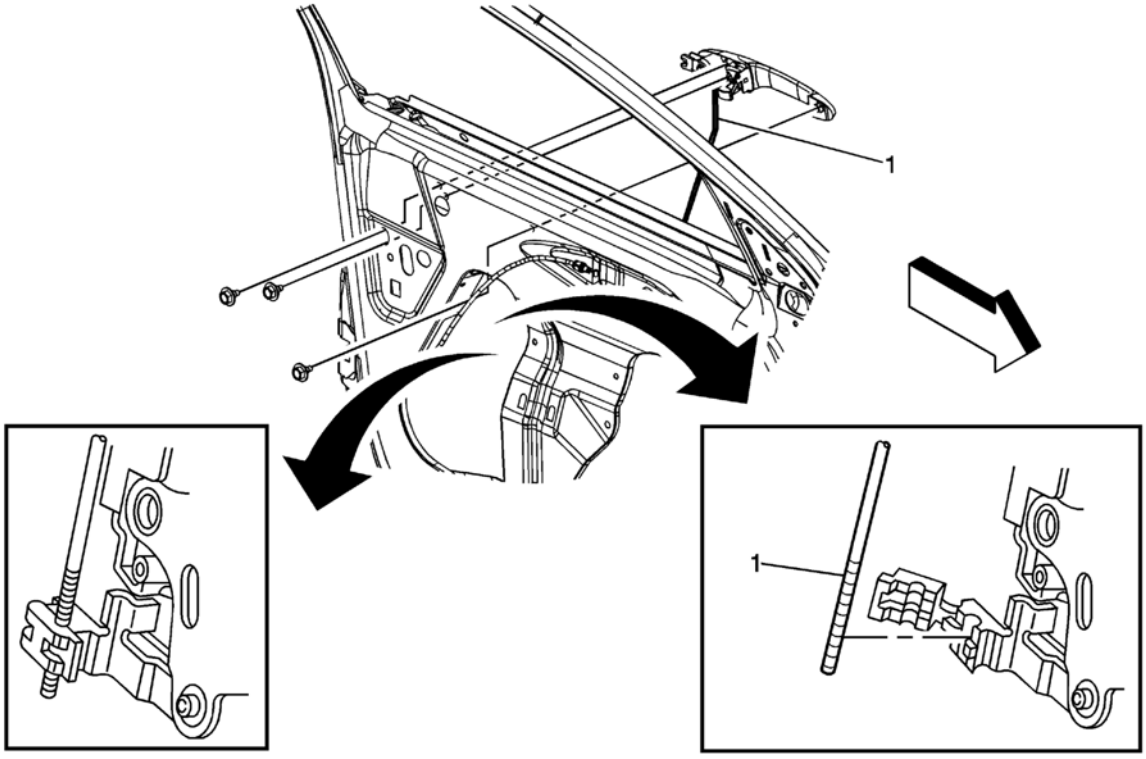

Fig. 29: Front Outside Door Handle Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** . 2. Remove the water deflector as needed. Refer to **Front Side Door Water Deflector Replacement (Impala)** .	
1	Outside Door Handle Rod **Procedure** 1. Use a flat-bladed tool to release the threaded rod (1) from the clip (2). 2. Position the rod in the clip in order to eliminate any free play in the outside door handle. 3. Inspect the door lock system for proper operation.

FRONT SIDE DOOR OUTSIDE HANDLE ROD REPLACEMENT

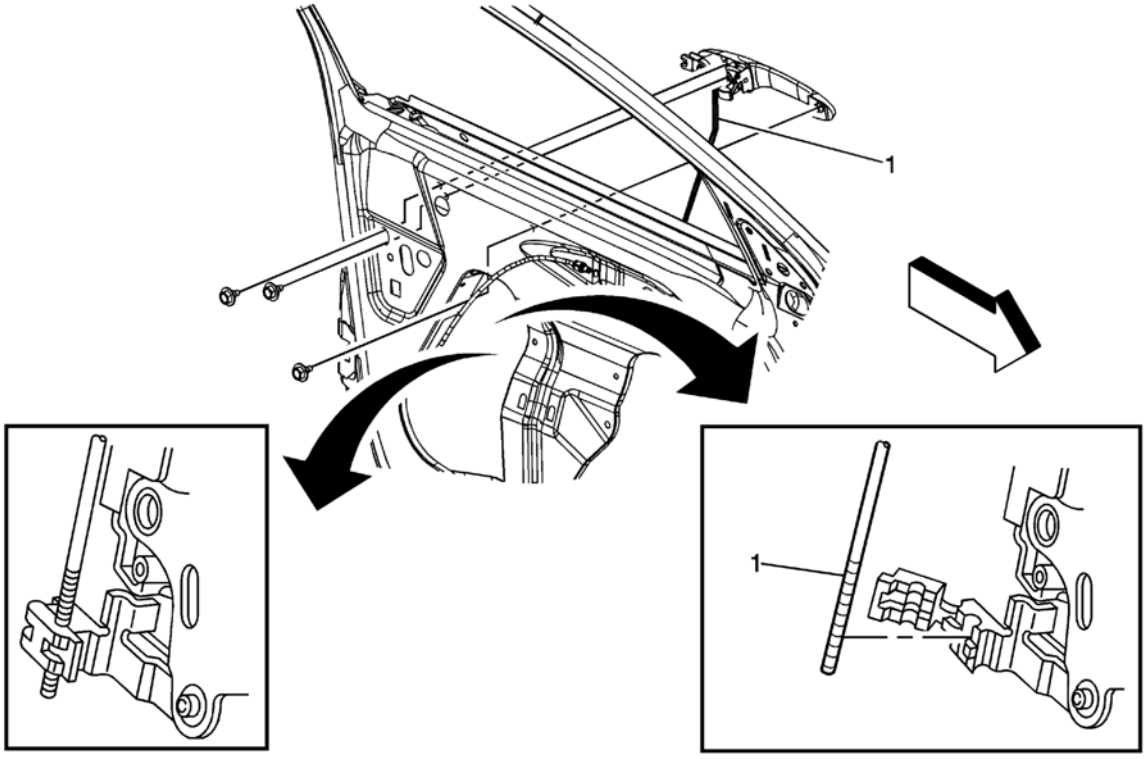

Fig. 30: Front Outside Door Handle Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the outside door handle. Refer to **Front Side Door Outside Handle Replacement (Impala)**.	
1	Outside Door Handle Rod **Procedure** 1. Remove the water deflector as needed. Refer to **Front Side Door Water Deflector Replacement (Impala)** . 2. Use a flat-bladed tool to release the threaded rod from the clip. 3. Position the rod in the clip in order to eliminate any free play in the outside door handle. 4. Inspect the door lock system for proper operation before installing the trim panel.

REAR SIDE DOOR OUTSIDE HANDLE ROD ADJUSTMENT

Removal Procedure

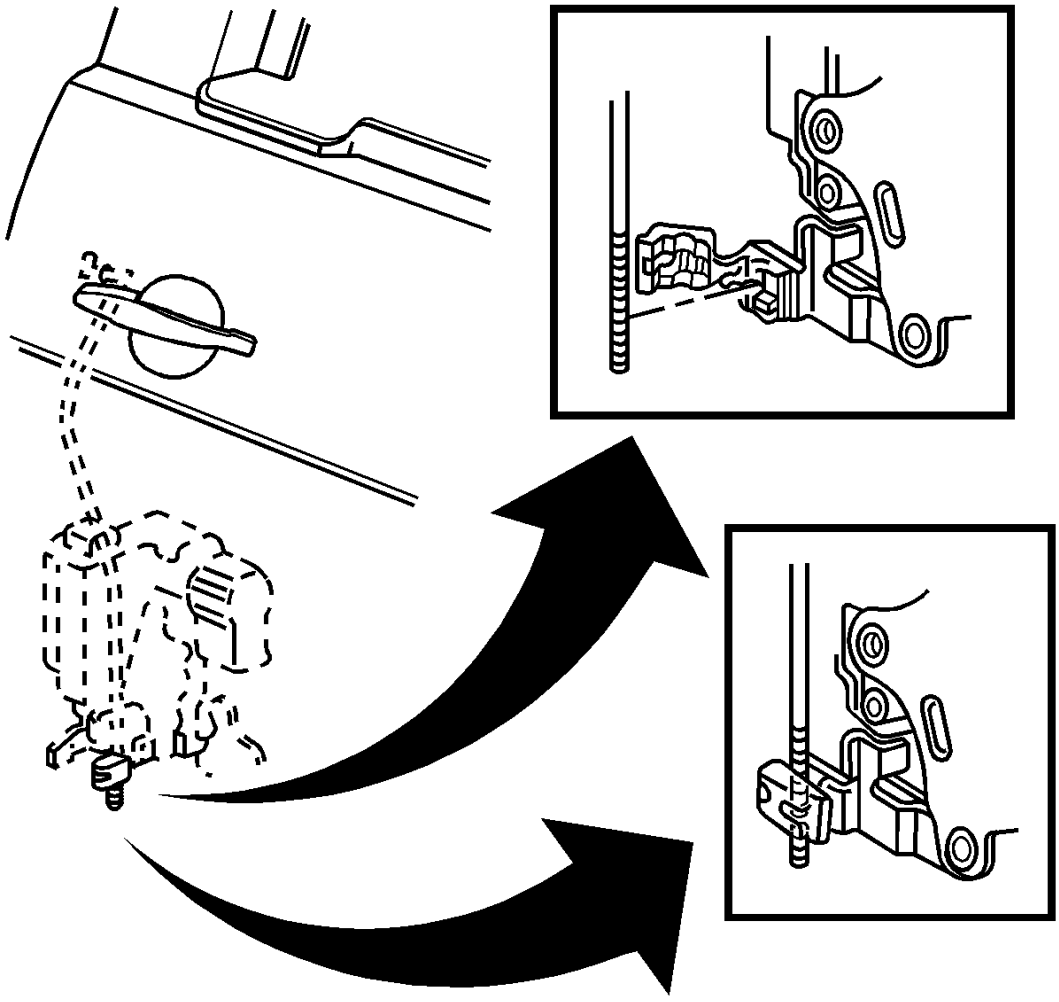

Fig. 31: View Of Handle Rod To Lock Clip
Courtesy of GENERAL MOTORS COMPANY

1. Remove the rear door trim panel. Refer to **Front Side Door Trim Panel Replacement** .
2. Remove the rear door water deflector as needed. Refer to **Rear Side Door Water Deflector Replacement** .
3. Use a flat-head tool to open the clip from the threaded rod connecting the lock to the outside handle.
4. Adjust the travel of the handle by removing the threaded rod from the clip.

Installation Procedure

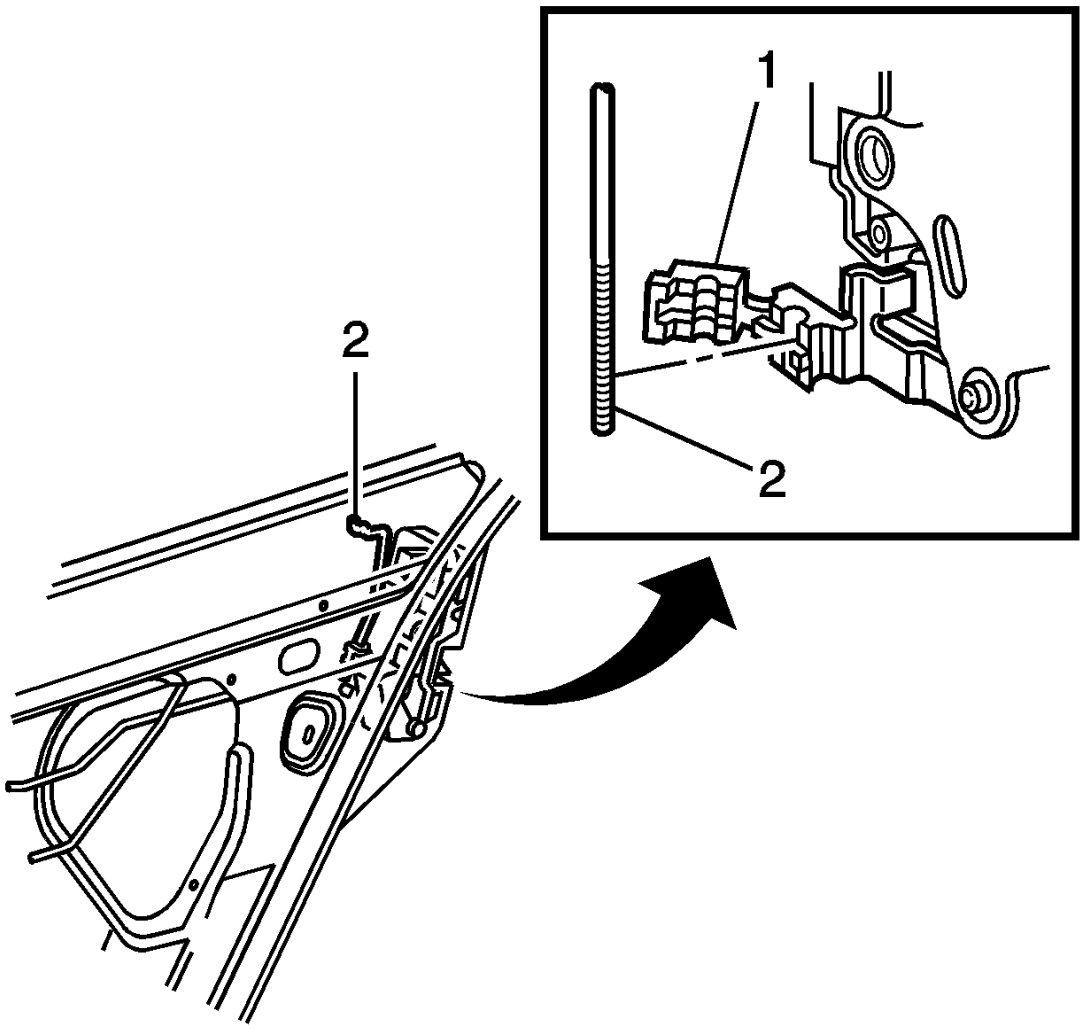

Fig. 32: Positioning Outside Door Handle Rod In Clip
Courtesy of GENERAL MOTORS COMPANY

1. Position the outside door handle rod (2) in the clip (1) in order to eliminate any free play in the outside door handle.
2. Install the clip cover closed over the threaded outside door handle rod.
3. Inspect the door lock system for proper operation.
4. Install the rear door water deflector as needed. Refer to **Rear Side Door Water Deflector Replacement** .
5. Install the rear door trim panel. Refer to **Front Side Door Trim Panel Replacement** .

DOOR LOCK STRIKER ADJUSTMENT (IMPALA) Special

Tools

J 39346-A Mini-Wedge Door Striker Aligner

NOTE: **Properly align the door before adjusting the striker.**

1. Open the door.

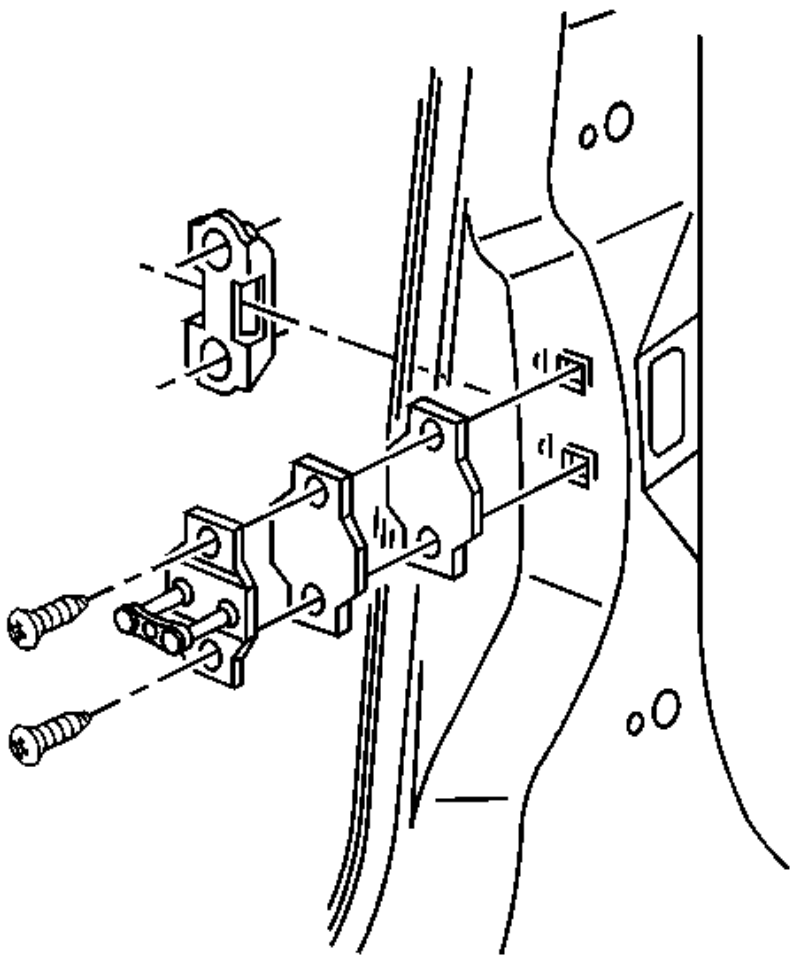

Fig. 33: View Of Lock Striker Components
Courtesy of GENERAL MOTORS COMPANY

2. Loosen the door striker screws just enough to allow movement of the door striker.
3. Install the **J 39346-A** mini-wedge door striker aligner.

NOTE: **Do not slam the door.**

4. Close the door while holding the outside handle in the open position.
5. Open the door.

CAUTION: **Refer to Fastener Caution .**

6. Tighten the door lock striker screws.

Tighten

Tighten the door striker screws to 25 N.m (18 lb ft).

7. Remove the **J 39346-A** mini-wedge door striker aligner.
8. Close the door.

REAR COMPARTMENT LATCH STRIKER REPLACEMENT

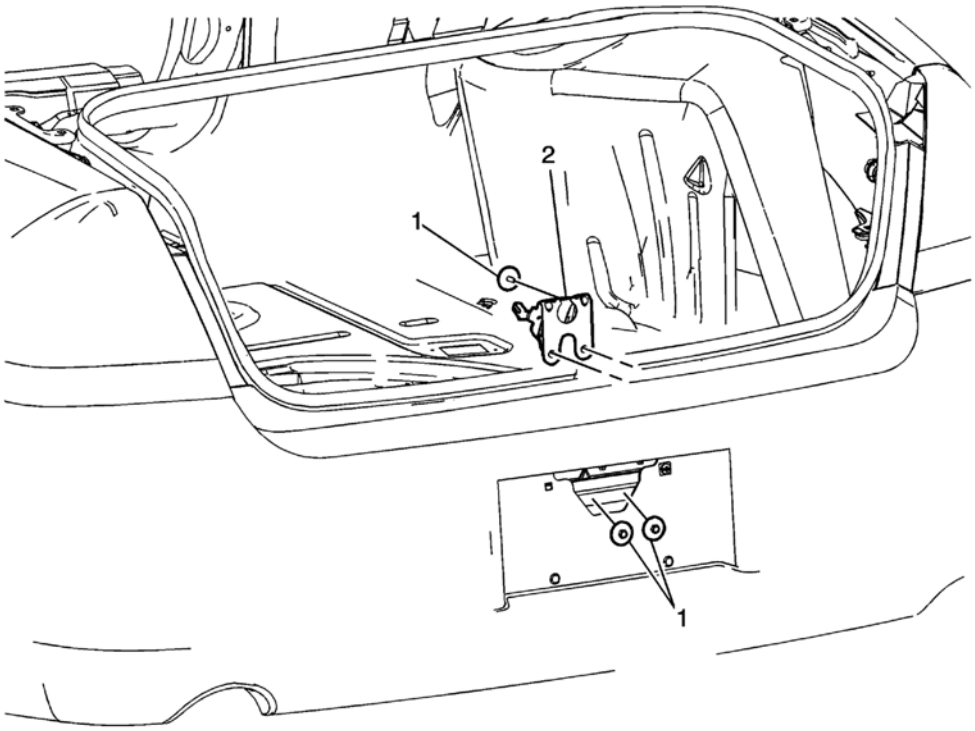

Fig. 34: Rear Compartment Latch Striker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear compartment lid inner panel trim. Refer to **Rear Compartment Sill Trim Plate Replacement** .	
1	Latch Striker Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 25 N.m (19 lb ft)
2	Rear Compartment Lid Latch Striker **TIP:** Remove the licence plate to gain access to the 2 outer bolts.

DOOR LOCK SWITCH REPLACEMENT (IMPALA)

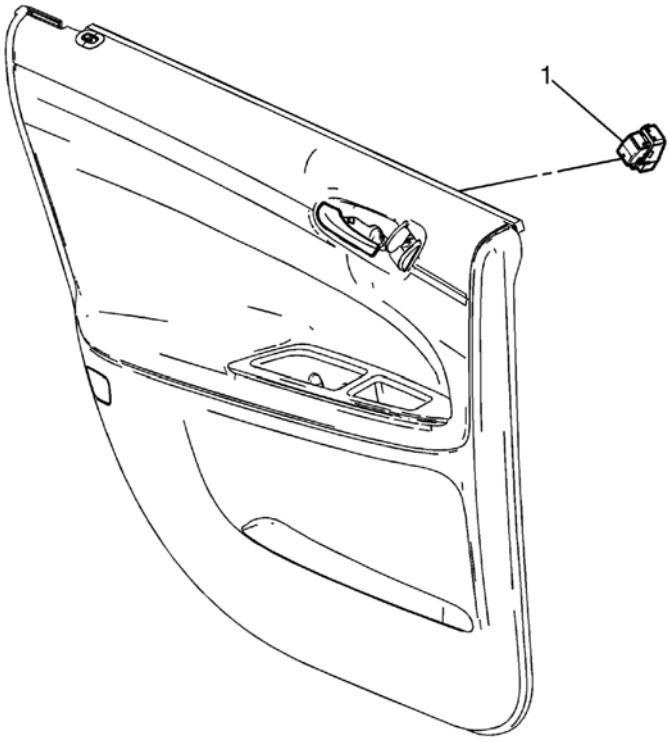

Fig. 35: Door Lock Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door trim panel. Refer to **Front Side Door Trim Panel Replacement** .	
1	Front Side Door Lock Switch Assembly **Procedure** Disconnect the electrical connector and remove from the back side of the door trim panel.

DESCRIPTION AND OPERATION

DOOR AJAR INDICATOR DESCRIPTION AND OPERATION

Door Ajar Indicator System Components

The door ajar indicator system consists of the following components:

- Body control module
- Instrument cluster
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch

Driver, Passenger and Rear Doors Ajar

The body control module provides a 12V signal to each door ajar switch within the door latch to indicate the status of the door. When the door is open, the contract within the ajar switch closes providing a ground path for the signal circuit. The body control module will detect the voltage drop in the ajar signal circuit and will send a message to the instrument cluster which will illuminate the door ajar icon

LUGGAGE COMPARTMENT DESCRIPTION AND OPERATION

Rear Compartment Lid System Components

The rear compartment lid release system consists of the following components:

- Rear Compartment Lid Latch
- Trunk Release Switch
- Trunk Release Relay
- Trunk Release 10A Fuse
- Body Control Module (BCM)

Rear Compartment Lid System Controls

The rear compartment lid may be released by any of the following:

- Trunk release switch activation
- Keyless entry trunk release command

Rear Compartment Lid Release Operation

In order for the rear compartment lid latch to release the trunk lid, the transaxle must be in the PARK position and the trunk release button is pressed or the trunk symbol on the remote keyless entry transmitter is pressed.

POWER DOOR LOCKS DESCRIPTION AND OPERATION

Power Door Locks System Components

The power window system consists of the following components:

- Body control module (BCM).
- Driver door lock cylinder switch.
- Front passenger door lock cylinder switch.
- Driver door lock switch.
- Front passenger door lock switch.
- Door lock actuators in each of the doors.
- DR LK Fuse 20-amp.

Door Lock System Controls

The Power Door Lock System is controlled by the body control module (BCM) and can be activated by any one of the following:

- A door lock switch lock or unlock actuation.

- A door lock cylinder switch unlock actuation.
- A keyless entry transmitter actuation.
- An automatic door lock actuation (Personalization function).
- An automatic door unlock actuation (Personalization function).
- A last door closed locking (LDCL) actuation (Personalization function).

Door Lock Operation

When the body control module (BCM) detects a transition of either of the door lock switches to the lock position, it switches the door lock actuator lock control circuit to voltage. Since the lock actuator unlock control circuits are at ground potential within the BCM, the door lock actuator motors transition to the lock position.

Driver Door Unlock Operation

When the body control module (BCM) detects a transition of either of the door lock switches to the unlock position, it switches the driver door lock actuator unlock control circuit to voltage. Since the door lock actuator lock control circuit is at ground potential within the BCM, the left front (LF) door lock actuator motor transitions to the Unlock position.

The driver door lock actuator unlock control circuit is a dedicated control circuit used only for the driver door lock actuator motor. This is done so that the driver door may be unlocked by itself using a keyless entry transmitter or an automatic door unlock function (if programmed).

Passenger Door Unlock Operation

When the body control module (BCM) detects a transition of either of the door lock switches to the unlock position, it switches the door lock actuator unlock control circuits to voltage. Since the door lock actuator lock control circuit is at ground potential within the BCM, the passenger door lock actuator motors transition to the unlock position.

The door lock actuator unlock control circuits are dedicated control circuits used only for the passenger door lock actuator motors. This is done so that the driver door may be unlocked separate from the passenger doors using a keyless entry transmitter or an automatic door unlock function (if programmed).

Lockout Prevention

This function is intended to prevent the vehicle operator from locking the doors if the key is left in the ignition and any vehicle door is open. The body control module (BCM) will react after locking all the doors by unlocking the driver door. The lockout prevention function can be overridden by manually locking the door.

Key Cylinder Unlock

The body control module (BCM) will provide unlocking of all the doors when either the driver or front passenger key cylinder switch is actuated to the unlock position for longer than one second.

Automatic Door Lock/Unlock

The automatic door lock/unlock function is a Vehicle Personalization feature with the following four programmable modes of operation:

1. The automatic door lock feature is disabled.

2. All of the doors lock when the vehicle is shifted out of Park with the ignition ON.
3. All of the doors lock when the vehicle is shifted out of Park with the ignition ON, and only the driver door Unlocks when the vehicle is shifted into Park.
4. All of the doors lock when the vehicle is shifted out of Park with the ignition ON, and all of the doors Unlock when the vehicle is shifted into Park.

The automatic door lock function can only be enabled by the body control module (BCM) if the driver door open switch and door ajar switches are in the Closed state. For information on programming the automatic door locks, refer to the owners manual.

Air Bag Deployment Unlock

The body control module (BCM) will provide unlocking of all the doors 15 seconds after determining the air bags have been deployed.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - MIRRORS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following system descriptions:
   - **Automatic Day-Night Mirror Description and Operation**
   - **OnStar Description and Operation**
   - **Outside Mirror Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Automatic Day-Night Mirrors Malfunction**
- **Heated Mirrors Malfunction**
- **OnStar Button LED Malfunction**
- **OnStar Button Malfunction**
- **Power Mirror Malfunction**

HEATED MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Heated Mirror Element Control	1	1	2	-
Ground	-	1	-	-
1. Heated Mirror Inoperative 2. Heated Mirror Always On				

Circuit/System Description

The REAR DEFOG relay supplies voltage to the outside rearview mirror heater elements based on the current state of the rear window defogger. The relay supplies B+ through the driver/passenger mirror heating element control circuits when a request is seen.

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON, press the rear window defogger switch. Verify the rear window defogger turns ON and the rear window becomes warm.
    - If the rear window defogger does not turn on, refer to Rear Window Defogger Malfunction .
2. Verify both the left and right outside mirror glass become warm.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the outside rearview mirror.
2. Test for less than 10 ohms between the ground circuit terminal E and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the heater element control circuit terminal F and ground.
4. Ignition ON, operate the rear window defogger ON and OFF with the rear defogger switch. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance.
5. If all circuits test normal, test or replace the outside rearview mirror glass.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Outside Rearview Mirror Glass Replacement

AUTOMATIC DAY-NIGHT MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Backup Lamp Control	B2545 00	2	2	-
Ground	-	1	-	-
1. Automatic Mirror Dimming Inoperative 2. Mirror Automatic Day-Night Disable Feature Malfunction				

Circuit/System Description

The inside rearview mirror uses 2 photocell sensors. One sensor is the rear light sensor, located on the face side of the mirror, facing the rear of the vehicle. The rear light sensor is used to determine light conditions present at the mirror face. The other sensor is the front light sensor, located on the backside of the mirror, facing the front of the vehicle. The front light sensor is used to determine the exterior light conditions at the front of the vehicle. With a low exterior light condition detected by the front light sensor and a high light condition from the rear light sensor, the inside rearview mirror will automatically darken the face of the inside rearview mirror.

With the gear selector lever in the REVERSE position, backup lamp control voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, regardless of the rear light sensor status.

Circuit/System Verification

1. Ignition ON.

2. Cover the windshield with a blanket or other suitable item.
3. Verify the A10 Inside Rearview Mirror face dims when shining a bright light into the rear light sensor
    - **If the A10 Inside Rearview Mirror does not dim**

      Refer to Circuit/System Testing - Inside Review Mirror Dimming Inoperative

    - **If the A10 Inside Rearview Mirror dims**
4. Verify the A10 Inside Rearview Mirror face transitions from dim to bright while commanding the Backup Lamps On and Off with a scan tool.
    - **If the A10 Inside Rearview Mirror does not transition between dim and bright.**

      Refer to Circuit/System Testing - Day-Night Disable Malfunction

    - **If the A10 Inside Rearview Mirror transitions between bright and dim states**
5. All OK.

Circuit/System Testing

Inside Review Mirror Dimming Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 13 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Retained Accessory Power Malfunction** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the A10 Inside Rearview Mirror.
    - **If the test lamp illuminates**
5. Replace the A10 Inside Rearview Mirror.

Day-Night Disable Malfunction

1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror.
2. Connect a test lamp between the control circuit terminal 9 and ground
3. Ignition ON, verify the test lamp turns ON and OFF while commanding the Backup Lamps On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit terminal 9 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Backup Lamps Malfunction** .
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, refer to **Backup Lamps Malfunction**
    - **If the test lamp turns ON and OFF**
4. Replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Inside Rearview Mirror Replacement

POWER MIRROR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Both Outside Power Mirrors Inoperative 2. Driver Outside Power Mirror Malfunction 3. Passenger Outside Power Mirror Malfunction				

Circuit/System Description

The outside rearview mirror switch controls the outside rearview mirrors based on the position of the mirror selector switch and which movement position is selected. The outside rearview mirror switch has four positions: up, down, left, and right. B+ is applied to the switch and when a movement position switch is selected, B+ is sent to the mirror via a motor control circuit. The opposite motor control circuit acts as a ground circuit for the bi-directional mirror motor.

Circuit/System Verification

1. Ignition ON.
2. Verify the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview

Mirror-Passenger move UP, DOWN, LEFT and RIGHT with the S52 Outside Rearview Mirror Switch.

- **If both outside mirror glasses do not move**

  Refer to Circuit/System Testing - Both Outside Rearview Mirrors Inoperative.

- **If the driver outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

  Refer to Circuit/System Testing - Driver Outside Mirror Movement Malfunction.

- **If the passenger outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

  Refer to Circuit/System Testing - Passenger Outside Mirror Movement Malfunction.

- **If the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT**

3. All OK.

Circuit/System Testing

Both Outside Rearview Mirrors Inoperative

1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal B and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal G and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for infinite resistance between each of the control circuit terminals listed below and ground:
      - Control circuit terminal C
      - Control circuit terminal D

- Control circuit terminal F
- Control circuit terminal H
- Control circuit terminal J
- Control circuit terminal K
- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the S52 Outside Rearview Mirror Switch.

- **If the test lamp illuminates**

4. Test or replace the S52 Outside Rearview Mirror Switch.

Driver Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the M77D Outside Rearview Mirror Motor-Driver. Ignition ON
2. Connect a test lamp between the control circuit terminal B and control circuit terminal C.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
   - **If the test lamp remains OFF during either of the commands**
   1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
   2. Test for infinite resistance between each control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in each control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, test or replace the S52 Outside Rearview Mirror Switch.
   - **If the test lamp is always ON**
   1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, Ignition ON.
   2. Test for less than 1 V between each control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
   - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal A and control circuit terminal C.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
   - **If the test lamp remains OFF during either of the commands**
   1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
   2. Test for infinite resistance between each control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in each control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the S52 Outside Rearview Mirror Switch.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, Ignition ON.
2. Test for less than 1 V between each control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch

- **If the test lamp turns ON during each of the commands**

6. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Passenger Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the M77P Outside Rearview Mirror Motor-Passenger. Ignition ON
2. Connect a test lamp between the control circuit terminal B and control circuit terminal C.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
    - **If the test lamp remains OFF during either of the commands**

    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S52 Outside Rearview Mirror Switch.

    - **If the test lamp is always ON**

    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, Ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch

    - **If the test lamp turns ON during each of the commands**

4. Connect a test lamp between the control circuit terminal A and control circuit terminal C.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
    - **If the test lamp remains OFF during either of the commands**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
2. Test for infinite resistance between each control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in each control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the S52 Outside Rearview Mirror Switch.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, Ignition ON.
2. Test for less than 1 V between each control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch

- **If the test lamp turns ON during each of the commands**

6. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Mirror Switch Replacement**
- **Outside Rearview Mirror Motor Replacement**

REPAIR INSTRUCTIONS

POWER MIRROR SWITCH REPLACEMENT

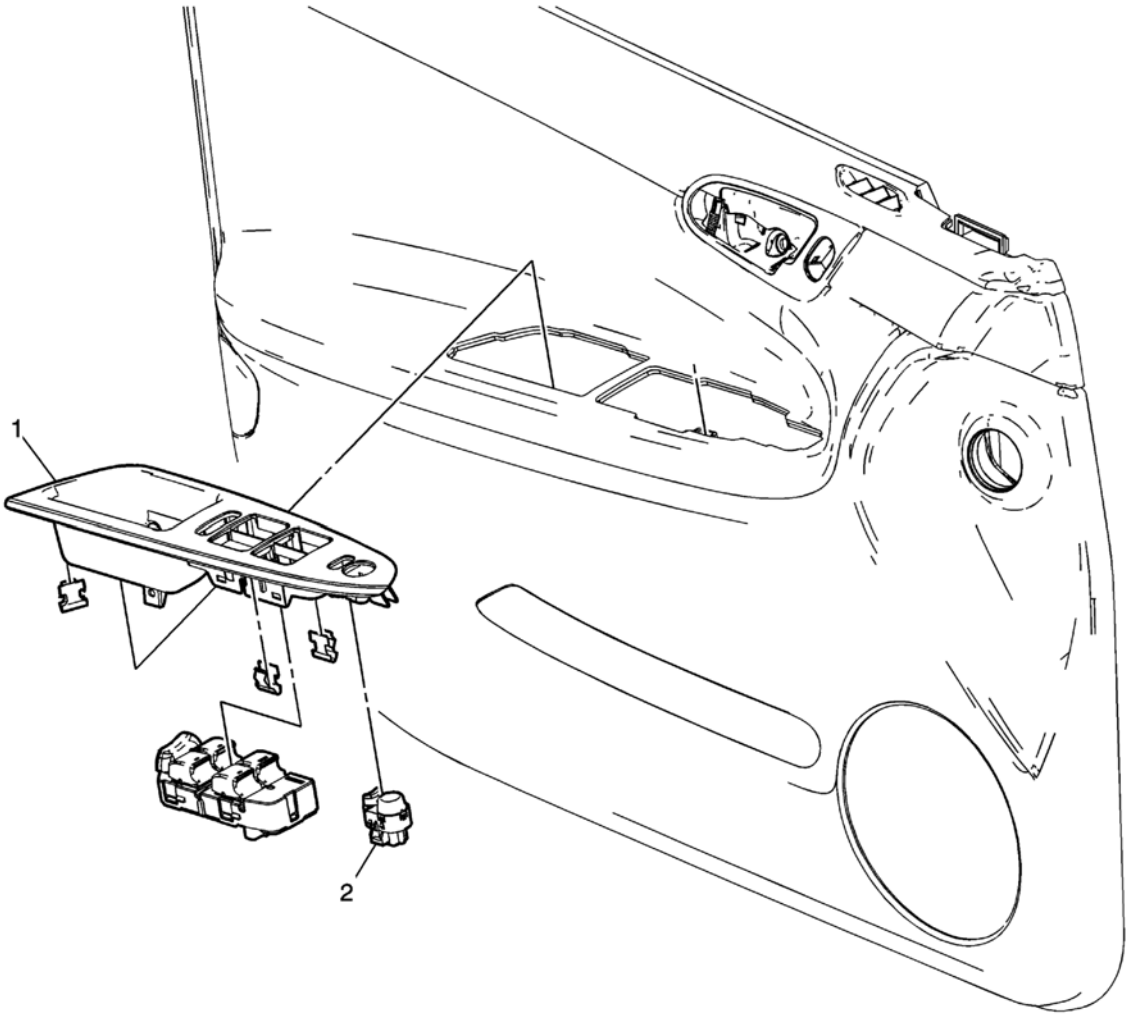

Fig. 3: Identifying Power Mirror Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Side Window Switch Bezel Refer to **Front Side Door Window Switch Bezel Replacement** .
2	Outside Rear View Mirror Switch Assembly **TIP:** Use a flat bladed tool to help disengage the switch from the bezel.

POWER MIRROR REPLACEMENT

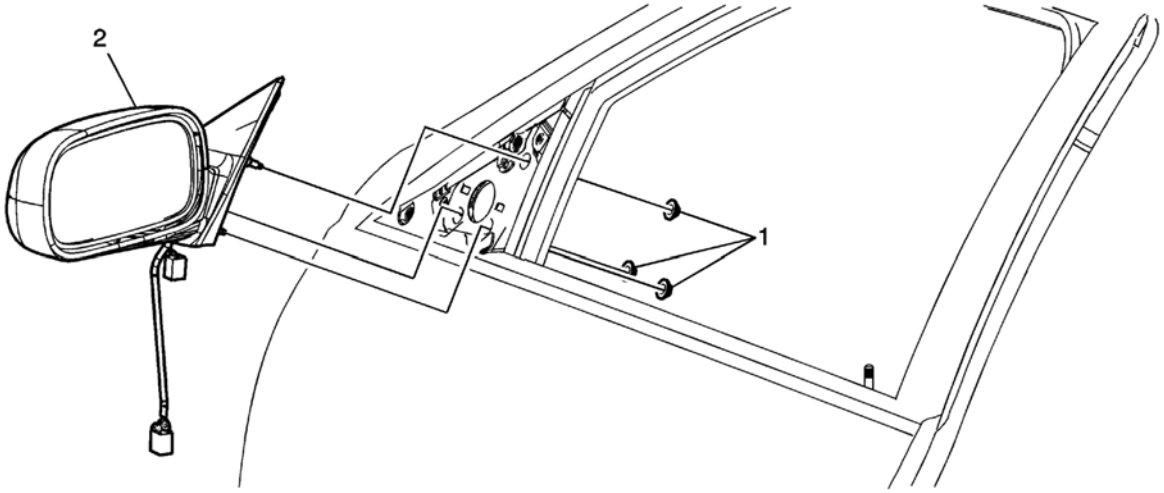

Fig. 4: Identifying Power Mirror
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement**	
1	Outside Rearview Mirror Nut (Qty: 3) **CAUTION:** **Refer to** **Fastener** **Caution** . **TIP:** Disconnect the mirror electrical connector. **Tighten** 10 N.m (89 lb in)
2	Outside Rearview Mirror Assembly

OUTSIDE REARVIEW MIRROR MOTOR REPLACEMENT

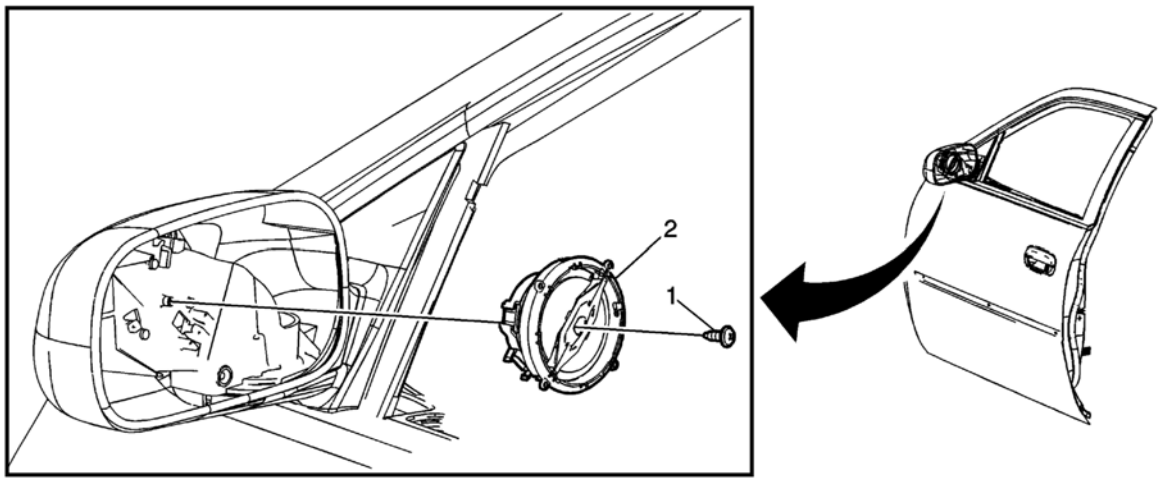

Fig. 5: Identifying Outside Rearview Mirror Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the door mirror face. Refer to Outside Rearview Mirror Glass Replacement.	
1	Front Door Mirror Motor Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Front Door Mirror Motor **TIP:** Disconnect the electrical connector from the mirror motor.

OUTSIDE REARVIEW MIRROR GLASS REPLACEMENT

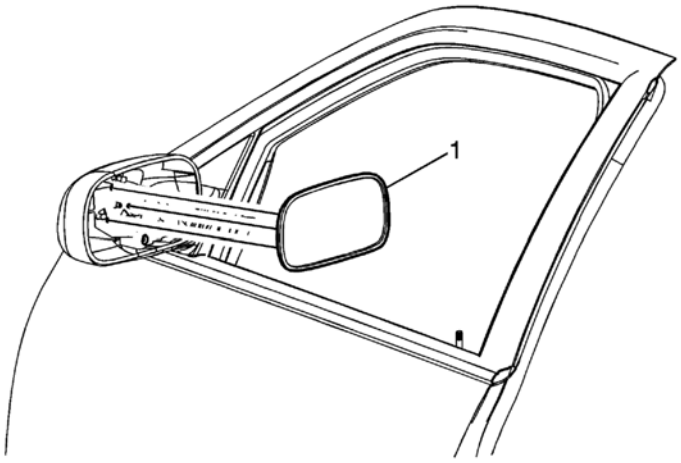

Fig. 6: Identifying Mirror Face
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Outside Rearview Mirror Face **Procedure** 1. Release the mirror face backing from the mirror housing by pulling outward. 2. Disconnect electrical connectors from mirror, if equipped.

INSIDE REARVIEW MIRROR REPLACEMENT

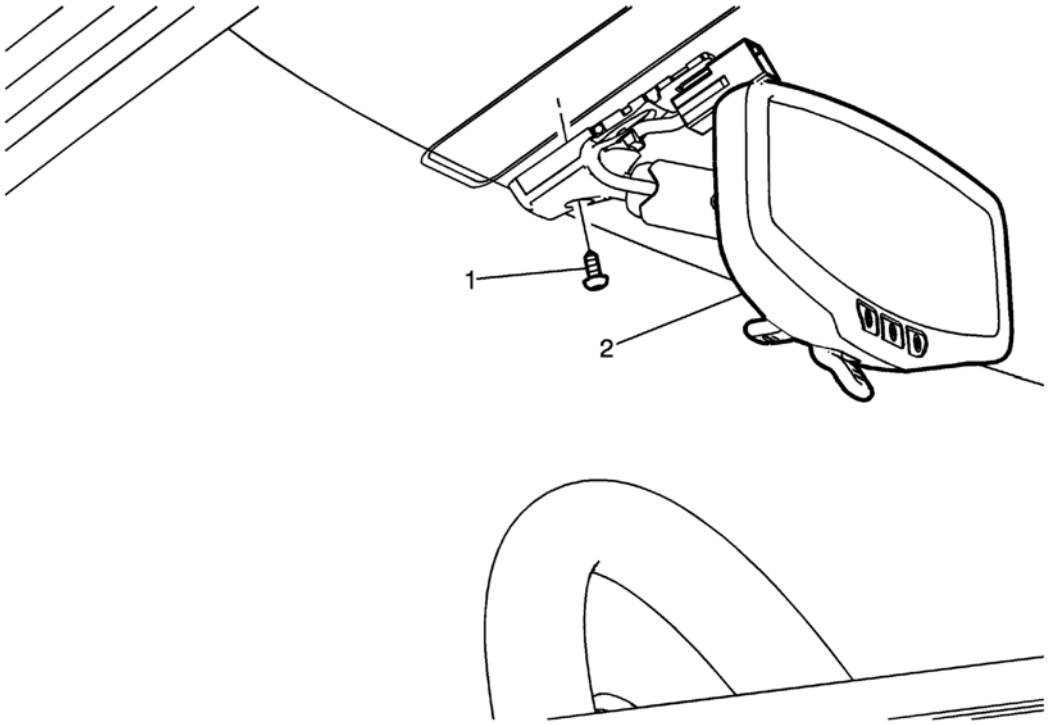

Fig. 7: Inside Rearview Mirror
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Inside Rearview Mirror Screw **CAUTION:** **Refer to Fastener Caution .** **Procedure** Remove the inside rearview mirror cover, if equipped. **Tighten** 2 N.m (18 lb in)
2	Inside Rearview Mirror **Procedure** 1. Disconnect the electrical connector, if equipped. 2. Adjust the mirror to the full upward position. 3. Slide the mirror upward off of the rearview mirror button. 4. Refer to **Control Module References** for programming and setup information.

DESCRIPTION AND OPERATION

AUTOMATIC DAY-NIGHT MIRROR DESCRIPTION AND OPERATION

The inside rearview mirror uses 2 photocell sensors. One sensor is the headlight sensor, located on the face side of the mirror. The headlight sensor is used to determine light conditions present at the mirror face. The other sensor is the ambient light sensor, located on the rear of the mirror or windshield side. The ambient light sensor is used to determine the exterior light conditions. With a low exterior light condition detected, and a high light condition from behind of the car, at the headlight sensor, the inside rearview mirror will automatically darken the face of the mirror. In the daytime, the mirror is in a normal state because of the high exterior light condition that is indicated by the ambient light sensor. With the gear selector lever in the REVERSE position, backup lamp supply voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, even during the night.

OUTSIDE MIRROR DESCRIPTION AND OPERATION

Power Mirror System Components

The power mirror system consists of the following components:

- Outside rearview mirror switch
- Mirror selector switch
- Left outside rearview mirror
- Right outside rearview mirror
- Power mirror fuse

Each of the outside rearview mirrors contains two motors. The vertical motor operates the mirror in the up and down directions, and the horizontal motor operates the mirror in the left and right directions. Each of the outside rearview mirror motors are circuit breaker protected.

Power Mirror System Controls

The outside rearview mirror switch is a four position directional switch: Up, Down, Left and Right.

The mirror select switch is a three position switch: left, neutral, and right.

Power Mirror System Operation

The outside rearview mirror switch receives power through the battery positive voltage circuit from the power mirror fuse. The power mirror switch also receives a constant ground.

The four positions of the direction switch have dual switch contacts. Each of the contacts are connected to opposing sides of the appropriate power mirror motors through the selector switch. The selector switch completes these circuits depending on the position of the selector switch, left or right.

If the selector switch is placed in the left position and the up switch is depressed, battery positive voltage will be supplied to the left outside rearview mirror vertical motor through the left mirror motor down control circuit and ground through the left mirror motor left control circuit. If the down switch is depressed, battery positive voltage will be supplied to the left outside rearview mirror vertical motor through the left mirror motor left

control circuit and ground through the left mirror motor down control circuit.

The remainder of the mirror functions operate in the same manner as described above. Placing the power mirror switch in opposing positions, left/right or up/down, will reverse the polarity to the mirror motor, reversing the direction of movement.

Heated Mirrors (If Equipped)

Battery positive voltage is supplied through the fuse in the underhood electrical center to the rear defog relay. With the ignition in the ON position, voltage is supplied to the rear defog relay coil when the rear window defogger switch is activated. This energizes the rear window defogger relay and allows battery positive voltage to the HTD MIRROR fuse. The HTD MIRROR fuse provides battery positive voltage to the heated mirrors.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B1008: CALIBRATION DATA NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1008 00

Calibration Data Not Programmed

Circuit/System Description

When replacing a remote control door lock receiver (RCDLR), the service replacement part is shipped with no installed software. Before the new RCDLR is operational, a software calibration is required to be downloaded using the SPS terminal. Failure to download this software calibration will result in the setting of DTC B1008.

Conditions for Running the DTC

This DTC runs continuously

Conditions for Setting the DTC

The RCDLR has no calibration loaded.

Action Taken When the DTC Sets

All functions handled by the RCDLR are inoperative

Conditions for Clearing the DTC

A current DTC will clear when software calibrations are installed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Perform the RCDLR Programming and Setup procedure. Refer to **Remote Control Door Lock Receiver Programming and Setup** .

- If the DTC resets, replace the RCDLR.

Repair Instructions

IMPORTANT:	This vehicle may be equipped with the 2 Way Advanced Remote Start System. Vehicle equipped with the 2 Way Advanced Remote Start System can be identified by an LCD screen on the keyless entry transmitter or a yellow label on the RCDLR. When servicing the 2 Way Advanced Remote Start System, ensure that the correct parts are installed during replacement. Service parts for the 2 Way Advanced Remote Start System can be found in the Accessory section of the parts manual.

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for RCDLR replacement, setup, and programming

DTC B3105: KEYLESS ENTRY SYSTEM KEY FOBS NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3105 00

Keyless Entry System Key Fobs Not Programmed

Circuit/System Description

The remote control door lock receiver (RCDLR) monitors the number of keyless entry transmitters programmed. Until at least one transmitter is programmed, the RCDLR determines a malfunction condition exists.

Conditions for Running the DTC

The keyless entry system must be enabled.

Conditions for Setting the DTC

The DTC is set if there are no keyless entry transmitter programmed to the RCDLR.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

A current DTC is cleared at least one transmitter has been programmed to the RCDLR.

Special Tools

J 43241 Keyless Entry Tester

Circuit/System Verification

1. Place the transmitter on the test pad of the **J 43241** keyless entry tester and press each transmitter button one at a time. The tester should sound a tone and illuminate a green light with each button press.
    - If one or more buttons does not sound the tone and illuminate the green light, replace the transmitter battery and retest with the **J 43241** keyless entry tester. If the condition continues after battery replacement, replace the transmitter.
2. Program the transmitter. Refer to **Remote Control Door Lock Transmitter Learn**. The transmitter should successfully complete the programming procedure.
    - If the transmitter does not program, replace the keyless entry transmitter. If the new keyless entry transmitter does not complete the programming, replace the RCDLR.
3. Operate the transmitter function while observing the vehicle. The vehicle should perform each of the corresponding functions when selected on the transmitter.
    - If any of the vehicle functions are inoperative, replace the keyless entry transmitter. If the functions remain inoperative after replacement of the transmitter, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for RCDLR replacement, setup, and programming

DTC B3109, B3110, B3111, OR B3112: KEYLESS ENTRY TRANSMITTER BATTERY 1-4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3109 00

Keyless Entry Transmitter 1 Low Battery

DTC B3110 00

Keyless Entry Transmitter 2 Low Battery

DTC B3111 00

Keyless Entry Transmitter 3 Low Battery

DTC B3112 00

Keyless Entry Transmitter 4 Low Battery

Circuit/System Description

With each press of a keyless entry transmitter button, a message containing the current battery state of the transmitter is sent to the remote control door lock receiver (RCDLR) along with the commanded keyless entry function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

The DTC sets after 3 consecutive low battery signals from the same programmed transmitter.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

The DTC is cleared when a normal transmitter voltage signal is received from the programmed transmitter that set the DTC.

Diagnostic Aids

The keyless entry transmitter used in the 2-Way Advanced Remote Start System is unique to the system. When servicing or replacing a transmitter, ensure that the correct transmitter is used. The correct transmitter part number can be found in the Accessory section of the parts catalog. Attempting to replace a 2-Way Advanced Remote Start transmitter with a regular service part may result in a failure to program the transmitter.

Circuit/System Verification

Verify DTC B3109, B3110, B3111, or B3112 are not set .

- If any of the DTCs are set, replace the battery in the appropriate keyless entry transmitter. Operate the transmitter 3 consecutive times. If the DTC resets, replace the keyless entry transmitter.

Repair Instructions

IMPORTANT: This vehicle may be equipped with the 2-Way Advanced Remote Start System. Vehicle equipped with the 2-Way Advanced Remote Start System can be identified by an LCD screen on the keyless entry transmitter or a yellow label on the RCDLR. When servicing the 2-Way Advanced Remote Start System, ensure that the correct parts are installed during replacement. Service parts for the 2-Way Advanced Remote Start System can be found in the Accessory section of the parts manual.

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Remote Control Door Lock Transmitter Learn

SYMPTOMS - REMOTE FUNCTIONS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Keyless Entry System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to

Checking Aftermarket Accessories .

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections, wiring, terminals, connectors, poor voltage and ground connections, temperature sensitivity, electromagnetic interference, electrical noise and/or incorrect control module installed may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Garage Door Opener Malfunction**
- **Keyless Entry System Malfunction**
- **Remote Vehicle Start Malfunction**

GARAGE DOOR OPENER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The garage door opener (GDO) is a transmitter operating between 288 and 399 MHz. The GDO has 3 buttons that may be programmed for individual transmitter/receiver combinations to control up to 3 GDOs, security gates, and lighting systems. Each button represents a transmitter code section of the transmitter, which operates separately from any other button, and may be considered a separate transmitter.

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Special Tools

J 41540 Universal Home Remote Tester

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the GDO.
2. Ignition OFF, test for less than 10 Ω between the ground circuit terminal 3 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.

NOTE: **This step will clear any learned transmitters from the GDO. This will require reprogramming by the customer to reestablish GDO functionality.**

4. Ignition ON, hold the two outer buttons on the GDO for 30 seconds. After 20 seconds, the LEDs will flash indicating that all learned transmitter values have been cleared. After an additional 10 seconds, the LEDs will flash again indicating it has entered the diagnostic mode. Place the **J 41540** universal home remote tester near the GDO and individually press each button of the GDO. The tester should indicate when each button is pressed.
   - If one or more of the buttons does not respond when each button is pressed, replace the GDO.
5. Instruct the customer to program the GDO. Refer to the vehicle owners manual. A possible rolling code or incompatibility with the GDO receiver will prevent programming.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for GDO replacement, setup, and programming

KEYLESS ENTRY SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The keyless entry system is a vehicle entry device. The keyless entry will unlock the vehicle doors or open the

rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver (RCDLR). The RCDLR interprets the signal and activates the requested function via a message over the GMLAN serial data line. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

Unwanted or inadvertent door lock/unlock activation may actually be triggered by the OnStarÂ® Remote Link Apps. Customer may be unaware of account usage, contact Technical Assistance Center (TAC) if root cause cannot be diagnosed to vehicle.

For the **J 43241** keyless entry tester , inspect the keyless entry transmitter part number to determine that it is the correct model for the vehicle. A wrong model transmitter may pass the test, but it will not activate the vehicle remote system.

J 43241 Keyless Entry Tester

Circuit/System Verification

1. Place the transmitter on the test pad of the **J 43241** keyless entry tester and press each transmitter button one at a time, holding each button for three seconds. The tester should sound a tone and illuminate a

green light for the entire three second button press.

- If one or more buttons does not sound the tone and illuminate the green light for the entire three seconds, replace the transmitter battery and retest with the **J 43241** keyless entry tester. If the condition continues after battery replacement, replace the transmitter.

2. Program the transmitter. Refer to **Remote Control Door Lock Transmitter Learn**. The transmitter should successfully complete the programming procedure.
    - If the transmitter does not program, replace the keyless entry transmitter. If the new keyless entry transmitter does not complete the programming, replace the RCDLR.
3. Operate the transmitter function while observing the vehicle. The vehicle should perform each of the corresponding functions when selected on the transmitter.
    - If any of the vehicle functions are inoperative, replace the keyless entry transmitter. If the functions remain inoperative after replacement of the transmitter, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Remote Control Door Lock Transmitter Learn**
- **Control Module References** for RCDLR replacement, programming and setup

REMOTE VEHICLE START MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of each diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Remote vehicle start (RVS) begins as an RF message received by the remote control door lock receiver (RCDLR) from a keyless entry transmitter. The RVS request is sent by the RCDLR to the body control module (BCM) via serial data. The BCM monitors system conditions such as content theft deterrent (CTD), hood ajar status, and body DTCs to determine if an RVS event will occur. If conditions are determined to be acceptable, the RVS message is sent to the engine control module (ECM). The ECM monitors system conditions such as engine control parameters and vehicle theft deterrent (VTD) to determine if engine starting will be allowed. If conditions are acceptable, the ECM will initiate engine starting. During the engine run time in a RVS attempt, before the operator enters the vehicle, the ECM may discontinue engine operation if system conditions require it or a message is received from the BCM requesting the engine be turned OFF.

Diagnostic Aids

Unwanted or inadvertent remote start activation may actually be triggered by the OnStarÂ® Remote Link Applications. Customer may be unaware of account usage, contact Technical Assistance Center (TAC) if root cause cannot be diagnosed to vehicle.

NOTE: **If the vehicle has a current vehicle DTC that illuminates the malfunction indicator lamp (MIL), the cause of the DTC must be diagnosed before**

proceeding with the Remote Vehicle Start Inoperative diagnostic.

The RVS system will not operate if any of the following conditions are present:

- A current vehicle DTC that illuminates the malfunction indicator lamp (MIL)
- A low fuel level with a low fuel warning light message.
- More than 2 remote starts have been attempted.
- The hazard switch is in the ON position.
- A current hazard switch DTC is set.
- The vehicle hood is ajar.
- A current hood ajar DTC is set.
- The CTD system detects an alarm trigger.
- Excessive engine RPM
- Excessive coolant temperature
- Accelerator pedal position greater than 0 percent
- Vehicle not in park
- Vehicle theft deterrent malfunction
- A current automatic transmission shift lock control system DRC is set.
- A vehicle speed sensor signal is detected by the ECM.

Circuit/System Verification

1. Verify that RVS is enabled through vehicle personalization.
    - If RVS is not enabled, use vehicle personalization to turn on RVS functionality. Refer to the vehicle owners manual.
2. Verify that the keyless entry functions operate with all available keyless entry transmitters.
    - If the keyless entry system does not function properly, refer to **Remote Control Door Lock Transmitter Learn**.
3. Observe the scan tool ECM and BCM RVS Disable History parameters, Verify that no RVS Disable History items are present.
    - If RVS Disable History items are present, refer to the appropriate subsection in which the failure occurred.
4. Verify the scan tool BCM Current CTD Trigger parameter displays None.
    - If not specified value, refer to **Content Theft Deterrent Malfunction** .

REPAIR INSTRUCTIONS

REMOTE CONTROL DOOR LOCK RECEIVER REPLACEMENT

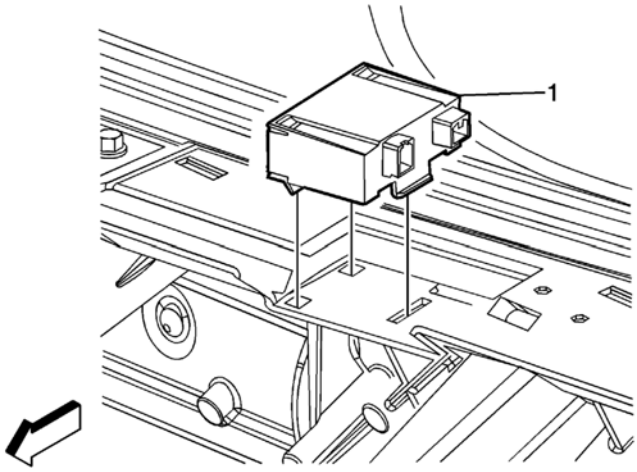

Fig. 3: Remote Control Door Lock Receiver
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel (I/P) upper trim panel. Refer to **Instrument Panel Upper Trim Panel Replacement** . 2. Program the remote control door lock receiver after replacement. Refer to **Control Module References** .	
1	Remote Control Door Lock Transmitter Assembly • Disconnect the electrical connector. • Push the 2 tabs towards the module assembly in order to release the module.

REMOTE CONTROL DOOR LOCK RECEIVER ANTENNA REPLACEMENT

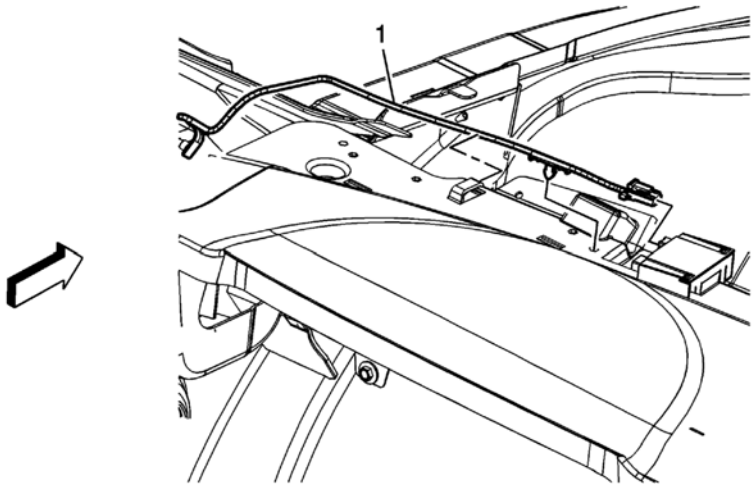

Fig. 4: Keyless Entry Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel upper trim panel. Refer to **Instrument Panel Upper Trim Panel Replacement** .	
1	Remote Control Door Lock Receiver Antenna Assembly • Disconnect the antenna from the door lock receiver. • Vehicles produced after December 6, 2006 will not have the antenna cable connected to the windshield. • Service antenna cables cannot be connected to the windshield.

GARAGE DOOR OPENER TRANSMITTER REPLACEMENT

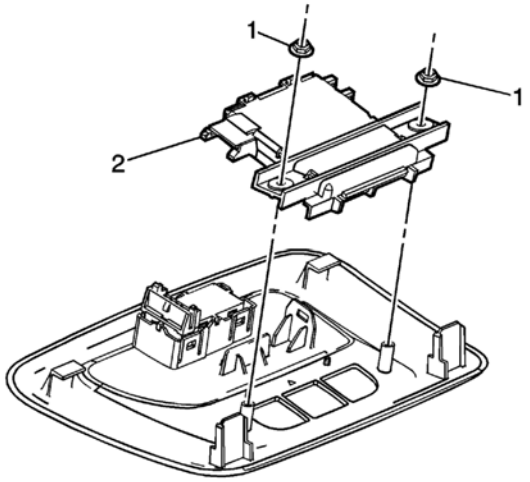

Fig. 5: Garage Door Opener

Courtesy of GENERAL MOTORS COMPANY

REMOTE CONTROL DOOR LOCK TRANSMITTER LEARN

Next Available Slot

NOTE:

- **On some vehicles, keyless entry transmitters may also be programmed using the driver information center (DIC). Refer to the vehicle owners manual for information.**
- **All transmitters which are to be recognized by the remote control door lock receiver (RCDLR) must be programmed in a single programming sequence. Once the Invalidate All Fobs selection is made, all learned transmitters are erased. If all the existing transmitters associated with the vehicle are not learned at this time, they will become inoperative and require additional programming.**
- **Do not operate or program the transmitters in the vicinity of other vehicles that are in the keyless entry program mode. This prevents the programming of the transmitters to the incorrect vehicle.**

This procedure will program keyless entry transmitters in sequential order. If two transmitters are currently learned to the vehicle as transmitters 1 and 2, using this procedure will learn the next transmitter are transmitter 3, and so on.

1. With a scan tool, access the Remote Control Door Lock Receiver Module Setup menu. Select Program Key Fobs.
2. Select Next Available Slot. The vehicle chime will sound two times to indicate programming mode has been entered. Follow the on-screen instructions. After each transmitter has been programmed, the vehicle chime will sound to confirm the programming.
3. When all the desired transmitters have been programmed, cycle the ignition from ON to OFF, exit the

vehicle, and operate the transmitter functions in order to verify correct system operation.

Invalidate All Fobs

NOTE:

- **On some vehicles, keyless entry transmitters may also be programmed using the driver information center (DIC). Refer to the vehicle owners manual for information.**
- **All transmitters which are to be recognized by the remote control door lock receiver (RCDLR) must be programmed in a single programming sequence. Once the Invalidate All Fobs selection is made, all learned transmitters are erased. If all the existing transmitters associated with the vehicle are not learned at this time, they will become inoperative and require additional programming.**
- **Do not operate or program the transmitters in the vicinity of other vehicles that are in the keyless entry program mode. This prevents the programming of the transmitters to the incorrect vehicle.**

This procedure will first erase all known keyless entry transmitters. After all transmitters are erased, the procedure will begin to program keyless entry transmitters in sequential order, beginning with transmitter 1.

1. With a scan tool, access the Remote Control Door Lock Receiver Module Setup menu. Select Program Key Fobs.
2. Select Invalidate All Fobs. This will erase all learned transmitters and prepare the RCDLR to learn new transmitters. Follow the on-screen instructions. After each transmitter has been programmed, the vehicle chime will sound to confirm the programming.
3. When all the desired transmitters have been programmed, cycle the ignition from ON to OFF, exit the vehicle, and operate the transmitter functions in order to verify correct system operation.

Transmitter Slot Programming

Transmitter slot programming allows a single transmitter to be programmed into a specific slot without affecting any of the other programmed transmitters. By using slot programming, the transmitter originally programmed to a specific slot is erased and the new transmitter learned in its placed.

1. Install a scan tool.
2. Turn ON the ignition with the engine OFF.
3. With the scan tool, select Body.
4. Select Remote Control Door Lock Receiver (RCDLR).
5. Select Module Setup.
6. Select Program Key Fobs.
7. Select the key fob desired to be programmed.
8. Follow the scan tool on screen instructions.
9. Remove the scan tool.
10. Exit the vehicle. Operate all functions on transmitters to verify correct system operation.

DESCRIPTION AND OPERATION

GARAGE DOOR OPENER DESCRIPTION AND OPERATION

The garage door opener is fixed and rolling code capable. Rolling code is a system that allows the code that the customers receiver receives from the garage door opener to change every time the garage door opener is used within operating range of the receiver. Rolling code programming requires the customer to push a learn/program button on the garage door opener receiver at their home. This button is usually located on the receiver unit under a cover (light cover) on one end of the unit. The customer must follow the garage door opener manufacturers instructions to program/learn the receiver to accept the Universal Home Remote System as an authorized opener for their unit . When the receiver and the garage door opener are initially programmed together, a code is established and a new code is created for every new transmission. The software in the receiver recognizes the garage door opener and accepts the new code.

The garage door opener is compatible with most, but not all types and brands of transmitters.

The garage door opener is a transmitter operating between 288-434 MHz. The power and range of the transmitter is to comply with laws governing the generation of radio frequency interference. The transmitter is programmed by the user to accept the signal generated by the user's transmitters.

The garage door opener has 3 buttons that may be programmed for individual transmitter/receiver combinations to control up to 3 garage door openers, security gates, lighting systems, etc. Each button represents a transmitter code section of the transmitter, which operates separately from any other button, and may be considered a separate transmitter. Operation consists of simply pressing a button to activate the corresponding transmitter.

KEYLESS ENTRY SYSTEM DESCRIPTION AND OPERATION

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the body control module (BCM) to remotely activate certain vehicle features. Keyless entry will lock/unlock the doors, or release the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver (RCDLR). The RCDLR interprets the signal and activates the requested function via a serial data message to the BCM. A low transmitter or vehicle battery or radio frequency (RF) interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High RF traffic areas may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following components:

- Door locks
- Rear compartment lid release
- Remote vehicle starting, if equipped
- Illuminated entry lamps
- Vehicle locator/Panic alarm

The keyless entry system has the following components:

- Keyless entry transmitters
- Keyless entry antenna
- BCM

- RCDLR

Keyless Entry Transmitters

The keyless entry transmitters are used to lock and unlock the vehicle door while away from the immediate area of the vehicle. Vehicles without remote vehicle start will operate at a distance of up to 20 m (65 ft) away. Vehicle with remote vehicle start will operate at a distance of up to 60 m (195 ft) away. Up to 8 transmitters may be programmed to a single vehicle. The vehicle comes with two transmitters. Each transmitter will have a number on top of it, "1" or "2", and each number corresponds to a separate driver of the vehicle.

Keyless Entry Antenna

The keyless entry antenna is used to receive radio frequency (RF) communications sent by the keyless entry transmitters. The keyless entry antenna also receives RF signals from the tire pressure monitoring (TPM) sensors located at each wheel.

A coax antenna lead connects the antenna to the remote control door lock receiver (RCDLR). When a transmitter button is present, the RF signal sent by the transmitter is received by the antenna and the communications are inputted to the RCDLR.

OnStarÂ® Remote Link

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as smart phones. Refer to **OnStar Description and Operation** .

Remote Control Door Lock Receiver (RCDLR)

The remote control door lock receiver (RCDLR) is a multifunction module that operates both the keyless entry system as well as the TPM system. When an RF message is received from a keyless entry transmitter, the RCDLR interprets this signal and will request via serial data that the body control module (BCM) perform the specific function, i.e. door lock, door unlock, or vehicle locate.

Unlock Driver Door Only

Momentarily press the transmitter UNLOCK button in order to perform the following functions:

- Unlock only the driver door.
- Illuminate the interior lamps for a determined length of time, or until the ignition is turned ON
- Flash the exterior lights, if enabled through personalization
- Disarm the Content Theft Deterrent (CTD) System, if equipped
- Deactivate the CTD system when in the alarm mode

Unlock All Doors - Second Operation

Momentarily press the transmitter UNLOCK button a second time, within 5 seconds of the first press, to perform the following function:

Unlock the remaining doors

Lock All Doors

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors
- Immediately turn OFF the interior lamps
- Flash the exterior lights, if enabled through personalization
- Chirp the horn, if enabled through personalization
- Arm the CTD System, if equipped

Rear Compartment Lid Release

Press the transmitter rear compartment lid release button to perform the following function:

Open the rear compartment lid

Vehicle Locator/Panic Alarm

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulse the horn three times
- Flash the exterior lamps three times

A press and hold of the panic button performs the following functions:

- Illuminate the interior lamps
- Pulse the horn and flash the exterior lamps for 30 second or until the following conditions occur:
    - The panic button is pressed
    - The ignition switch is turned to the RUN position with a valid key

Remote Vehicle Start (RVS) - if equipped

The remote vehicle start (RVS) function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. RVS functions have an operating range of up to 195 feet, depending on conditions. The RVS sequence begins by pressing and releasing the lock button and then pressing and holding the RVS buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time an RVS is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter or vehicle key at any time. Once activated, the engine is allowed to run for 10 minutes. The RVS time may be extended by an additional 10 minute by again pressing and releasing the lock button and then pressing and holding the RVS buttons on the transmitter. This feature is called a RVS continue and allows a maximum of 20 minutes of engine running. If the RVS continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The RVS event may be suspended at any time by pressing only the RVS button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two RVS events may occur or be attempted. Once two events or attempts have been made, future RVS events will be suspended until the vehicle is started using the ignition.

Enable/Disable RVS

Using the driver information center (DIC), RVS may be enabled or disabled as a part of vehicle personalization. Refer to the vehicle owners manual for more information.

Hood Ajar Switch

The hood switch provides status of the hood to the BCM for RVS purposes. The switch is integrated into the hood latch assembly. The hood ajar switch provides 2 separate inputs to the BCM. These separate inputs allow the BCM to actively monitor for a hood ajar switch fault.

RVS Circuit Description

The RCDLR receives a signal from the keyless entry transmitter indicating a RVS request. A message is then sent to the BCM which determines if a crank request message will be sent to the ECM to allow engine starting. To determine if conditions are correct for an RVS event, the BCM will ensure the following conditions are met:

- All vehicle doors are closed
- A valid hood ajar switch closed signal is present
- The doors are locked
- The hazard switch is OFF
- The vehicle power mode is correct
- No content theft deterrent (CTD) alarm triggers are present
- The vehicle is not in valet mode (if equipped)

When the BCM determines all conditions meet those required for an RVS event, a message is sent via serial data to the ECM. The ECM relies on the RVS message from BCM to enable RVS when the crank request signal is received. If the ECM does not receive a valid RVS message, it will not attempt to start the engine. While the ECM is in RVS mode it will suspend engine operation if any of the following additional conditions occur:

- Vehicle speed is greater than 0
- Transmission is not in PARK
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates tamper

Keyless Entry Personalization

Vehicle lock/unlock functions and remote vehicle start (RVS) settings may be personalized. For functional descriptions and personalization instructions, refer to the vehicle owners manual.

Rolling Code

The Keyless Entry System uses rolling code technology. Rolling code technology prevents anyone from

recording the message sent from the transmitter and using the message in order to gain entry to the vehicle. The term "rolling code" refers to the way that the Keyless Entry System sends and receives the signals. The transmitter sends the signal in a different order each time. The transmitter and the remote control door lock receiver (RCDLR) are synchronized to the appropriate order. If a programmed transmitter sends a signal that is not in the order that the RCDLR expects, then the transmitter is out of synchronization. This occurs after 256 presses of any transmitter button when it is out of range of the vehicle.

Automatic Synchronization

The keyless entry transmitters do not require a manual synchronization procedure. If needed, the transmitters automatically re-synchronize when any button on the transmitter is pressed within range of the vehicle. The transmitter will operate normally after the automatic synchronization.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - POWER SEATS

IMPORTANT: Review the system description in order to familiarize yourself with the system functions. Refer to **Power Seats System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Seat Adjuster Mechanical Diagnosis**

- **Power Seat Inoperative**

POWER SEAT ADJUSTER MECHANICAL DIAGNOSIS

Condition	Possible Cause	Correction
Horizontal Operation of Seat Not Smooth but Jerky-Apparent Hard Operation	The adjuster horizontal actuator is damaged.	Replace the adjuster assembly.
Horizontal Chuck or Looseness	• The horizontal actuator is improperly adjusted to the rack. • The top plate subassembly is loose.	• Replace the adjuster assembly. • Replace the adjuster assembly.
One Adjuster Will Not Operate Horizontally	• The horizontal drive cable is disconnected or damaged. • The horizontal actuator is inoperative.	• Inspect the drive cables, they must be stright to be engaged. Replace if damaged. • Replace the adjuster assembly.
One Adjuster Will not Operate Vertically	• The vertical drive cable is disconnected or damaged. • The vertical actuator subassembly is inoperative.	• Inspect the vertical drive cables, replace if damaged. • Replace the adjuster assembly.
Both Adjusters Will Not Operate Horizontally and/or Vertically	• The motor is damaged or inoperative. • The wiring harness is damaged.	• Replace the adjuster assembly • Replace the wiring harness.
Vertical Chuck or Looseness	The vertical actuator is inoperative.	Replace the adjuster assembly.

POWER SEAT INOPERATIVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Recline Motor Rearward Control	1	1	-	-
Seat Adjuster Switch Ground	-	1	-	-
1. Power seat inoperative				

Circuit/System Description

Power seat without memory is completely controlled through the seat adjuster switch. Battery voltage is supplied at all times to the seat adjuster switch through the PWR/SEAT 25 A circuit breaker located in the I/P fuse block. When the seat adjuster switches are in an inactive state, the switch contacts are closed to the switch ground circuit.

All seat motors are reversible. For example, when the seat horizontal forward switch is pressed to move the entire seat forward, battery voltage is applied through the switch contacts and the seat horizontal motor forward control circuit to the motor. The motor is grounded through the horizontal motor rearward switch contacts and the horizontal motor rearward control circuit to the motor. The motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction. All seat motors are powered this way.

Description and Operation

Power Seats System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

Operate the seat switches for the seat directional motors listed below in both directions. The seat should move in the commanded directions.

- Horizontal Motor
- Front Vertical Motor
- Rear Vertical Motor
- Recline Motor

- If the power seat is inoperative in all directions, refer to the Seat Adjuster Switch Circuit Test.
- If just the recline function is inoperative, refer to the Recline Motor Circuit Test.
- If 1 or more of the seat adjuster motors operate, refer to the Seat Adjuster Motor Circuit Test.

Circuit/System Testing

Seat Adjuster Switch Circuit Test

1. Disconnect the harness connector at the seat adjuster switch.
2. Test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Verify that a test lamp illuminates between the appropriate B+ circuit terminal listed below and ground.
    - Driver seat terminal E (AH5)
    - Driver seat terminal D (AG1)
    - Passenger seat terminal D
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If all circuits test normal, test or replace the seat adjuster switch.

Recliner Motor Circuit Test

1. Ignition OFF, disconnect the harness connector at the recline motor.
2. Connect a test lamp between control circuit terminal A and control circuit terminal B.
3. Ignition ON, command the seat recline motor Forward and Rearward using the seat recline switch. The test lamp should turn ON when commanding the forward and rearward states.
    - If the test lamp remains OFF for either of the commands, test the control circuits for a short to ground or an open/high resistance. If the circuits test normal, test or replace the seat adjuster switch.
4. If all circuits test normal, test or replace the recline motor.

Seat Adjuster Motor Circuit Test

1. Ignition OFF, disconnect the harness connector at the appropriate seat adjuster assembly.
2. Connect a test lamp between the appropriate control circuit terminals listed below:
    - Seat horizontal motor terminal 3 and terminal 6
    - Seat front vertical motor terminal 2 and terminal 5
    - Seat rear vertical motor terminal 1 and terminal 4
3. Ignition ON, command the appropriate seat motor Up and Down or Forward and Rearward using the seat adjuster switch. The test lamp should turn ON when commanding the up and down or forward and rearward states.
    - If the test lamp remains OFF for either of the commands, test the control circuits for a short to ground or an open/high resistance. If the circuits test normal, test or replace the seat adjuster switch.
4. If all circuits test normal, test or replace the seat adjuster assembly.

Component Testing

Seat Adjuster Switch

1. Ignition OFF, disconnect the harness connector at the seat adjuster switch.
2. Test for infinite resistance between each control terminal and the B+ terminal with the switch in the open position.
    - If not the specified value, replace the seat adjuster switch.
3. Test for less than 1 ohm between each control terminal and the B+ terminal with the switch in the closed position.
    - If greater than the specified range, replace the seat adjuster switch.
4. Test for less than 1 ohm between each control terminal and the ground terminal with the switch in the open position.
    - If greater than the specified range, replace the seat adjuster switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Power Seat Switch Replacement (Impala) Front**
- **Seat Adjuster Replacement**
- **Front Seat Recliner Actuator Motor Replacement**

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT ADJUSTER SWITCH KNOB REPLACEMENT (IMPALA)

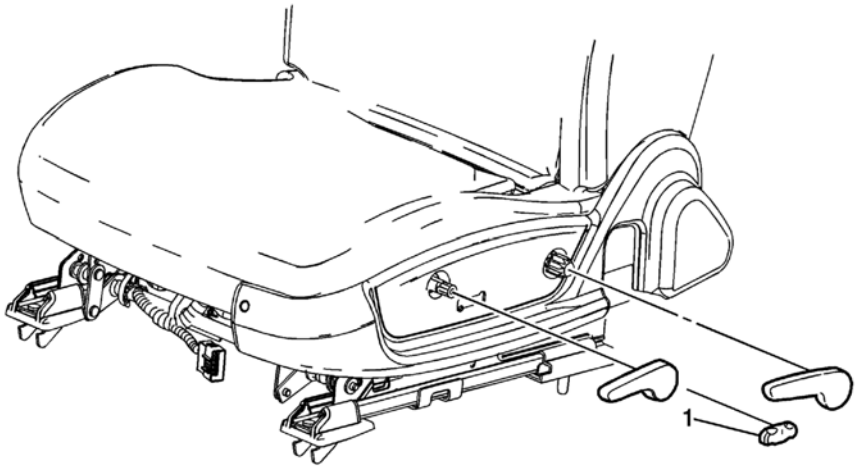

Fig. 3: Power Seat Switch And Seat Cushion Knob

Callout	Component Name
Preliminary Procedure 1.Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)** .	

Callout	Component Name
2. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala)** . Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala)** . 3. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala)**. 4. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement** . 5. Remove the front seat back cushion cover and pad. ~~Refer to **Seat Back Cover and Pad Replacement (Impala Limited)** .~~ 6.	
1	Seat Recliner Bracket **TIP:** Remove the push on nuts from the ends for the rod and slide out to remove.
2	Front Seat Back Cushion Frame Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
3	Front Seat Recliner Actuator Motor

DESCRIPTION AND OPERATION

POWER SEATS SYSTEM DESCRIPTION AND OPERATION

The driver and passenger power seat systems each consist of the following components:

- Seat Adjuster Switch
- Seat Horizontal Motor
- Seat Front Vertical Motor
- Seat Rear Vertical Motor
- Seat Recline Motor
- PWR/SEAT Circuit Breaker 25 A

Seat Adjuster Switch

The seat adjuster switches provide both power and ground to the selected seat motors. Battery positive voltage is supplied at all times to the driver and passenger seat adjuster switches from the PWR/SEAT Circuit Breaker located in the I/P fuse block. The driver seat adjuster switch receives ground through the switch ground circuit and G301, while the passenger seat switch receives ground through the switch ground circuit and G302.

Motors

All of the seat motors operate independently of each other. Each motor contains an electronic circuit breaker (PTC) that opens in the event of a circuit overload and will reset only after voltage has been removed from the circuit. There are four seat position motors. These are the horizontal motor, front vertical motor, rear vertical motor, and the seat back recline motor. The horizontal motor moves the entire seat forward and rearward. The seat vertical motors may operate independently to tilt the front or rear of the seat cushion up or down. Both motors can also run simultaneously to move the entire seat up or down. The recline motor moves the angle of the seat back forward or rearward.

Horizontal

When the seat switch is operated to move the entire seat forward, battery positive voltage is applied through the switch contacts and the horizontal motor forward control circuit to the motor. The motor is grounded through the horizontal motor rearward switch contacts and the horizontal motor rearward control circuit to the motor. The motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction.

Rear Vertical

When the seat switch is operated to tilt the rear of the seat cushion up, battery positive voltage is applied through the switch contacts and the rear vertical motor up control circuit to the rear vertical motor. The motor is grounded through the down switch contacts and the rear vertical motor down control circuit to the motor. The motor runs in order to drive the rear of the seat cushion up until the switch is released. Tilting the rear of the seat cushion down works similarly to tilting the rear of the seat cushion up, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction.

Front Vertical

When the seat switch is operated to tilt the front of the seat cushion up, battery positive voltage is applied through the switch contacts and the front vertical motor up control circuit to the motor. The motor is grounded through the down switch contacts and the front vertical motor down control circuit to the motor. The motor runs in order to drive the front of the seat cushion up until the switch is released. Tilting the front of the seat cushion down works similarly to tilting the front of the seat cushion up, except that battery positive voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction.

Entire Seat Up or Down

When the seat switch is operated in order to move the entire seat to the up position, battery positive voltage is simultaneously applied through the front and rear vertical motor up switch contacts and the front and rear vertical motor up control circuits to both vertical motors. The motors are grounded through the down switch contacts and the front and rear vertical motor down control circuits to both vertical motors. Both motors run simultaneously in order to drive the entire seat up until the switch is released. Moving the entire seat down works similarly to moving the entire seat up, except that battery positive voltage and ground are applied on the opposite circuits causing the motors to run in the opposite direction.

Recline

When the seat recline switch is operated to move the seat back forward, battery positive voltage is applied through the switch contacts and the recline motor forward control circuit to the motor. The motor is grounded

through the rearward switch contacts and the recline motor rearward control circuit to the motor. The motor runs in order to move the seat back forward until the switch is released. Moving the seat back rearward works similarly to moving the seat back forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction.

REPAIR INSTRUCTIONS

AUDIO AMPLIFIER PROGRAMMING AND SETUP

This device requires no programming or setup.

BODY CONTROL MODULE PROGRAMMING AND SETUP

Introduction

A new Body Control Module (BCM) must be programmed with the latest operating software and vehicle calibrations. Ensure that the following conditions exist in order to prepare for BCM programming:

- The battery is fully charged.
- The ignition switch is in the ON position.
- The Data Link Connector (DLC) is accessible.
- All control modules and devices are connected.

The procedures below are designed to program the Body Control Module (BCM) correctly during BCM related service. Before you start, read these procedures carefully and completely.

Programming the BCM

NOTE: **The vehicle will not start and many other functions may not operate properly if a replacement BCM is not properly set up. The following procedures must be completed.**

NOTE: **After the procedure is completed, the personalization settings of the BCM are set to default settings. Inform the customer that the personalization must be set again.**

1. Programming the BCM-Refer to Service Programming System (SPS).
2. Brake Pedal Position (BPP) Sensor calibration-Refer to Brake Pedal Position Sensor Calibration .
3. Learning the Restraints ID-Navigate to Body Control Module > Configuration/Reset Functions > Setup SDM Part Number in BCM, then follow the instructions on the screen.

NOTE: **After any programming or setup, perform the following to avoid future misdiagnosis:**

1. Turn the ignition OFF for 10 s.
2. Connect the scan tool to the Data Link Connector.
3. Turn the ignition ON, with the engine OFF.
4. Use the scan tool in order to retrieve history DTCs from all control modules.
5. Clear all history DTCs.

CHASSIS CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K38 Chassis Control Module - Programming and follow the on-screen instructions.

4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. With a scan tool, perform the Suspension Sensor Trim Height Calibration, if applicable.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
    - **If the control module cannot be reprogrammed**
    1. Ignition OFF for one minute, ignition ON.
    2. Verify the control module can be reprogrammed.
        - If the control module cannot be reprogrammed, replace the control module.
        - If the control module can be reprogrammed.
    3. All OK.
    - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

COMMUNICATION INTERFACE MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**

- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

- Before beginning any programming first determine which Generation of the Telematics Communication Interface Control Module you are working with. One way to accomplish this is by using a scan tool. The Telematics Communication Interface Control Module Generation will be listed under the Selected Vehicle Configuration section, in addition the Generation (9 or 10) can be determined from the Module ID data table. Additional programming steps may be necessary depending on the generation of the module.
- It is critical to use the service replacement Communication Interface Module only in the vehicle for which it was ordered.
- Failure to perform the following procedures will result in a red LED, DTC(s) being set, and or incomplete OnStarÂ® services.
- An OnStarÂ® button press to the OnStarÂ® call center is required to complete the procedure.
- To fully activate an OnStarÂ® module, both the setup and activation request procedures must be completed on all vehicles with and without an active OnStarÂ® subscription to insure the unit has been setup properly for the vehicle it has been installed into and also to update the OnStarÂ® with the correct unit information.
- If the vehicle is equipped with RPO VV4 the Telematics Communication Interface Control Module WiFi Enable (Gen 10 only) Programming step must be performed AFTER the Programming and Service Activation step. Failure to complete this step in the proper sequence will result in WiFi being disabled.
- To initialize the Turn-by-Turn feature, the vehicle must first be driven In open sky condition at speeds greater than 10 mph (16 kph) or more for a minimum of 5 miles (8 km) , and perform at least 2 left and 2 right 90 degree turns coming to complete stops prior to each turn.
- On vehicles up fitted with TTY capabilities, it is necessary to perform a power cycle of the OnStarÂ® Interface Module (OTIM), and toggle the TTY mode after completing the Communication Interface Module installation and setup procedures.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.

NOTE:

- **Due to a change in SPS you must select 'Reprogram ECU', for Telematics Communication Interface Control Module Programming from the Selected Programming Process even if**

the unit is being replaced.

- **If 'Replace and Program ECU' is selected the Telematics Communication Interface Control Module will not be listed in the Supported Controllers screen. You must go back and select 'Reprogram ECU'.**

3. In the SPS Supported Controllers screen, select Telematics Communication Interface Control Module Programming and Service Activation and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. After Telematics Communication Interface Control Module Programming and Service Activation, if the vehicle is equipped with RPO VV4, on the Supported Controllers screen select Telematics Communication Interface Control Module WiFi Enable (Gen 10 only) Programming and follow the on-screen instructions.

NOTE: **The WiFi Enable step must be performed AFTER the Programming and Service Activation step, or WiFi will not function. If Programming and Service Activation step is performed after the WiFi Enable step, WiFi will be disabled.**

6. Press the OnStarÂ® Blue Button to call OnStarÂ® and have the system activated. If the customer refused OnStarÂ® services (terms and conditions) and the vehicle is equipped with RPO VV4 have the OnStarÂ® consultant turn off the WiFi demo message that occurs after every ignition on event.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
   - **If the control module cannot be reprogrammed**
   1. Ignition OFF for one minute, ignition ON.
   2. Verify the control module can be reprogrammed.
      - If the control module cannot be reprogrammed, replace the control module.
      - If the control module can be reprogrammed.
   3. All OK.
   - **If the control module can be reprogrammed**
3. All OK.

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly**

configured with the correct calibration software, the control module will not control all of the vehicle features properly.

- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required, install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module

To program a replacement transmission control module (TCM), perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Transmission Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. With a scan tool, perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

Reprogram Control Module

To reprogram an existing TCM, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select Transmission Control Module - Programming and follow the on-screen instructions.
3. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

4. With a scan tool, perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
    - **If the control module cannot be reprogrammed**
    1. Ignition OFF for one minute, ignition ON.
    2. Verify the control module can be reprogrammed.
        - If the control module cannot be reprogrammed, replace the control module.
        - If the control module can be reprogrammed.
    3. All OK.
    - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for control module replacement, programming, and setup.

DIGITAL RADIO RECEIVER PROGRAMMING AND SETUP

Each of the following service procedures requires programming or setup procedures to be performed on the digital radio receiver.

XM™ Activation

IMPORTANT: After replacement of an XM™ receiver, call XM™ radio to deactivate the receiver that has been removed from the vehicle. The vehicle must be parked in view of a satellite within 24 hours after an activation call.

1. Radio ON, tune to the XM™ channel 0 and record the radio ID. The radio ID will be required for activation of the new receiver. The customer's name, address and phone number may also be needed for account verification.
2. Call XM™ radio to deactivate the faulty receiver and activate the new receiver.
    - US: 1-800-556-3600
    - Canada: 1-877-438-9677
3. Park the vehicle outside in an area with an unobstructed view of the southern sky.
4. Leave the vehicle outside with the ignition switch in the ACC position and the radio ON, tune to the XM™ channel 1 for 30 minutes to activate XM™ service.
5. Once activated, the radio will receive the remaining XM™ channels.

ELECTRONIC BRAKE CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Special Tools

EL-49642 SPS Programming Support Tool

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing Electronic Brake Control Module (EBCM), perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Electronic Brake Control Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Electronic Brake Control Module - Configuration and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
6. With a scan tool, perform the Steering Angle Sensor Centering. Refer to **Steering Angle Sensor Centering** .
7. With a scan tool, perform the Yaw Rate Sensor Recalibration. Refer to **Vehicle Yaw Sensor Learn** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
    - **If the control module cannot be reprogrammed**
    1. Ignition OFF for one minute, ignition ON.
    2. Verify the control module can be reprogrammed.
        - If the control module cannot be reprogrammed, replace the control module.
        - If the control module can be reprogrammed.
    3. All OK.
    - **If the control module can be reprogrammed**
3. All OK.

K20 ENGINE CONTROL MODULE: PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector (DLC). If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**
- **Note the engine oil life remaining percentage.**

Replace and Program Control Module

To program a replacement K20 Engine Control Module (ECM), perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Before removing the old control module, perform the SPS function Prepare Control Module for Removal, if available.

> **NOTE:** **The Prepare Control Module for Removal function can only be performed when communication with the old control module is still possible.**

4. Replace the ECM.
5. Perform the SPS function K20 Engine Control Module - Programming and follow the on-screen instructions.
6. Clear the DTCs after completing the Programming procedure.
7. Perform the SPS function Immobilizer Learn and follow the on-screen instructions. Refer to **Immobilizer System Component Programming** .
8. Perform the SPS function K20 Engine Control Module - Configuration & Setup and follow the on-screen instructions.
9. Clear DTCs after completing the Configuration & Setup procedure.

Reprogram Control Module

To reprogram an existing K20 Engine Control Module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Clear DTCs after completing the Programming procedure.

> **NOTE:** **If vehicle fails to start during Configuration and Setup, perform the SPS Function Immobilizer Learn and follow the on-screen instructions.**

4. Perform the SPS function Engine Control Module - Configuration & Setup and follow the on-screen instructions, if available.
5. Clear DTCs after completing the Configuration & Setup procedure.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following:

1. Ignition ON. Ensure the control module, DLC, and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
    - **If the control module cannot be reprogrammed**
    1. Ignition OFF for one minute, ignition ON.

2. Verify the control module can be reprogrammed.
    - If the control module cannot be reprogrammed, replace the K20 Engine Control Module.
- **If the control module can be reprogrammed**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM replacement, programming and setup.

GARAGE DOOR OPENER PROGRAMMING AND SETUP

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming but does require the following setup procedures after a new ECU is installed:

The customer must learn the device they wish to control. This must be done at the device (garage door opener, electric gate, etc.) and cannot be performed at a dealership. Refer to the vehicle owner's manual for programming instructions.

HEATED SEAT CONTROL MODULE PROGRAMMING AND SETUP

Heated Seat Module Replacement

If the heated seat module is replaced or if the module needs to be reprogrammed, refer to **Service Programming System (SPS)**.

HVAC SYSTEM CONTROL MODULE PROGRAMMING AND SETUP

Each of the following service procedures may require programming or setup procedures to be performed on the HVAC control module or HVAC actuators.

HVAC Control Module Replacement

If the HVAC control module is replaced, the following procedure must be performed: Reprogram the HVAC control module. Refer to **Service Programming System (SPS)**.

HVAC Control Module Reprogramming

Do not reprogram the HVAC control module unless directed by a service procedure or a service bulletin.

Reprogram the HVAC control module. Refer to **Service Programming System (SPS)**.

Actuator Replacement

If an actuator is replaced, the following procedure must be performed: Re-Calibrating Actuators. Refer to **Actuator Recalibration** .

INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE PROGRAMMING AND SETUP

NOTE: **The air bag indicator light may remain ON after the body control module (BCM), or inflatable restraint sensing and diagnostic module (SDM) is replaced, and during the programming procedure for the BCM until after the procedure is completed. When installing a new SDM, there may be several DTCs set prior to programming. Once programmed, these DTCs should be in history and can be cleared.**

1. Ignition ON, program the SDM. Refer to **Service Programming System (SPS)**.
2. In the Inflatable Restraint Sensing and Diagnostic Module, Configuration / Reset Functions menu, select Setup SDM Part Number in BCM. Follow the scan tool on screen instructions.
3. In the Inflatable Restraint Sensing and Diagnostic Module, Configuration / Reset Functions menu, select Configure New Module. Follow the scan tool on screen instructions. If during this procedure a fault is detected, the SDM will not allow this procedure to complete. Repair any existing DTCs, then use the scan tool to command the Configuration / Reset Function again.
4. Cycle the ignition from OFF to ON. Verify no DTCs are set. If any DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

INSTRUMENT CLUSTER PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Instrument Cluster - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Instrument Cluster - Setup and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
    - If the ECU still cannot be programmed, replace the ECU.

PASSENGER PRESENCE SYSTEM PROGRAMMING AND SETUP

Passenger Presence System Preload Test

The passenger presence system (PPS) consists of an electronic control module, a sensor mat in the seat, a harness, and PASSENGER AIR BAG ON/OFF indicators. The passenger presence detection system transmits and receives a low-level electric field. The measured capacitance value of this field is used to determine the type of occupant sitting in the front passenger seat. If the measured capacitance is less than a calibrated value, then the passenger presence module will send a hard wire signal to the inflatable restraint sensing and diagnostic module to disable the passenger instrument panel air bag. If the measured capacitance is greater than a calibrated value, then the passenger presence module will send a serial data signal to the inflatable restraint sensing and diagnostic module to enable the passenger instrument panel air bag. The passenger presence detection system module will notify the customer of the enable/disable status by illuminating one of the PASSENGER AIR BAG ON/OFF indicator. If the passenger seat bottom cushion, seat bottom trim, or heater pad has been serviced, reinstalled, or removed for any reason, the procedure below will check for any preloads on the passenger presence system. A service replacement passenger presence system module does not require an unlock procedure prior to an initial preload test.

NOTE:

- **Before the passenger presence system can be checked for preloads the front passenger seat must be completely empty of all items. The presence of any items on the front passenger seat will affect the calibration and operation of the passenger presence system.**
- **DTC B0081 will set if the preload system test is performed with:**
    - **An aftermarket seat heater located too close to the sensor mat**
    - **A scan tool, laptop, or other electronic device is in the seat**

- The seat is damp or wet
- An object or person is in the seat

- **When the preload test is perform, the instrument panel cluster and dash lights will begin illuminating at varying intensity. This is normal operation during the preload test procedure and does not indicate additional system faults.**
- **The Diagnostic Repair Verification must be performed after successfully completing the preload test procedure to ensure the system is functioning properly.**

Passenger Presence System Preload System Test

1. Empty the front outboard passenger seat (this system is susceptible to conductive material).
2. With the scan tool, perform the Passenger Presence Sensor Learn procedure.
3. Using the scan tool, check for DTC B0081 in history. If the test fails or DTC B0081 11 is current, confirm that the seat is empty. Perform the passenger presence sensor learn test again. If the test fails again, for heated seats, ensure that the sensor pad is on top of the heater element. Once the test successfully completes, cycle the Vehicle OFF.
4. Perform the **Diagnostic Repair Verification** after successfully completing the preload test procedure to ensure the system is functioning properly.

RADIO PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

- During radio programming you may be required to select multiple calibrations dependant upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- The XM satellite radio (if equipped) is integrated into the radio. If XM was activated in the previous radio, the replacement radio will require additional activation steps after programming to transfer customer subscription information.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select A11 Radio - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

XM Activation (If Equipped)

NOTE: **After replacement of an XM receiver, call XM radio to deactivate the receiver that has been removed from the vehicle.**

1. Turn the radio ON, tune to the XM channel 0, and record the radio ID. The radio ID will be needed for activation of the receiver.
2. From the USA, Call XM radio at 1-800-556-3600 to activate the receiver. From Canada, call 1-877-438-9677.
3. Park the vehicle outside in an area with an unobstructed view of the southern sky.
4. Leave the vehicle outside with the ignition switch in the ACC position and the radio on for 30 minutes to activate XM service.
5. Once activated, the radio will receive the remaining XM channels.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
    - **If the control module cannot be reprogrammed**
    1. Ignition OFF for one minute, ignition ON.

2. Verify the control module can be reprogrammed.
    - If the control module cannot be reprogrammed, replace the control module.
    - If the control module can be reprogrammed.
3. All OK.

- **If the control module can be reprogrammed**

3. All OK.

REMOTE CONTROL DOOR LOCK RECEIVER PROGRAMMING AND SETUP

NOTE:

- **When replacing the remote control door lock receiver (RCDLR), the tire pressure monitoring (TPM) information can be learned to the new RCDLR in one of two ways. These two methods are reflected in the selections below. Only choose one of the methods; it is not required to do both methods when replacing the RCDLR.**
- **If you choose to perform the Copy and Restore TPM Information procedure, Step 1 must be performed BEFORE removing the old RCDLR. This procedure requires that specific TPM information be extracted from the old RCDLR prior to its removal.**

Remote Control Door Lock Receiver Replacement (Copy and Restore TPM Information)

This procedure will learn the TPM information to the new RCDLR using the Copy and Restore function on the scan tool. This procedure will extract the TPM Tire Type information as well as the sensor data from the existing RCDLR prior to its replacement and store this information in the scan tool. After RCDLR replacement and SPS programming, the tire type and sensor data stored in the scan tool is written to the new RCDLR, negating the need to perform the tire type setup and sensor learn procedure.

This procedure should be considered as the first programming choice when replacing an RCDLR. The Copy and Restore procedure eliminates the possibility of incorrectly inputting the tire type or learning stray TPM sensors.

NOTE: **This step must be performed prior to the removal or replacement of the old RCDLR.**

1. Using a scan tool, navigate to the Copy and Restore TPM Information procedure and copy the existing TPM information from the RCDLR using the outline below. Follow the on-screen instructions.
    - Remote Control Door Lock Receiver
    - Configure/Reset Functions
    - Copy and Restore TPM Information
2. At this point, install the new RCDLR.
3. Program the RCDLR. Refer to **Service Programming System (SPS)**.
4. Using a scan tool, navigate to the Copy and Restore TPM Information procedure to restore the TPM information. Follow the on-screen instructions.
5. Program the keyless entry transmitters - Refer to **Remote Control Door Lock Transmitter Learn** .

6. Perform the 10-Minute Immobilizer Relearn procedure. Refer to **Immobilizer System Component Programming**

   When performing the relearn procedure, select Theft Deterrent Learn - Keyless Ignition (with rotary switch) on the SPS terminal.

Remote Control Door Lock Receiver Replacement (TPM Sensor Learn)

This procedure will learn TPM information to the new RCDLR by manually inputting the tire type using the scan tool and performing the TPM sensor learn. This procedure should be performed if the above Copy and Paste procedure can not be completed. An example of this would be an RCDLR that is unable to communicate with the scan tool and is required to be replaced.

1. RCDLR Programming-Refer to **Service Programming System (SPS)**.
2. Keyless Entry Transmitter Programming-Refer to **Remote Control Door Lock Transmitter Learn** .
3. Tire Type Setup:
   1. Install a scan tool.
   2. Select Remote Control Door Lock Receiver Configuration/Reset Functions.
   3. Select Tire Type/Pressure Selection.
   4. Follow the on-sceen instructions.
4. Perform the 10-Minute Immobilizer Relearn procedure. Refer to **Immobilizer System Component Programming** .

   When performing the relearn procedure, select Theft Deterrent Learn - Keyless Ignition (with rotary switch) on the SPS terminal.

5. Tire Pressure Monitoring Sensor Learn-Refer to **Tire Pressure Indicator Sensor Learn** .

SERVICE PROGRAMMING SYSTEM (SPS)

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

For step-by-step control module programming instructions, please refer to the techline information system (TIS) terminal.

Review the information below to ensure proper programming protocol.

NOTE:

- **DO NOT program a control module unless you are directed by a service procedure or you are directed by a General Motors service bulletin. Programming a control module at any other time will not permanently correct a customers concern.**
- **It is essential that the TIS terminal, MDI, and/or Scan Tool, is equipped with the latest software before performing service programming.**
- **Stable battery voltage is critical during programming. Any fluctuation,**

spiking, over voltage or loss of voltage will interrupt programming. When required, install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12V jumper or booster pack disconnected from the AC voltage supply.

- **Some modules will require additional programming/setup events to be performed before or after programming.**
- **Some vehicles may require the use of a CANDi or MDI module for programming.**
- **Review the appropriate service information for these procedures.**
- **DTCs may set during programming. Clear DTCs after programming is complete.**
- **Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Ensure the following conditions are met before programming a control module:

- Vehicle system voltage:
  - There is not a charging system concern. All charging system concerns must be repaired before programming a control module.
  - Battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the control module.
  - Turn OFF or disable any system that may put a load on the vehicles battery, such as the following components:
    - Interior lights
    - Exterior lights including daytime running lights (DRL)-Applying the parking brake, on most vehicles, disables the DRL system
    - Heating, ventilation, and air conditioning (HVAC) systems
    - Engine cooling fans
    - Radio, etc.
- The ignition switch must be in the proper position. SPS prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure, unless instructed to do so.
- Make certain all tool connections are secure, including the following components and circuits:
  - Scan Tool
    - The RS-232 communication cable port
    - The connection at the data link connector (DLC)
    - The voltage supply circuits
  - MDI
    - The USB, Ethernet or Wireless communication port
    - The connection at the data link connector (DLC)
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the

programming procedure, programming failure or control module damage may occur.

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all control module and DLC connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the control module.
3. If the control module can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the control module. The control module should program.
    - If the control module still cannot be programmed, replace the control module.

After successfully programming the control module, ensure that all post programming procedures are performed; refer to **Control Module References** for the appropriate control module Programming and Setup document for any required procedures.

SUNROOF CONTROL MODULE PROGRAMMING AND SETUP

When replacing the sunroof motor/control module, the sunroof motor/actuator initialization/teach procedure must be followed. Refer to **Sunroof Motor/Actuator Initialization/Teach Process** before starting the repair procedure.

THEFT DETERRENT MODULE PROGRAMMING AND SETUP

1. Connect a scan tool to the vehicle in the Pass-thru arrangement.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. On the Techline Terminal, select Service Programming System and follow the Techline Terminal on-screen instructions. Go to TDM Theft Deterrent Module from the controller list and select the appropriate on-screen calibration options.
5. After the programming has completed, turn the ignition OFF for 30 seconds.
6. Turn ON the ignition with the engine OFF.
7. On the Techline Terminal, go to V.T.D. Vehicle Theft Deterrent Learn from the controller list and select Vehicle Theft Deterrent Learn, ECM or PK3 Replaced. Follow the on-screen instructions.
8. At this point the scan tool must remain connected for the duration of the 10-minute relearn procedure.

NOTE:

- **The Techline Terminal will initially display 12 Minutes. The first 2 minutes allow the scan tool to initialize the appropriate control module. The remaining 10 minutes is the relearn timer.**
- **On some vehicles the security indicator may be illuminated for the duration of the 10-minute relearn procedure.**

9. Observe the scan tool, after approximately 12 minutes the scan tool will display "Programming Successful, Turn OFF Ignition". The vehicle is now ready to relearn the key information and/or the passwords on the next ignition switch transition from OFF to CRANK.
10. Turn OFF the ignition and wait 2 minutes.

11. With a master vehicle key, turn the ignition to the RUN position for 15 seconds, then start the vehicle. The TDM and ECM have now relearned the pre-release password and the challenge/response data.
12. With a scan tool, clear any DTCs.

REPAIR INSTRUCTIONS

FRONT SEAT REMOVAL AND INSTALLATION - BUCKET (IMPALA)

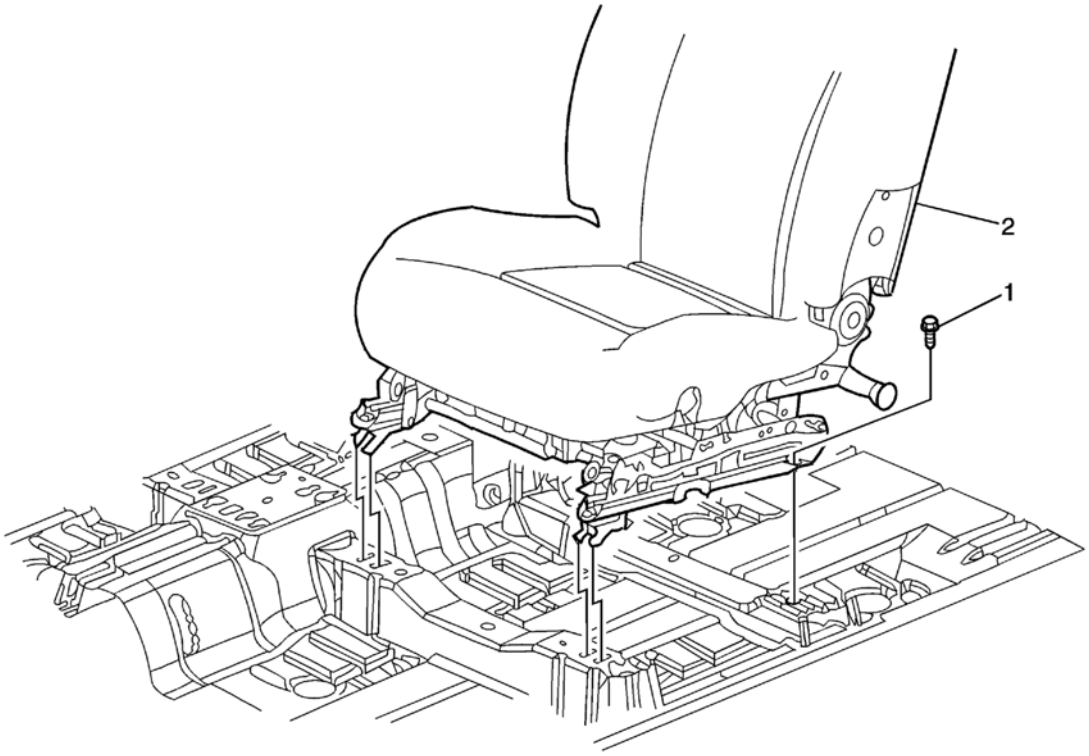

Fig. 1: View Of Front Bucket Seat (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Disconnect the seat belt from the seat. Refer to **Seat Belt Retractor Pretensioner Replacement - Front** .	
1	Seat Adjuster Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener** **Caution** . **Procedure** Remove the front seat track covers to access the bolts. **Tighten** 45 N.m (33 lb ft)
2	Seat Assembly **Procedure** Disconnect the electrical connectors.

FRONT CENTER SEAT REMOVAL AND INSTALLATION

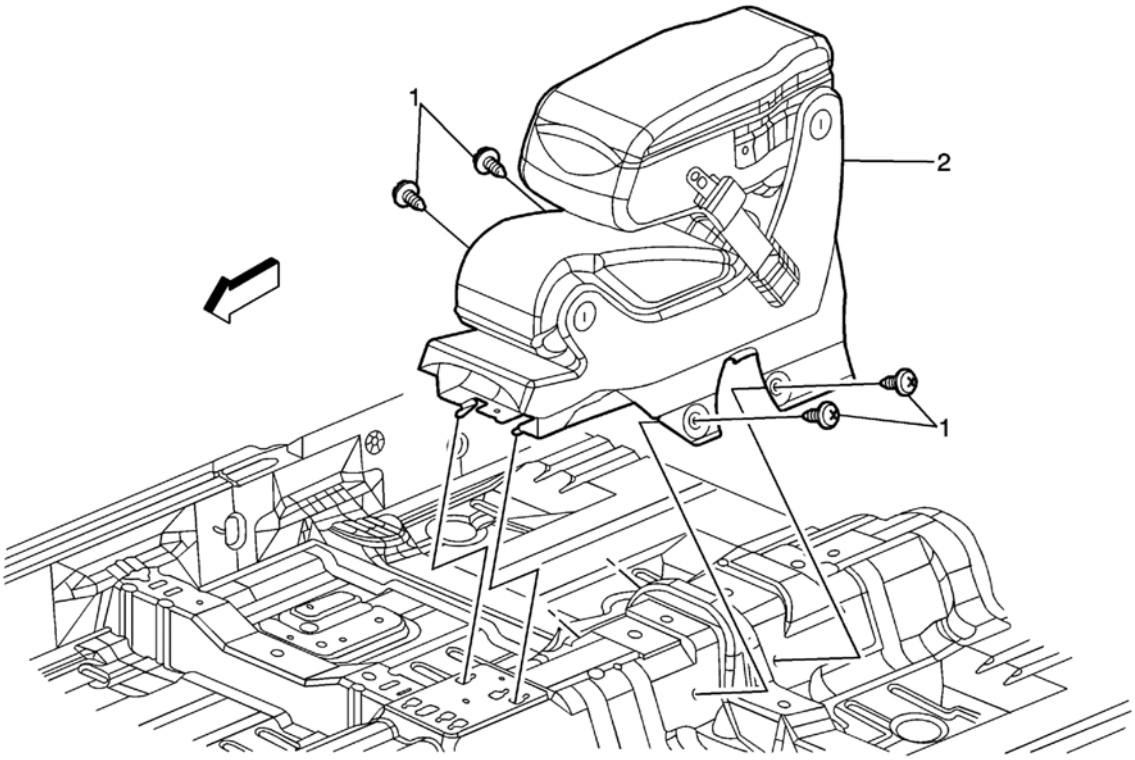

Fig. 2: Center Seat
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Move the driver and passenger seats forward or rearward.	
1	Front Center Seat Assembly Bolt (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution .** **TIP:** Remove the plastic caps that cover the bolts. **Tighten** 44 N.m (32 lb ft)
2	Front Center Seat Assembly • Slide the center seat assembly forward and lift up to disengage the retaining hooks at the front of the seat. • Disconnect the electrical connectors.

FRONT SEAT ADJUSTER REPLACEMENT

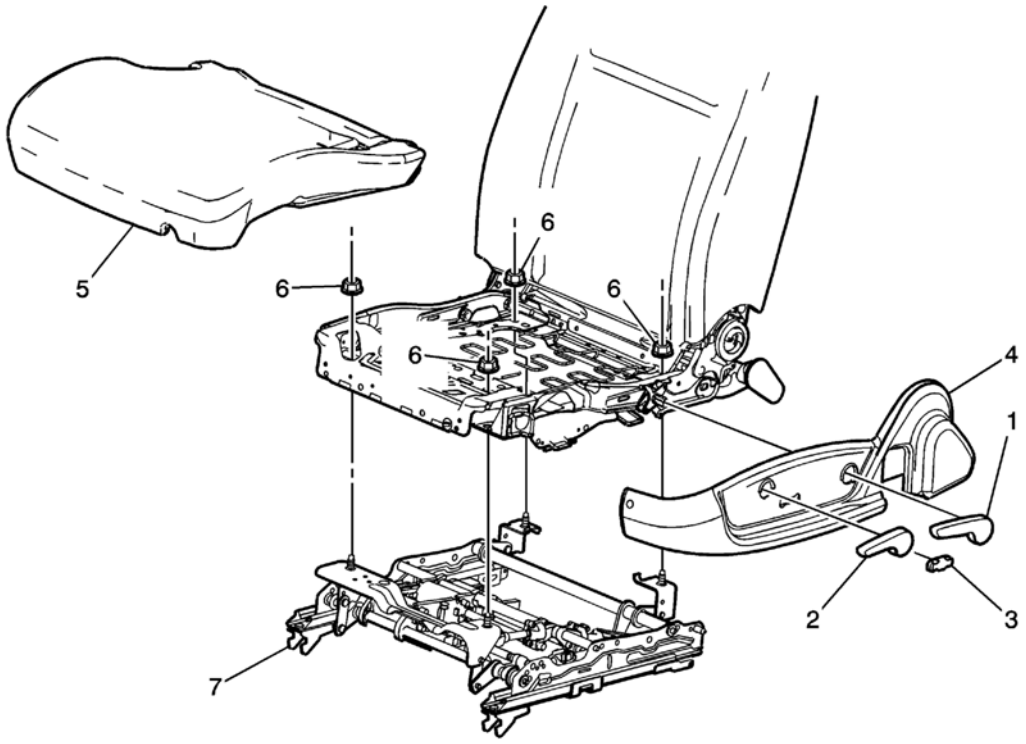

Fig. 3: Locating Front Seat Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**.	
1	Recliner Handle **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.
2	Lumbar Actuator Handle **TIP:** Pull outward to remove.
3	Power Seat Switch Knob **TIP:** Pull outward to remove.
4	Seat Cushion Outer Trim Panel Refer to **Seat Cushion Outer Trim Panel Replacement**.
5	Seat Cushion Cover **Procedure** 1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.
6	Front Seat Cushion Frame Nut (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 9 N.m (80 lb in)
7	Front Seat Adjuster Assembly

PASSENGER SEAT ADJUSTER REPLACEMENT (IMPALA W/O AG2)

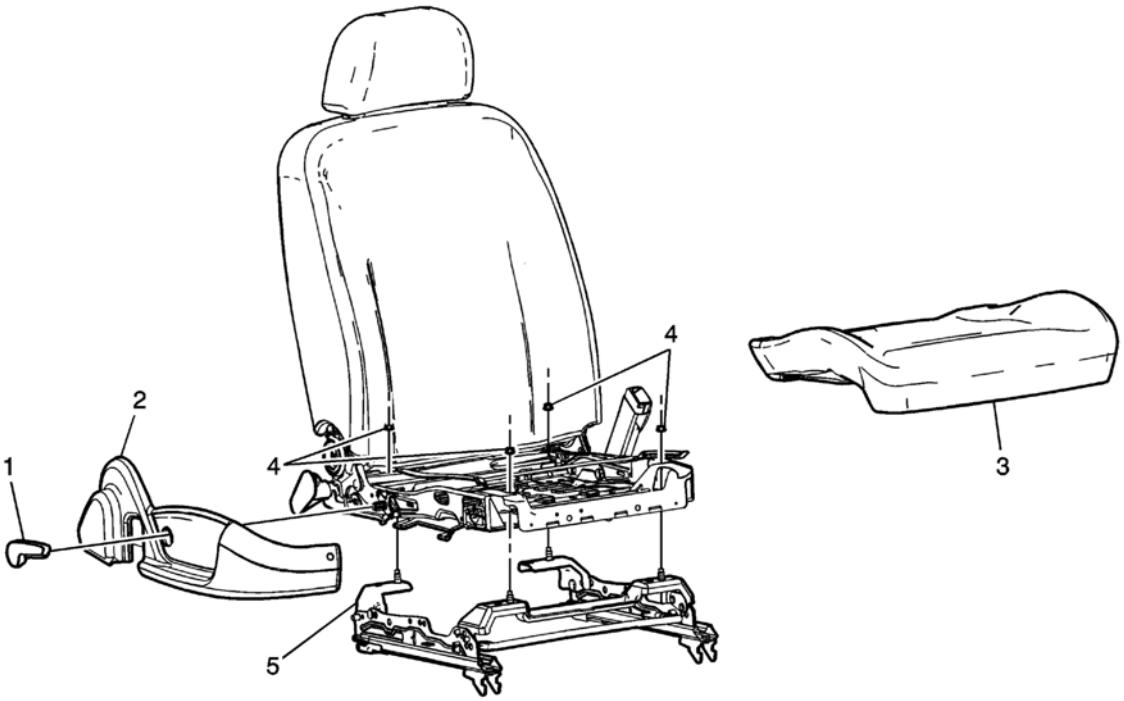

Fig. 4: Passenger Side Seat Adjuster (Impala w/o AG2)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala).**	
1	Recliner Handle **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.
2	Seat Cushion Outer Trim Panel Refer to **Seat Cushion Outer Trim Panel Replacement**.
3	Seat Cushion Cover **Procedure**

Callout	Component Name
	1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.
4	Front Seat Cushion Frame Nut (Qty: 4) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 9 N.m (80 lb in)
5	Front Seat Adjuster Assembly

FRONT SEAT ARMREST LATCH REPLACEMENT (IMPALA)

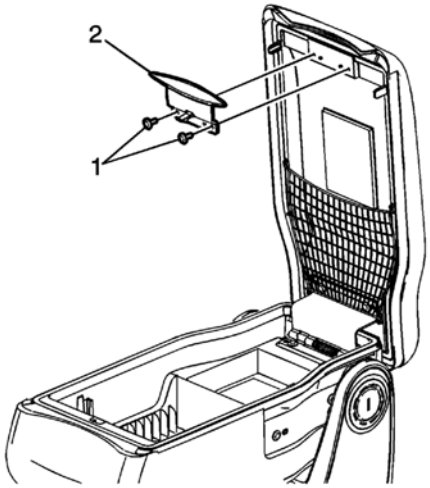

Fig. 5: Identifying Front Seat Armrest Latch (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 3 N.m (25 lb in)

Callout	Component Name
2	Front Seat Armrest Latch Assembly

FRONT SEAT ARMREST REPLACEMENT (IMPALA)

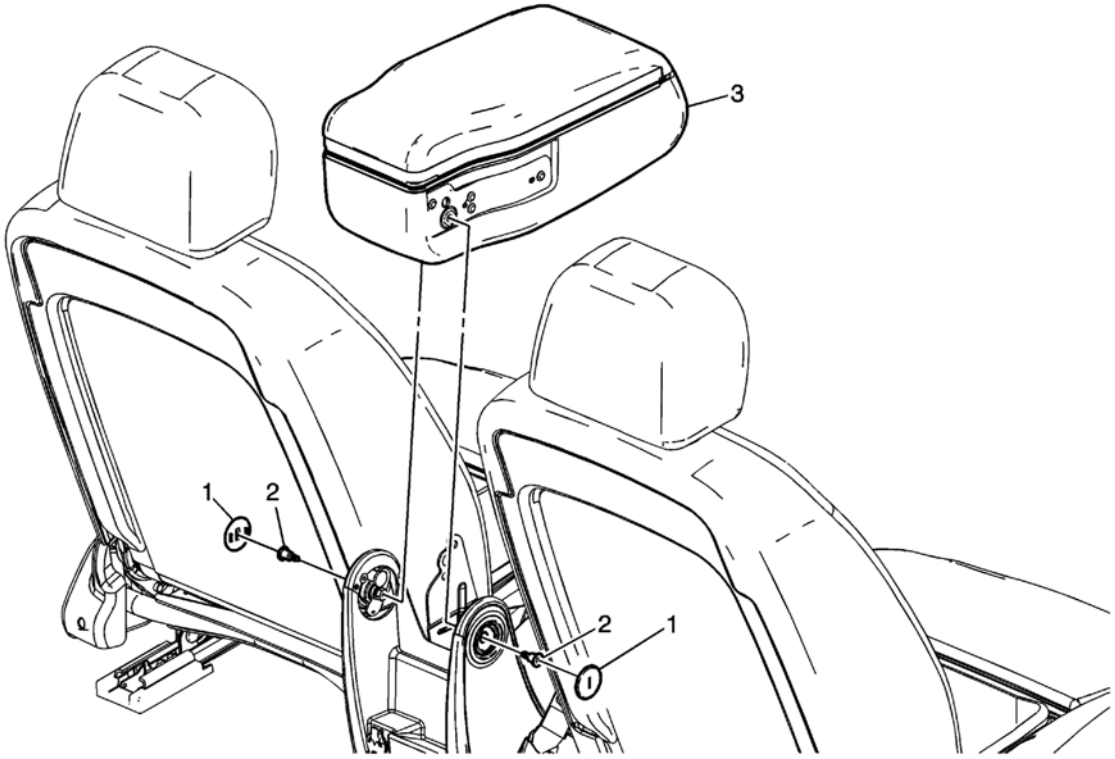

Fig. 6: Front Seat Armrest (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Center Seat Armrest Bolt Cover (Qty: 2) **TIP:** Move the front bucket seats forward far enough to gain access to the armrest bolt cover.
2	Front Center Seat Armrest Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 3 N.m (25 lb in)
3	Front Center Seat Armrest Assembly

FRONT SEAT ARMREST HINGE REPLACEMENT (IMPALA)

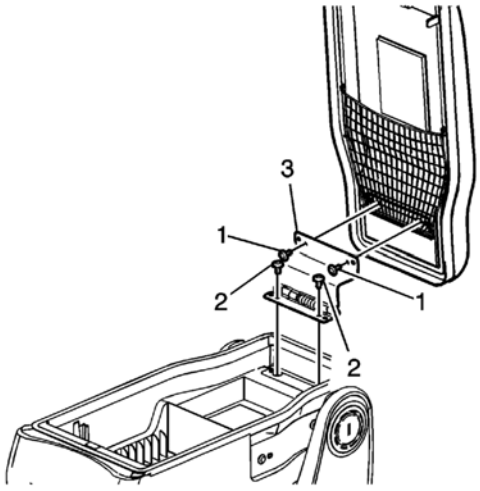

Fig. 7: Identifying Front Seat Armrest Hinge (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 3 N.m (25 lb in)
2	Front Seat Armrest Hinge Screw (Qty: 2) **Tighten** 3 N.m (25 lb in)
3	Front Seat Armrest Hinge

FRONT SEAT ARMREST LID REPLACEMENT (IMPALA)

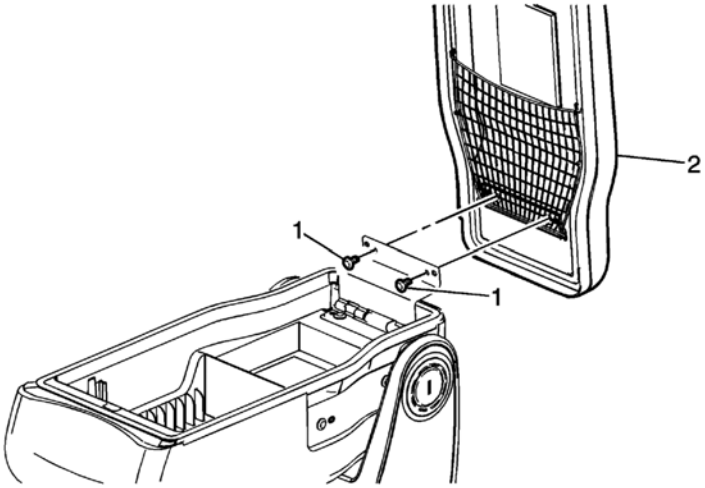

Fig. 8: Identifying Front Seat Armrest Lid (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 3 N.m (25 lb in)
2	Front Seat Armrest Lid Assembly

FRONT SEAT ARMREST STOWAGE COMPARTMENT REPLACEMENT (IMPALA)

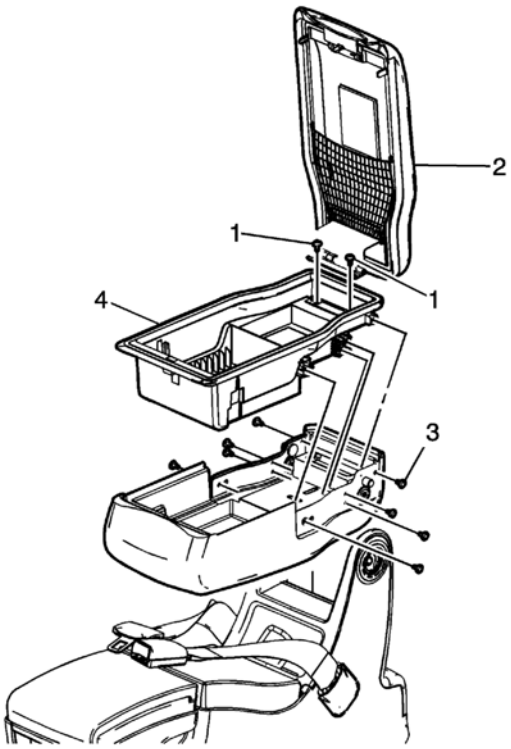

Fig. 9: Identifying Front Seat Armrest Stowage Compartment (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 3 N.m (25 lb in)
2	Front Seat Armrest Lid Assembly
3	Front Seat Armrest Bin Screw (Qty: 8) **Tighten** 3 N.m (25 lb in)
4	Front Seat Armrest Stowage Compartment Assembly

DRIVER OR PASSENGER SEAT HEAD RESTRAINT REPLACEMENT (IMPALA)

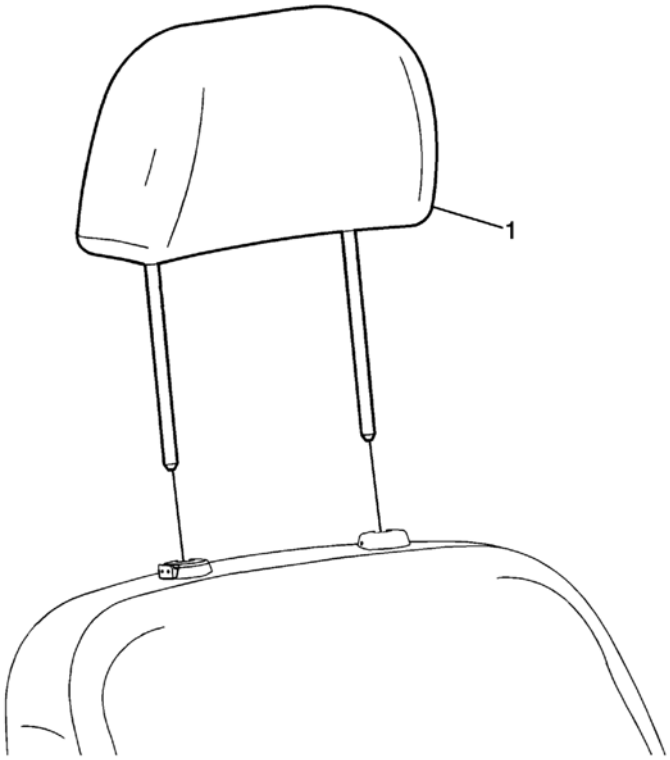

Fig. 10: Front Seat Head Restraint (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Head Restraint **Procedure** 1. Depress the button on the inboard head restraint guide to raise the head restraint to the full up position. 2. Insert a small diameter tool into the hole on the inboard side of the outboard head

Callout	Component Name
	restraint guide and pull upward to remove.

DRIVER OR PASSENGER SEAT HEAD RESTRAINT GUIDE REPLACEMENT (IMPALA)

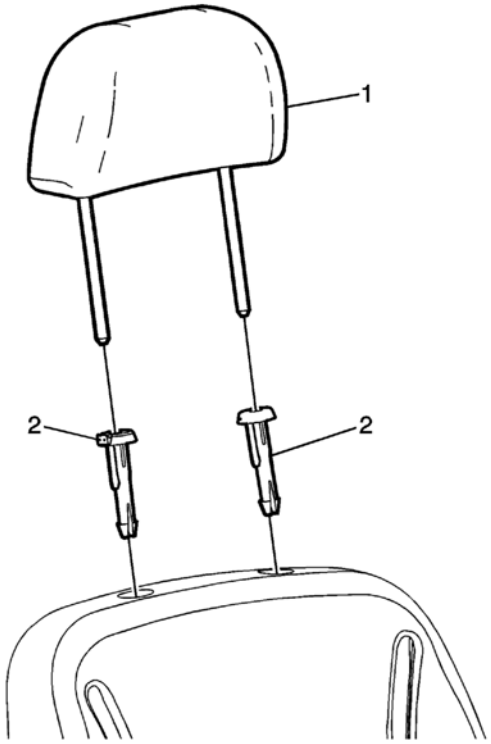

Fig. 11: Front Seat Head Restraint Guide (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat back panel. Refer to **Front Seat Back Cushion Finish Panel Replacement (Impala)**.	
1	Front Seat Head Restraint **Procedure** 1. Depress the button on the inboard head restraint guide to raise the head restraint to the full up position. 2. Insert a small diameter tool into the hole on the inboard side of the outboard head restraint guide and pull upward to remove.
2	Front Seat Head Restraint Guide (Qty: 2) **TIP:** Reach up and into the top of the seat back, while pressing the tabs on the bottom of the head restraint guide, pull the guide from the seat back frame.

DRIVER SEAT ADJUSTER HORIZONTAL PINION GEAR SHAFT REPLACEMENT

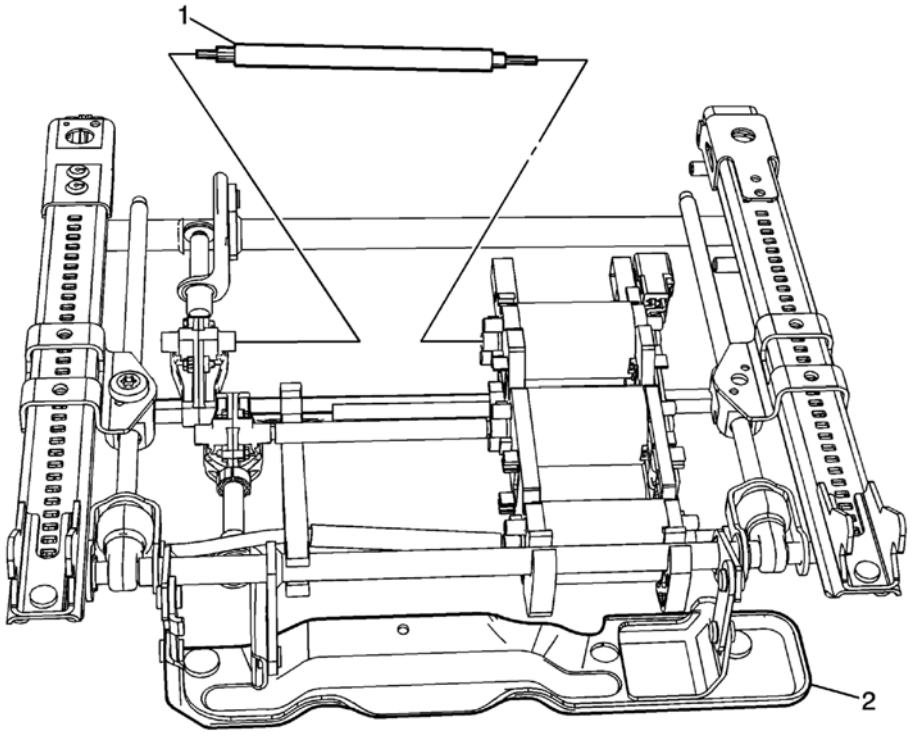

Fig. 12: Driver Seat Adjuster Horizontal Pinion Gear Shaft Replacement
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat adjuster. Refer to **Front Seat Adjuster Replacement**.	
1	Driver Seat Adjuster Horizontal Pinion Gear Shaft **TIP:** Remove the cable by pulling on the end of each side.
2	Driver Seat Adjuster Horizontal Pinion Gear Shaft **Procedure** Follow the steps below to reinstall the seat adjuster horizontal pinion gear shaft 1. Ensure both inboard and outboard tracks fully rearward position. 2. Reinstall seat adjuster horizontal pinion gear shaft cable 3. activated the motor ensure the adjuster is operating normal.

DRIVER OR PASSENGER SEAT CUSHION FRAME REPLACEMENT

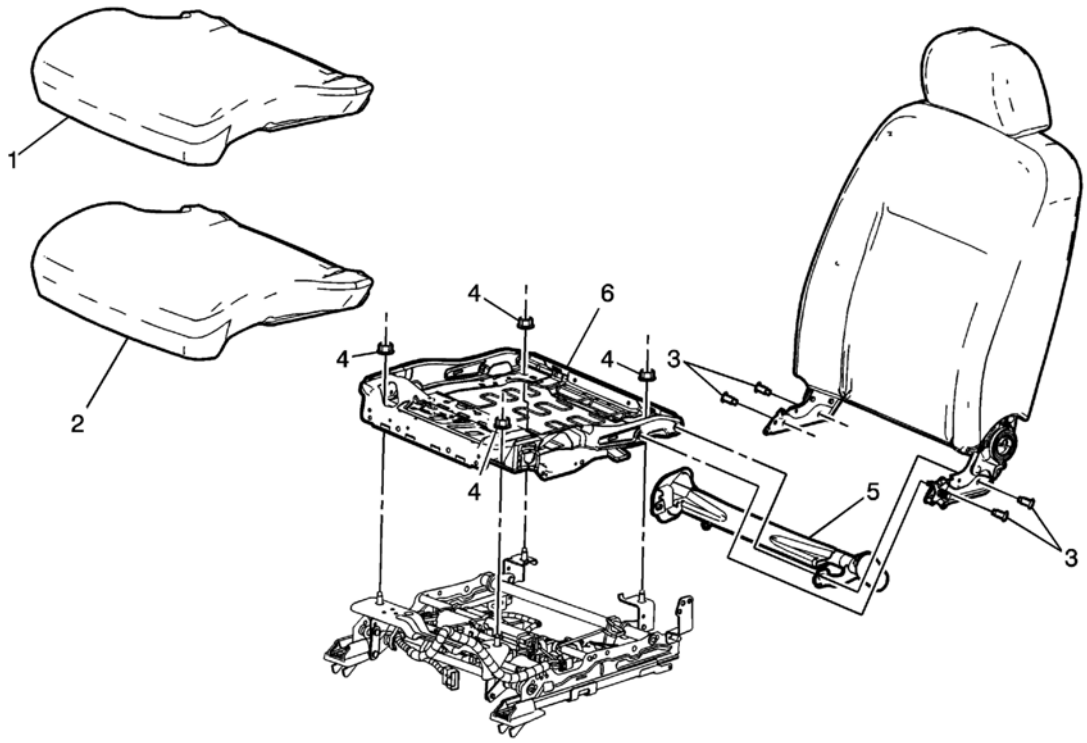

Fig. 13: Front Seat Cushion Frame
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala)**. 2. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala Limited)**. 3. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala)** . 4. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**. 5.	
1	Seat Cushion Cover Refer to **Front Seat Cushion Cover and Pad Replacement (Impala).**
2	Seat Cushion Pad Refer to **Front Seat Cushion Cover and Pad Replacement (Impala).**
3	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 45 N.m (33 lb ft)
4	Front Seat Cushion Frame Nut (Qty: 4) **Tighten** 9 N.m (80 lb in)
5	Seat Cushion Frame Rear Reinforcement
6	Front Seat Cushion Frame **Procedure** 1. Remove the heated seat module, if equipped. Refer to **Front Seat Heater Control Module Replacement (Impala)** . 2. Remove the inflatable restraint passenger presence system if working on the passenger seat. Refer to **Inflatable Restraint Passenger Presence System Replacement - Front** . 3. Disconnect the wiring harness from the seat cushion. 4. Re-zero the inflatable restraint passenger presence system whenever the seat cushion or any component of the passenger presence system is removed. Refer to **Passenger Presence System Programming and Setup** .

SEAT CUSHION OUTER TRIM PANEL REPLACEMENT

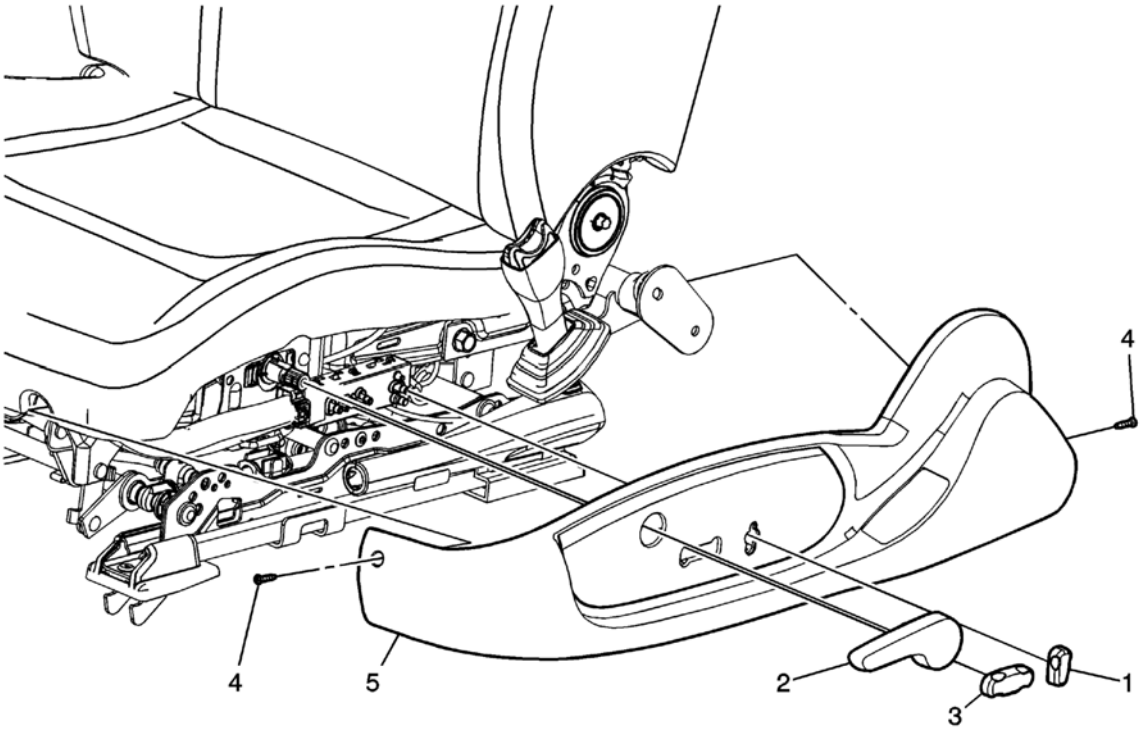

Fig. 14: Seat Cushion Outer Trim Panel & Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Recliner Knob (If equipped) **TIP:** Pull outward to remove.
2	Lumbar Actuator Handle (If equipped) **TIP:** Pull outward to remove.
3	Power Seat Switch Knob (If equipped) **TIP:** Pull outward to remove.
4	Seat Cushion Outer Trim Panel Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
5	Seat Cushion Outer Trim Panel **Procedure** 1. Disconnect the electrical connector. 2. Remove the seat cushion outer trim panel by pulling it upward over the pretensioner

Callout	Component Name
	upper and lower boot. 3. If replacing the cover, transfer components as necessary.

FRONT SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA)

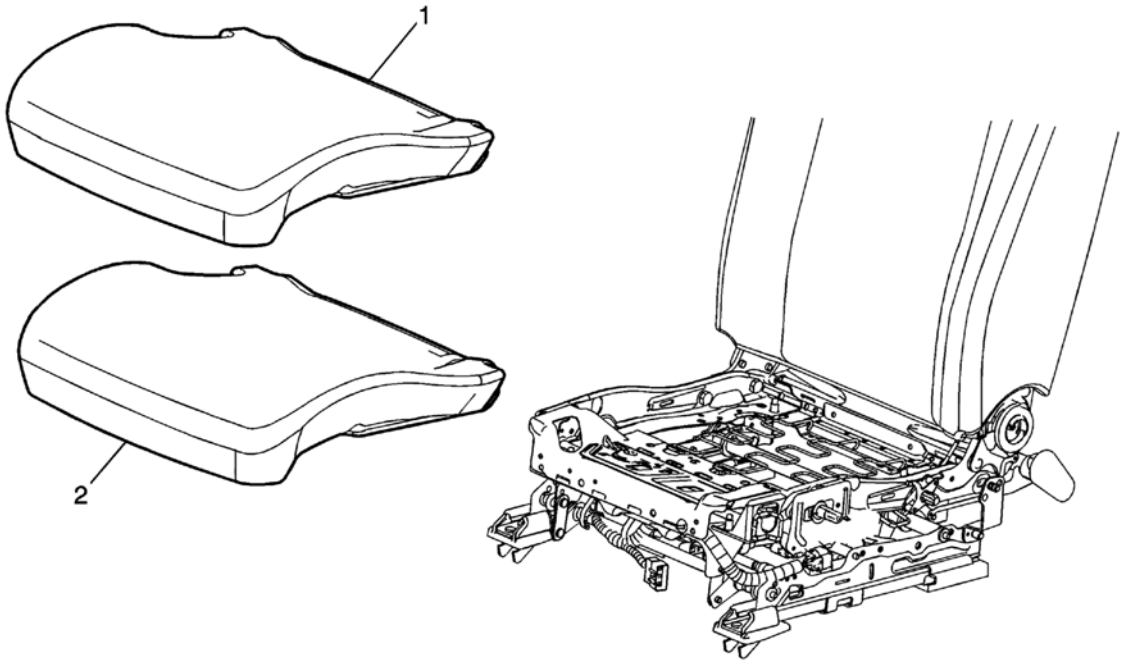

Fig. 15: Front Seat Cushion Cover And Pad (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seats. Refer to **Front Seat Removal and Installation - Bucket (Impala)**. 2. Remove the front seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**.	
1	Seat Cushion Cover **Procedure** 1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.

Callout	Component Name
2	Seat Cushion Pad **Procedure** 1. Remove the seat cushion pad from the cover by pulling away to release to hook and loop fasteners. 2. When working on the passenger seat re-zero the passenger presence system. Refer to **Control Module References** .

SEAT BACK COVER AND PAD REPLACEMENT (IMPALA)

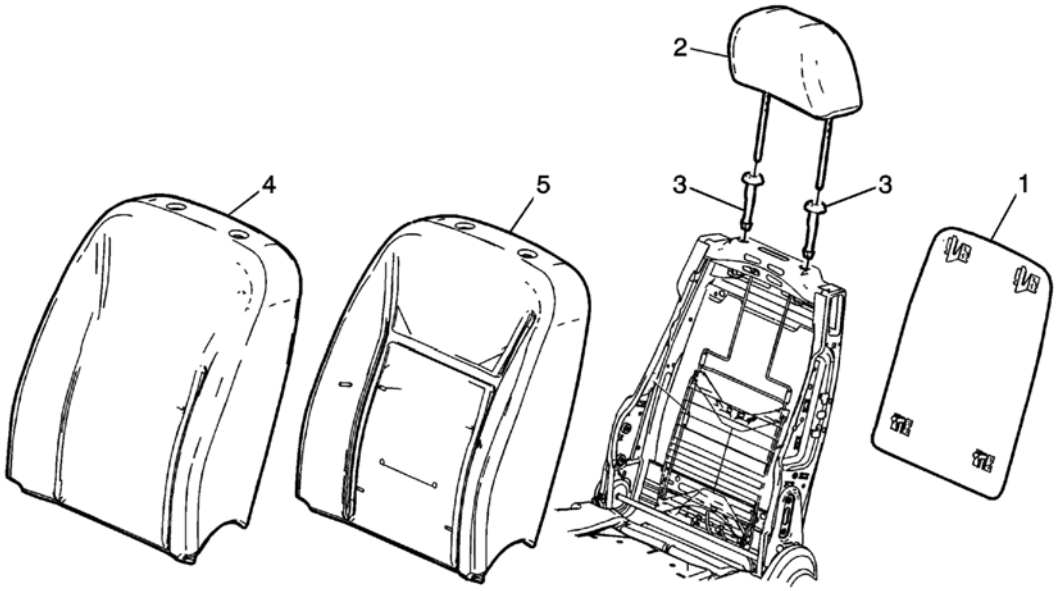

Fig. 16: Seat Back Cover And Pad (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**. 2. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**.	
1	Seat Back Cushion Finish Panel Refer to **Front Seat Back Cushion Finish Panel Replacement (Impala)**.

Callout	Component Name
2	Front Seat Head Restraint Refer to **Driver or Passenger Seat Head Restraint Replacement (Impala Limited)**.
3	Front Seat Head Restraint Guides Refer to **Driver or Passenger Seat Head Restraint Guide Replacement (Impala)**.
4	Seat Back Cushion Cover **Procedure** 1. Disconnect the j-channel from the seat back frame. 2. Remove the 2 lower push pin retainers that secures the cover to the frame. 3. Remove the pad and cover as an assembly.
5	Seat Back Cushion Pad **Procedure** 1. Remove the cover from the pad by pulling apart to release the hook and loop fasteners. 2. Disconnect the electrical connector, if equipped.

DRIVER OR PASSENGER SEAT BACK CUSHION PAD SUPPORT REPLACEMENT

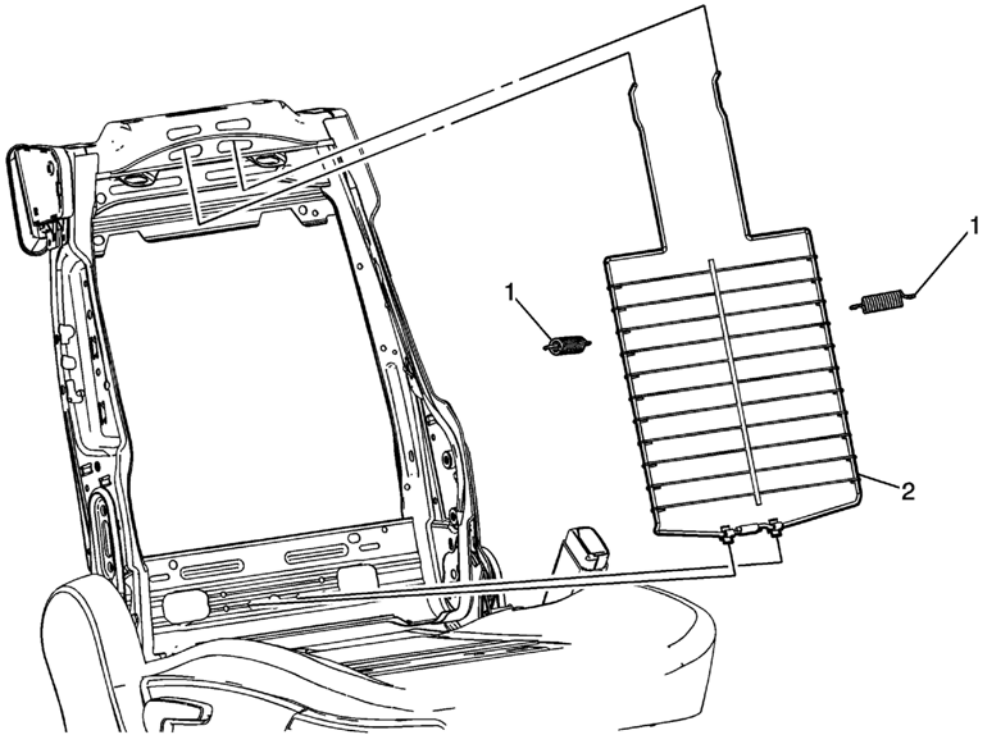

Fig. 17: Front Seat Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala)**.	
1	Front Seat Lumbar Spring (Qty: 2)
2	Front Seat Back Cushion Pad Support **Procedure** 1. Push the retainers at the bottom out of the seat back frame to release the bottom of the lumbar assembly. 2. Tilt and pull down and forward to remove the top portion of the lumbar assembly from the seat back frame.

DRIVER OR PASSENGER SEAT BACK CUSHION FRAME REPLACEMENT (IMPALA)

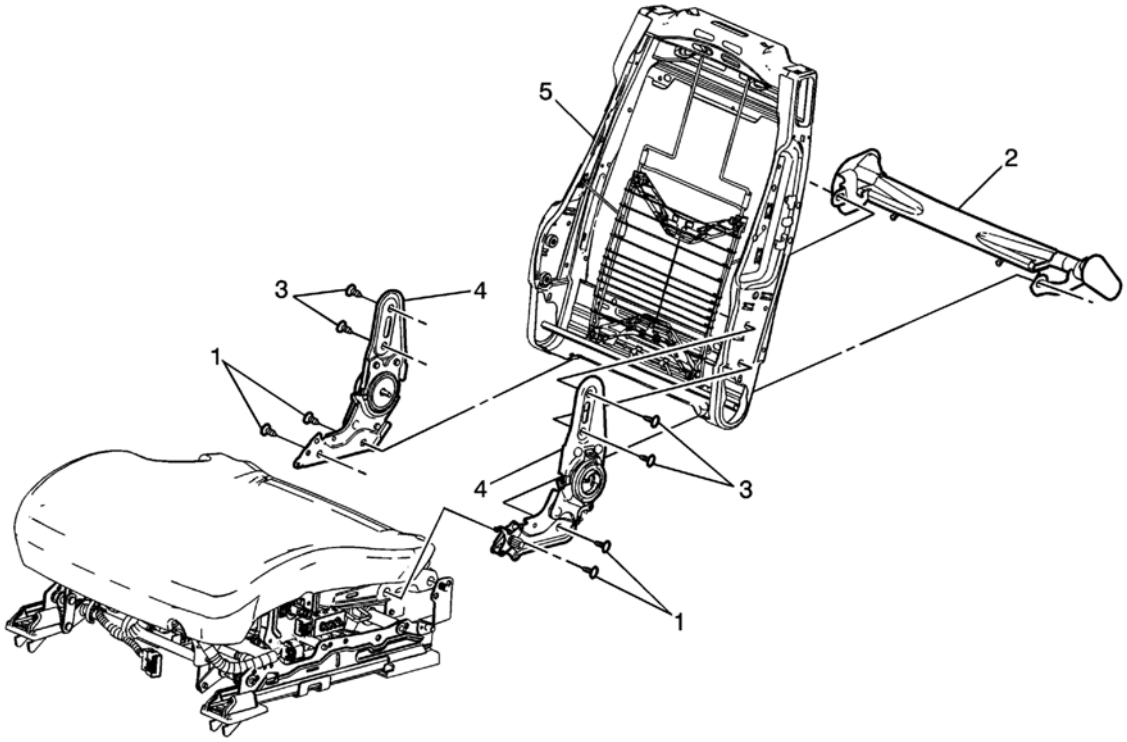

Fig. 18: Identifying Front Seat Back Frame (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**. 2. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala)**.	

Callout	Component Name
3. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala Limited)**. 4. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala)** . 5. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**. 6. Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala)**. 7. Remove the lumbar assembly. Refer to **Driver or Passenger Seat Lumbar Support Replacement**.	
1	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 45 N.m (33 lb ft)
2	Seat Cushion Frame Rear Reinforcement
3	Front Seat Back Cushion Frame Bolt (Qty: 4) **Tighten** 45 N.m (33 lb ft)
4	Seat Recliner Assembly
5	Seat Back Frame Assembly

DRIVER OR PASSENGER SEAT RECLINER REPLACEMENT (IMPALA)

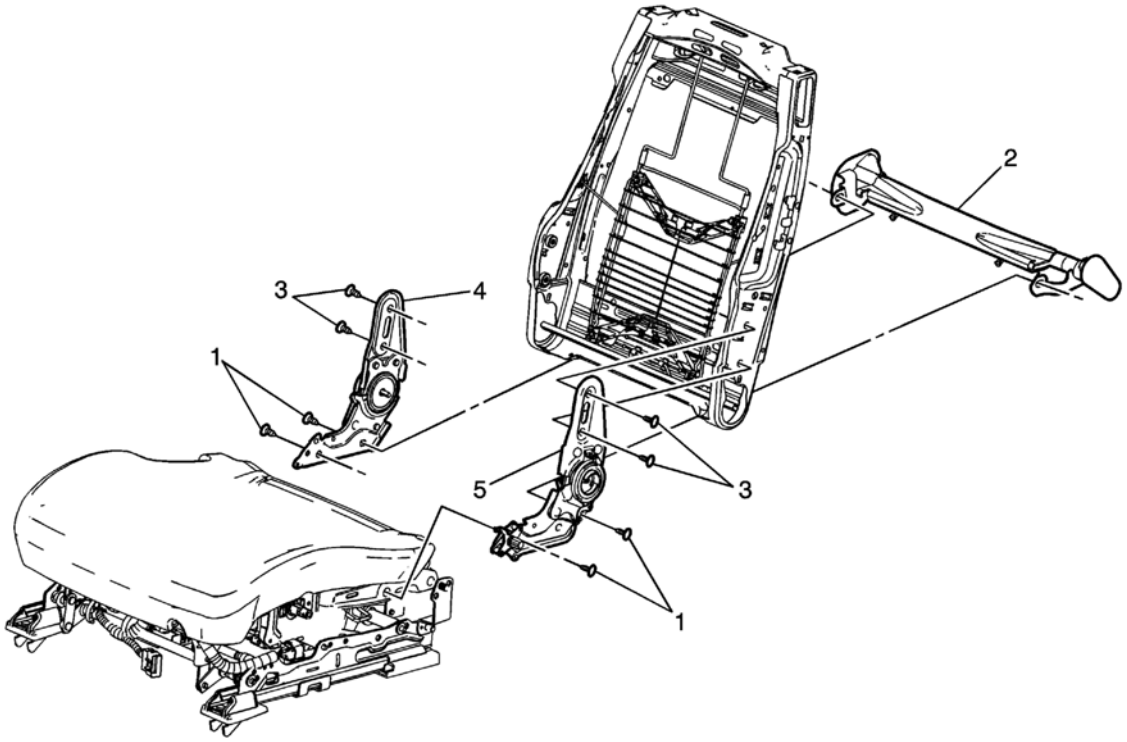

Fig. 19: Seat Back Recliner (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala)**. 2. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala)**. 3. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala Limited)** . 4. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**. 5. Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala)**. 6. Remove the lumbar assembly. Refer to **Driver or Passenger Seat Lumbar Support Replacement**. 7.	
1	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 45 N.m (33 lb ft)
2	Seat Cushion Frame Rear Reinforcement
3	Front Seat Back Cushion Frame Bolt (Qty: 4) **Tighten** 45 N.m (33 lb ft)
4	Seat Inner Recliner Assembly
5	Seat Outer Recliner Assembly

FRONT SEAT BACK RECLINER HANDLE REPLACEMENT (IMPALA)

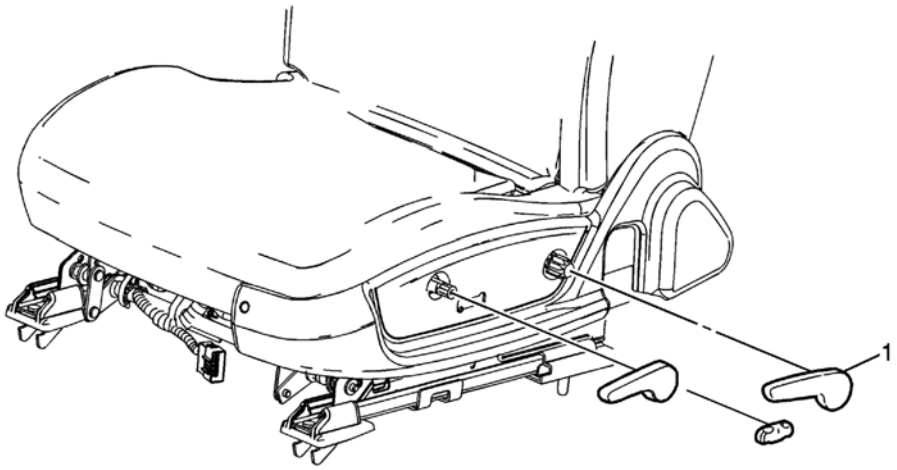

Fig. 20: Front Seat Back Recliner Handle (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to Fastener Specifications.	
1	Handle, Recliner **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.

FRONT SEAT BACK CUSHION FINISH PANEL REPLACEMENT (IMPALA)

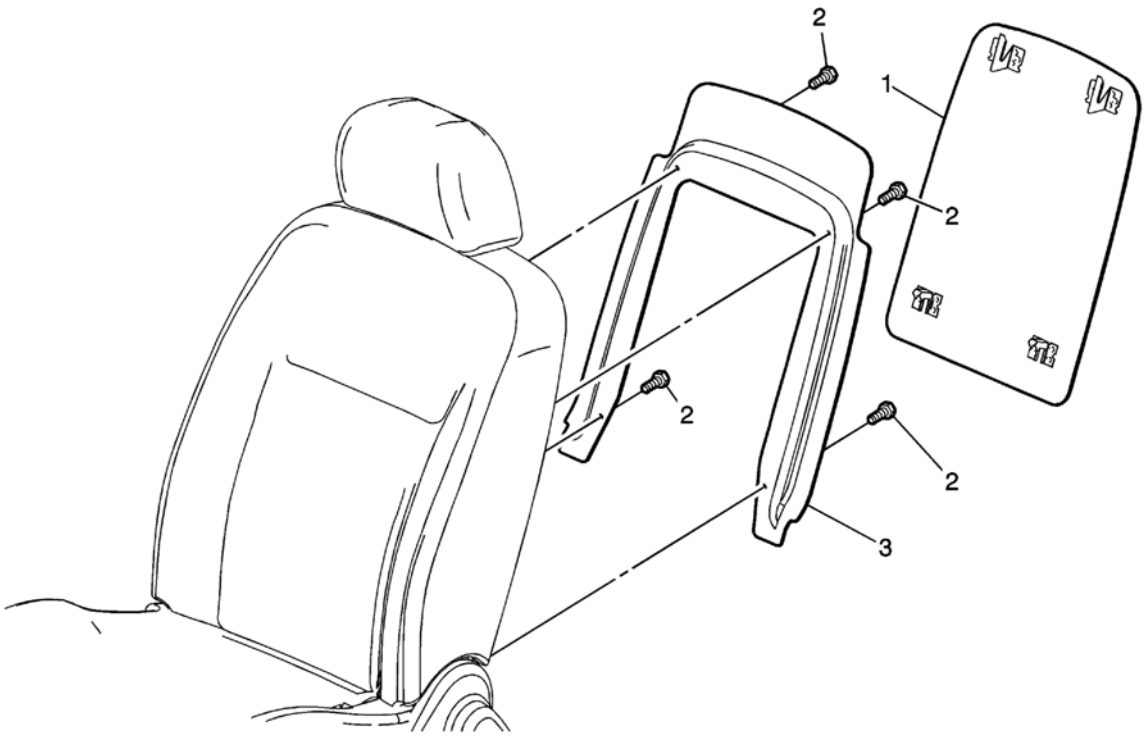

Fig. 21: Front Seat Back Panel (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Seat Back Cushion Finish Panel **Procedure** Pull up on the bottom of the panel while bowing the panel outward in the center, and when the panel disengages then pull rearward.
2	Seat Back Cushion Rear Finish Retainer (Qty: 4) **Procedure** Release the rear seat back cover j-channel retainers and reposition the cover to gain access to the retainers.
3	Seat Back Cushion Rear Finish Panel

DRIVER OR PASSENGER SEAT LUMBAR SUPPORT REPLACEMENT

Removal Procedure

1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala)**.
2. Remove the front seat back cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala)**.
3. Remove the front seat cushion cover and pad. Refer to **Front Seat Cushion Cover and Pad Replacement (Impala)**.

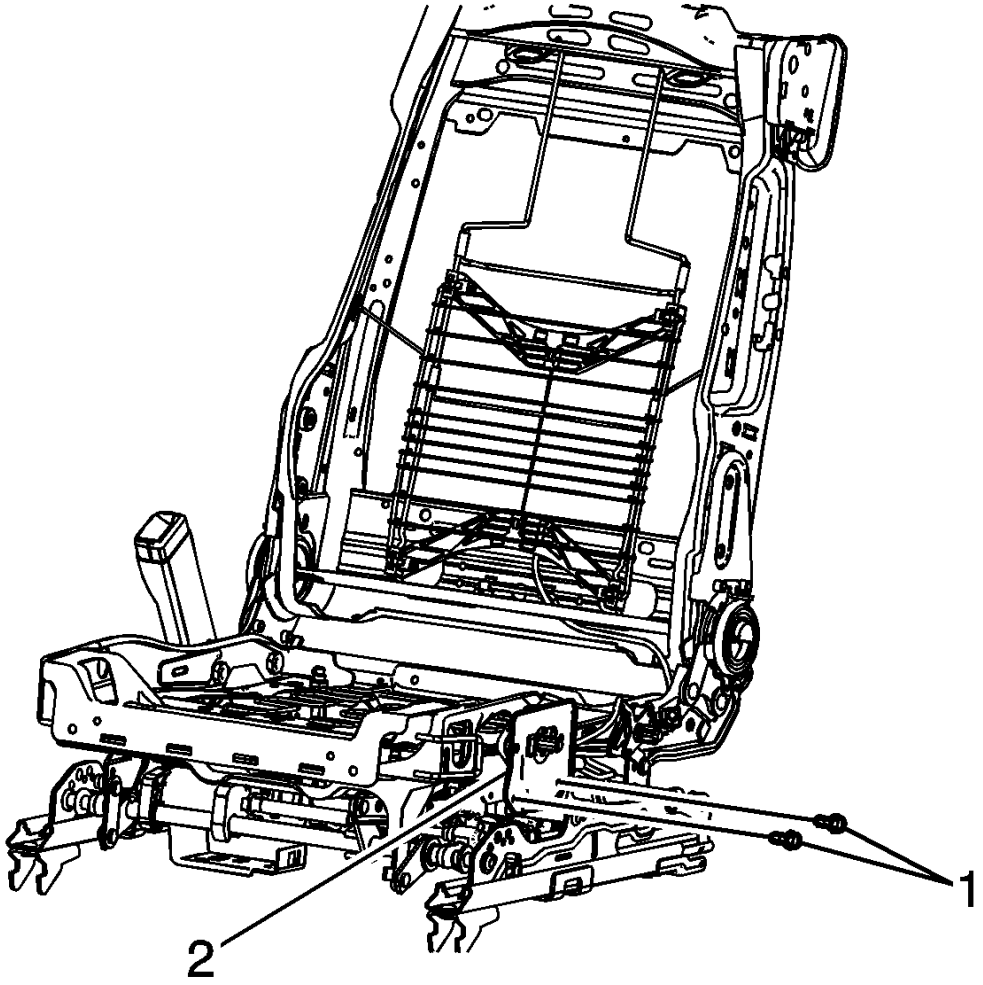

Fig. 22: Identifying Lumbar Support Actuator Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the screws (1) that retain the lumbar actuator to the seat cushion pan.

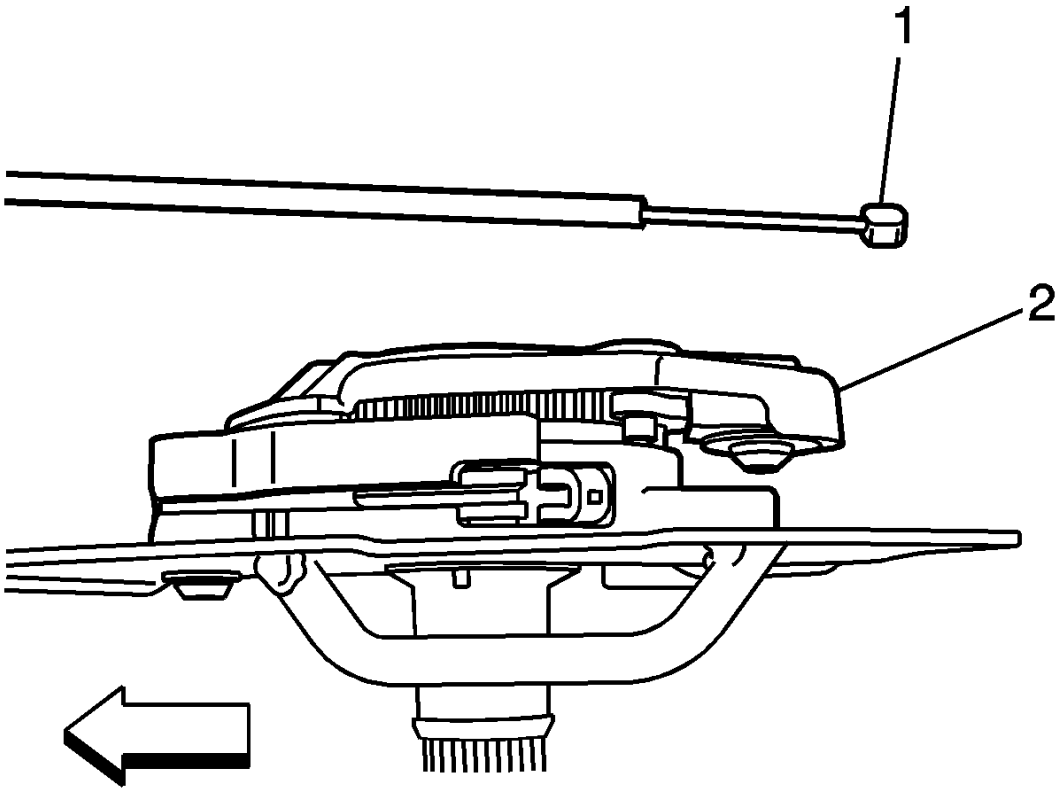

Fig. 23: Identifying Lumbar Cable & Lumbar Actuator
Courtesy of GENERAL MOTORS COMPANY

5. Move the lumbar actuator away from the seat far enough to disconnect the lumbar cable (1) from the actuator (2).

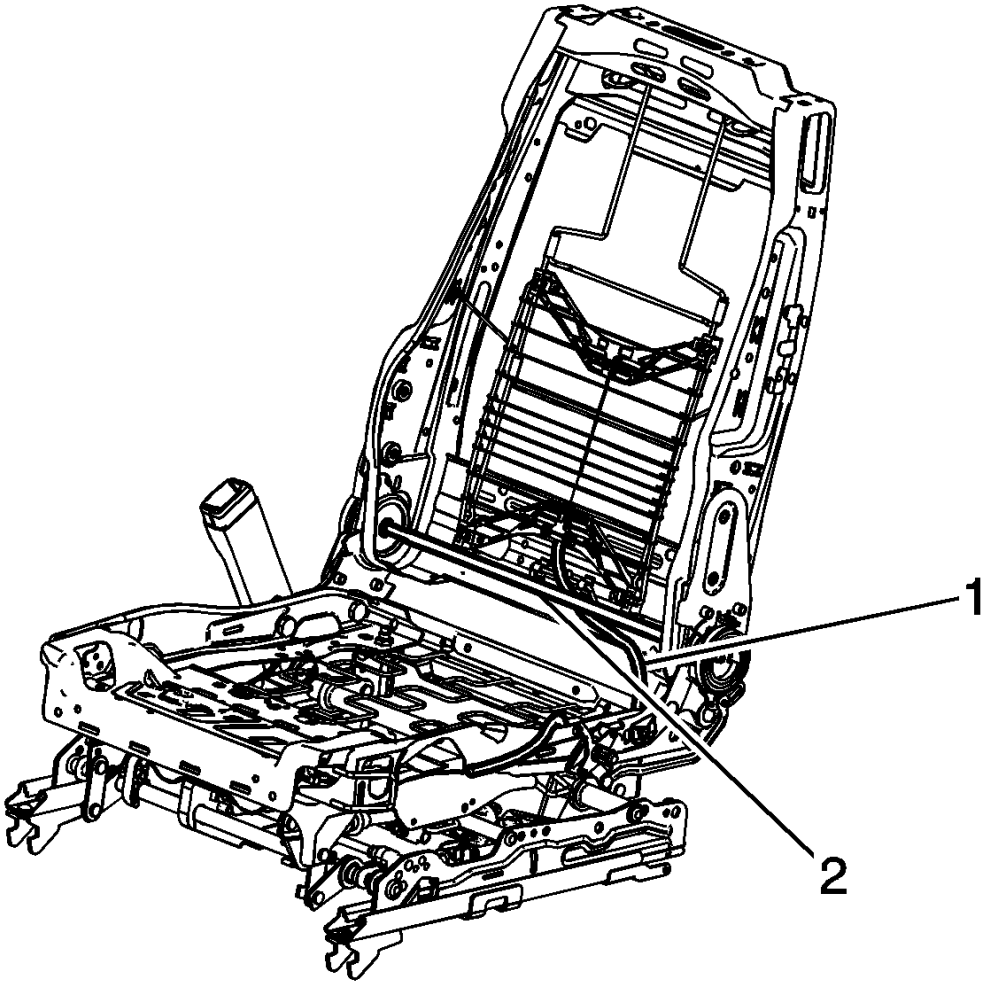

Fig. 24: Locating Lumbar Support Cable & Recliner Rod
Courtesy of GENERAL MOTORS COMPANY

6. Note the routing of the cable for installation purposes, the cable (1) must route between the recliner rod (2) and the seat back frame.

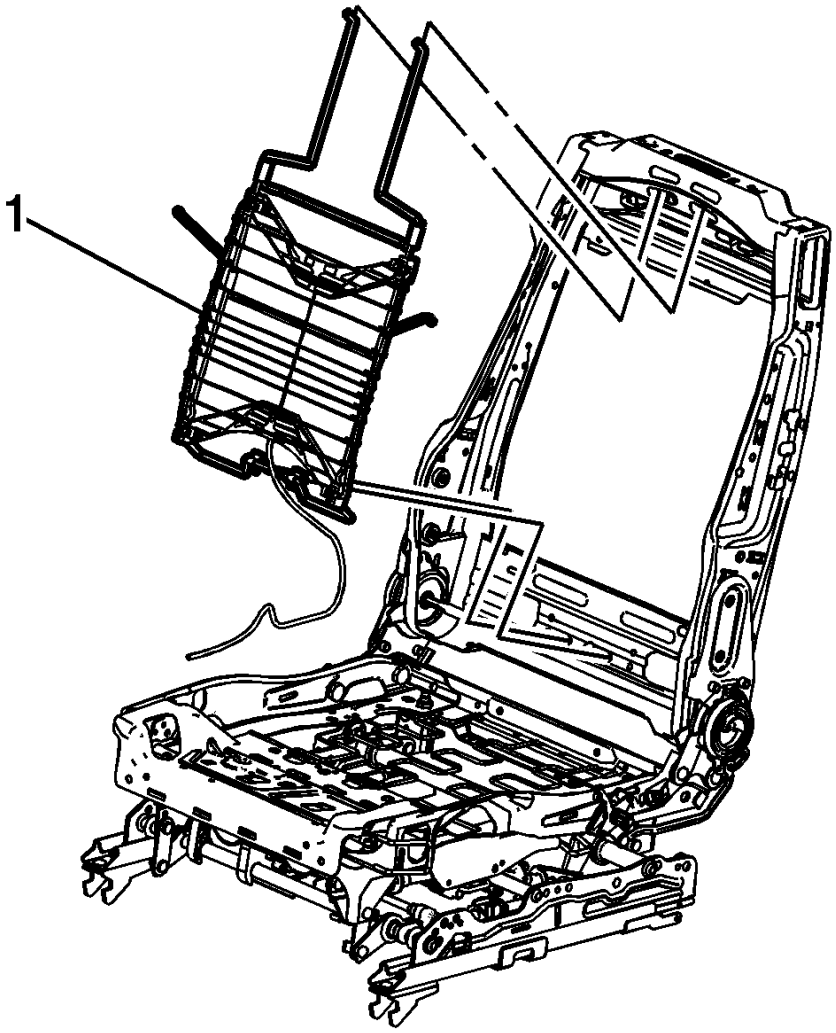

Fig. 25: View Of Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Remove the lumbar assembly (1) from the seat back frame by doing the following:
    - Disconnect the lumbar assembly (1) from each side of the seat back frame.
    - Pull the bottom of the lumbar assembly (1) forward to disengage the retainers from the seat back frame.
    - Slide the lumbar assembly (1) downward and forward to release from the seat back frame.

Installation Procedure

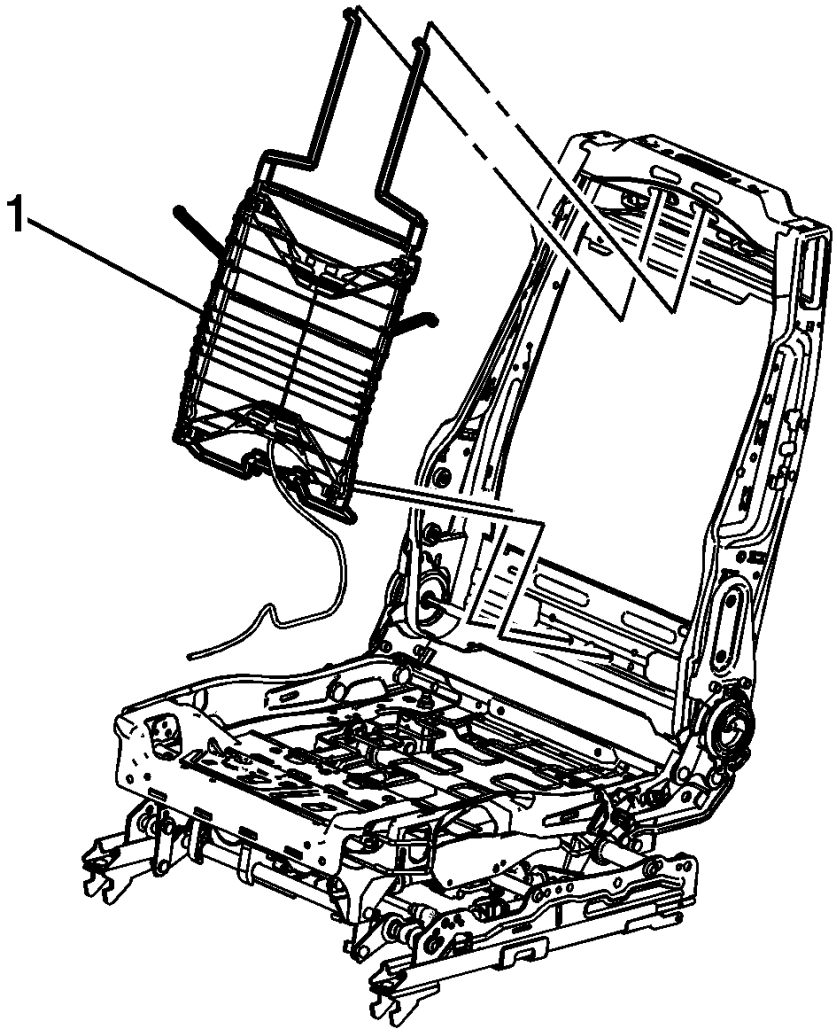

Fig. 26: View Of Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the lumbar assembly (1) to the front seat back frame by doing the following:
    - Insert the top of the lumbar assembly (1) into the upper locations on the seat back frame.
    - Secure the lower portion of the lumbar assembly (1) by pushing the retainers firmly into the seat back frame.
    - Attach the sides of the lumbar assembly (1) to the sides of the seat back frame.

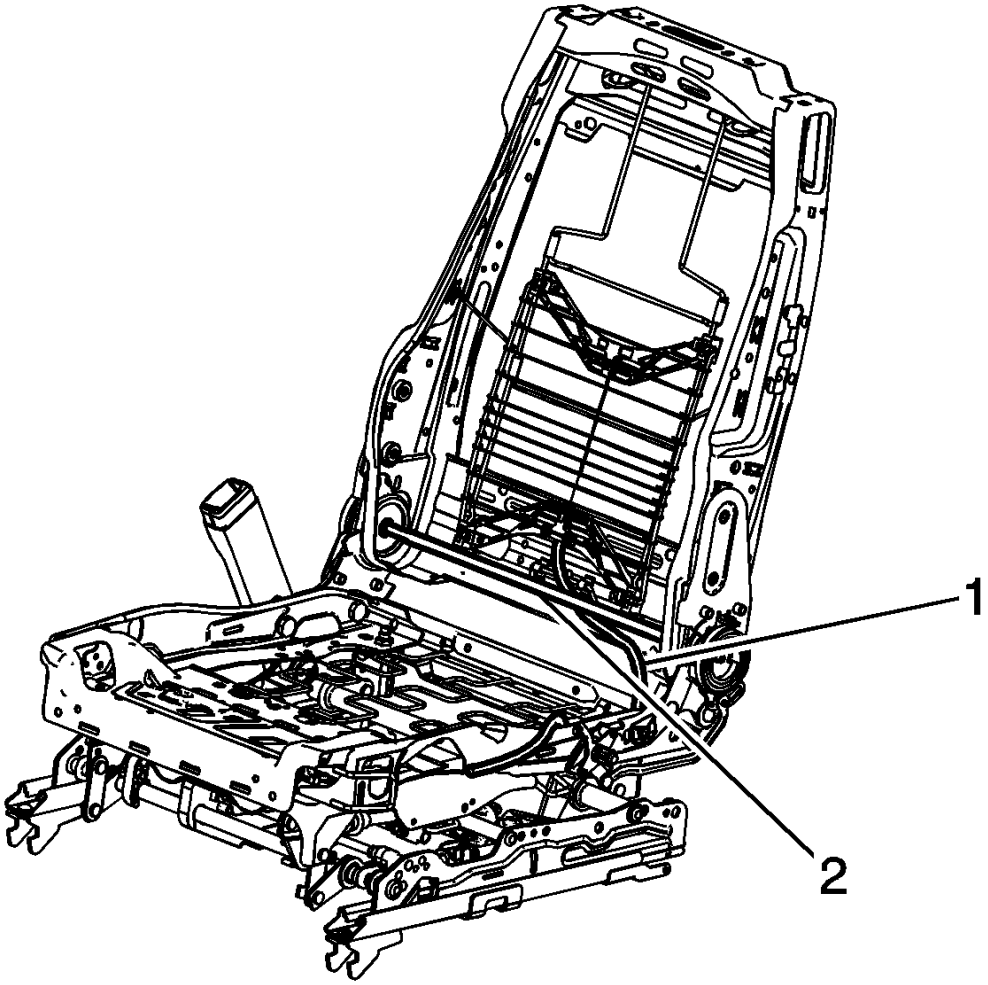

Fig. 27: Locating Lumbar Support Cable & Recliner Rod
Courtesy of GENERAL MOTORS COMPANY

2. Route the lumbar cable (1) between the front seat back frame and the recliner rod (2).

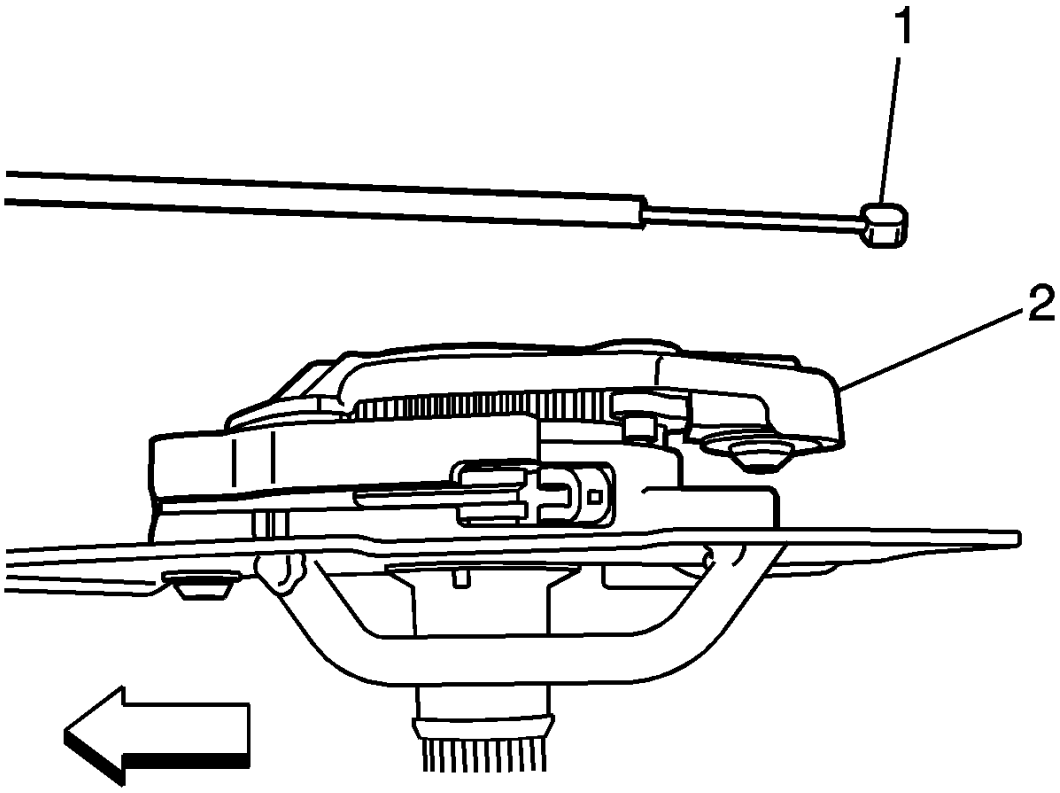

Fig. 28: Identifying Lumbar Cable & Lumbar Actuator
Courtesy of GENERAL MOTORS COMPANY

3. Connect the lumbar cable (1) to the lumbar actuator (2).

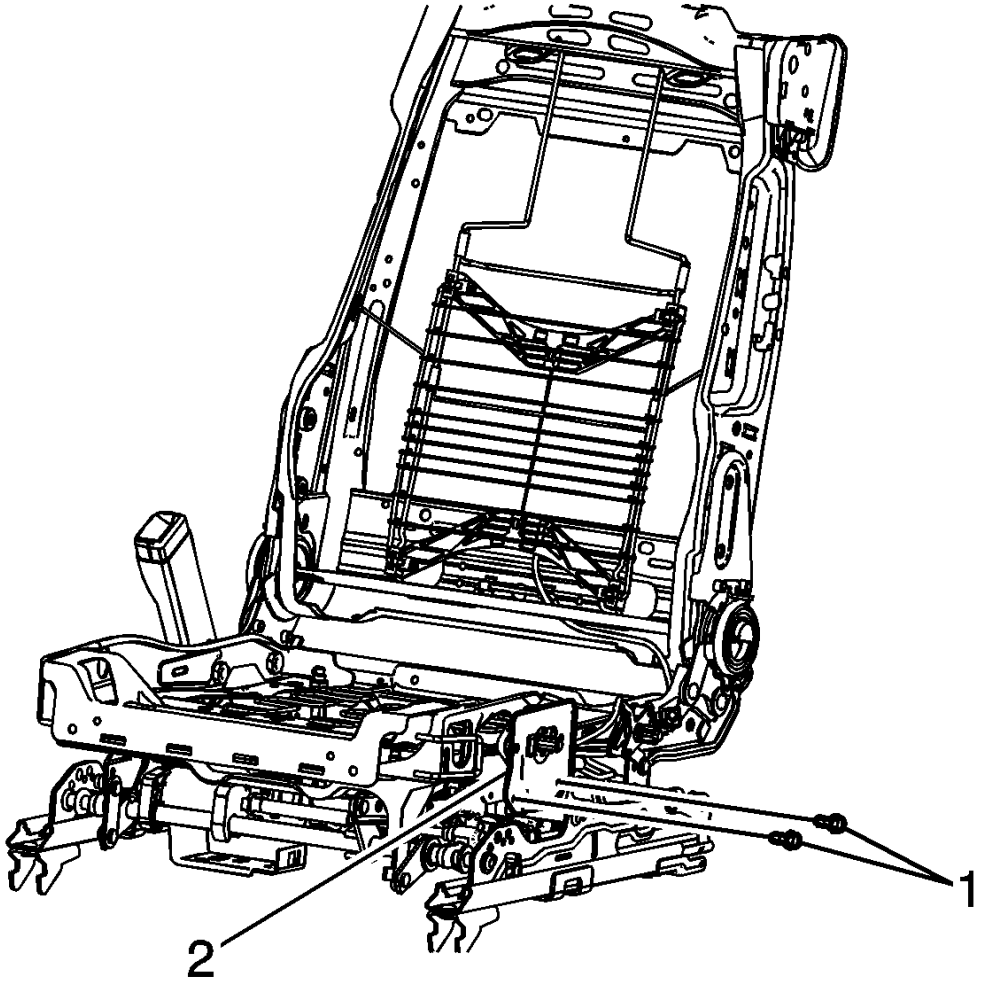

Fig. 29: Identifying Lumbar Support Actuator Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Position the lumbar actuator to the seat cushion frame and install the 2 screws that secure the lumbar actuator to the seat cushion frame.

   Tighten

   Tighten the bolts to 6 N.m (53 lb in).

5. Install the seat cushion cover and pad. Refer to **Front Seat Cushion Cover and Pad Replacement (Impala)**.
6. Install the seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala)**.
7. Install the front seat to the vehicle. Refer to **Front Seat Removal and Installation - Bucket (Impala)**.

LUMBAR SUPPORT KNOB REPLACEMENT (IMPALA)

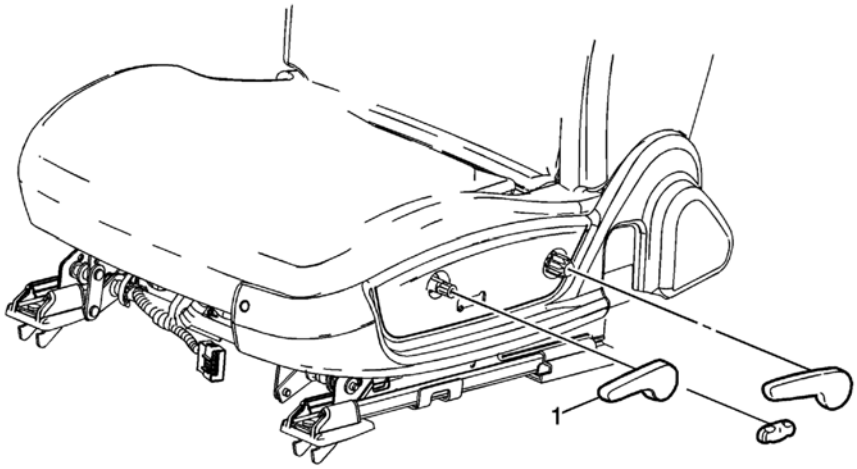

Fig. 30: Lumbar Support Knob (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Knob, Lumbar Actuator **TIP:** Pull outward to remove.

REAR SEAT ARMREST REPLACEMENT (IMPALA W/AM9)

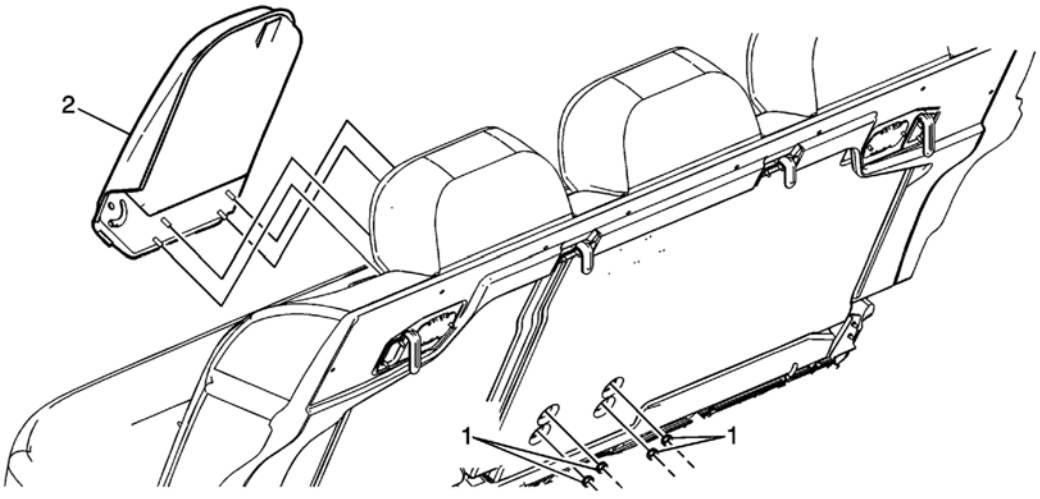

Fig. 31: Rear Seat Armrest (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Armrest Nut (Qty: 4) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Procedure 1. Fold the rear seat back cushion forward to gain access to the nuts. 2. Release J-Channel at bottom of seat-back Trim Cover and fold cover open to gain access to the nuts. **TIP:** Armrest is only serviced as an assembly. **Tighten** 3 N.m (25 lb in)
2	Rear Seat Armrest Assembly

REAR SEAT PULL STRAP REPLACEMENT

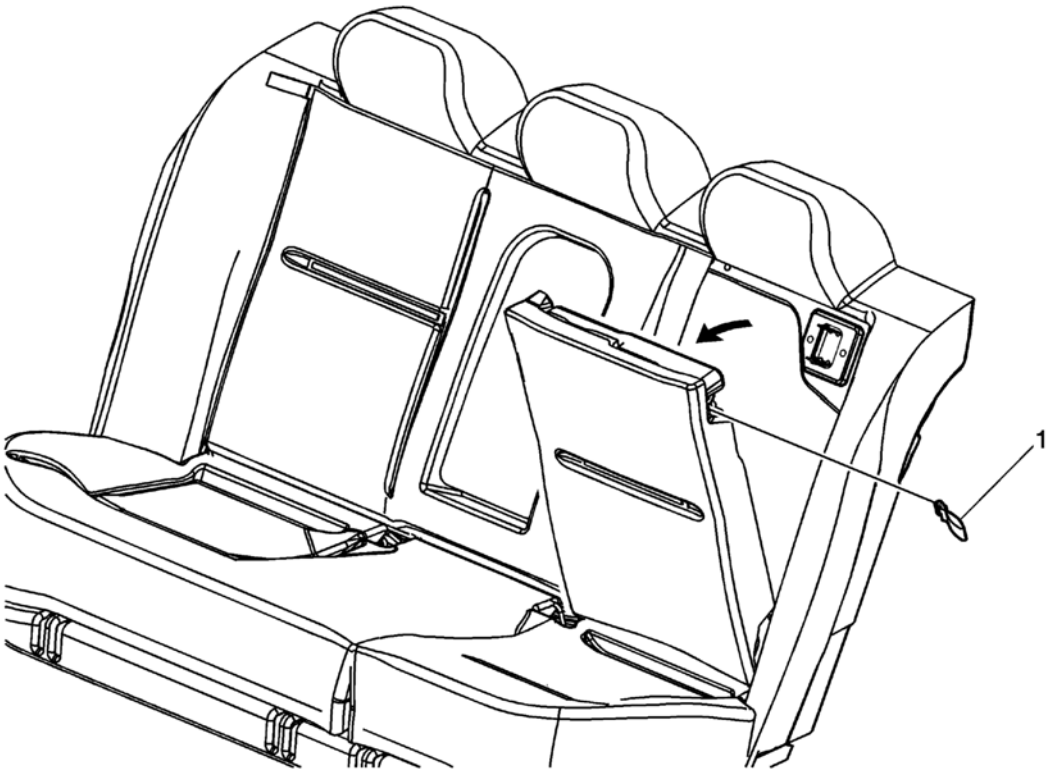

Fig. 32: Rear Seat Pull Strap
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Pull Strap **Procedure** Lay the seat back down before removing the pull strap from the latch.

REAR SEAT HINGE BRACKET REPLACEMENT (REAR SPLIT FOLDING)

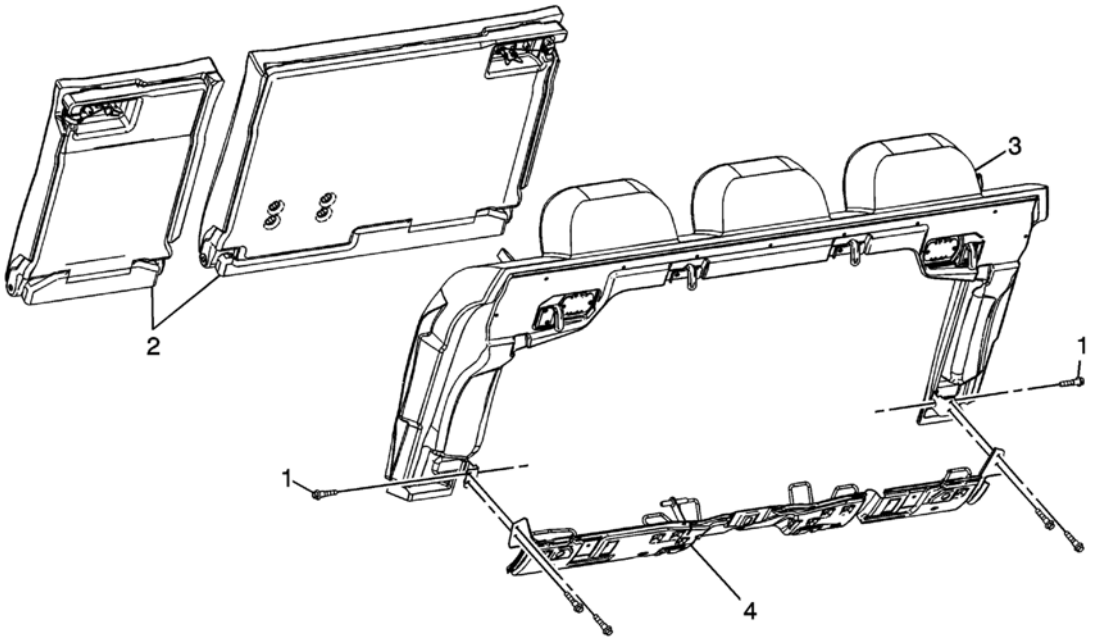

Fig. 33: Identifying Rear Seat Hinge Bracket (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala)**.	
1	Rear Seat Back Cushion Pivot Support Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 15 N.m (11 lb ft)
2	Rear Seat Back Cushion Assembly (Qty: 2) **TIP:** Tilt and slide outward to remove the rear seat back cushion assembly from the rear seat back hinge.
3	Rear Seat Back Hinge Bolt (Qty: 4) **Tighten** 15 N.m (11 lb ft)
4	Rear Seat Back Cushion Hinge Bracket

REAR SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA)

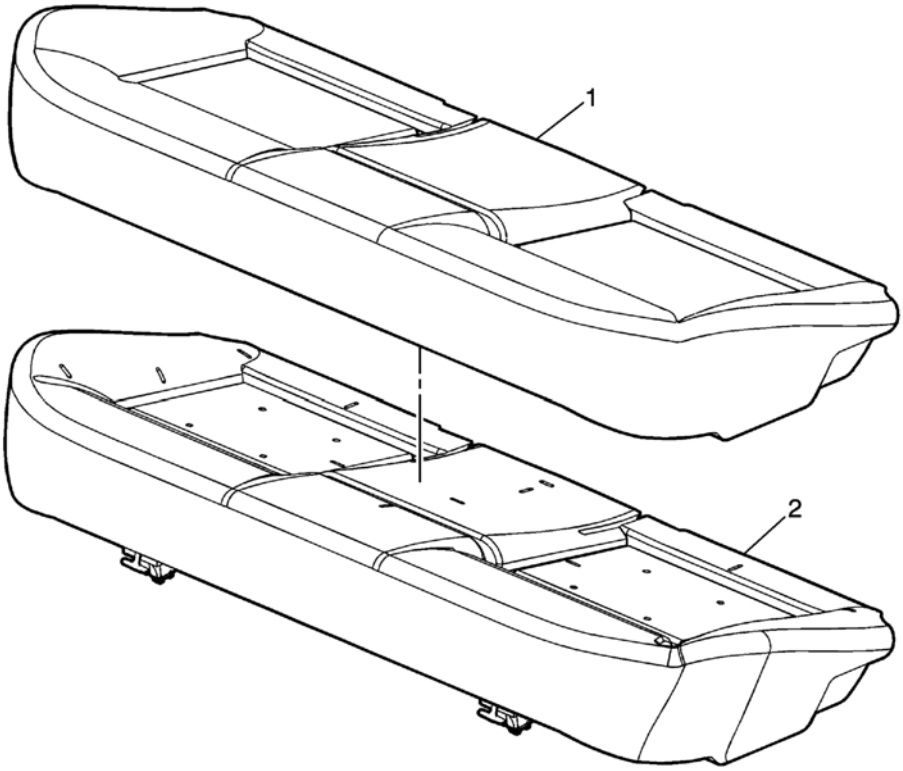

Fig. 34: Rear Seat Cushion Cover And Pad (Impala)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala)**.	
1	Rear Seat Cushion Cover **TIP:** The cushion cover and pad are serviced as an assembly.
2	Rear Seat Cushion Pad

REAR SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA W/AM9)

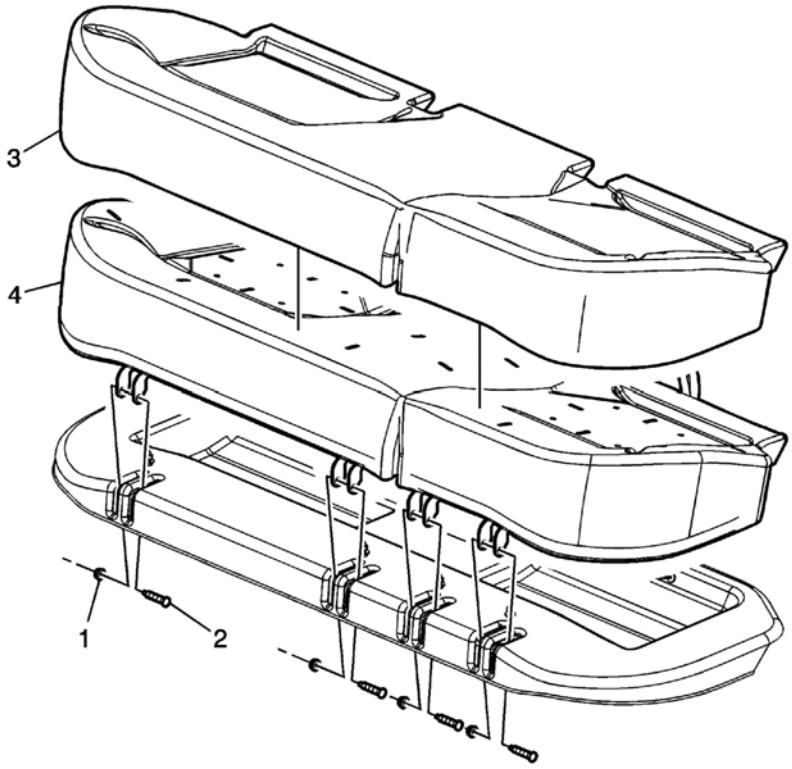

Fig. 35: Rear Seat Cushion Cover and Pad (Impala w/AM9)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Cushion Compartment Tray Nut (Qty 4) **Procedure** With the seat assembly on bench (up-side down), remove the nuts on the underside of the compartment tray at the cushion hinge locations.
2	Rear Seat Cushion Compartment Tray Hinge Pin (Qty 4) **Procedure** Gently tap the hinge pins outward until the cushion assembly is free of the stowage compartment.
3	Rear Seat Cushion Cover
4	Rear Seat Cushion Pad **TIP:** The cushion cover and pad are serviced as an assembly.

REAR SEAT CUSHION FLOOR STOWAGE COMPARTMENT REPLACEMENT (IMPALA LIMITED W/AM9)

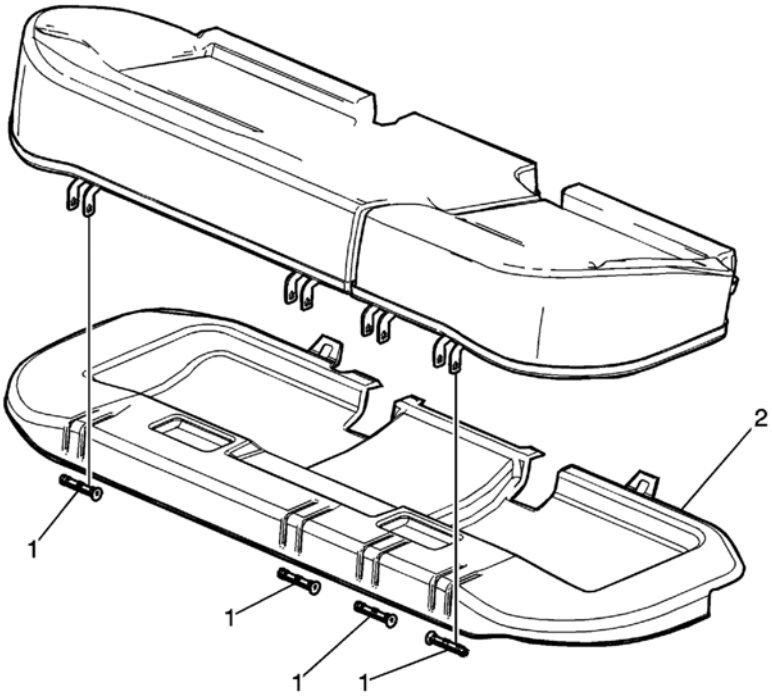

Fig. 36: Rear Seat Cushion Floor Stowage Compartment (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)** 2. Remove the rear seat cushion cover and pad. Refer to **Rear Seat Cushion Cover and Pad Replacement (Impala Limited)Rear Seat Cushion Cover and Pad Replacement (Impala Limited w/AM9)**	
1	Rear Seat Cushion Hinge Pin (Qty: 4)
2	Rear Seat Cushion Floor Stowage Compartment **TIP:** Floor stowage compartment is only serviced as an assembly.

REAR SEAT CUSHION REMOVAL AND INSTALLATION (IMPALA LIMITED)

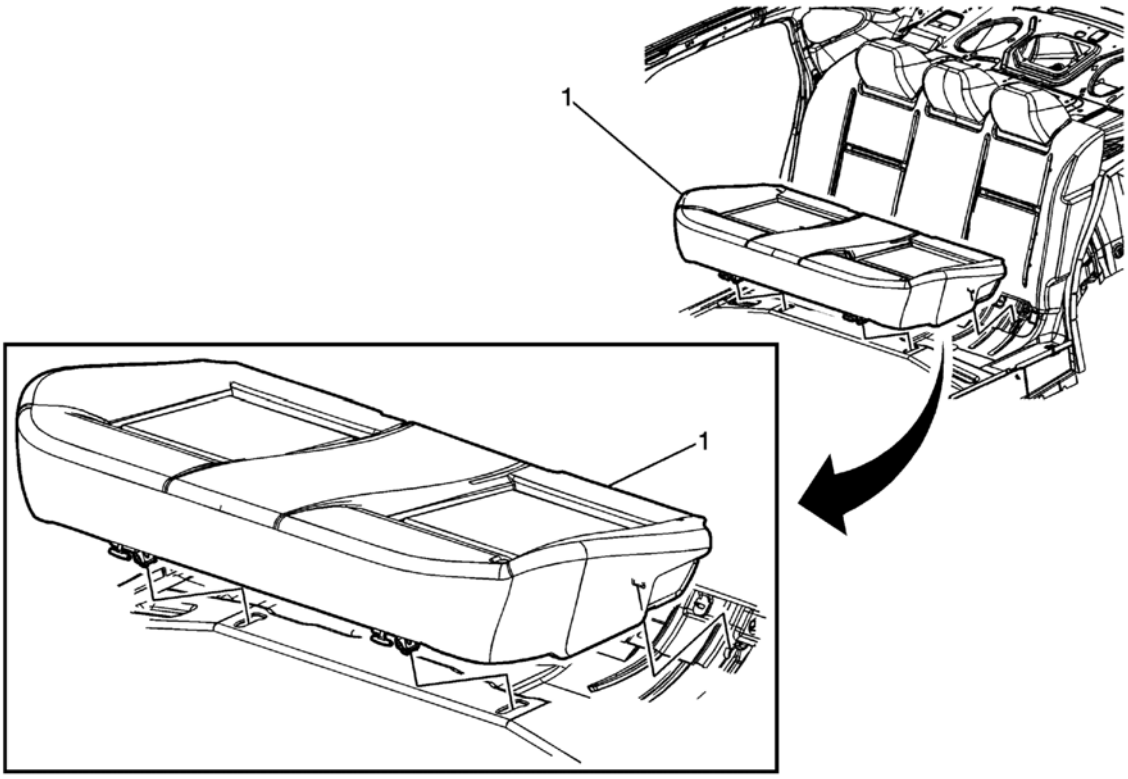

Fig. 37: Identifying Rear Seat Cushion (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Cushion Assembly **Procedure** 1. Reach under the seat cushion and locate both the left and the right "T" handles. 2. Press down on the seat and pull the handles to release the seat retainer. 3. Remove the seat cushion by lifting the cushion up and pulling the cushion outward from the seat back. **TIP:** The handles are hidden from view by the floor stowage compartment for the flip folding seat.

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (IMPALA LIMITED)

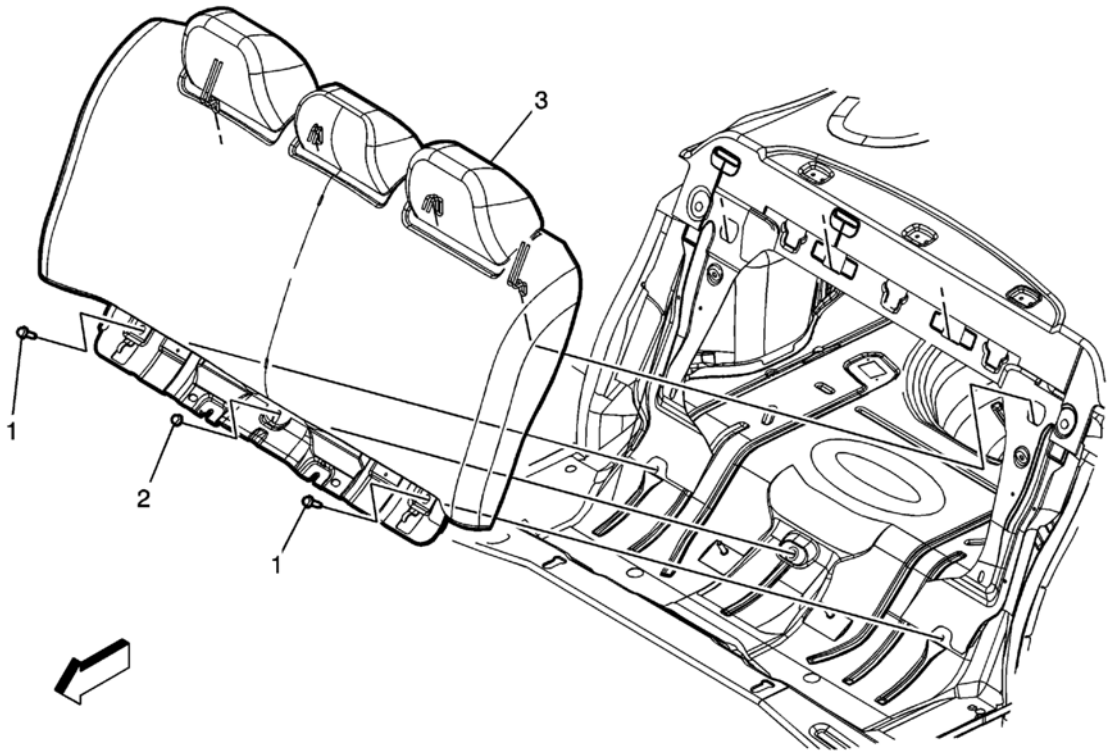

Fig. 38: Rear Seat Back (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the seat belt buckles. Refer to **Rear Seat Buckle Side Belt Replacement (Impala Limited without AM9)** **Rear Seat Buckle Side Belt Replacement (Impala Limited with AM9)** . 2. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Back Cushion Bolts (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 45 N.m (33 lb ft)
2	Rear Seat Back Cushion Nut **Tighten** 45 N.m (33 lb ft)
3	Rear Seat Back Cushion • Lift upward to clear the retaining hooks on the seat back to remove.

Callout	Component Name
	• The removal and installation for the standard and the split bench seat are the same.

REAR SEAT BACK CUSHION OPENING TRIM COVER AND OUTER COVER PAD REPLACEMENT (REAR SPLIT FOLDING)

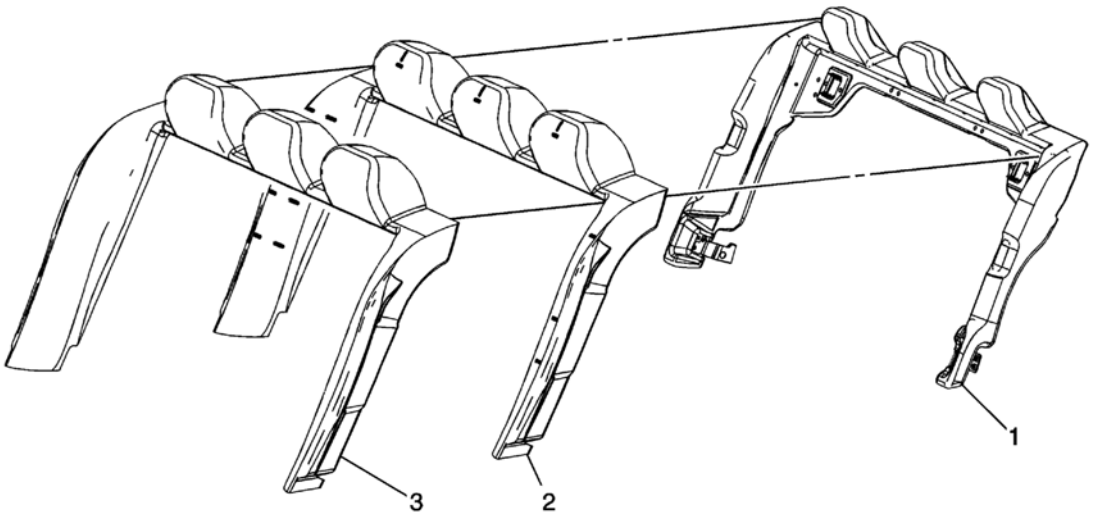

Fig. 39: Rear Seat Back Cushion Opening Trim Cover and Outer Cover Pad (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Back Cushion Opening Panel Refer to **Rear Seat Back Cushion Opening Panel Replacement**.
2	Rear Seat Back Cushion Opening Trim Cover
3	Rear Seat Back Cushion Outer Cover Pad

REAR SEAT BACK CUSHION PANEL REPLACEMENT (REAR SPLIT FOLDING)

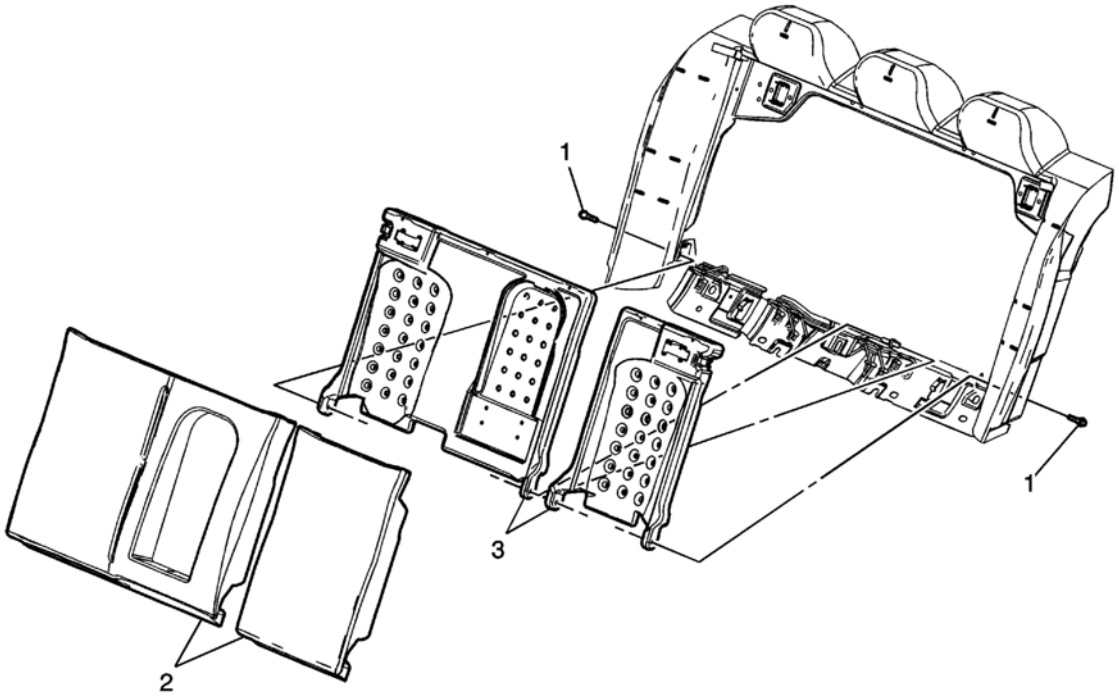

Fig. 40: Identifying Rear Seat Back Cushion Panel (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)**. 2. Remove the rear seat armrest. Refer to **Rear Seat Armrest Replacement (Impala Limited w/AM9)**.	
1	Rear Seat Back Cushion Pivot Support Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 15 N.m (11 lb ft)
2	Rear Seat Back Cushion Cover **TIP:** Remove the seat back cover by disengaging the retainers securing the cover to the seat back cushion panel.
3	Rear Seat Back Cushion Panel

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B1395: DEVICE VOLTAGE REFERENCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1395 02

Device Voltage Reference Output Circuit Short to Ground

DTC B1395 05

Device Voltage Reference Output Circuit Short to Battery or Open

Description

This diagnostic applies to internal microprocessor integrity conditions within the heated seat module (HSM).

Conditions for Running the DTC

The HSM must be powered.

Conditions for Setting the DTC

The voltage sensing calibration data is out of range.

Action Taken When the DTC Sets

The heated seat function for both front seats will be disabled.

Conditions for Clearing the DTC

- The current DTC clears when the malfunction is no longer present and the power mode changes to OFF then back to RUN or ACC.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Description

The heated seat temperature sensor that set this diagnostic trouble code (DTC) is located in the seat cushion just under the seat cover with the seat heating element. The heated seat module (HSM) supplies a 5-volt reference voltage through the temperature sensor signal circuit and a ground through the low reference circuit to the sensor. The HSM monitors the voltage of the sensor signal circuit to determine the temperature of the seat. The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the seat reaches the set temperature, the HSM will then cycle the control circuit of the heating elements ON and OFF in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Conditions for Running the DTC

The HSM must be powered.

Conditions for Setting the DTC

B1925 02, B2170 02

The temperature sensor voltage drops below 0.8 volt for more than 1 second.

B1925 05, B2170 05

The temperature sensor voltage is greater than 5 volts for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B1925 02 or B1925 05

1. Ignition OFF, disconnect the X2, X4 harness connectors at the HSM.

   IMPORTANT: When measuring the resistance, the resistance values are based on the seat being at room temperature of 20Â°C (68Â°F).

2. Test for 1.9K-300K ohms between the signal circuit terminal 9 X4 and the low reference circuit terminal 6 X2.
   - If greater than the specified range, test the signal circuit and the low reference circuit for a short to voltage or an open/high resistance. If the circuits test normal, replace the seat temperature sensor.
   - If less than the specified range, test for a short between the signal and low reference circuits. If the circuits test normal, replace the seat temperature sensor.
3. Ignition OFF, connect the X2, X4 harness connectors at the HSM.
4. Disconnect the harness connector at the seat cushion heating element/temperature sensor.
5. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal C and ground.
   - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the HSM.
   - If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the HSM.
6. If all circuits test normal, replace the HSM.

B2170 02 or B2170 05

1. Ignition OFF, disconnect the X2, X4 harness connectors at the HSM.

   IMPORTANT: When measuring the resistance, the resistance values are based on the seat being at room temperature of 20Â°C (68Â°F).

2. Test for 1.9K-300K ohms between the signal circuit terminal 20 X4 and the low reference circuit terminal 8 X2.
   - If greater than the specified range, test the signal circuit and the low reference circuit for a short to voltage or an open/high resistance. If the circuits test normal, replace the seat temperature sensor.
   - If less than the specified range, test for a short between the signal and low reference circuits. If the circuits test normal, replace the seat temperature sensor.
3. Ignition OFF, connect the X2, X4 harness connectors at the HSM.

4. Disconnect the harness connector at the seat cushion heating element/temperature sensor.
5. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal C and ground.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the HSM.
    - If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the HSM.
6. If all circuits test normal, replace the HSM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Circuit/System Description

The heated seat heating elements are controlled by a common high current relay internal to the heated seat module (HSM) and by individual low side element control circuits. The HSM connects the heater element supply voltage circuits for both seats to a common reference point. This reference point is biased to approximately 2 volts. Before the HSM will allow heated seat operation, it checks to see if the heating element supply voltage circuits and control circuits are shorted to ground or voltage. Once the HSM verifies that it is not closing into a shorted heating element, it allows heated seat operation. After which it continues to monitor for a shorted a circuit.

Conditions for Running the DTC

The HSM must be powered.

Conditions for Setting the DTC

B2345 00

After the heated seat is activated, the HSM detects a short on either the heating element supply voltage circuit or control circuit.

B2345 13

Any temperature sensor input that remains below 1.5 volts for more that 1 second.

B2345 42

This DTC will set if the module calibration is not programmed.

B2345 4B

This DTC will set if the module calibration is out of range.

Action Taken When the DTC Sets

The heated seat function for both seats will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B2345 00

1. Ignition OFF, disconnect the X1 harness connector at the HSM.
2. Test for infinite resistance between the control circuit terminal 3 and ground.
    - If less than the specified range, test the control circuit for a short to ground.
3. Test for infinite resistance between the control circuit terminal 6 and ground.
    - If less than the specified range, test the control circuit for a short to ground.
4. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 3 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
5. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 6 and ground.

- If the test lamp illuminates, test the control circuit for a short to voltage.

6. If all circuits test normal, replace the HSM.

B2345 13

1. Ignition OFF, disconnect the X2, X4 harness connector at the HSM.
2. Test for greater than 1.9K ohms between the signal and low reference circuits listed below:
   - Driver seat cushion terminal 9 X4 and terminal 6 X2
   - Passenger seat cushion terminal 20 X4 and terminal 8 X2
   - If less than the specified range, test for a short between the signal and low reference circuits. If the circuits test normal, replace the appropriate seat temperature sensor.
3. If all circuits test normal, replace the HSM.

B2345 42 or B2345 4B

If either DTC is set, replace the HSM.

Circuit/System Description

Both, the driver and passenger heated seats are controlled by the heated seat module (HSM) that is located under the driver seat cushion. When the heated seat is active, the HSM applies power through a common voltage supply circuit to the seat heater elements. The HSM controls the seat temperature by providing a pulse width modulation (PWM) ground through the seat heater element control circuit to the heater elements. The HSM then monitors the current flow through the heating elements and the rate of change of the temperature sensor to verify correct heated seat operation.

Conditions for Running the DTC

The HSM must be powered and the heated seat must be enabled.

Conditions for Setting the DTC

B2425 04 or B2430 04

The HSM does not detect a temperature change for up to 210 seconds.

B2425 0A or B2430 0A

The HSM detects that the set point temperature has not been reached for up to 8.5 minutes.

B2425 0B, B2425 0E, B2430 0B, or B2430 0E

By measuring current and voltage output to the seat heating elements every 10 seconds, the HSM calculates that the heating element resistance is below the minimum resistance.

B2425 0C, B2425 0D, B2430 0C, or B2430 0D

By measuring current and voltage output to the seat heating elements every 10 seconds, the HSM calculates that

the heating element resistance is above the maximum resistance.

B2425 1F or B2430 1F

The temperature sensor voltage is erratic or changes suddenly.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC clears when the malfunction is no longer present, and the power mode changes to OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B2425 0A, B2425 0B, B2425 0C, B2425 0D, B2425 0E, B2425 04, or B2425 1F

1. Ignition OFF, disconnect the harness connector at the seat back heating element.

   IMPORTANT: When measuring the resistance, all of the resistance values below are based on the seat being at room temperature of 20Â°C (68Â°F).

2. Test for 1.64 - 5.54 Ω between terminal A and terminal B.

- If not within the specified range, replace the seat back heating element.

3. Connect the harness connector at the seat back heating element.
4. Disconnect the X1 harness connector at the HSM.
5. Test for 1.64 - 5.54 Ω between control circuit terminal 3 and control circuit terminal 5.
    - If less than the specified range, test for a short between the control circuits. If the circuits test normal, replace the seat cushion heating element.
    - If greater than the specified range, test the control circuits for an open/high resistance. If the circuits test normal, replace the seat cushion heating element.
6. Disconnect the X2, X4 harness connectors at the HSM.
7. Test for 1.9 k - 300 kΩ between the signal circuit terminal 9 X4 and the low reference circuit terminal 6 X2.
    - If less than the specified range, test for a short between the signal and low reference circuits. If the circuits test normal, replace the seat temperature sensor.
    - If greater than the specified range, test the signal circuit and the low reference circuit for a short to voltage or an open/high resistance. If the circuits test normal, replace the seat temperature sensor.
8. Ignition OFF, connect the X1, X2, X4 harness connectors at the HSM.
9. Disconnect the harness connector at the seat cushion heating element/temperature sensor.
10. Ignition ON, test for 4.8 - 5.2 V between the signal circuit terminal C and ground.
    - If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the HSM.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the HSM.
11. If all circuits test normal, replace the HSM.

B2430 0A, B2430 0B, B2430 0C, B2430 0D, B2430 0E, B2430 04, or B2430 1F

1. Ignition OFF, disconnect the harness connector at the seat back heating element.

    IMPORTANT: When measuring the resistance, all of the resistance values below are based on the seat being at room temperature of 20Â°C (68Â°F).

2. Test for 1.64 - 5.76 Ω between terminal A and terminal B.
    - If not within the specified range, replace the seat back heating element.
3. Connect the harness connector at the seat back heating element .
4. Disconnect the X1 harness connector at the HSM.
5. Test for 1.64 - 5.76 Ω between control circuit terminal 6 and control circuit terminal 2.
    - If less than the specified range, test for a short between the control circuits. If the circuits test normal, replace the seat cushion heating element.
    - If greater than the specified range, test the control circuits for an open/high resistance. If the circuits test normal, replace the seat cushion heating element.
6. Disconnect the X2, X4 harness connectors at the HSM.
7. Test for 1.9 k - 300 kΩ between the signal circuit terminal 20 X4 and the low reference circuit terminal 8

X2.

- If less than the specified range, test for a short between the signal and low reference circuits. If the circuits test normal, replace the seat temperature sensor.
- If greater than the specified range, test the signal circuit and the low reference circuit for a short to voltage or an open/high resistance. If the circuits test normal, replace the seat temperature sensor.

8. Ignition OFF, connect the X1, X2, X4 harness connectors at the HSM.
9. Disconnect the harness connector at the seat cushion heating element/temperature sensor.
10. Ignition ON, test for 4.8 - 5.2 V between the signal circuit terminal C and ground.
    - If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the HSM.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the HSM.
11. If all circuits test normal, replace the HSM.

Circuit/System Description

The driver and passenger seat heating elements are controlled by a common high current relay internal to the heated seat module (HSM) and by individual low side element control circuits. The HSM connects the heated seat heater element supply voltage circuits for both seats to a common reference point. This reference point is biased to approximately 2.0 volts. Before the HSM will allow heated seat operation, it checks to see if this reference voltage is shorted to ground or voltage. Once the HSM verifies that it is not closing to a shorted heating element, it allows for heated seat operation. The HSM will then continue to monitor the heating elements for a shorted circuit.

Conditions for Running the DTC

The HSM must be powered.

Conditions for Setting the DTC

B2508 01

The HSM detects a short to voltage on the heater element supply voltage circuit or control circuit.

B2508 02

The HSM detects a short to ground for on the heater element supply voltage circuit or control circuit.

Action Taken When the DTC Sets

The heated seat function for both seats will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set a history code 3 seconds after the reference voltage returns to normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the HSM.
2. Test for infinite resistance between the control circuit terminal 3 and ground.
    - If not the specified value, test the control circuit for a short to ground.
3. Test for infinite resistance between the control circuit terminal 6 and ground.
    - If not the specified value, test the control circuit for a short to ground.
4. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 3 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
5. Verify that a test lamp does not illuminate between the control circuit terminal 6 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
6. If all circuits test normal, replace the HSM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Driver or Passenger Seat Back Heater Replacement (Impala Limited)**
- **Front Seat Cushion Heater Replacement (Driver Only)**

- **Control Module References** for HSM replacement, setup, and programming

SYMPTOMS - SEAT HEATING AND COOLING

IMPORTANT: The following steps must be completed before using the symptom tables.

1. When diagnosing a heated seat system condition perform the **Diagnostic System Check - Vehicle** , before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control module(s) can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Heated Seats Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power seats. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the seat adjuster track for conditions which may cause binding or objects within the seat adjustment range which obstruct movement or interfere with wiring.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to the **Heated Seat Inoperative** diagnostic procedure in order to diagnose the symptom.

HEATED SEAT INOPERATIVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The driver and passenger heated seats are controlled by separate heated seat switches. Both switches are located in the HVAC control module face plate. When a heated seat switch is pressed, the HVAC control module sends a serial data message to the heated seat control module (HSM) indicating the heated seat request. In response to this signal, the HSM activates the heated seat by applying battery voltage to the seat heating elements. The HSM then sends a serial data message back to the HVAC control module commanding it to illuminate the appropriate seat temperature indicator.

Circuit/System Verification

1. Ignition ON.
2. Verify that no DTCs are set.
    - **If any DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no DTCs are set**
3. Verify that both the driver and front passenger heated seats operate.
    - **If just one or both of the heated seats is inoperative**

      Refer to Circuit/System Testing.

    - **If both heated seats operate**
4. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Replace the heated seat control module, ignition ON.
3. Verify the heated seat operates.
    - **If the heated seat does not operate**

      Replace the HVAC control module.

    - **If the heated seat operates**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

and calibrated as a unit. Using only some of the components in the service kit will cause the passenger presence system to operate improperly. **Preliminary Procedure** Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)** .	
1	Recliner Handle **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.
2	Power Seat Switch Knob **TIP:** Pull outward to remove.
3	Seat Cushion Outer Trim Panel Refer to **Seat Cushion Outer Trim Panel Replacement** .
4	Seat Cushion Cover Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)** .
5	Seat Cushion Heater Assembly **Procedure** 1. Disconnect the electrical connector. 2. The seat cushion heater is attached to the pad with adhesive, peel away from the pad to remove.

DESCRIPTION AND OPERATION

HEATED SEATS DESCRIPTION AND OPERATION

The front heated seat system consists of the following components.

- Left heated seat switch
- Right heated seat switch
- Heated seat module
- Left seat cushion heater element

- Left seat back heater element
- Left seat temperature sensor
- Right seat cushion heater element
- Right seat back heater element
- Right seat temperature sensor
- Climate Control Panel (CCP)
- HTD/SEAT 10 A

Power and Ground

Battery positive voltage is supplied at all times to the heated seat module from the HTD/SEAT fuse located in the I/P fuse block. This voltage is used by the module to supply power to the seat heating elements. The module is grounded through the module ground circuit and G301.

Heated Seat Operation

The driver and passenger heated seats are controlled by a single heated seat module that is located under the driver seat cushion. Both heated seats are controlled by separate heated seat switches that are located in the climate control panel (CCP). When a heated seat switch is pressed, the CCP sends a GMLAN message via the serial data line to the heated seat module indicating the heated seat command. In response to this signal, the heated seat module then applies battery positive voltage through the element supply voltage circuit to the appropriate seat heating elements. The heated seat module then sends a GMLAN message back to the CCP to either illuminate or turn off the appropriate temperature indicator.

Temperature Regulation

When the ignition is turned to the ON position, the heated seats will initialize in the OFF state. With each activation of the heated seat switch, the heated seat module will cycle the temperature setting in the following manner: HIGH, LOW, and OFF.

The heated seat module monitors the seat temperature through the temperature sensor signal circuit and the temperature sensor (thermistor) that is located in the seat cushion. The temperature sensor is a variable resistor, it's resistance changes as the temperature of the seat changes. When the temperature sensor resistance indicates to the heated seat module that the seat has reached the desired temperature, the module opens the ground path of the seat heating elements through the heated seat element control circuit. The module will then cycle the element control circuit open and closed in order to maintain the desired temperature.

Load Management

The load-shed operation is a means of reducing vehicle electrical loads during a low voltage or low battery state of charge (SOC) condition. During certain load-shed conditions, all heated seat functions will be disabled. Refer to **Electrical Power Management Description and Operation** .

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B1529: DEVICE VOLTAGE REFERENCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1529 03

Device Voltage Reference Output Circuit Voltage Below Threshold

DTC B1529 07

Device Voltage Reference Output Circuit Voltage Above Threshold

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ Voltage Reference	B1529 03	1	-	B1529 07
Signal	1	1	B3622 07	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The body control module (BCM) supplies voltage to the audio steering wheel control switches and monitors the return signal. Each switch state is associated to a set resistance value and when pressed a specific voltage drop occurs across the resistor unique to the switch. The BCM identifies the switch selection and activates the feature.

Conditions for Running the DTC

- Battery voltage is between 9-16 V
- The ignition is ON.

Conditions for Setting the DTC

B1529 03

- The BCM detects a short to ground in the B+ voltage reference circuit.
- The above condition is present for greater than 30 seconds.

B1529 07

- The BCM detects a short to voltage in the B+ voltage reference circuit.
- The above condition is present for greater than 30 seconds.

Action Taken When the DTC Sets

The BCM will ignore switch inputs.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free ignition cycles have occurred.

SYMPTOMS - SECONDARY AND CONFIGURABLE CUSTOMER CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Steering Wheel Controls Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel controls. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which

could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Refer to **Steering Wheel Controls Malfunction** in order to diagnose the symptom.

STEERING WHEEL CONTROLS MALFUNCTION

The steering wheel control switches duplicate the function of the primary controls of the associated component, through a network of momentary contact switches and a series of resistors. The body control module (BCM) supplies voltage to the switches and monitors the return signal. When a switch is pressed, a specific voltage drops across the resistor unique to that switch. The BCM identifies the switch selected and sends a serial data message to the component controlled by the switch, activating the feature.

This section is intended to diagnose the circuits between the BCM and the steering wheel control switches. If the primary control for the device is inoperative, refer to the appropriate section for the component the steering

wheel control switch is used for.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - STEERING WHEEL AND COLUMN

Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Steering Wheel and Column Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel and column.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Noise in Steering Column**
- **Looseness in Steering Column**
- **Steering Column Tilt Function Inoperative**
- **Ignition Can/Cannot Be Turned Off with Transmission in Any Gear**

STEERING COLUMN TILT FUNCTION INOPERATIVE

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that the steering column tilt function is inoperative. Does the steering column tilt function operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	If equipped, verify that the following components are not seized or corroded: • Tilt pivot pins • Tilt head lock shoes Are the components seized or corroded?	Go to **Step 7**	Go to **Step 4**
4	Inspect the tilt pivot pins for binding. Are the tilt pivot pins binding?	Go to **Step 8**	Go to **Step 5**
5	Inspect for a weak or broken steering column tilt spring. Is the steering column tilt spring weak or broken?	Go to **Step 9**	Go to **Step 6**
6	Inspect the steering column wiring harness routing for tightness. Was the steering column wiring harness routed correctly?	Go to **Step 11**	Go to **Step 10**
7	Replace the steering column. Refer to **Steering Column Replacement**. Did you complete the repair?	Go to **Step 11**	-
8	If serviceable, replace the pivot pins. If not serviceable replace the steering column. Refer to **Steering Column Replacement**. Did you complete the repair?	Go to **Step 11**	-
9	If serviceable, replace the tilt spring. Did you complete the repair?	Go to **Step 11**	-
10	Route the steering column wiring harness to the correct location. Did you correctly route the wiring harness?	Go to **Step 11**	-
11	Operate the steering column tilt function in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

NOISE IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	Go to **Step 3**	System OK

Step	Action	Yes	No
3	Inspect the steering column mounting features for the following conditions: • The steering column mounting fasteners are loose. • The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to **Step 10**	Go to **Step 4**
4	Inspect the SIR/SRS coil for noise. Is the SIR/SRS coil noisy?	Go to **Step 11**	Go to **Step 5**
5	If equipped, inspect the lock plate retaining ring for correct installation. Is the lock plate retaining ring installed incorrectly?	Go to **Step 12**	Go to **Step 6**
6	Inspect the steering column upper and lower bearings for the following conditions: • Damage • Lubrication • Wear • Proper seating Are the bearings in need of repair or replacement?	Go to **Step 13**	Go to **Step 7**
7	Does the steering column tilt joint need to be lubricated?	Go to **Step 14**	Go to **Step 8**
8	**NOTE:** **Inspect the intermediate steering shaft for noise while driving the vehicle, turning the steering wheel, and applying the brakes.** Inspect the intermediate steering shaft for noise.Is the intermediate steering shaft noisy?	Go to **Step 15**	Go to **Step 9**

Step	Action	Yes	No
9	**NOTE:** **For vehicles equipped with a telescoping steering column, perform this step. If not equipped, go to next step.** Inspect the steering column for noise while telescoping the column.Is the steering column noisy while telescoping?	Go to **Step 16**	Go to **Step 17**
10	**NOTE:** **If the steering column mounting features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement.** Tighten the steering column mounting fasteners to specification. Refer to **Fastener Specifications**.Did you complete the repair?	Go to **Step 17**	-
11	Replace the SIR/SRS coil. Refer to **Steering Wheel Airbag Coil Replacement** . Did you complete the repair?	Go to **Step 17**	-
12	Install the lock plate retaining ring correctly. Did you complete the repair?	Go to **Step 17**	-
13	**NOTE:** **If the steering column upper and/or lower bearings are**	Go to **Step 17**	-

Step	Action	Yes	No
	not serviceable, replace the steering column. Refer to Steering Column Replacement. Replace the steering column upper and/or lower bearings, if serviceable.Did you complete the replacement?		
14	Lubricate the steering column tilt joint. Did you complete the repair?	Go to **Step 17**	-
15	Replace the appropriate intermediate steering shaft component. Did you complete the repair?	Go to **Step 17**	-
16	Redistribute or add lubricant to the steering column lower jacket with the column telescoped to its end of outward travel. Did you complete the repair?	Go to **Step 17**	-
17	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

LOOSENESS IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that the steering column is loose. Is the steering column loose?	Go to **Step 3**	System OK
3	Inspect the steering column mounting features for the following conditions. • The steering column mounting fasteners are loose. • The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to **Step 5**	Go to **Step 4**
4	Inspect the upper and/or lower bearings for looseness. Are any of the bearings worn or loose?	Go to **Step 6**	Go to **Step 7**

Step	Action	Yes	No
5	**NOTE:** **If the steering column mounting features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement.** Tighten the steering column mounting fasteners to specification. Refer to **Fastener Specifications**.Did you complete the repair?	Go to **Step 7**	-
6	**NOTE:** **If the steering column upper and/or lower bearings are not serviceable, replace the steering column. Refer to Steering Column Replacement.** Replace the upper and/or lower bearings, if serviceable.Did you complete the repair?	Go to **Step 7**	-
7	Operate the steering column in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

REPAIR INSTRUCTIONS

INTERMEDIATE STEERING SHAFT SEAL REPLACEMENT

Special Tools

J-42640 Steering Column Anti-rotation Pin

Removal Procedure

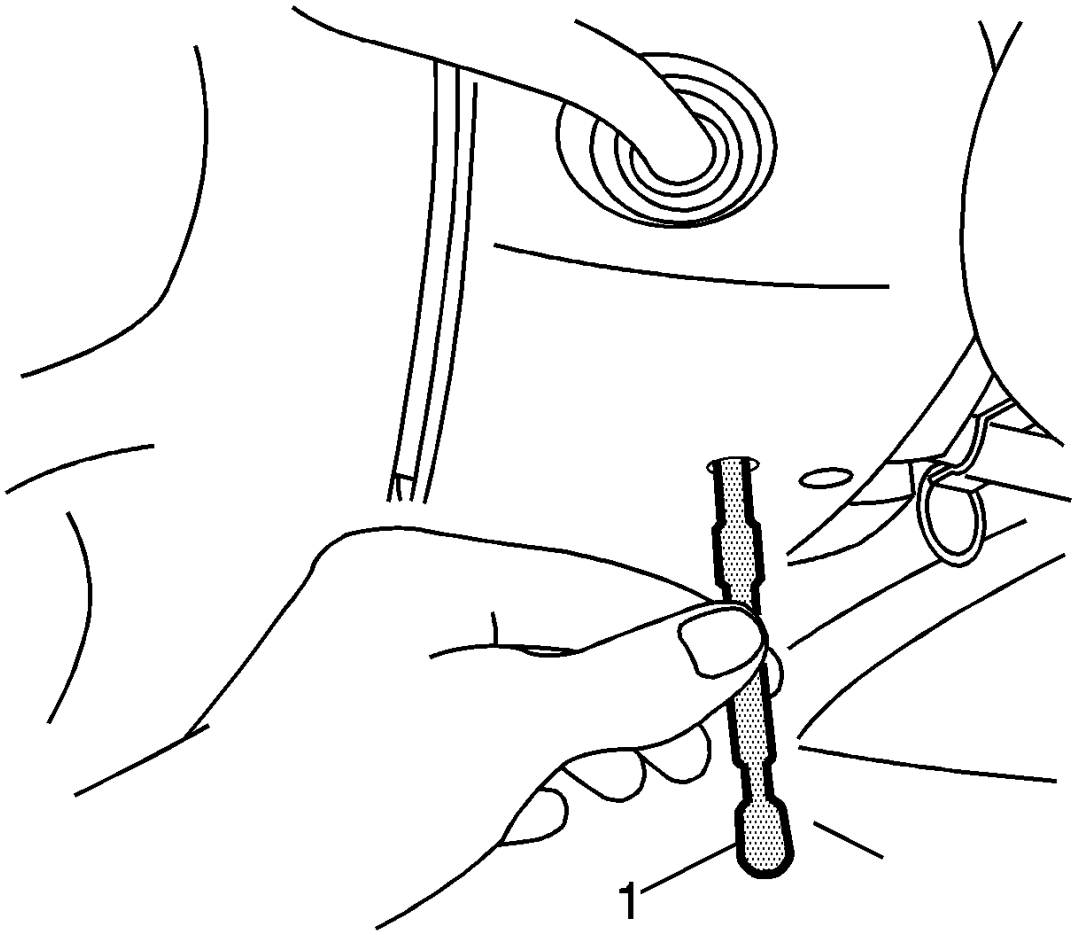

Fig. 3: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible

damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column.
2. Separate the intermediate steering shaft seal from the steering column.
3. Disconnect the intermediate steering shaft from the steering column. Refer to **Intermediate Steering Shaft Replacement**.
4. Push the intermediate steering shaft down in order to collapse the intermediate steering shaft.

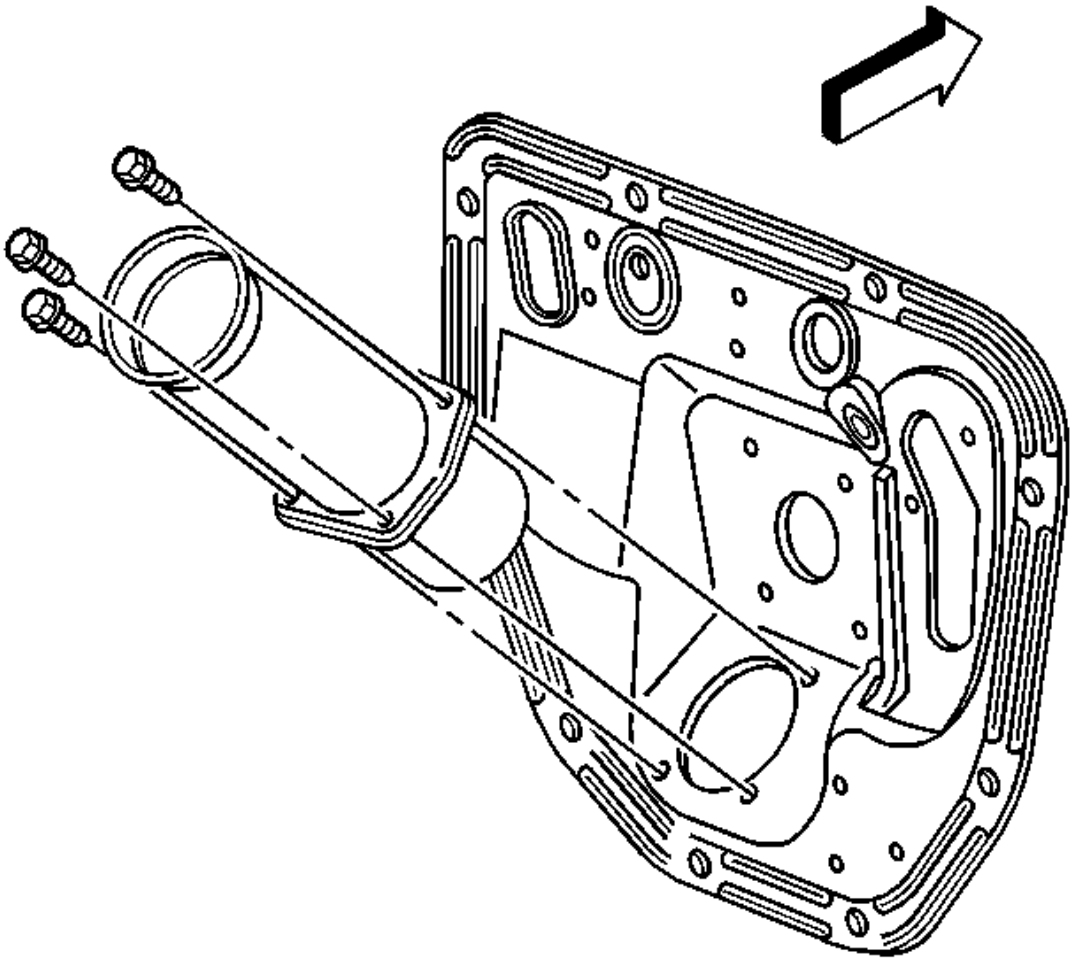

Fig. 4: Locating Intermediate Shaft Seal Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intermediate steering shaft seal bolts.
6. Separate the intermediate steering shaft seal from the steering gear.
7. Remove the intermediate steering shaft seal from the vehicle.

Installation Procedure

1. Position the intermediate steering shaft seal in the vehicle.
2. Position the intermediate steering shaft lower seal on the intermediate shaft and on the steering gear.
3. Position the intermediate steering shaft upper seal over the lower seal and on the dash panel.
4. Connect the intermediate steering shaft to the steering column. Refer to **Intermediate Steering Shaft Replacement**.
5. Install the intermediate steering shaft seal to the steering column.

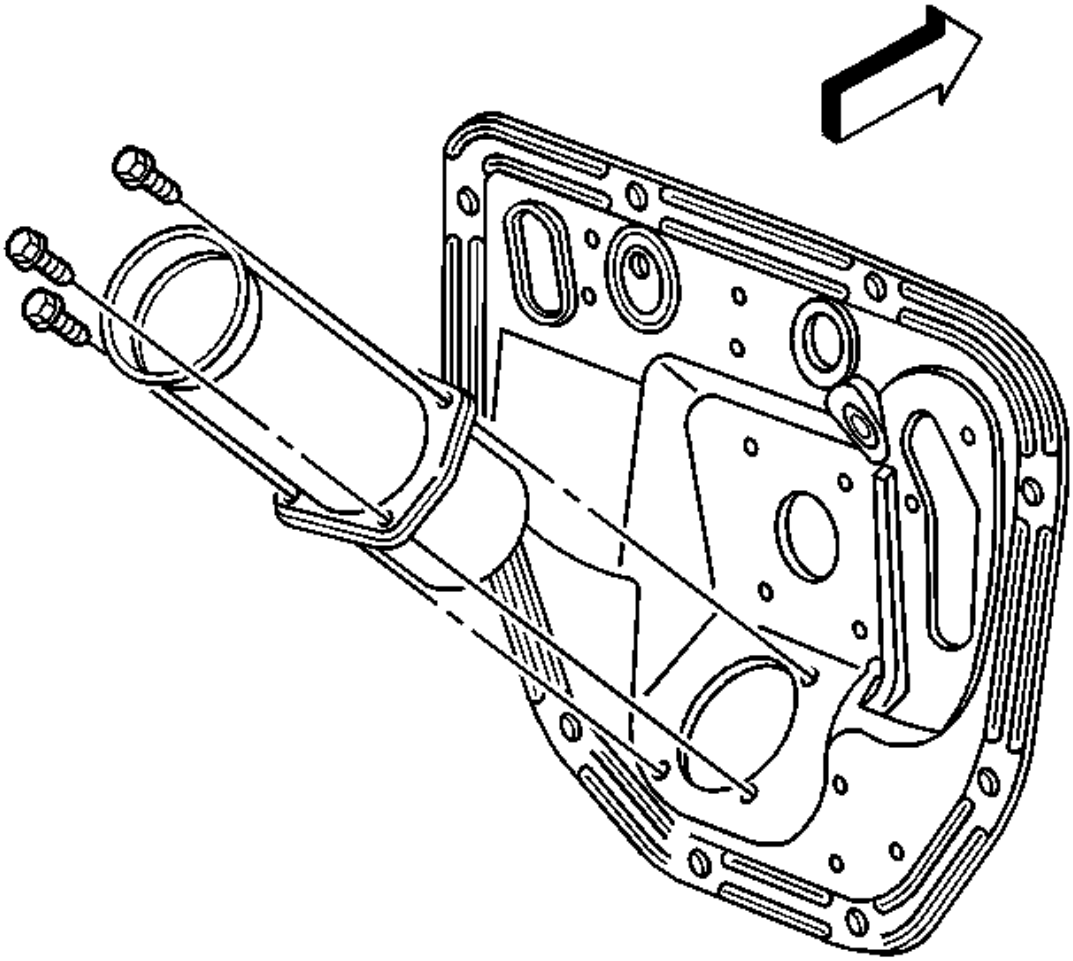

Fig. 5: Locating Intermediate Shaft Seal Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Install the intermediate steering shaft seal bolts and tighten to 3 N.m (27 lb in).
7. Remove the **J-42640** pin.

INTERMEDIATE STEERING SHAFT REPLACEMENT

Special Tools

J 42640 Steering Column Anti-rotation Pin

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

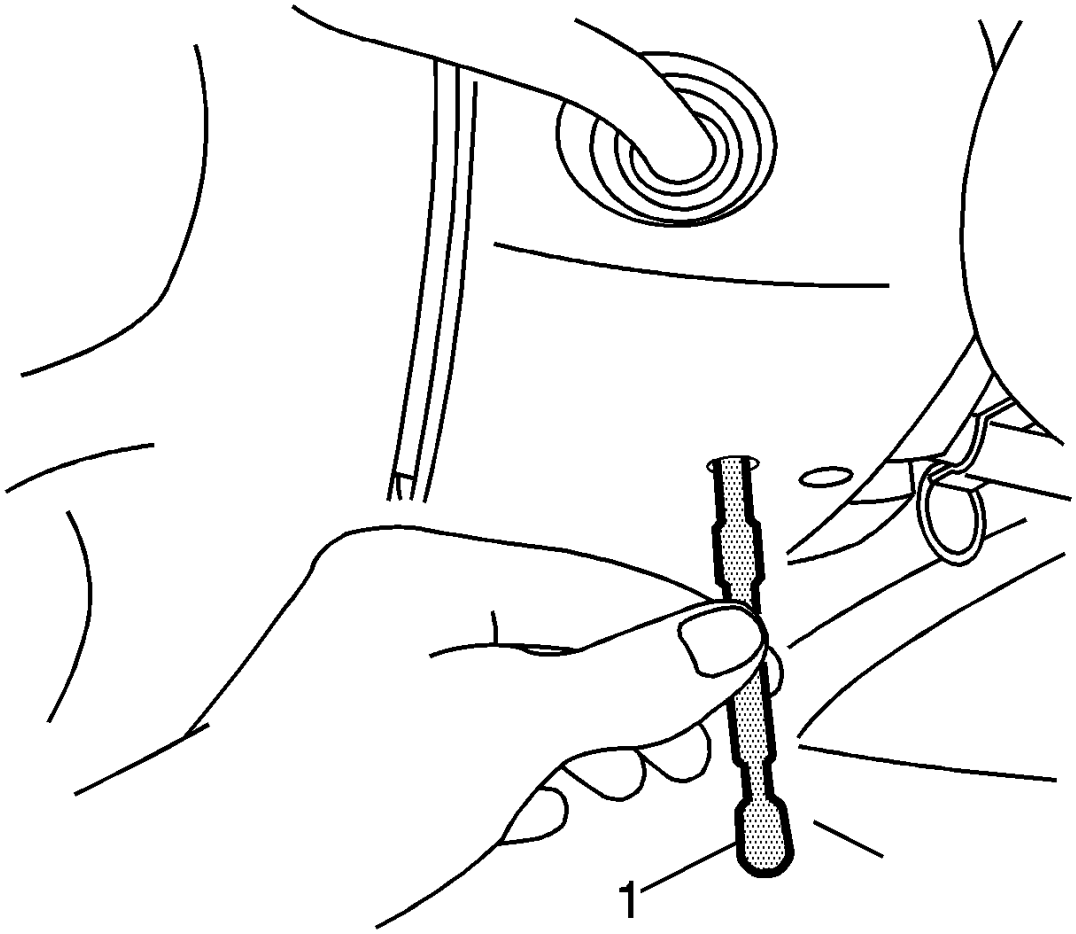

Fig. 6: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may

cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has became un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column.
2. Remove the front left tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

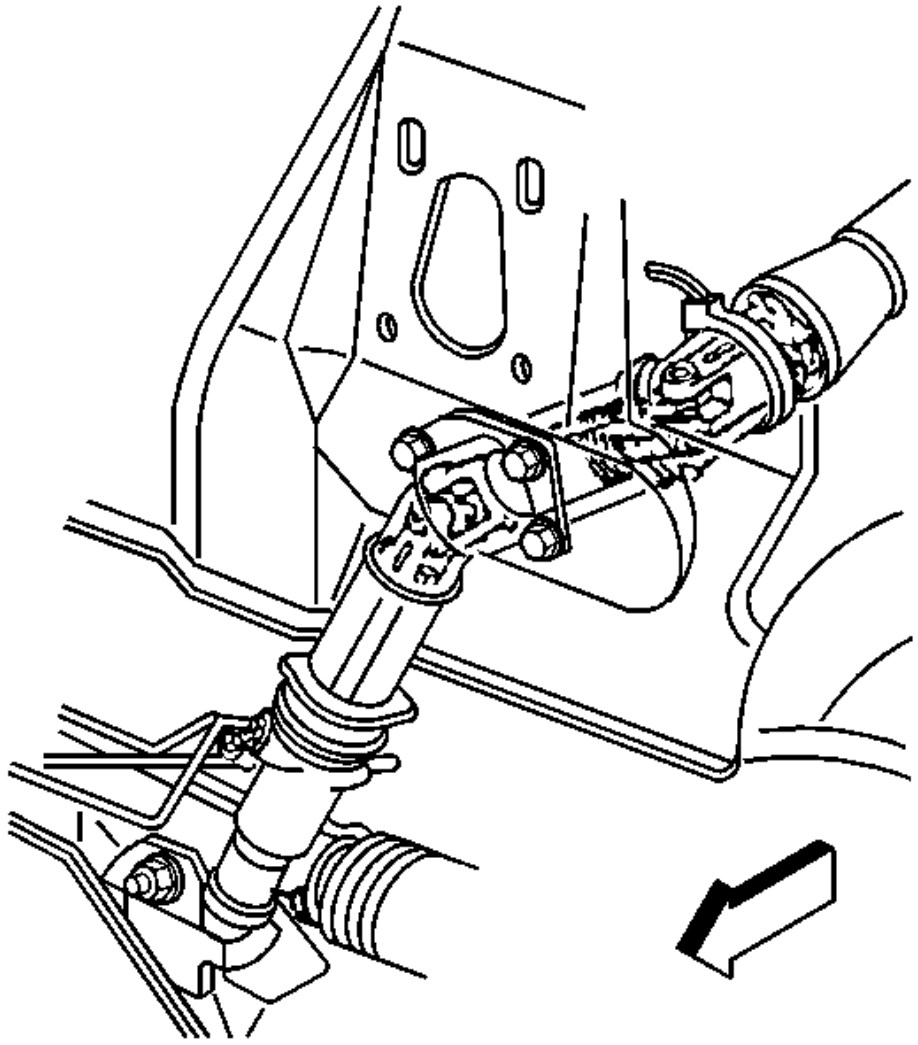

Fig. 7: Providing Access To Intermediate Steering Shaft Lower Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Move the intermediate steering shaft seal at the steering gear in order to provide access to the intermediate steering shaft lower bolt.
4. Use paint in order to place match marks on the intermediate shaft and on the steering gear.

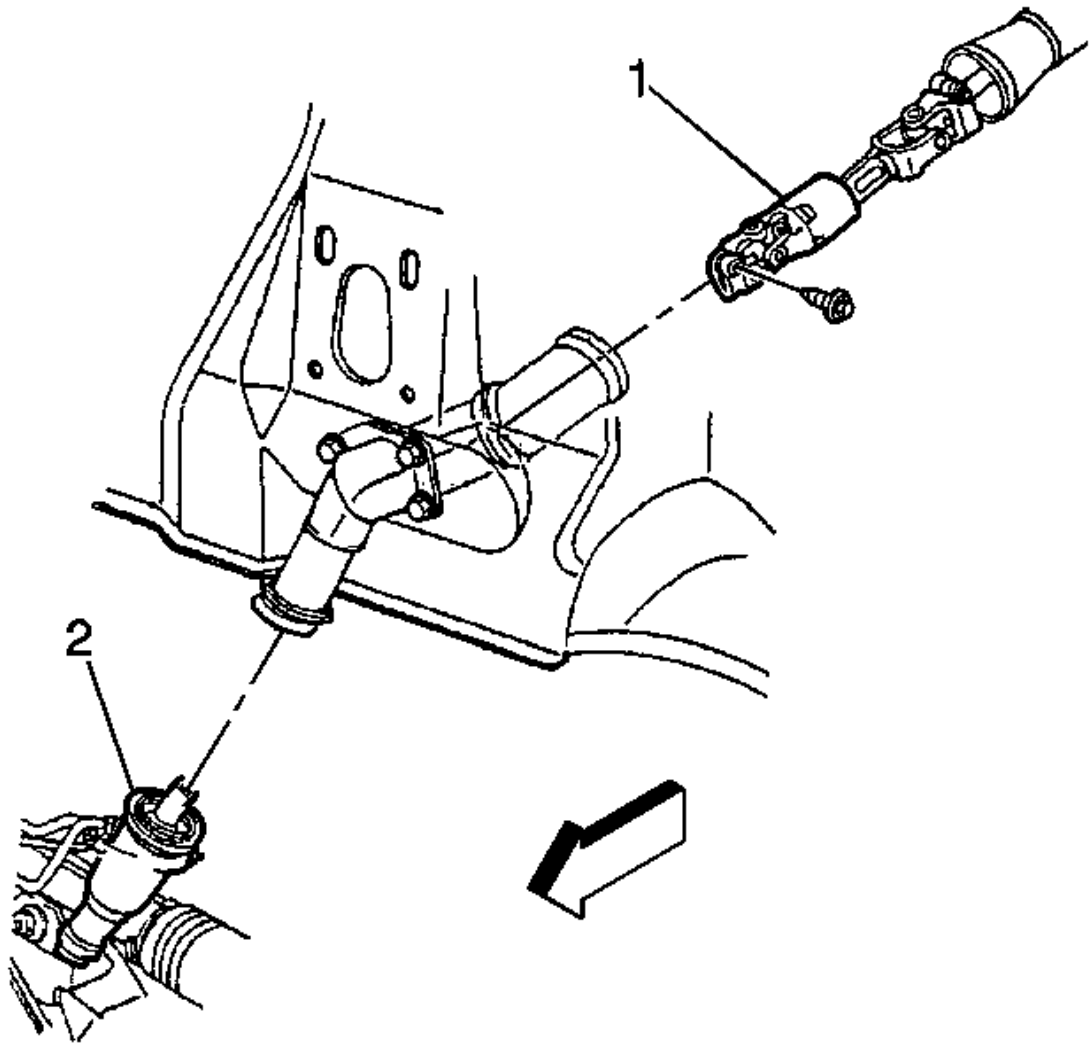

Fig. 8: View Of Intermediate Steering Shaft To Power Steering Gear Stub Shaft
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intermediate steering shaft lower pinch bolt from the steering gear (2).
6. Separate the intermediate steering shaft (1) from the steering gear (2).
7. Remove the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .

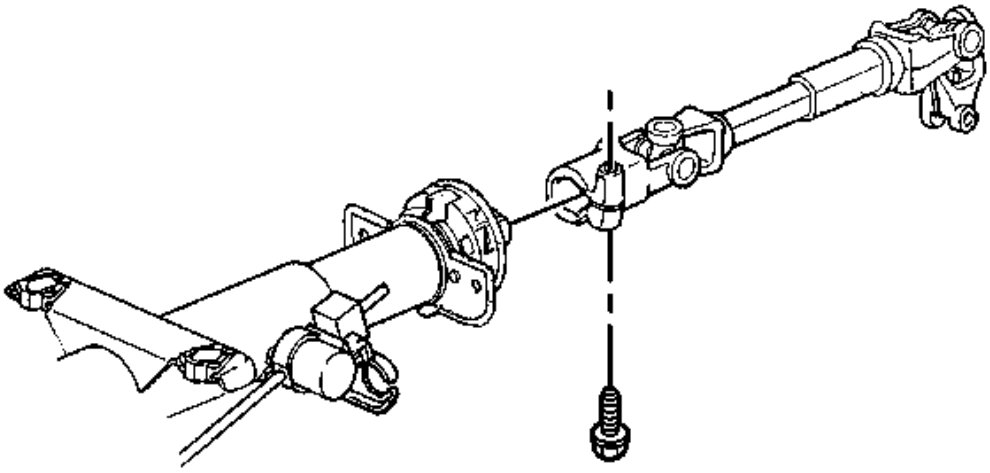

Fig. 9: View Of Upper Pinch Bolt Of Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

8. Reposition the intermediate steering shaft seal in order to gain access to the intermediate steering shaft bolt at the steering column.
9. Use paint in order to place match marks on the intermediate shaft and on the steering column.
10. Remove the intermediate steering shaft bolt and nut at the steering column.
11. Disconnect the intermediate steering shaft from the steering column.
12. Remove the intermediate steering shaft from the vehicle.

Installation Procedure

1. If you are installing a NEW intermediate shaft, copy the match marks from the old intermediate shaft to the new intermediate shaft.

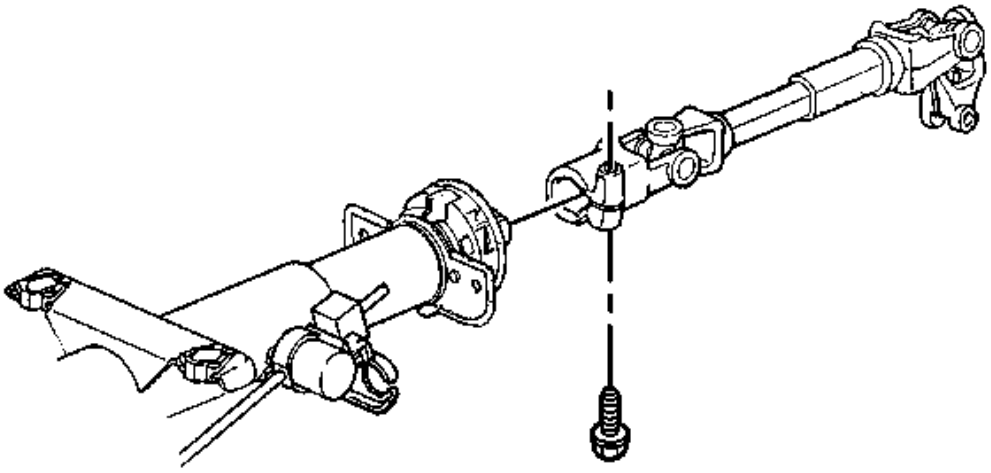

Fig. 10: View Of Upper Pinch Bolt Of Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Position the intermediate steering shaft in the vehicle.
3. Align the match marks and connect the intermediate shaft to the steering column.

CAUTION: Refer to Fastener Caution .

4. Install the intermediate steering shaft bolt at the steering column and tighten to 62 N.m (46 lb ft).
5. Position the intermediate steering shaft seal onto the steering column.
6. Install the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .

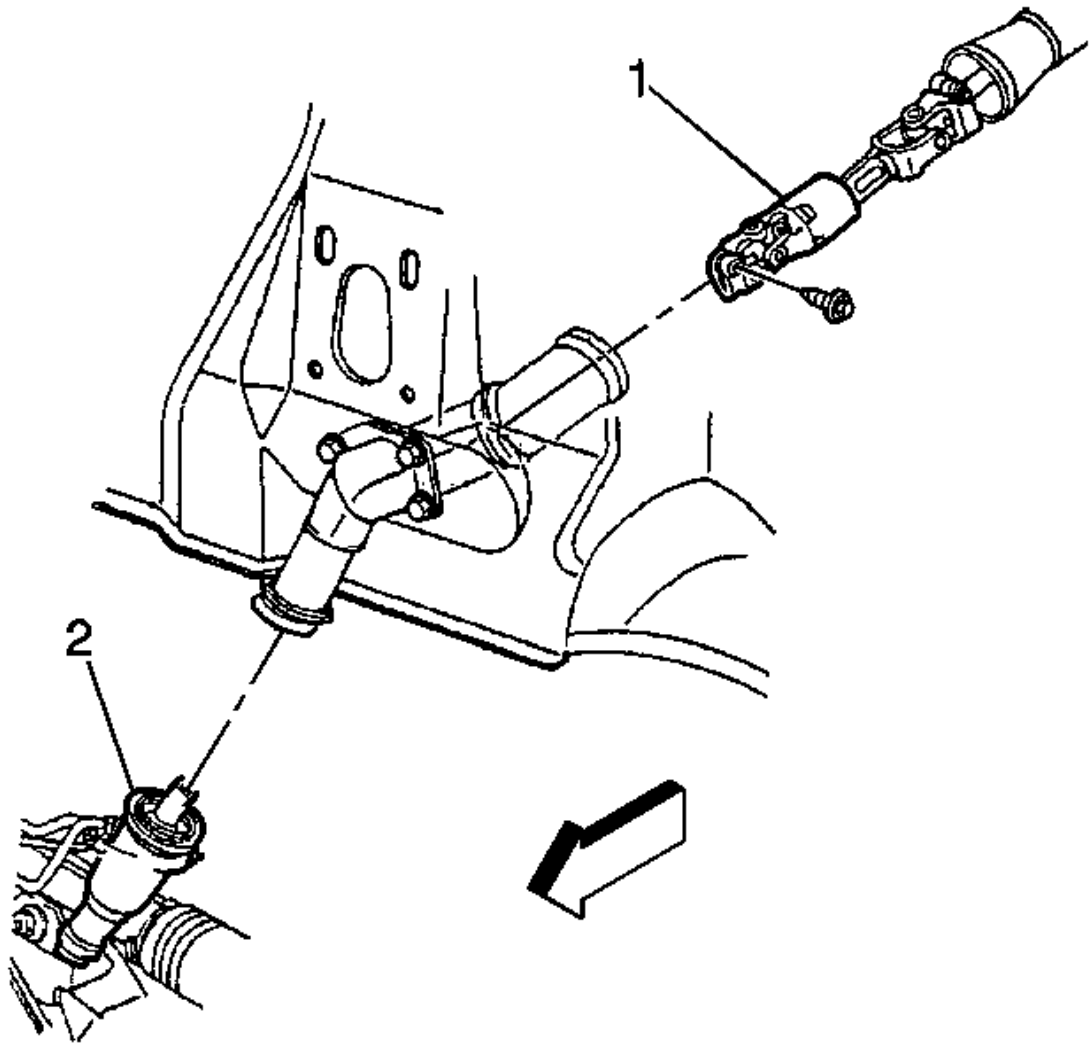

Fig. 11: View Of Intermediate Steering Shaft To Power Steering Gear Stub Shaft
Courtesy of GENERAL MOTORS COMPANY

7. Align the match marks and connect the intermediate steering shaft (1) to the power steering gear stub shaft (2).
8. Install the intermediate steering shaft lower bolt at the steering gear and tighten to 48 N.m (35 lb ft).

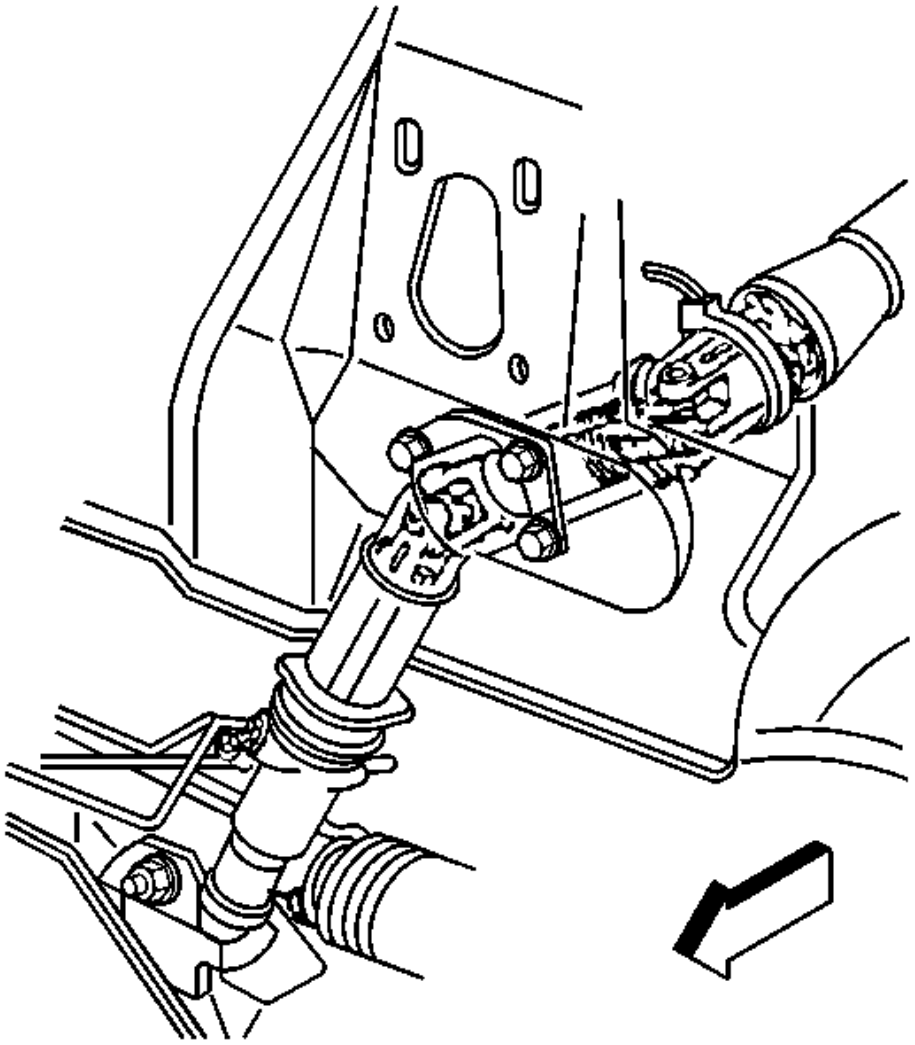

Fig. 12: Providing Access To Intermediate Steering Shaft Lower Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Position the intermediate steering shaft seal onto the steering gear.
10. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
11. Remove the **J 42640** pin.

STEERING COLUMN ACCIDENT DAMAGE INSPECTION

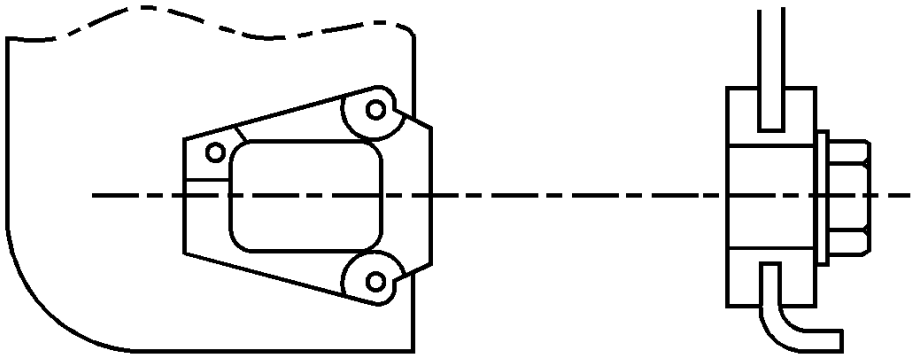

Fig. 13: Inspecting Capsules On Steering Column Bracket Assembly
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Vehicles involved in accidents that result in any of the following kinds of damage or situations, may also have a damaged or misaligned steering column:

- **Frame damage**
- **Major body damage**
- **Sheet metal damage**
- **If the steering column has been impacted**
- **If the supplemental inflatable restraints system was deployed**

- Inspect the capsules on the steering column bracket assembly. All capsules must be securely seated in the bracket slots and inspected for any loose conditions when pushed or pulled by hand.
- Observe how the bracket is attached to the jacket assembly.
  - If the capsules are not securely seated and the bracket is bolted to the jacket assembly, replace only the bracket.

- If the capsules are not securely seated and the bracket is welded to the jacket assembly, replace only the jacket assembly.

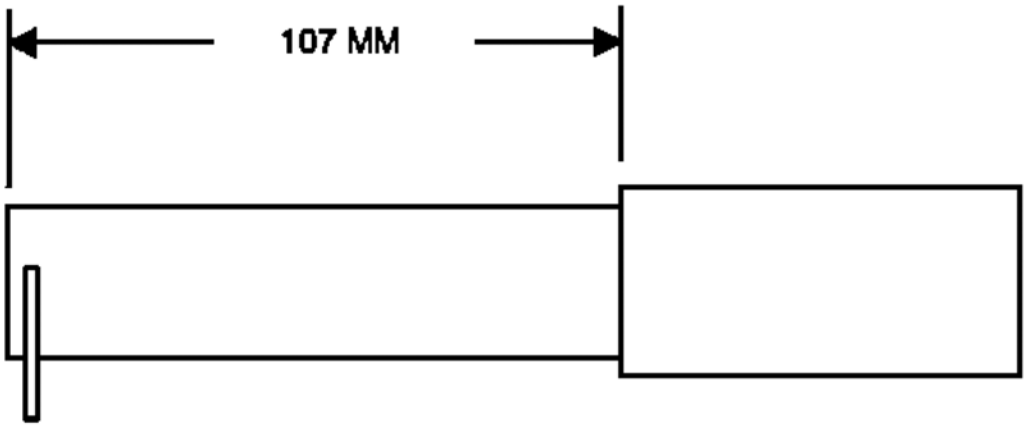

Fig. 14: Measuring Distance From Lower Edge Of Upper Jacket To A Defined Point On Lower Jacket
Courtesy of GENERAL MOTORS COMPANY

- Inspect for jacket assembly collapse by measuring the distance from the lower edge of the upper jacket to a defined point on the lower jacket. Replace the jacket assembly if the measured dimensions are not within specifications.

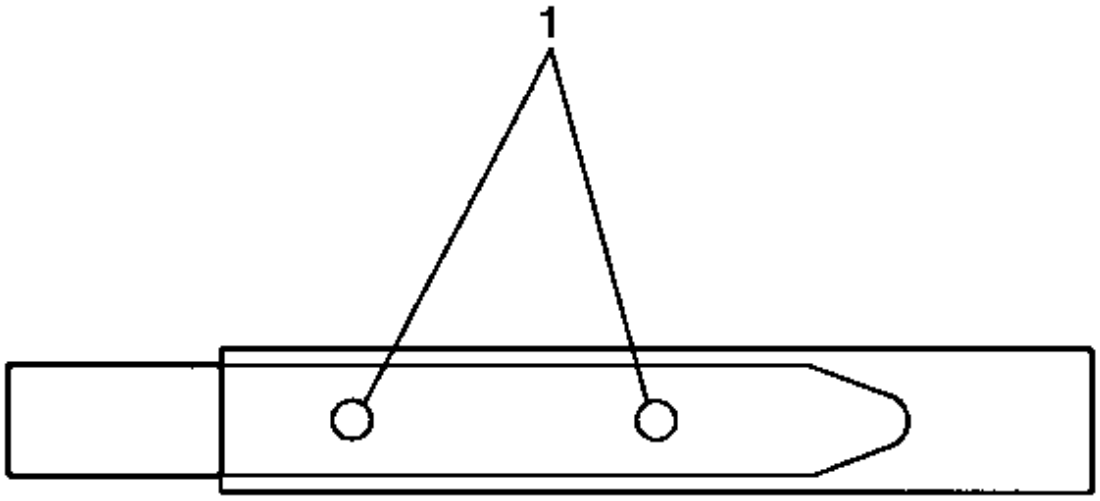

Fig. 15: Inspecting Steering Shaft For Sheared Injected Plastic
Courtesy of GENERAL MOTORS COMPANY

- Visually inspect the steering shaft for sheared injected plastic (1). If the steering shaft shows sheared plastic (1), replace the steering shaft.
- Any frame damage that could cause a bent steering shaft must have the steering shaft runout checked. Using a dial indicator at the lower end of the steering shaft, rotate the steering wheel. The runout must not exceed 1.60 mm (0.06 in).

STEERING COLUMN TRIM COVER REPLACEMENT

Removal Procedure

1. Remove the steering wheel. Refer to **Steering Wheel Replacement**.
2. Remove the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .

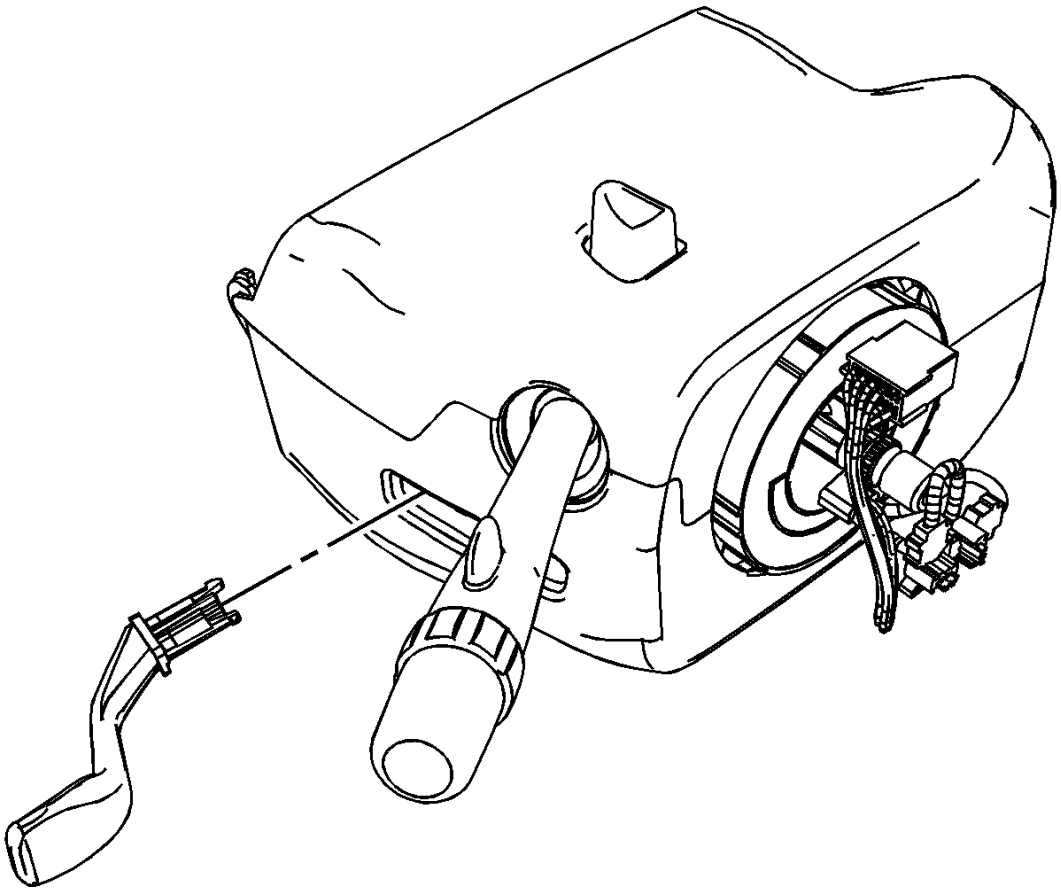

Fig. 16: View Of Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

3. Remove the tilt lever.

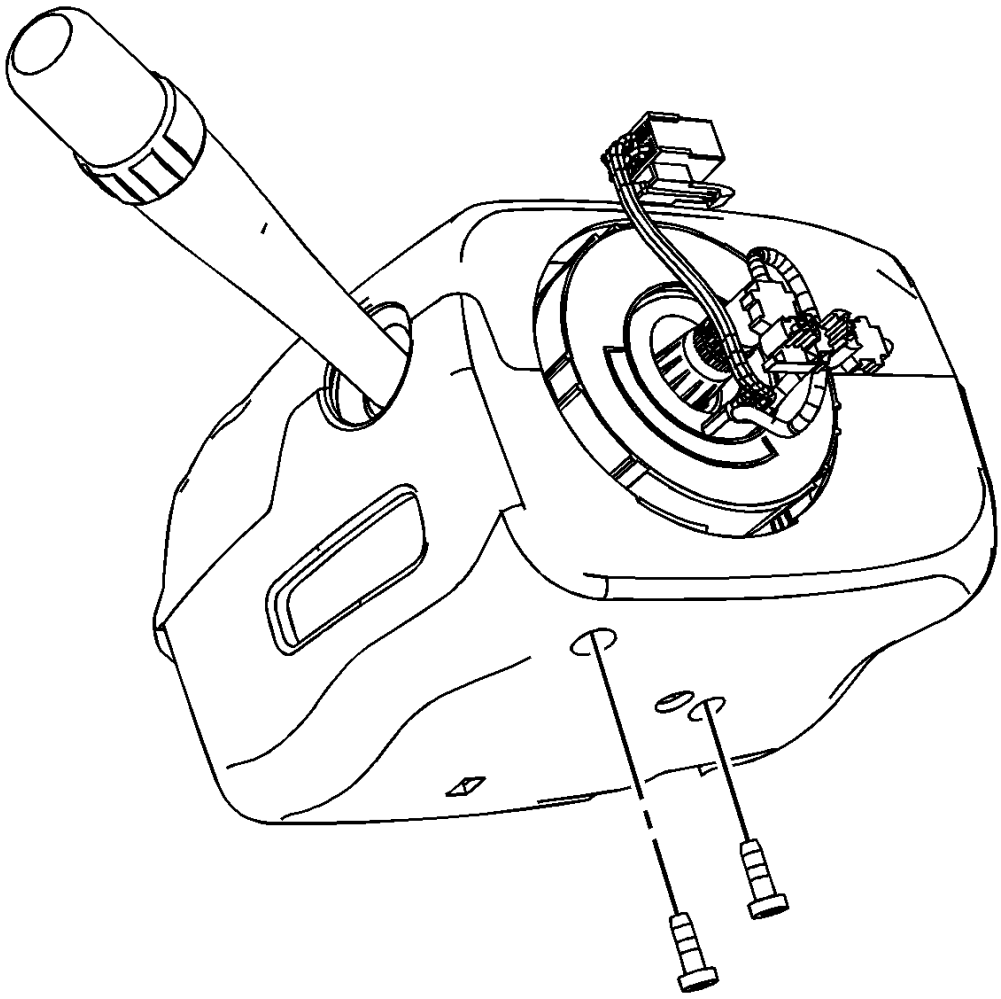

Fig. 17: View Of Lower Steering Column Trim Cover & Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the steering column trim cover bolts.

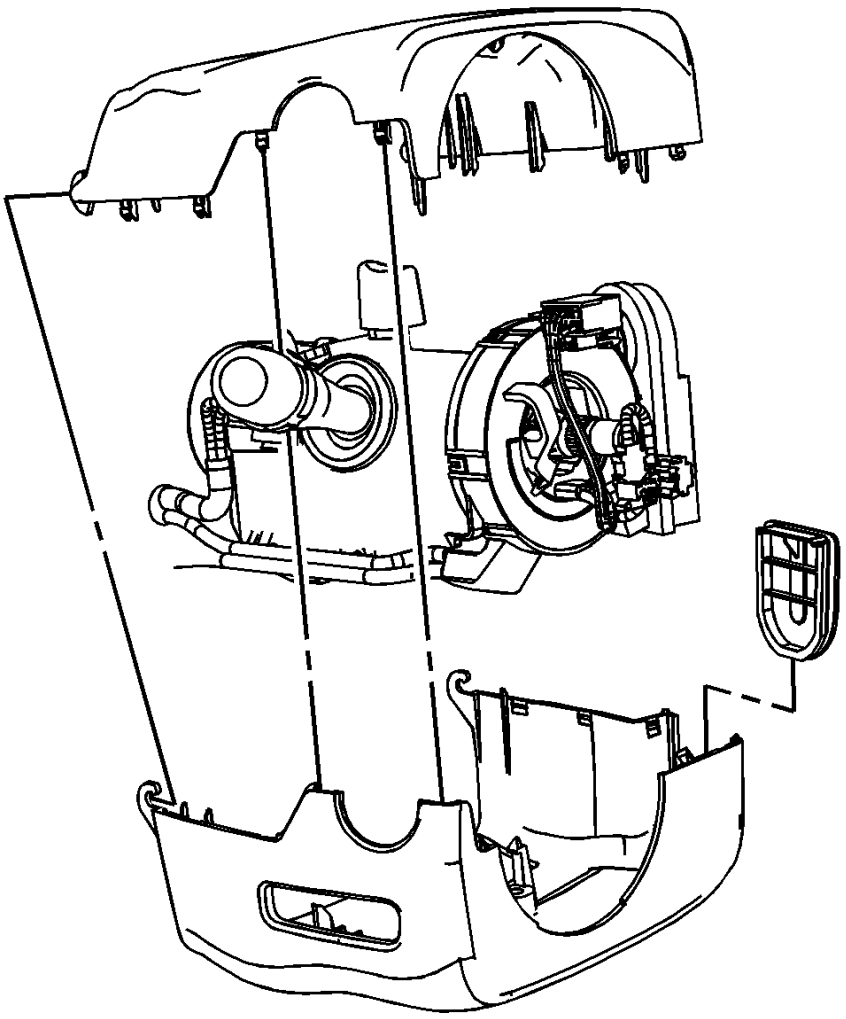

Fig. 18: View Of Upper & Lower Steering Column Cover & Steering Column
Courtesy of GENERAL MOTORS COMPANY

5. Separate the upper steering column trim cover from the lower steering column trim cover and remove them from the vehicle.

Installation Procedure

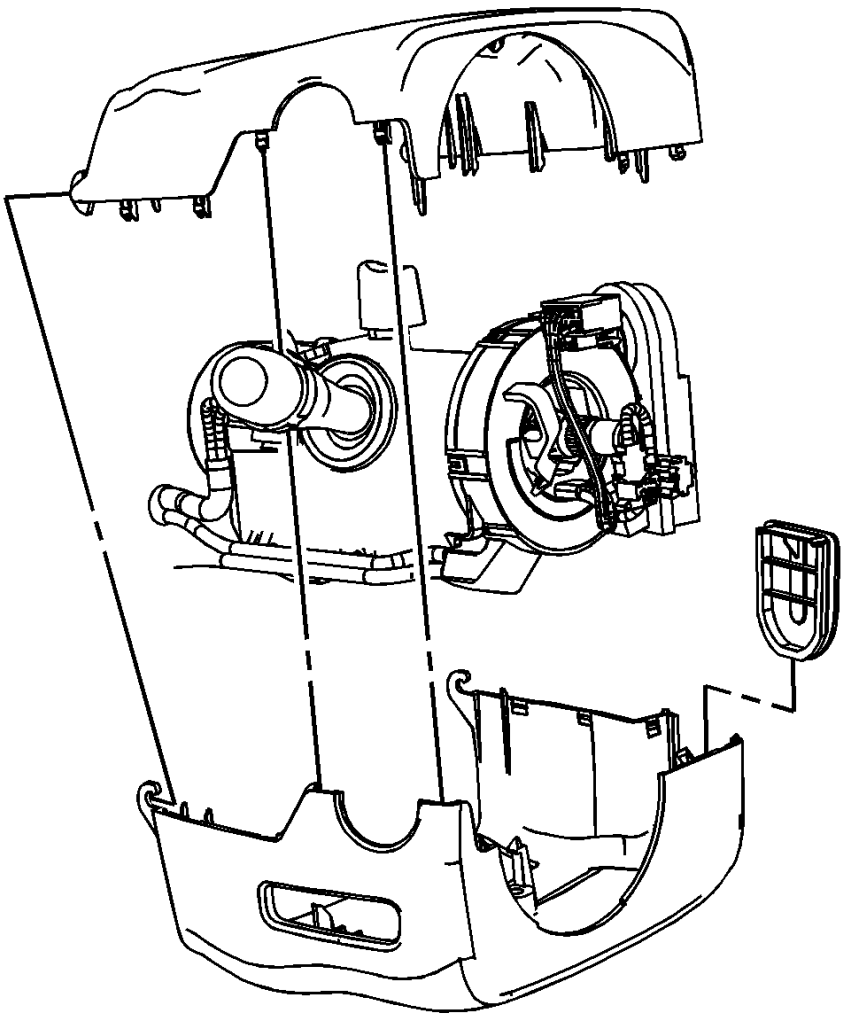

Fig. 19: View Of Upper & Lower Steering Column Cover & Steering Column
Courtesy of GENERAL MOTORS COMPANY

1. Position the upper steering column trim cover and the lower steering column trim cover together on the steering column.

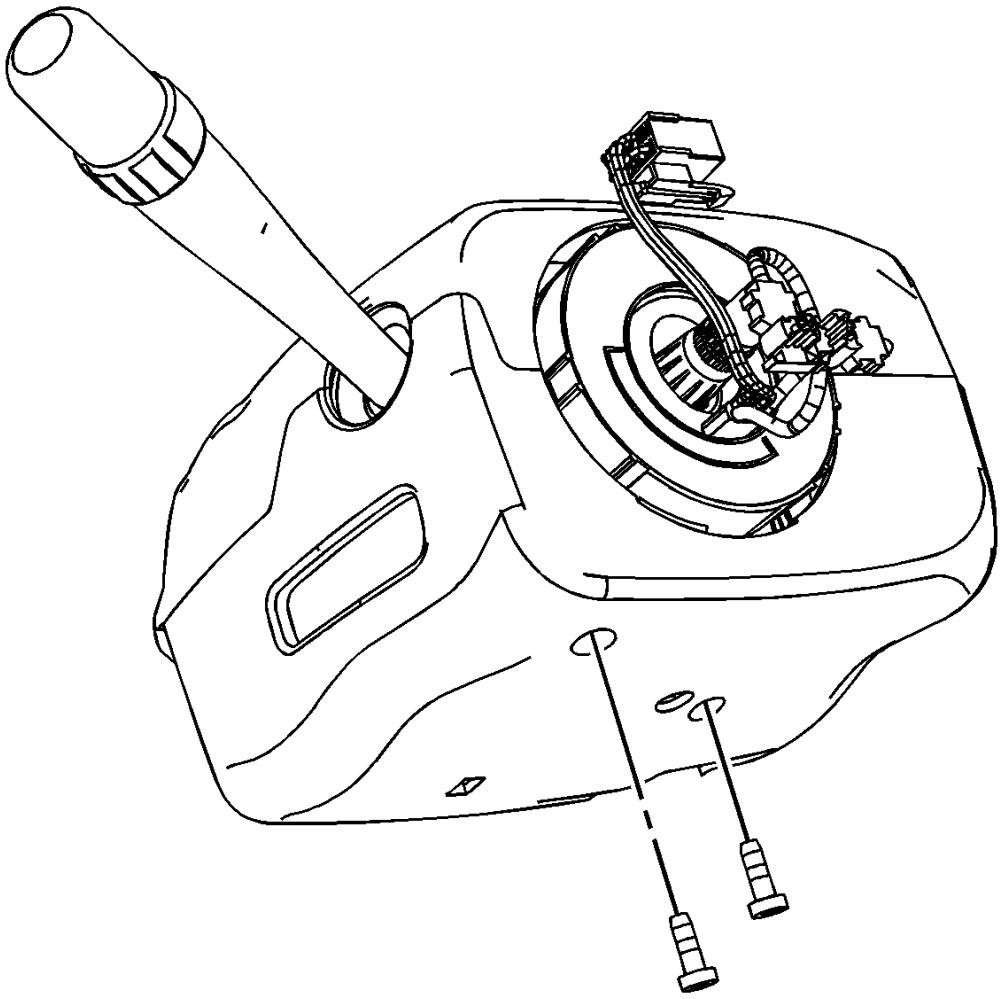

Fig. 20: View Of Lower Steering Column Trim Cover & Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the steering column trim cover bolts and tighten to 3 N.m (27 lb in).

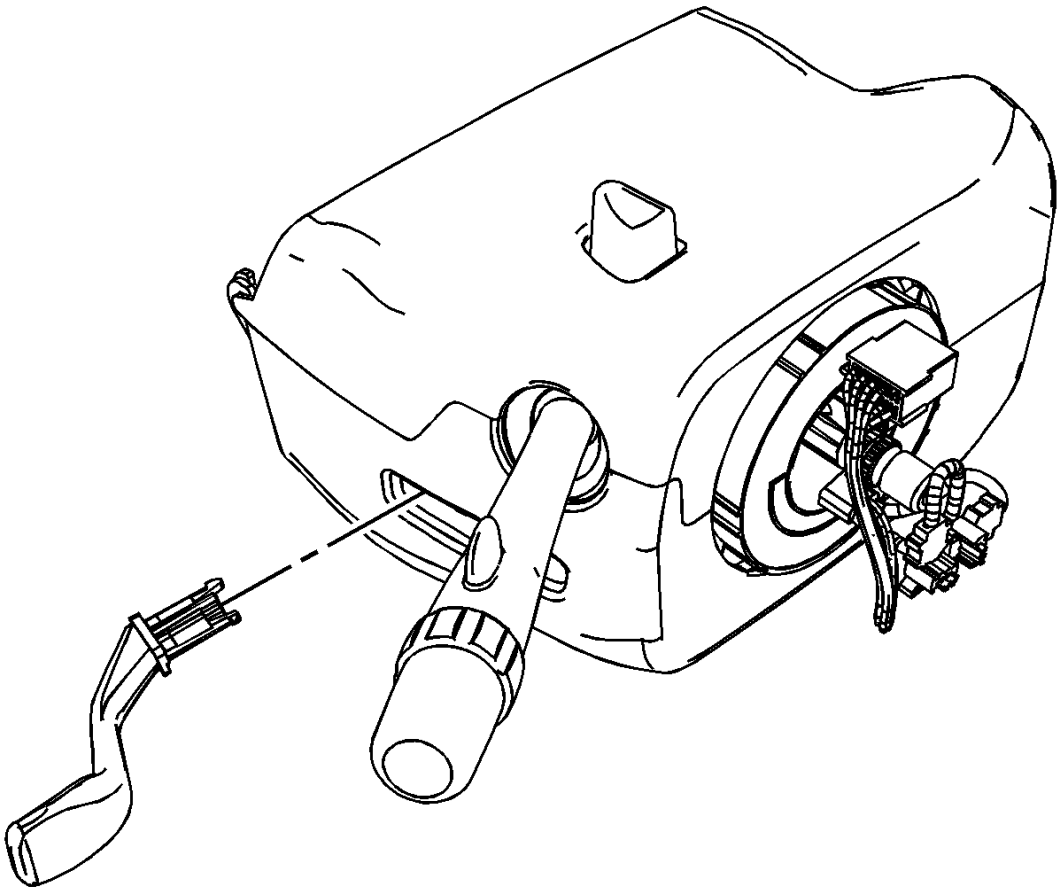

Fig. 21: View Of Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

3. Install the tilt lever.
4. Install the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .
5. Install the steering wheel. Refer to **Steering Wheel Replacement**.

TURN SIGNAL CANCEL CAM AND STEERING SHAFT UPPER BEARING SPRING REPLACEMENT

Special Tools

- **J 23653-SIR** Steering Column Lock Plate Compressor
- **J 42137** Steering Column Lock Plate Compressor Adapter

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the inflatable restraint steering wheel module coil. Refer to **Steering Wheel Airbag Coil**

Replacement .

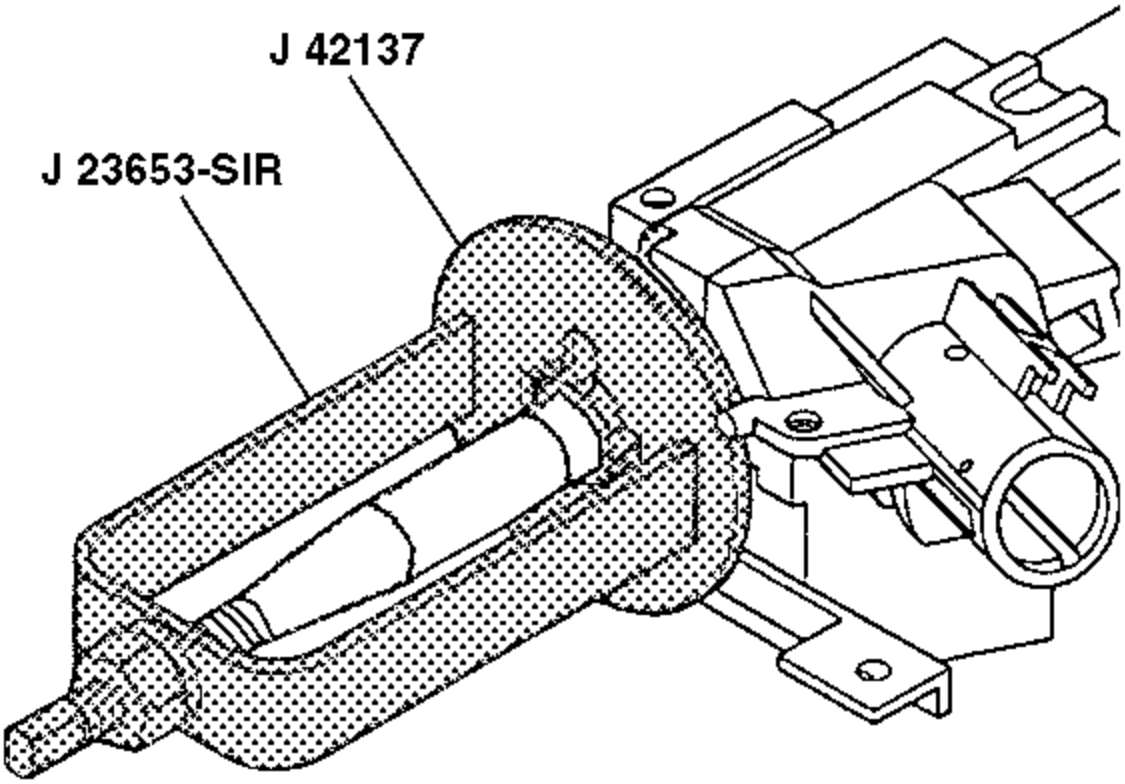

Fig. 22: Compressing Cam Orientation Plate
Courtesy of GENERAL MOTORS COMPANY

2. Remove the steering shaft lock plate retaining ring using the **J 23653-SIR** compressor and the **J 42137** adapter and dispose of it.

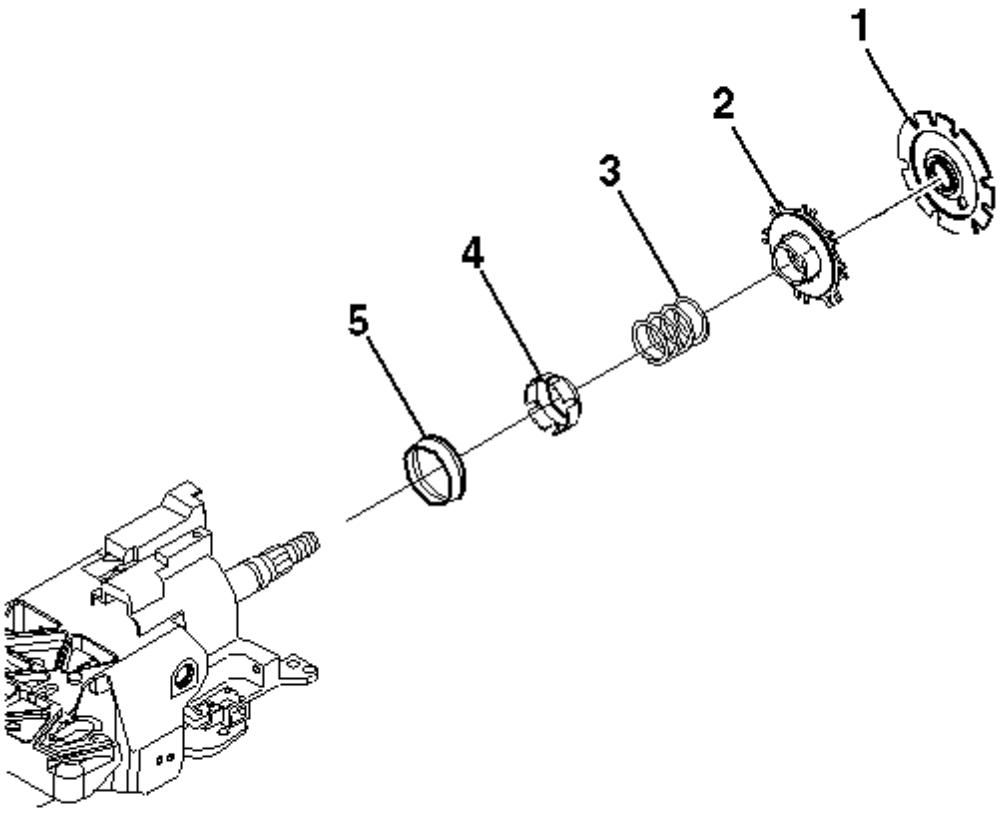

Fig. 23: View of Shaft Lock Shield Assembly, Turn Signal Cancel Cam Assembly, Upper Bearing Spring, Bearing Inner Race Seat and Inner Race
Courtesy of GENERAL MOTORS COMPANY

3. Remove the turn signal cancel cam plate (1).
4. Remove the turn signal cancel cam (2).
5. Remove the steering shaft upper bearing spring (3).
6. Remove the steering shaft upper bearing race seat (4).
7. Remove the steering shaft upper bearing (5).

Installation Procedure

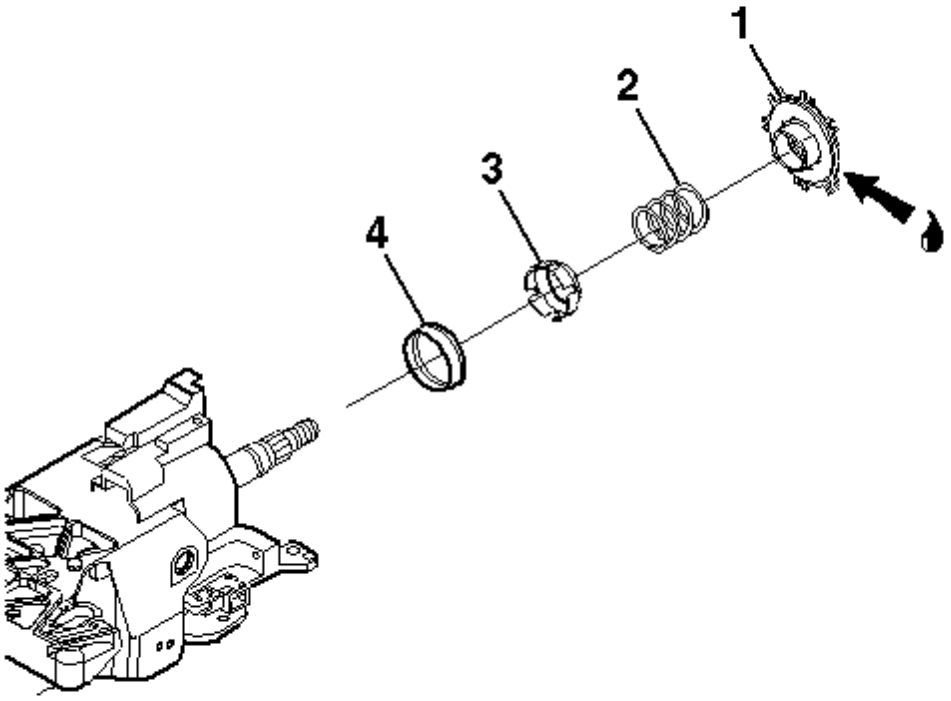

Fig. 24: View of Inner Race, Upper Bearing Inner Race Seat, Upper Bearing Spring, and Turn Signal Cancel Cam Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the steering shaft upper bearing (4).
2. Install the steering shaft upper bearing race seat (3).
3. Install the steering shaft upper bearing spring (2).
4. Apply lubricant to the turn signal cancel cam (1). Refer to **Adhesives, Fluids, Lubricants, and Sealers** for the recommended lubricant.
5. Install the turn signal cancel cam (1).

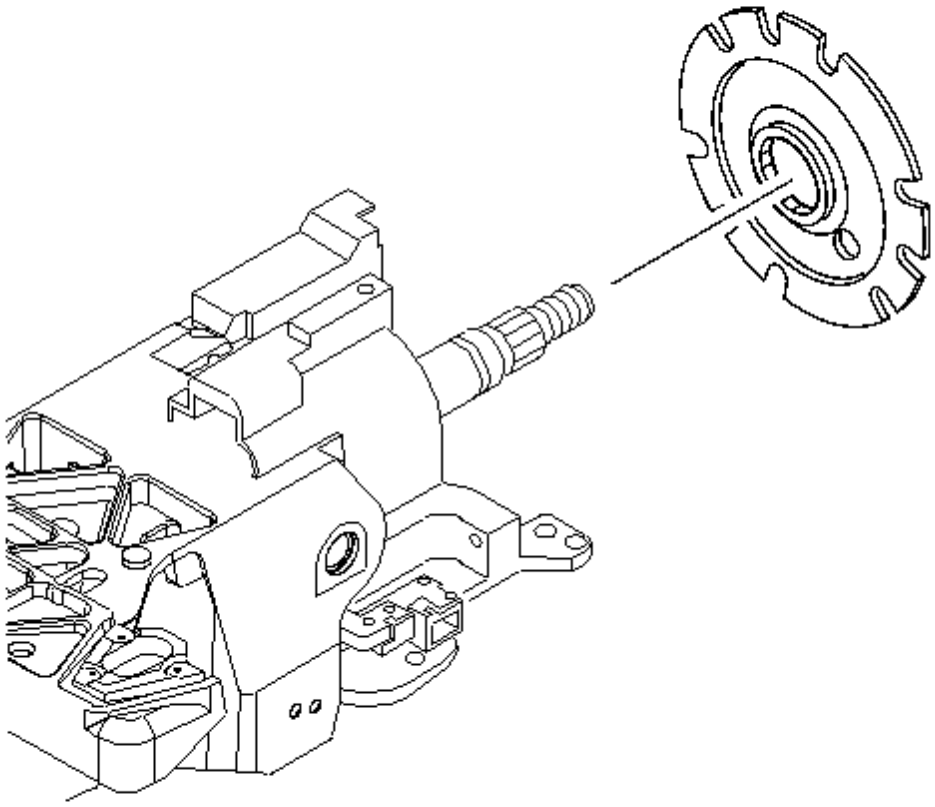

Fig. 25: View of Shaft Lock Shield Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Install the turn signal cancel cam plate.

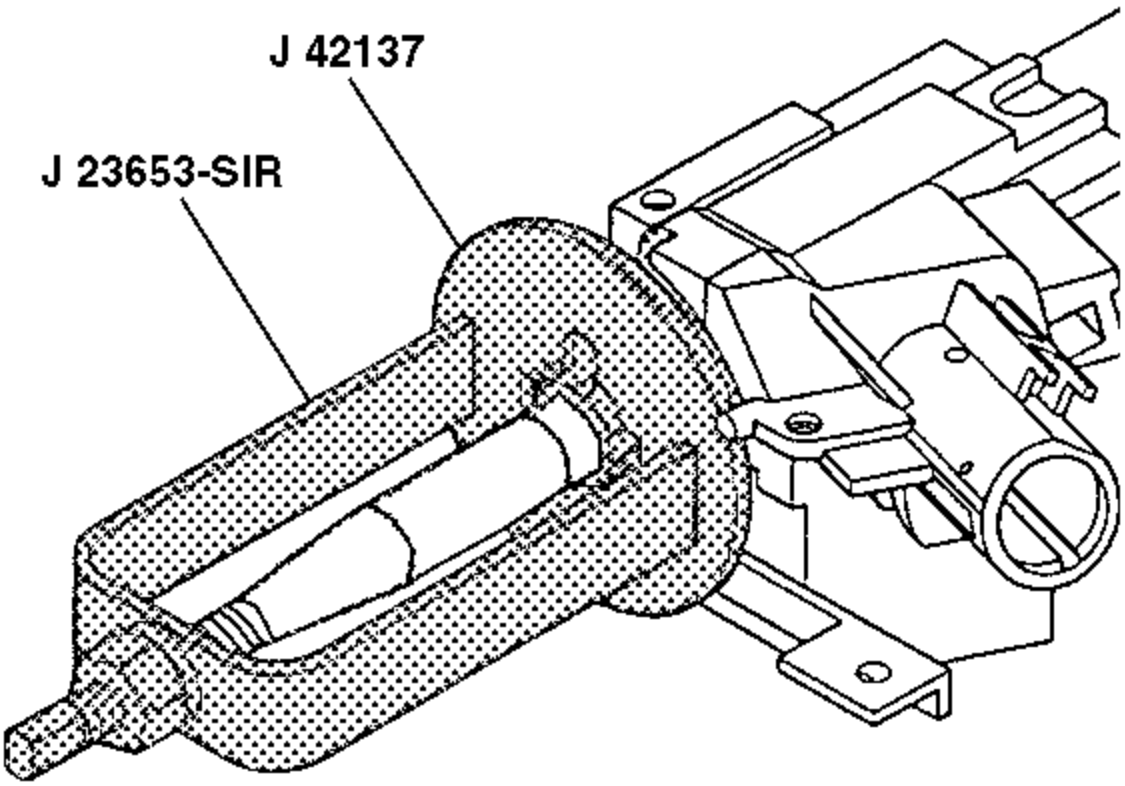

Fig. 26: Compressing Cam Orientation Plate
Courtesy of GENERAL MOTORS COMPANY

7. Install the new steering shaft lock plate retaining ring using the **J 23653-SIR** compressor and the **J 42137** adapter.

TURN SIGNAL MULTIFUNCTION SWITCH REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

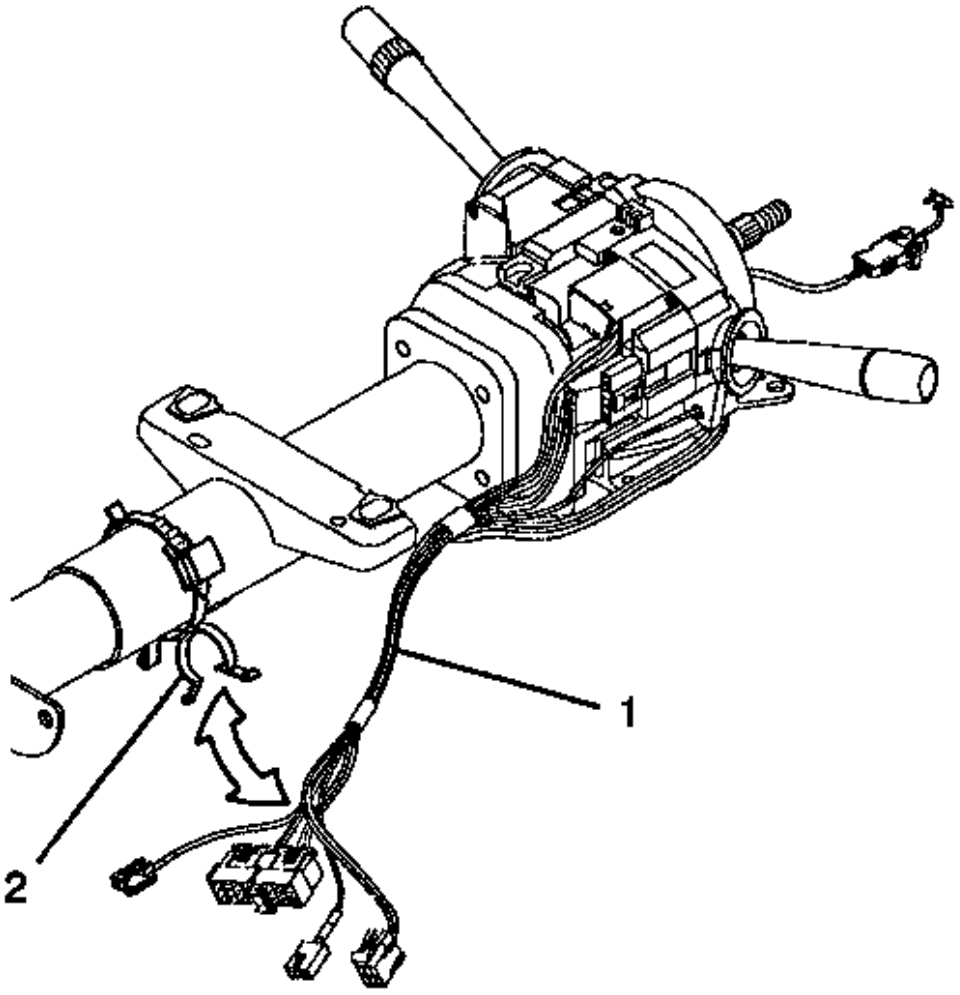

Fig. 27: View Of Steering Column Wire Harness Assembly & Wire Harness Strap
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The abrasion sleeve located on the steering column wire harness assembly must be reinstalled. Make note of what connector is coming out of the abrasion sleeve for installation purposes.**

2. Remove the wire harness assembly (1) from the wire harness strap (2).
3. Disconnect the turn signal multifunction switch connector from the inflatable restraint steering wheel module coil connector.

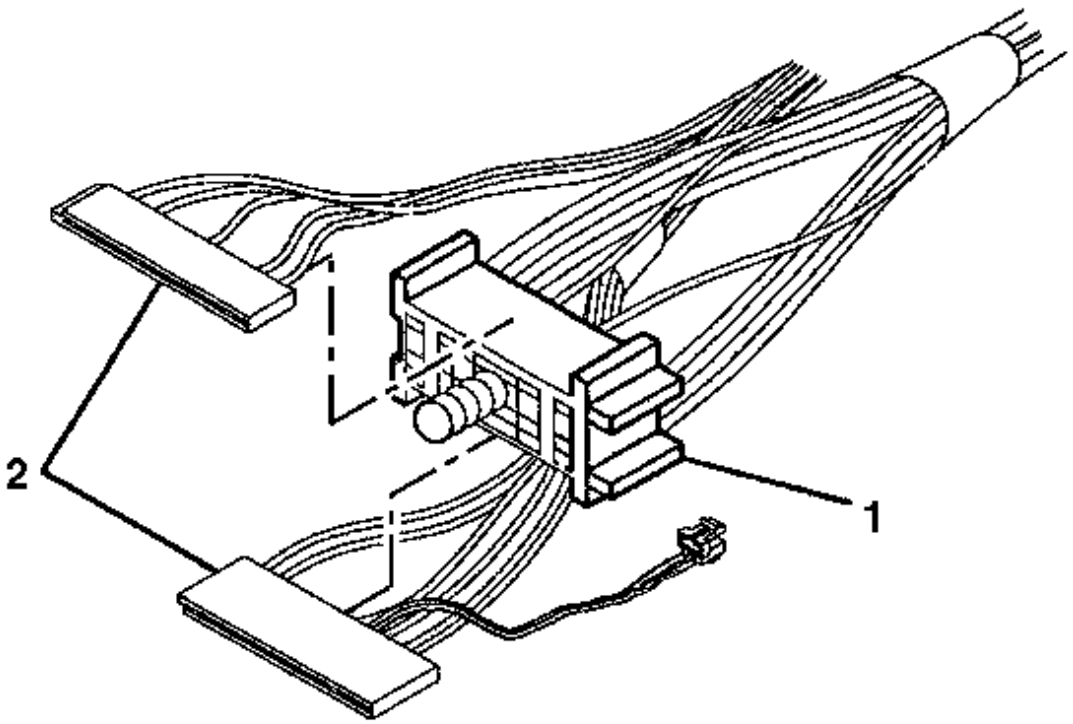

Fig. 28: Turn Signal & Multifunction Switch Assembly Connectors
Courtesy of GENERAL MOTORS COMPANY

4. Slide the 2 connectors (2) of the turn signal multifunction switch assembly out of the bulkhead connector (1).

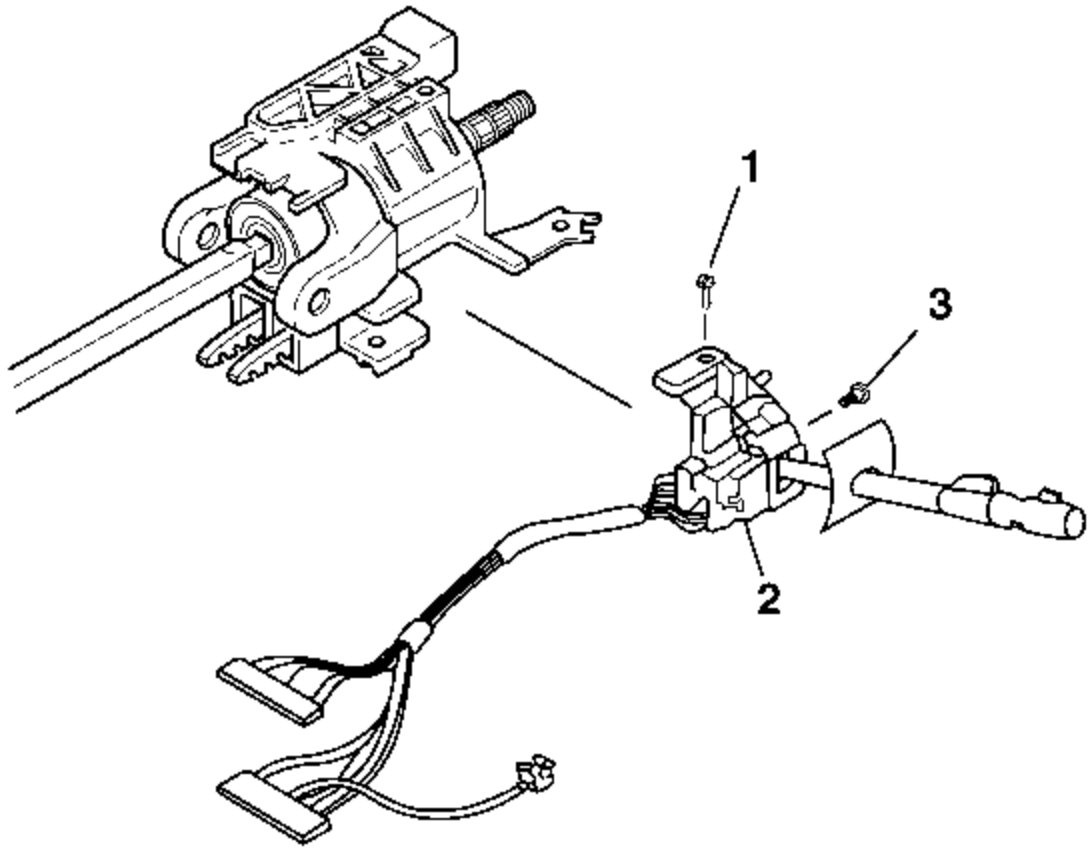

Fig. 29: View Of Turn Signal & Multifunction Switch Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Remove the turn signal multifunction switch bolts (1) and (3) from the turn signal multifunction switch (2).
6. Remove the turn signal multifunction switch (2) from the steering column tilt head assembly.

Installation Procedure

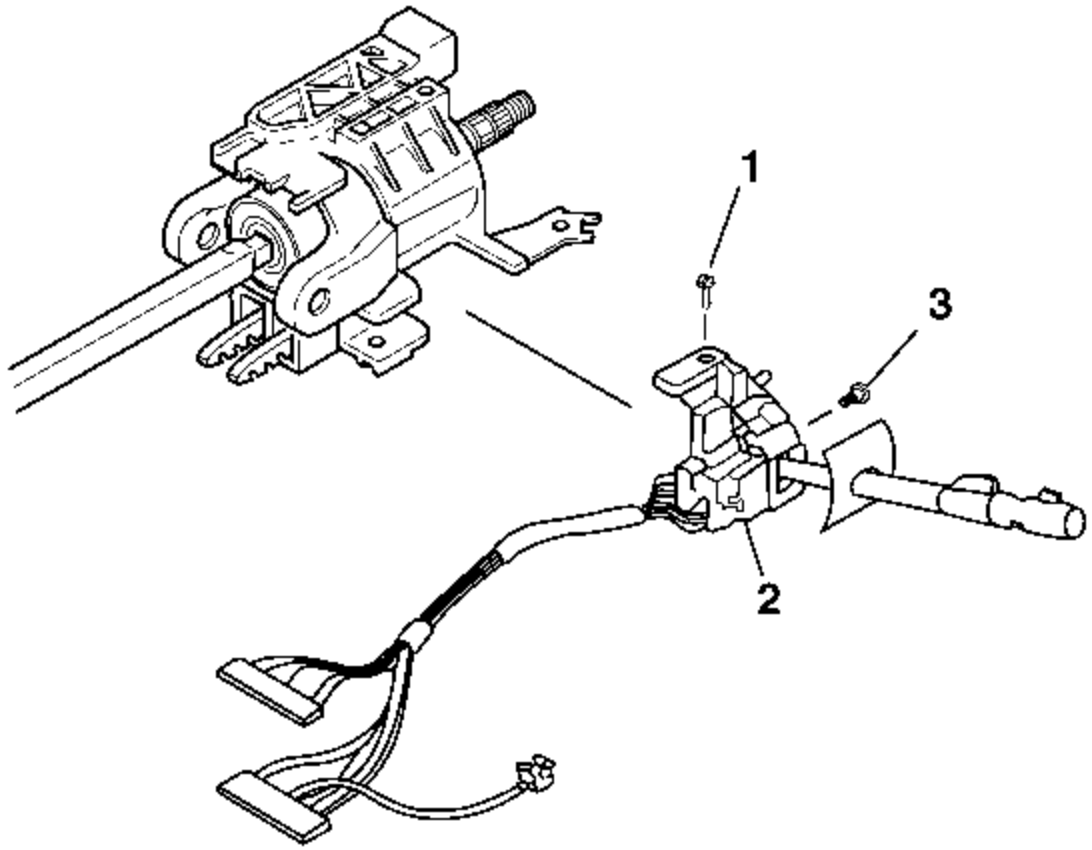

Fig. 30: View Of Turn Signal & Multifunction Switch Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Position the turn signal multifunction switch (2) onto the steering column tilt head assembly.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Be sure that the electrical contact of the turn signal and multifunction switch assembly (2) rests on the turn signal cancel cam assembly.**

2. Install the turn signal multifunction switch bolts (1) and (3) into the turn signal multifunction (2) and tighten to 1 N.m (11 lb in).

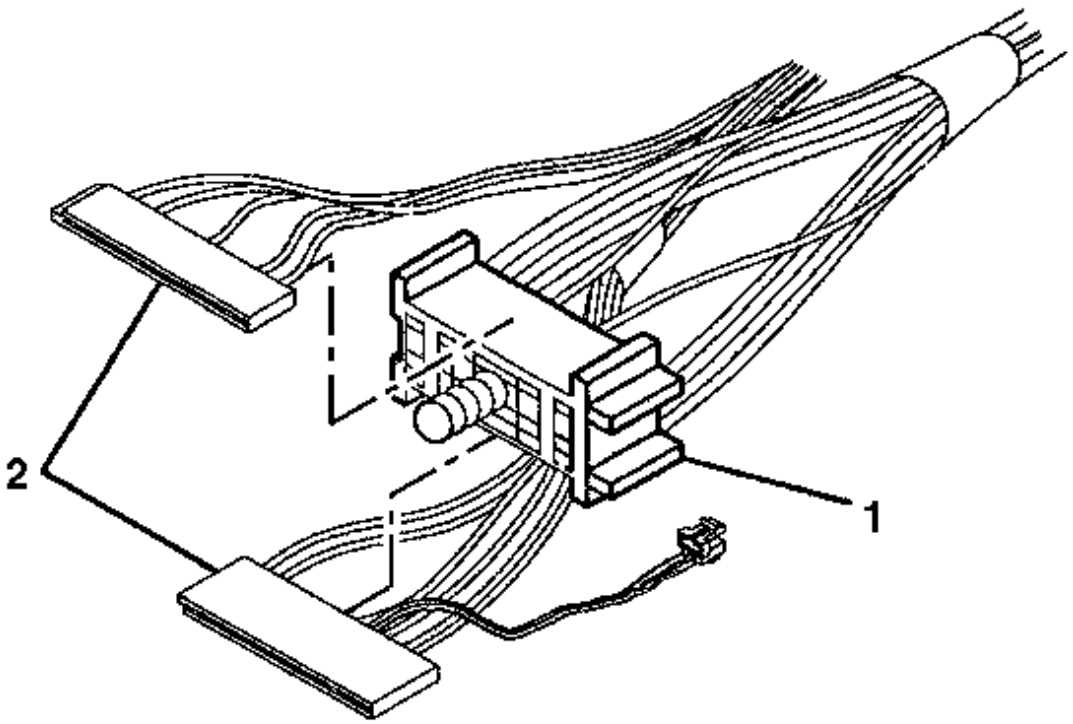

Fig. 31: Turn Signal & Multifunction Switch Assembly Connectors
Courtesy of GENERAL MOTORS COMPANY

3. Slide the 2 connectors (2) of the turn signal multifunction switch assembly into the bulkhead connector (1).

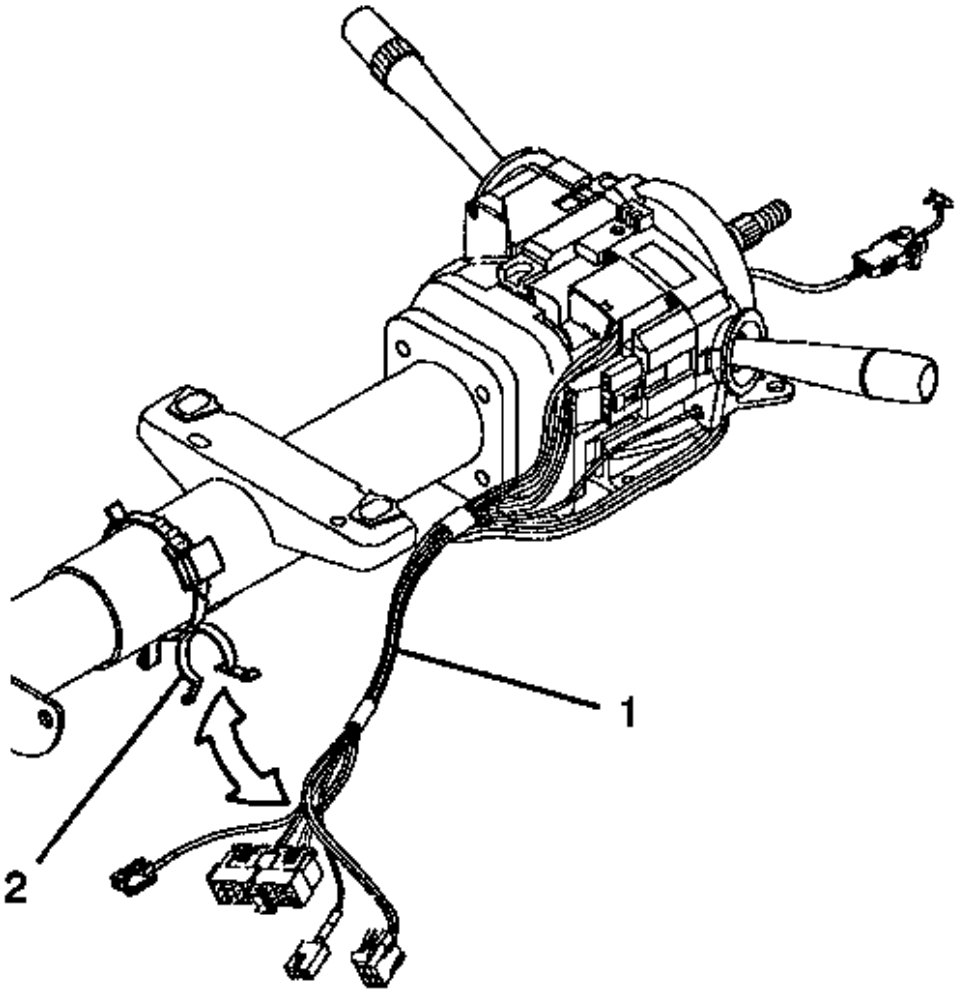

Fig. 32: View Of Steering Column Wire Harness Assembly & Wire Harness Strap
Courtesy of GENERAL MOTORS COMPANY

4. Connect the turn signal multifunction switch connector to the inflatable restraint steering wheel module coil connector.

NOTE: **The abrasion sleeve must be installed back onto the steering column wire harness assembly. The ignition lock cylinder case wires and connector must be hanging out of the middle of the abrasion sleeve.**

5. Install the wire harness assembly (1) to the wire harness strap (2).
6. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

TURN SIGNAL SWITCH HOUSING REPLACEMENT

Removal Procedure

1. Remove the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.
2. Remove the turn signal multifunction switch. Refer to **Turn Signal Multifunction Switch Replacement**.

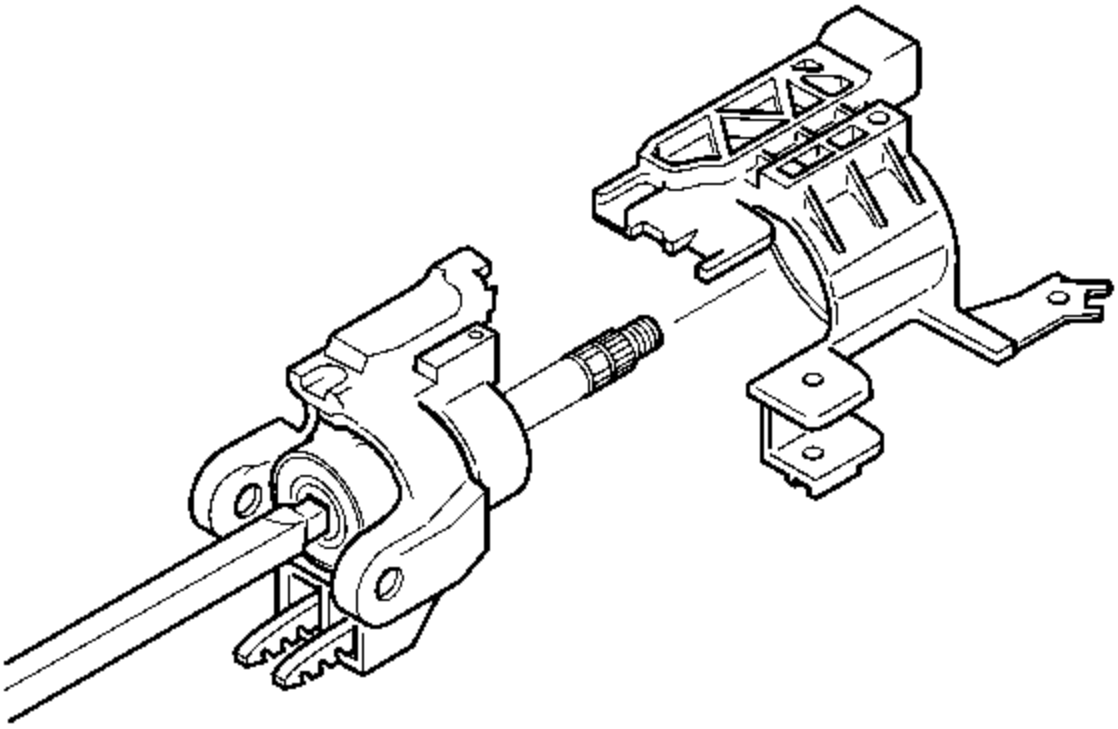

Fig. 33: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Slide the turn signal switch housing off of the steering column.

Installation Procedure

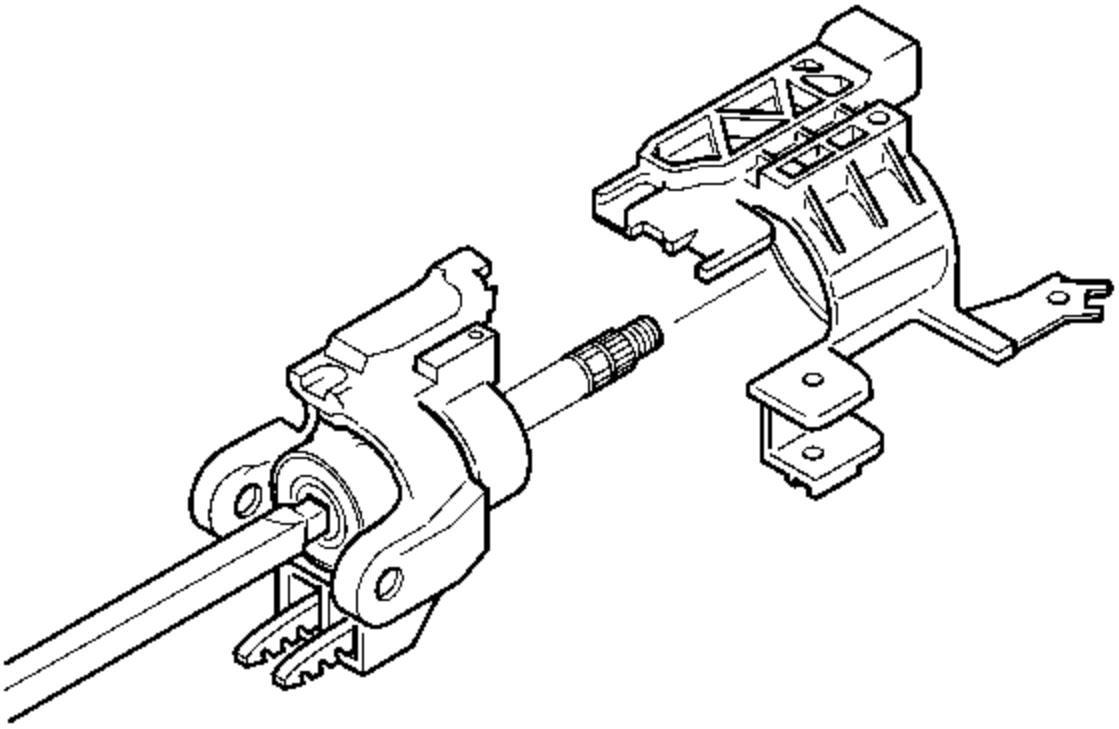

Fig. 34: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The turn signal switch housing must be pressed firmly against the steering column to seat it properly.**

1. Slide the turn signal switch housing onto the steering column.
2. Install the turn signal multifunction switch. Refer to **Turn Signal Multifunction Switch Replacement**.
3. Install the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.

SHIFT LEVER REPLACEMENT

Removal Procedure

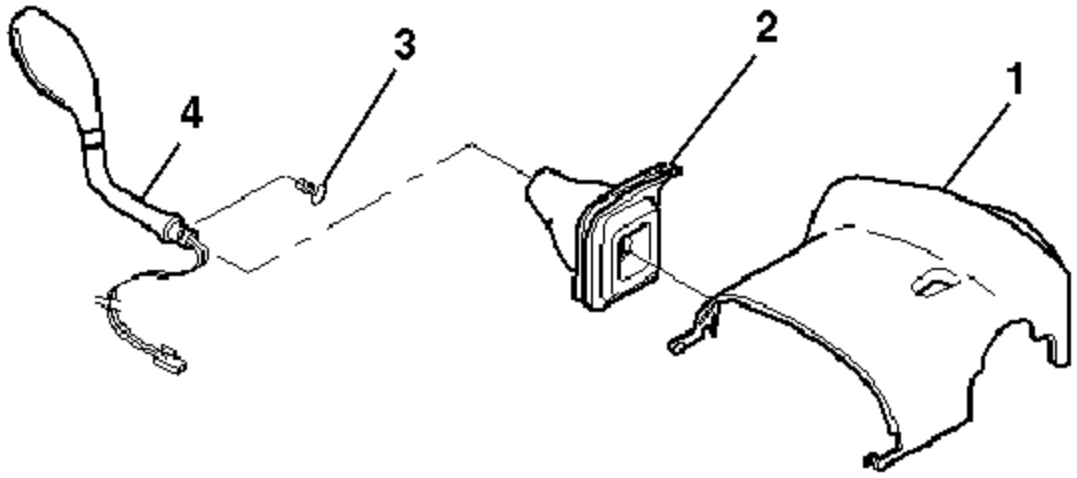

Fig. 35: View Of Shift Lever, Seal (Boot), Screw & Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.
2. Disconnect the shift lever electrical connector at the base of the steering column.
3. Remove the shift lever screw (3) from the shift lever (4).
4. Disengage the shift lever (4) from the linear shift assembly.
5. Transfer the shift lever seal (2) if needed.

Installation Procedure

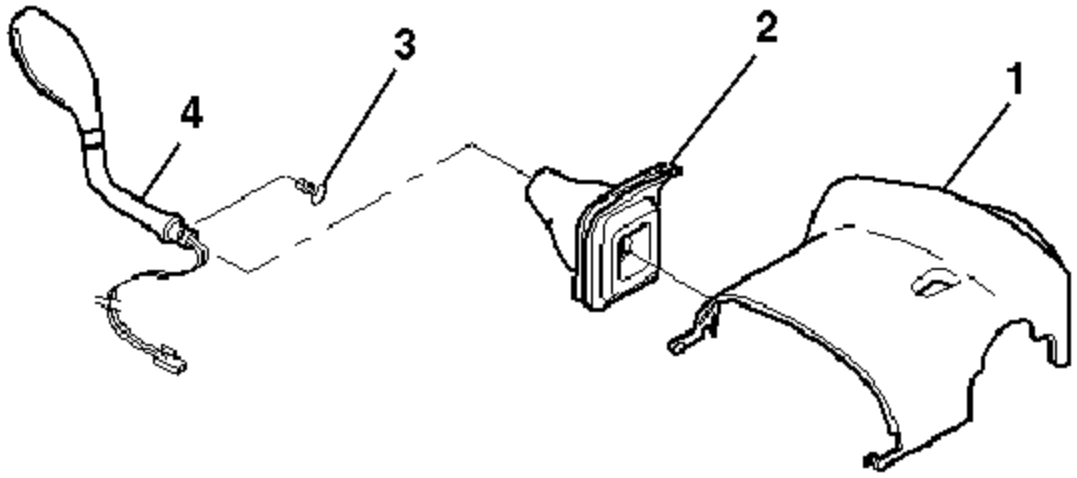

Fig. 36: View Of Shift Lever, Seal (Boot), Screw & Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

1. Engage the shift lever (4) to the linear shift assembly.

CAUTION: Refer to Fastener Caution .

2. Install the shift lever screw (3) to the shift lever (4) and tighten it to 20 N.m (15 lb ft).
3. Connect the shift lever electrical connector at the base of the steering column.
4. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

LINEAR SHIFT ASSEMBLY REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.
2. Remove the shift lever. Refer to **Shift Lever Replacement**.

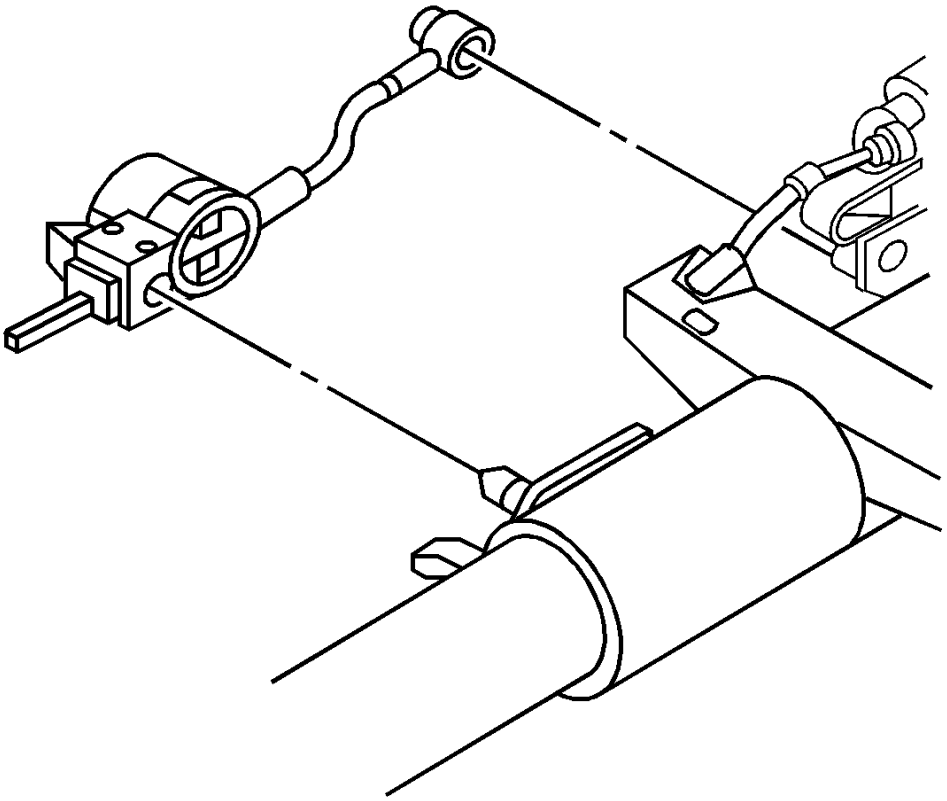

Fig. 37: View Of Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

3. With a screwdriver, carefully pry the automatic transmission shift lock control away from the steering column jacket.
4. Place the ignition lock cylinder in the OFF-LOCK position.

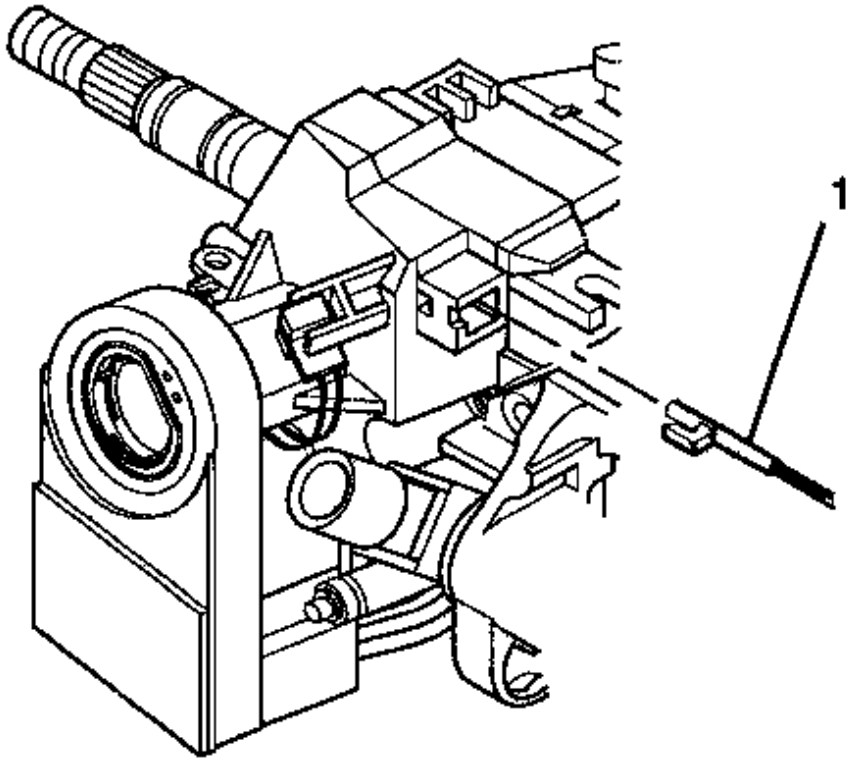

Fig. 38: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT remove the tape on the park lock cable. If the tape is removed from the park lock cable, you MUST order a new linear shift assembly.**

5. Insert a small screwdriver into the slot on the ignition lock cylinder case and push against the locking tab to remove the park lock cable (1).

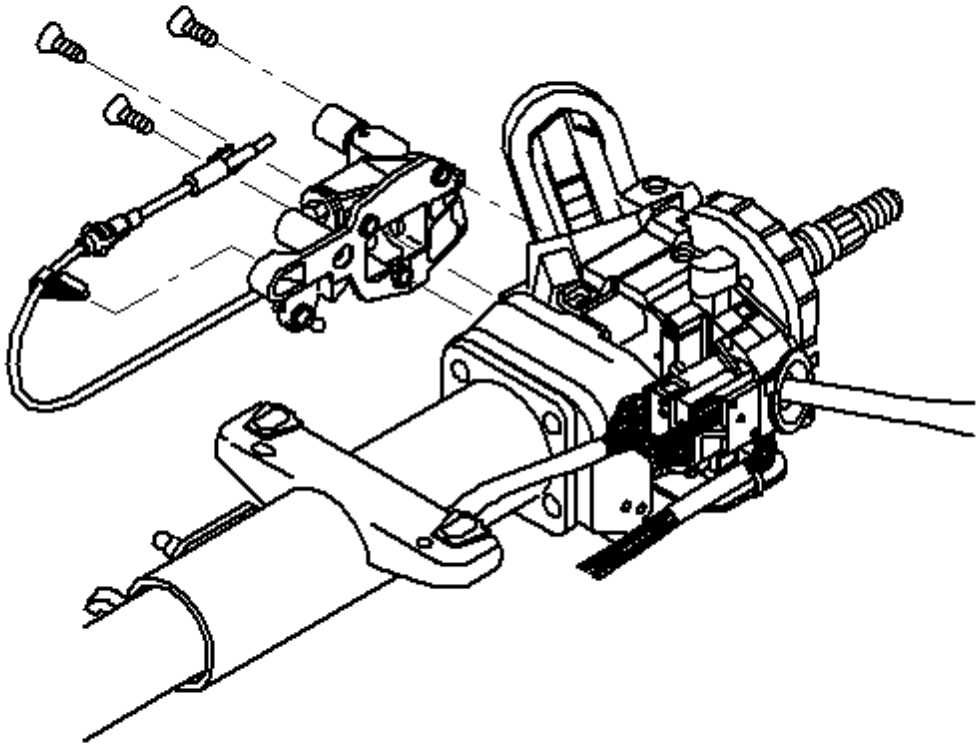

Fig. 39: Flat-Head 6-Lobed Socket Tap Screws & Linear Shift Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **It may be necessary to move the linear shift assembly out of park to access the lower linear shift assembly bolt.**

6. Remove the linear shift assembly bolts.
7. Remove the linear shift assembly.

Installation Procedure

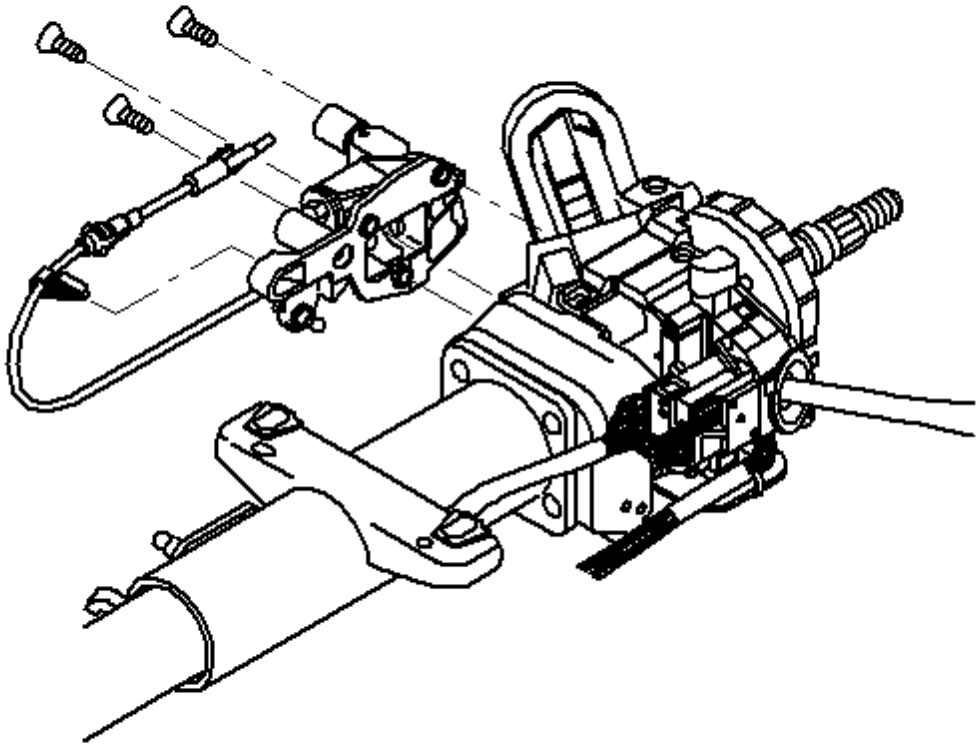

Fig. 40: Flat-Head 6-Lobed Socket Tap Screws & Linear Shift Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Position the linear shift assembly to the steering column.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Start all linear shift assembly bolts by hand before finalizing any torques.**

2. Install the linear shift assembly bolts and tighten to 10 N.m (89 lb in).

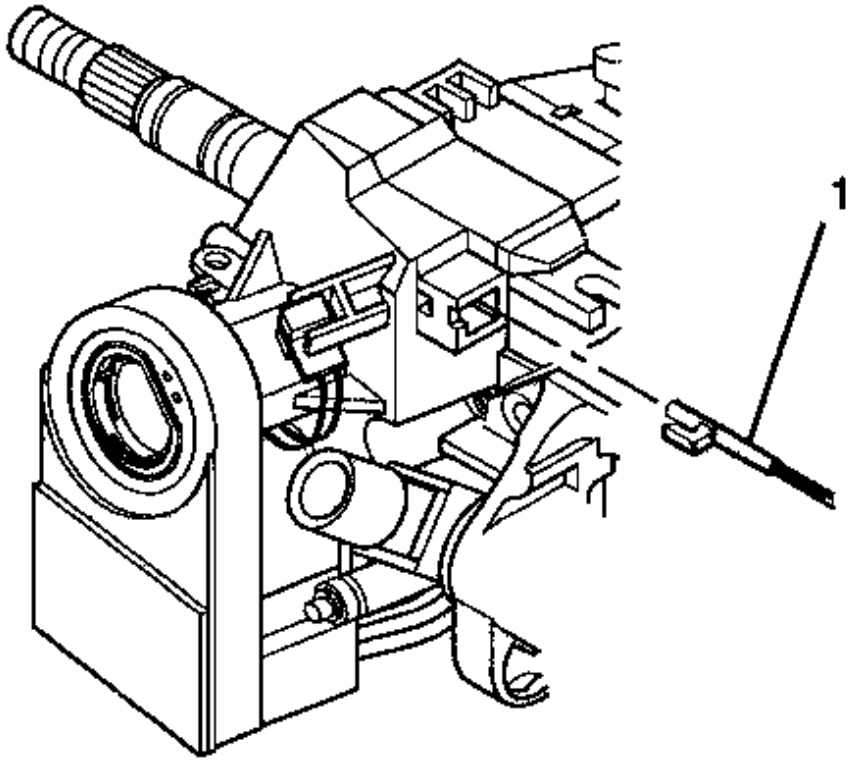

Fig. 41: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

3. Connect the park lock cable (1) to the ignition lock cylinder case.
    - The ignition lock cylinder should be in the OFF-LOCK position.
    - The locking tab at the end of the park lock cable (1) must be installed into the ignition lock cylinder case completely.

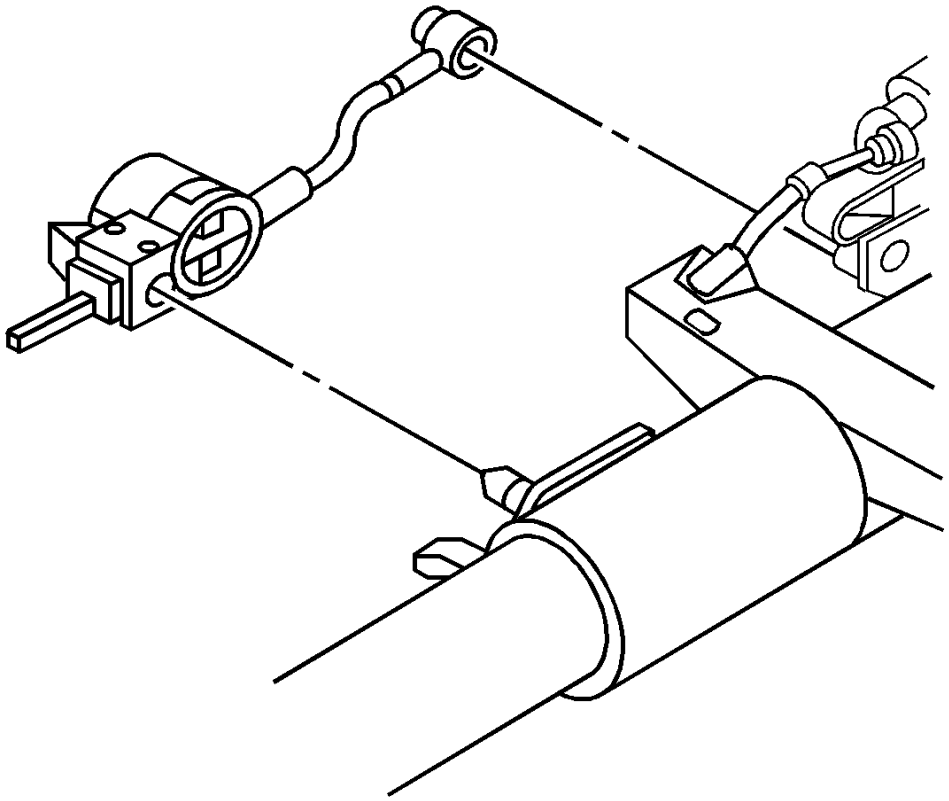

Fig. 42: View Of Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

4. Install the automatic transmission shift lock control.
5. Install the shift lever and put the column in the NEUTRAL position. Refer to **Shift Lever Replacement**.

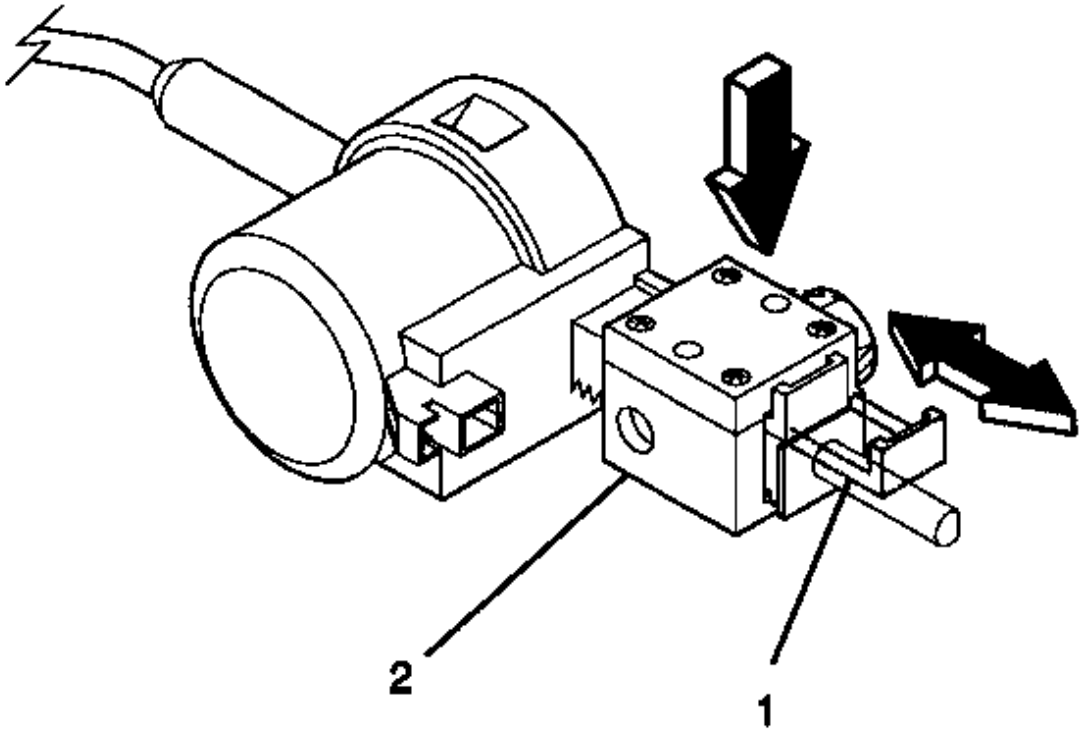

Fig. 43: Adjusting Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

6. Adjust the automatic transmission shift lock control.
    1. Pull the tab (1) out on the block side (2) of the automatic transmission shift lock control.
    2. Press on the adjuster block (2) to compress the internal adjuster spring to disengage the adjuster teeth. Slide the adjuster block as far away from the solenoid as possible.
    3. Lock in place by pushing the tab (1) back in.
7. Inspect the automatic transmission shift lock control.
    1. The automatic transmission shift lock control must lock the shift lever when it is put into the PARK position.
    2. When the column is installed in the vehicle you will not be able to move the shift lever out of the PARK position without pressing on the brake pedal. The solenoid will be energized.
    3. Readjust if needed.
8. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

STEERING COLUMN TILT WHEEL RELEASE LEVER REPLACEMENT

Removal Procedure

1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling** .

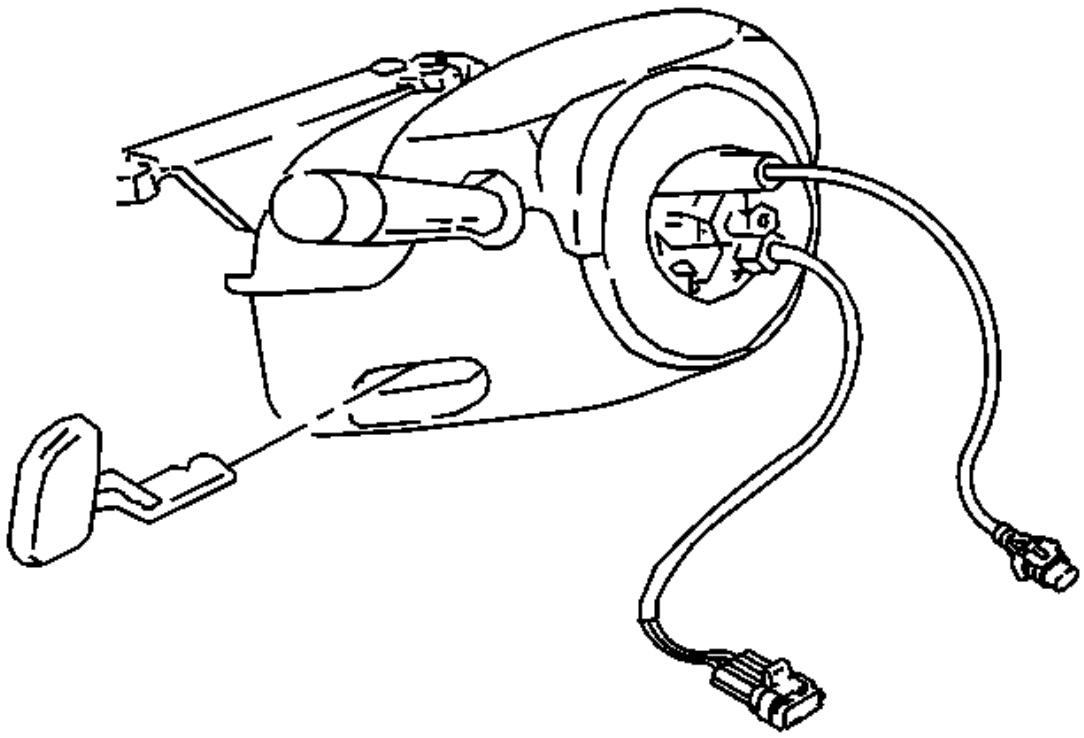

Fig. 44: Identifying Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

2. Pull the tilt lever out from the steering column.

Installation Procedure

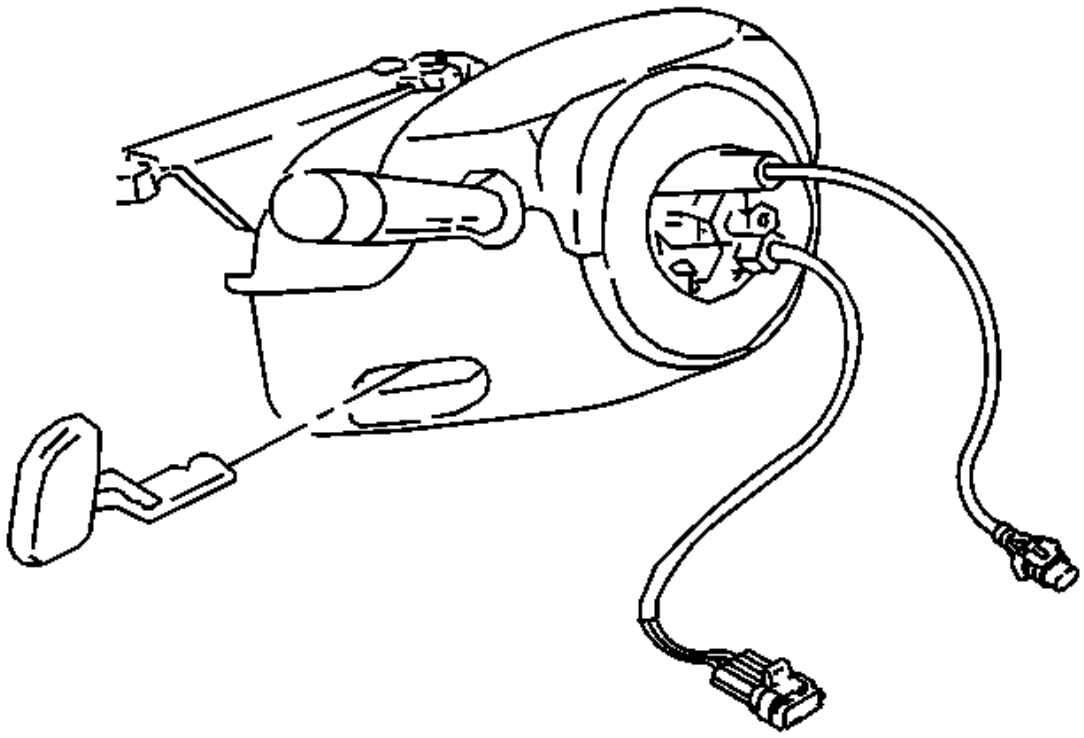

Fig. 45: Identifying Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

1. Push the tilt lever into the steering column.
2. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

STEERING WHEEL REPLACEMENT

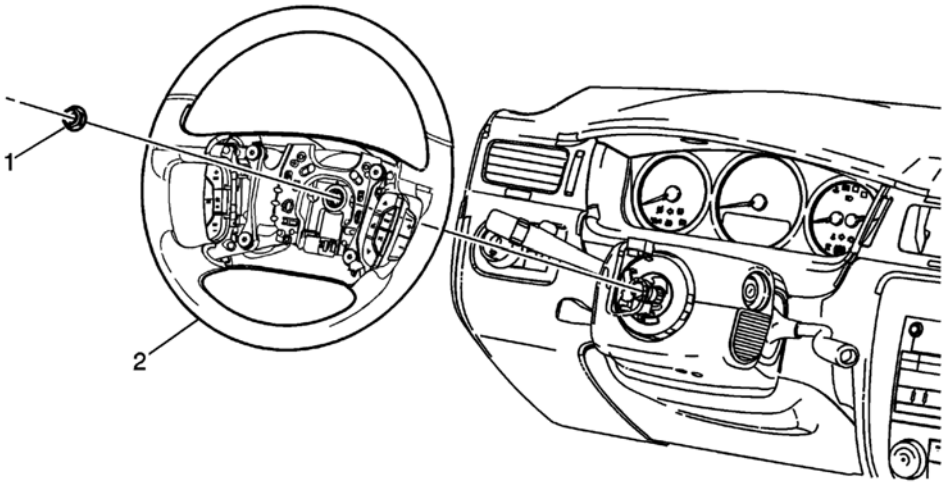

Fig. 46: Steering Wheel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint steering wheel module. Refer to **Airbag Steering Wheel Module Replacement** .	
1	Steering Wheel Nut **CAUTION:** **Refer to Fastener Caution .** **Tighten** 41 N.m (30 lb ft)
2	Steering Wheel **Procedure** 1. Disconnect any electrical connectors as needed. 2. Use the **J 1859-A** puller and the **J 42578** legs to remove the steering wheel. **Special Tools** • **J 1859-A** Steering Wheel Puller • **J 42578** Steering Wheel Puller Legs For regional tools, refer to **Special Tools**.

STEERING WHEEL THEFT DETERRENT LOCK REPLACEMENT

Removal Procedure

1. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** .

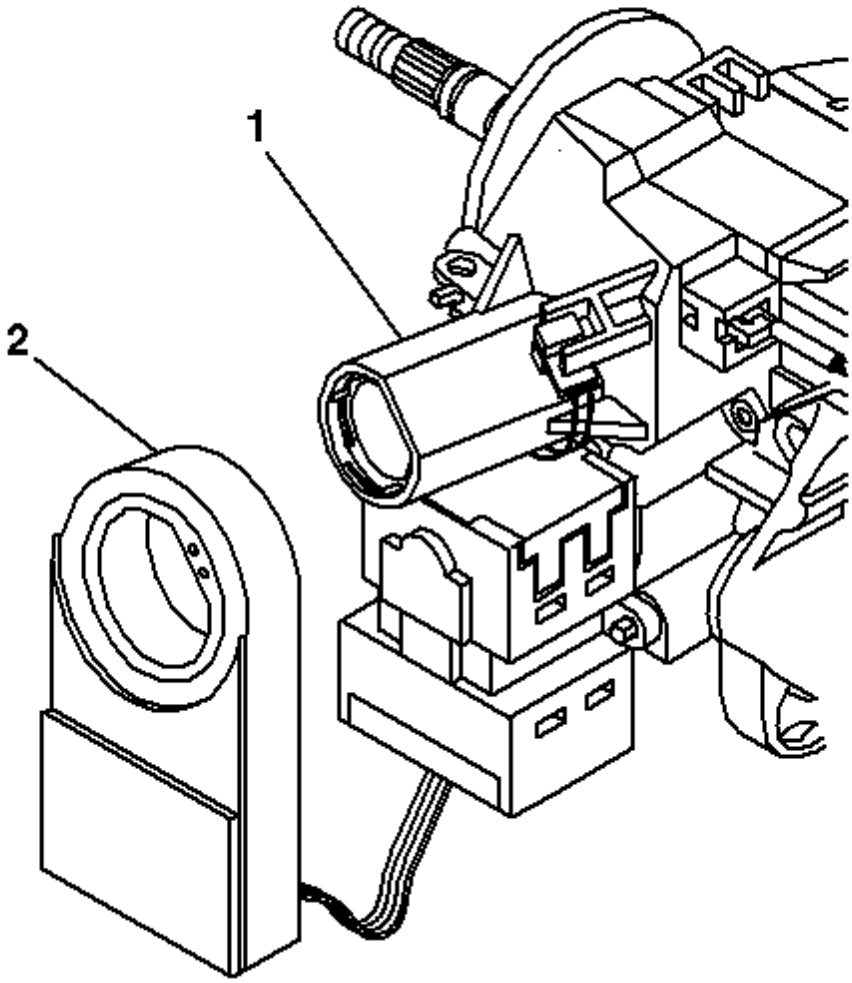

Fig. 47: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the electrical connector from the steering wheel theft deterrent lock.
3. If necessary, disconnect the electrical connector from the ignition lock cylinder case (1).
4. Remove the steering wheel theft deterrent lock (2) from ignition lock cylinder case (1).

Installation Procedure

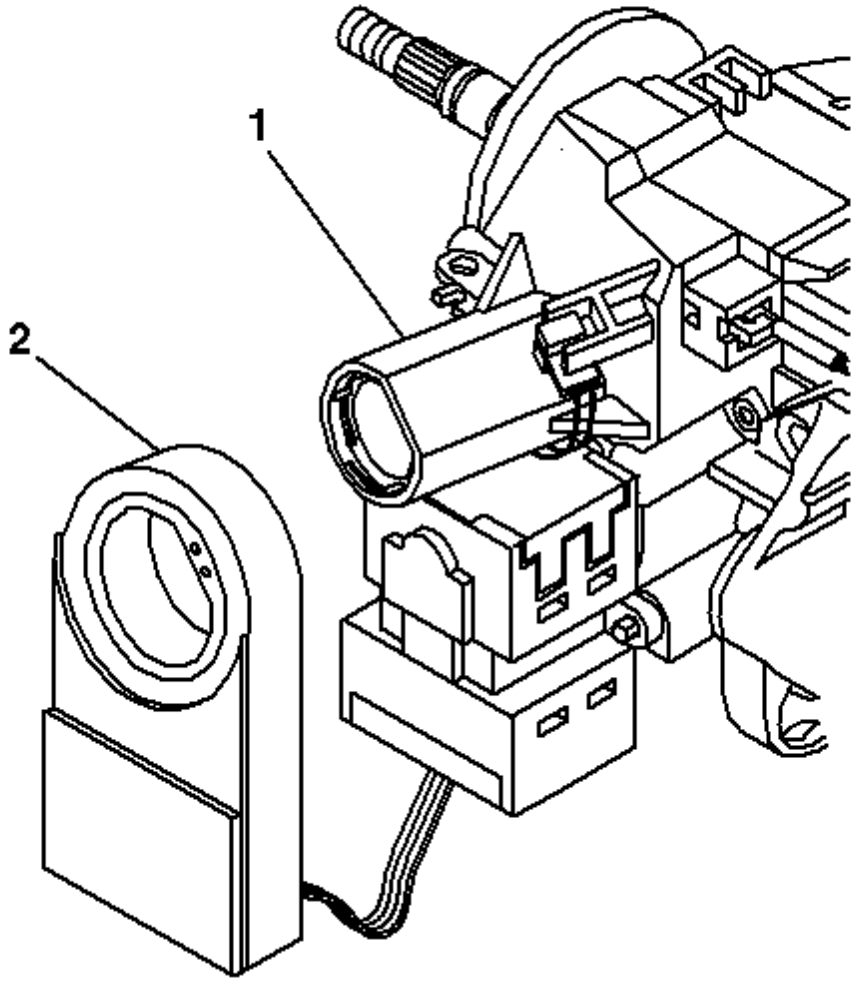

Fig. 48: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the steering wheel theft deterrent lock (2) to ignition lock cylinder case (1).
2. Connect the electrical connector to the steering wheel theft deterrent lock.
3. If necessary, connect the electrical connector to the ignition lock cylinder case (1).
4. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** .

STEERING COLUMN TILT SPRING REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

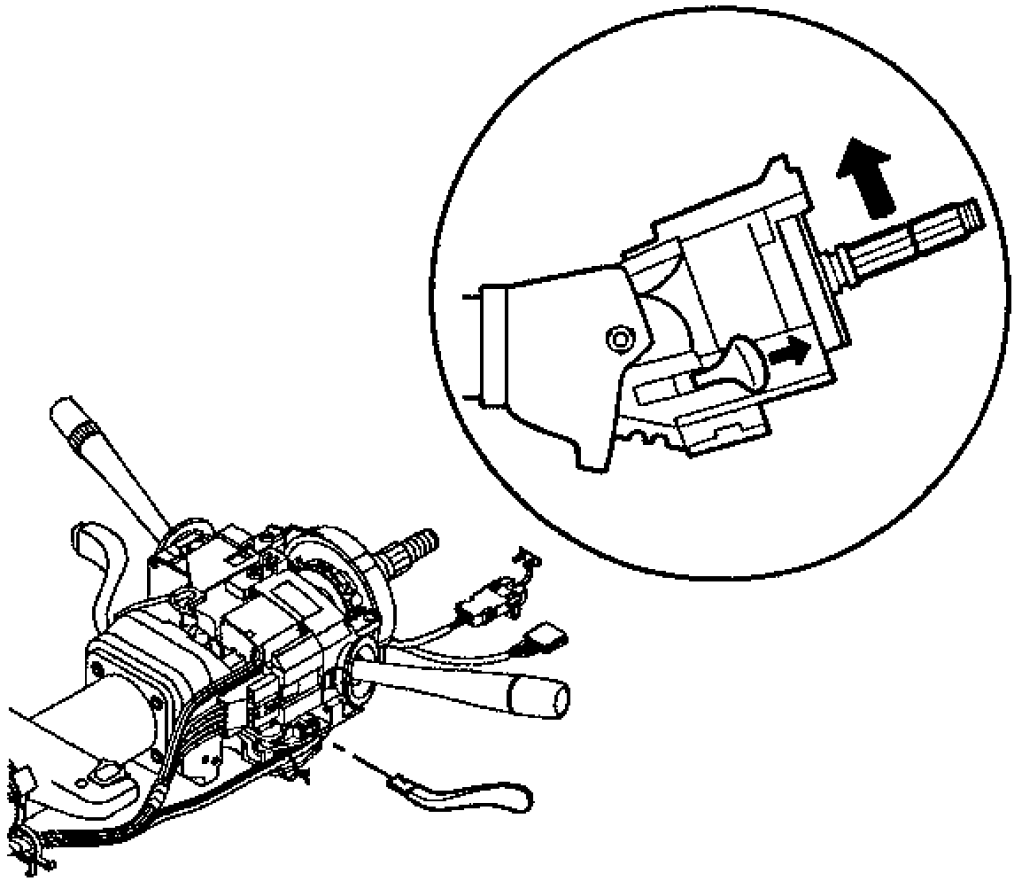

Fig. 49: Tilting Column To Up Position
Courtesy of GENERAL MOTORS COMPANY

2. Install the tilt lever onto the steering column tilt head assembly.
3. Use the tilt lever to tilt the column to the UP position.

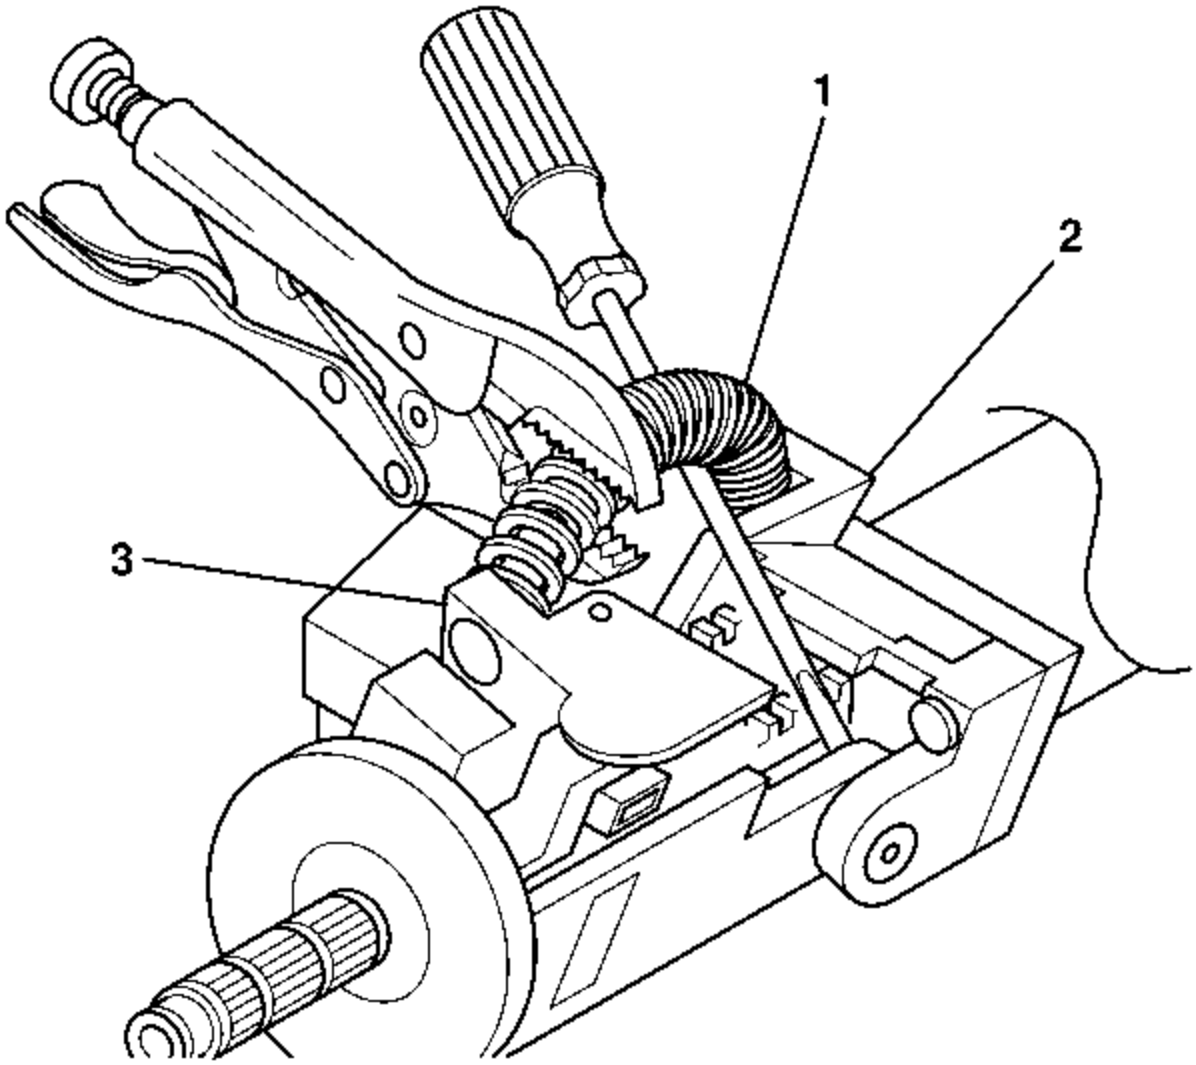

Fig. 50: View Of Tilt Spring And Steering Column Support Assembly
Courtesy of GENERAL MOTORS COMPANY

WARNING: The tilt spring and the spring guide are under pressure. The tilt spring and the spring guide may become a projectile. Secure the spring with locking pliers during removal. Secure the spring with locking pliers during installation. Bodily injury may result during removal and installation of the tilt spring and the spring guide. Always use caution during removal and installation of the tilt spring and the spring guide.

4. Remove the steering column tilt spring (1) from the steering column support assembly (2) and from the steering column tilt head assembly (3) by using the following procedure:
    1. Pry up the steering column tilt spring (1) until a bulge occurs and most of the tension is removed.
    2. Secure the steering column tilt spring (1) with locking pliers.
    3. Continue prying up the steering column tilt spring (1) until it disengages from the post on the steering column support assembly (2) and from the steering column tilt head assembly (3).

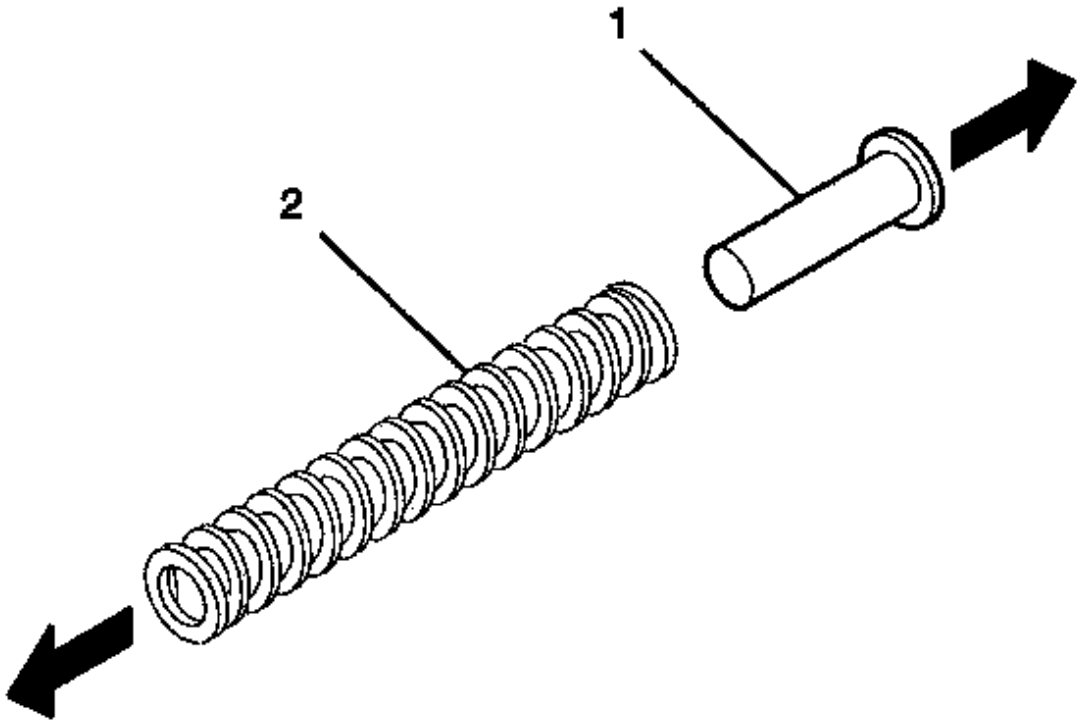

Fig. 51: Identifying Spring Guide Components
Courtesy of GENERAL MOTORS COMPANY

5. Remove the steering column tilt spring guide (1) from the steering column tilt spring (2).

Installation Procedure

1. Tilt the steering column to the UP position.

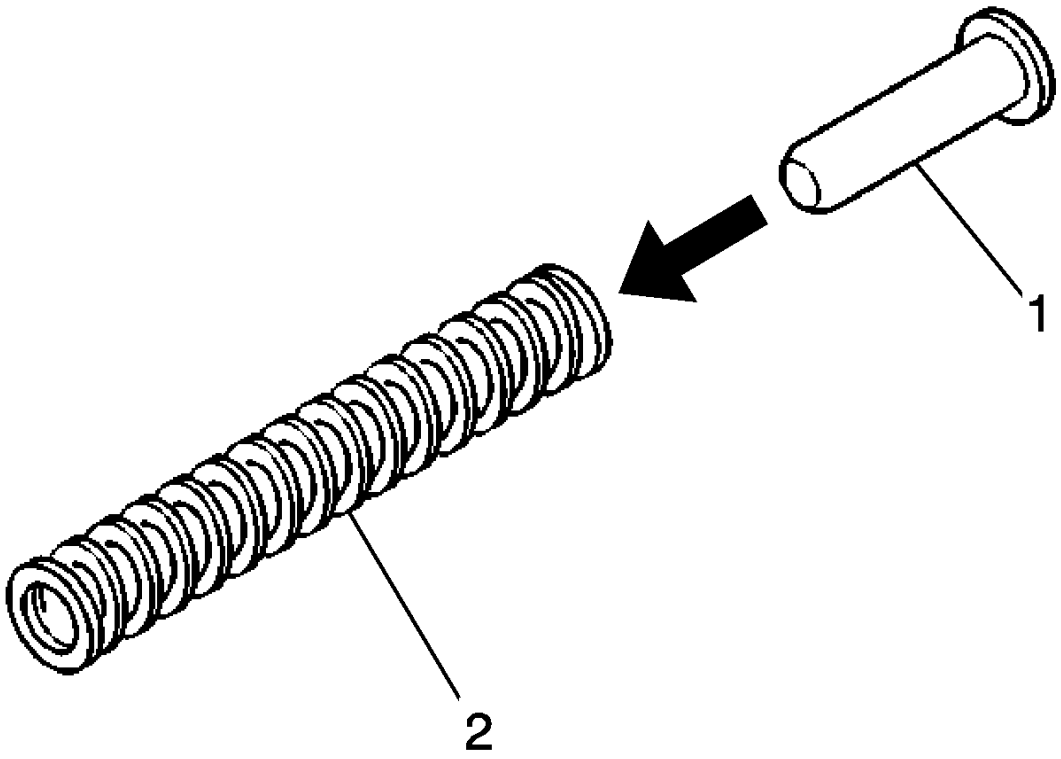

Fig. 52: Spring Guide & Tilt Spring
Courtesy of GENERAL MOTORS COMPANY

2. Install the steering column spring guide (1) into the steering column tilt spring (2).

DESCRIPTION AND OPERATION

STEERING WHEEL AND COLUMN DESCRIPTION AND OPERATION

The steering wheel and column has 4 primary functions:

- Heated Steering Wheel

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Heated Steering Wheel

The heated steering wheel control module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering wheel control module supplies ground to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel. The heated steering wheel temperature is monitored through an internal temperature sensor. When the steering wheel reaches operating temperature the module will cycle the voltage on and off to maintain the operating temperature.

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

Vehicle Security, Found on Some Vehicle Models

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch-location varies
- The steering column lock-content varies
- The ignition cylinder-location varies
- The theft deterrent module-location varies

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on or near the steering wheel or column.

- The turn signal switch
- The hazard switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad/cruise control switch
- The redundant radio/entertainment system controls
- The manual/power tilt or tilt/telescoping functions
- The power pedal adjustment control switch
- The navigation/OnStarÂ® features

- The HVAC controls

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column

The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident. In addition to these features, the following driver safety features may be on the steering column. To inspect the steering column for damage, refer to **Steering Column Accident Damage Inspection**.

Electronic Park Lock (EPL)/Ignition Lock Cylinder Control Actuator

If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an ignition lock cylinder control actuator system in the steering column. The ignition lock cylinder control actuator purpose is to prevent the ignition key from being turned to the OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The column ignition lock system consists of an ignition lock cylinder control actuator, and a park position switch that is located in the automatic transmission shift lock control switch. The ignition lock cylinder control actuator contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the PARK position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

Linear Shift Assembly

If the vehicle is equipped with a column mounted gear shift, it has a linear shift assembly on the steering column. The linear shift assembly has a cable that runs from the linear shift assembly to the ignition lock cylinder case. The purpose of this cable is to prevent the ignition key from being turned to the OFF position when the transmission is in gear and the vehicle may still be moving. The linear shift assembly cable contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the PARK position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

SIR Coil and Module

For additional information on the operation of the SIR coil and module, refer to **Supplemental Inflatable Restraint System Description and Operation** .

Automatic Transmission Shift Lock Actuator

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consists of the following components: the automatic transmission shift lock control solenoid, the automatic transmission shift lock control switch, the body

control module (BCM), the powertrain control module (PCM)/engine control module (ECM). With the ignition in the ON position, voltage is supplied to automatic transmission shift lock control switch. Voltage flows through the normally closed contacts of the automatic transmission shift lock control switch to the automatic transmission shift lock control solenoid. When the BCM receives a class 2 message from the PCM/ECM indicating the transmission is in the park position the BCM then grounds the automatic transmission shift lock solenoid control circuit . This energizes the automatic transmission shift lock control solenoid causing the transmission shift lever to be physically locked in the PARK position. When the brake pedal is pressed the contacts in the automatic transmission shift lock control switch open, de-energizing the automatic transmission shift lock control solenoid. This allows the shift lever to be move out of the PARK position.

Steering Wheel Angle Sensor or Steering Wheel Position Sensor

The steering wheel position sensor is located somewhere along the steering shaft assembly. The sensor measures the position of the steering wheel and the speed at which it is rotated. A signal representing this measurement is provided to the vehicle stability enhancement system (VSES) module. The VSES module uses this signal, along with several others representing different vehicle conditions, to monitor the driving behavior of the vehicle and ensure that it stays in control. If the VSES module determines that the vehicle is out of control it provides signals to the powertrain control module (PCM) and the ABS module. These output signals are used to modulate the transmission torque and brake pressure of each of the vehicles wheels in order to regain control of the vehicle.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - THEFT DETERRENT

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform **Diagnostic System Check - Vehicle** in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following **Theft Systems Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Theft Deterrent System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Content Theft Deterrent Malfunction**
- **Security Indicator Malfunction**

CONTENT THEFT DETERRENT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The content theft deterrent (CTD) system is a software based system in which the body control module (BCM) actively monitors certain inputs to determine if unauthorized vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch, and the hood ajar switch, the BCM determines whether a CTD alarm is warranted. If unauthorized access is being detected, the BCM will pulse the vehicle horn and flash the turn signals as a means of theft deterrence.

Circuit/System Verification

1. Individually open and close each vehicle door while observing the door ajar indicator/message. The indicator/message should accurately transition between the door ajar and door closed state when each door is opened and closed.
    - If the door ajar indicator/message does not properly transition when each door is opened and closed, refer to **Door Ajar Indicator Malfunction** .
2. Open and close the trunk while observing the trunk ajar indicator/message. The indicator/message should accurately transition between the trunk ajar and trunk closed state when the trunk is opened and closed.
    - If the trunk ajar indicator/message does not properly transition when the trunk is opened and closed, refer to **Trunk Ajar Indicator Malfunction** .
3. Completely lower the driver door window and close all vehicle doors.
4. Ignition OFF, arm the CTD system using the keyless entry system by pressing the transmitter LOCK button twice. Verify the scan tool CTD Status parameter displays Armed.
    - If not the specified value, refer to **Remote Control Door Lock Transmitter Learn** .
5. Without disarming the system, reach in through the open driver window, unlock and open the driver door. Verify the scan tool CTD Status parameter displays Alarm Active.
    - If not the specified value, replace the BCM.
6. With the door open, verify the vehicle horn is pulsing and the exterior lamps are flashing.
    - If the horn is not pulsing, refer to **Horns Malfunction** .
    - If the exterior lights are not flashing, refer to **Turn Signal Lamps and/or Indicators Malfunction** .

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

SECURITY INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The security indicator acts as a status indicator for the content theft deterrent (CTD) system when the ignition is

OFF and as a fault indicator for the immobilizer system when the ignition is ON. When either the body control module (BCM) or theft deterrent module (TDM) requires the security indicator to be illuminated, a serial data message is sent to the instrument panel cluster (IPC), which will illuminate the indicator.

DESCRIPTION AND OPERATION

THEFT SYSTEMS DESCRIPTION AND OPERATION

When armed, the content theft deterrent (CTD) system is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorized vehicle entry is detected. However, the CTD system does not affect engine starting.

An unauthorized entry can be any of the following with the CTD system armed:

- Unauthorized entry into the underhood area, if equipped with remote vehicle start
- Unauthorized entry into the rear compartment
- When any door is opened without first being unlocked using the vehicle key or using the UNLOCK command from a keyless entry transmitter
- After a battery reconnect, if the battery was disconnected with the CTD system armed

The components of the CTD system are:

- Body Control Module (BCM)
- Remote Control Door Lock Receiver (RCDLR)
- Security indicator
- Door ajar switches
- Driver door key cylinder switch
- Rear compartment lid ajar switch
- Hood ajar switch (if equipped)

Arming the CTD System

Use the following procedure in order to arm the system:

1. Place the shift lever in P (park).
2. Turn OFF the ignition.
3. Open any door.

IMPORTANT: The system is not armed if the doors are locked manually; the power door lock switch or remote keyless entry transmitter must be used to arm the content theft deterrent (CTD) system.

4. Lock the doors with the power door lock switch or the LOCK button on the transmitter. The system is in standby mode and will not start the arming timer until all doors are closed.
5. The system will begin the arm sequence immediately after the last door is closed. If the keyless entry transmitter is used to arm the system after the vehicle doors are closed, the arm sequence will begin as soon as the LOCK command is received from the transmitter.

Locking the Vehicle Without Arming the CTD System

Locking the vehicle may be accomplished without arming the content theft deterrent (CTD) system. Use of the manual door locks or using the key to lock the doors will lock the vehicle, but will not arm the CTD system.

Disarming an Armed System/Silencing an Alarm

If system arming has been requested by the power door lock switch or the keyless entry transmitter, it must be disarmed.

IMPORTANT: Using the power door unlock switch or manually unlocking the doors does not disable the content theft deterrent (CTD) arm mode. Also, disconnecting the battery or pulling fuses does not disable the arm mode, since the BCM stores the CTD mode status in memory.

- To disarm the CTD system in standby mode, perform one of the following:
  - Press either power door unlock switch.
  - Use the vehicle key to unlock the driver door.
  - Press the UNLOCK button on the keyless entry transmitter.
  - Insert a valid key into the ignition and switch to the ON position.
- To disarm the CTD system in the armed mode (non-event) or when activated (during an alarm event):
  - Use the vehicle key to unlock the driver door.
  - Press the UNLOCK button on the keyless entry transmitter.
  - Insert a valid key into the ignition and switch to the ON position

CTD Circuit Description

The following is a description of each component used in the content theft deterrent (CTD) system:

Body Control Module (BCM)

The CTD system is an internal function of the BCM which utilizes serial data and various switch inputs information to perform CTD functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps. The BCM has 4 basic modes (disarmed, standby, armed, and alarm) for operating the CTD system. The different modes are described below.

1. The BCM has the CTD system in a disarmed mode until the following conditions are detected:
   - Ignition key turned to the OFF position.
   - Doors locked by either the power door lock switch or the LOCK button on the transmitter.
2. The BCM enters the standby mode when the above conditions are detected. If a door was already opened when the arm mode was requested, the standby mode does not start the timer until the last door is closed.
3. When the last door is closed, a 15 second timer is activated. Once the timer has expired, the BCM enters the armed mode. After this delay, any forced entry activates the alarm mode.
4. When the BCM detects a forced entry, the BCM enters the alarm mode. The BCM activates the horns and exterior lamps for 30 seconds. This is followed by a three minute time-out with the horn no longer active. If no new intrusions are detected after the time-out, the horn is not active. The system must be disarmed or the intrusion condition removed after the time-out for the system to exit alarm mode.

Remote Control Door Lock Receiver (RCDLR)

The keyless entry system can arm and disarm the CTD system. When the keyless entry module receives a door lock or unlock signal from the transmitter, the keyless entry module sends a message to the BCM via serial data to perform the appropriate arm/disarm functions.

Security Indicator

The security indicator is illuminated by the instrument panel cluster (IPC) based on information (via serial data) from the BCM for CTD, or theft deterrent module (TDM) for immobilizer. The CTD system uses the security indicator to inform the driver of system status prior to arming. The security indicator on the instrument cluster is controlled by both the CTD system and the immobilizer system.

- The CTD system, integral to the BCM, commands the IPC to control the security indicator only when the ignition switch is OFF. The CTD system uses the indicator to identify system status.
- The immobilizer system, integral to the theft deterrent module (TDM) or the RCDLR when the vehicle has keyless entry, commands the IPC to control the security indicator only when the ignition switch is ON as a malfunction indicator. The immobilizer system is to deter vehicle theft. Refer to **Immobilizer Description and Operation** for more information on the immobilizer system.

Door Ajar Switches

The CTD system uses the door ajar switches as a status indicator to activate the alarm. The door ajar switches are monitored by the BCM via a discrete input from each door ajar switch. If the BCM receives a signal indicating a door is opened when the CTD system is armed, the BCM activates the alarm.

Driver Door Key Cylinder Switch

The CTD system uses the driver door cylinder switch as a means to disarm the CTD system. The BCM receives the status of the driver door cylinder switch based on a discrete input from the switch. When the driver door key cylinder is rotated the CTD system will immediately disarm.

Hood Ajar Switch

The CTD system uses the hood ajar switch as a status indicator to activate the alarm. The BCM monitors the hood ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the hood has been opened when the CTD system is armed, the BCM activates the alarm.

Rear Compartment Lid Ajar Switch

The CTD system uses the rear compartment ajar switch as a status indicator to activate the alarm. The BCM monitors the rear compartment ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the rear compartment has been opened when CTD system is armed, the BCM activates the alarm.

Inputs

The BCM monitors the following inputs for CTD:

- The door ajar switches
- Driver door cylinder switch
- The keyless entry transmitter LOCK/UNLOCK buttons; a serial data message from the RCDLR
- The immobilizer status-The BCM uses the immobilizer status for disarming the system or silencing an alarm when the correct vehicle key is used to start the vehicle
- The rear compartment ajar switch
- The hood ajar switch

Outputs

The BCM controls the following for CTD:

- The horn relay
- The exterior lamps

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0569: SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Error

Circuit/System Description

If the tire type and pressure selection information is not entered with the scan tool during the remote control door lock receiver (RCDLR) setup, the tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete. If equipped, the driver information center (DIC) will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The RCDLR has not undergone the programming procedure.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) flashes for 1 minute and then remains illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays the suspect tire pressure as dashes.
- If equipped, the DIC displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the RCDLR has undergone the tire type and pressure selection setup procedure and 1 ignition cycle has occurred.

Diagnostic Aids

A newly replaced RCDLR will set DTC C0569 after programming on its initial ignition ON cycle if the module setup information has not been entered. The Tire Type and Tire Pressure Selection setup must be performed with the scan tool.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation

Right Rear Low Tire Pressure Sensor

DTC C0765 08

Right Rear Low Tire Pressure Sensor Signal Invalid

Circuit/System Description

The tire pressure monitor (TPM) system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Rolling mode. The remote control door lock receiver (RCDLR) receives and translates the data contained in the tire pressure sensor RF transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 mph), the RCDLR waits for the sensors to go into rolling mode. If one or more sensors do not go into rolling mode, or do not transmit at all, the RCDLR will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 mph).

Conditions for Setting the DTC

- A sensor does not transmit for 18 minutes.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) flashes for 1 minute and then remains illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays the suspect tire pressure as dashes.
- If equipped, the DIC displays a service tire monitor type message.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and 1 ignition cycle occurs.
- The RCDLR automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the TPM special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.
- Aftermarket wheel valve stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed or stray sensor transmissions have been received from other vehicles . Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn**.
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure indicator or display a message on the DIC, if equipped. The sensor battery condition can be verified in the scan tool RCDLR data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need to be replaced. Refer to **Tire Pressure Indicator Sensor Replacement**.

Special Tools

EL-46079/J-46079 Tire Pressure Monitor Diagnostic Tool

Circuit/System Verification

1. Using the **EL-46079/J-46079** tool , activate each tire pressure sensor and record each sensors transmission data and physical location. Verify **EL-46079/J-46079** tool displays the 8-digit ID number, accurate tire pressure Â±27.6 kPa (4 psi), Learn Mode, and at least a 1/4 graph signal strength displayed.

- If any of the parameters listed above are not displayed, replace the suspect tire pressure sensor.

2. With the scan tool, verify tire pressure sensors ID and locations displayed on the scan tool match the IDs and locations recorded from the special tool.
   - If the IDs and locations do not match, perform the **Tire Pressure Indicator Sensor Learn**.
3. Enable the TPM learn mode. Use the **EL-46079/J-46079** tool in simulate mode to learn 4 simulated sensor transmissions into the RCDLR. Verify that all 4 simulated sensor locations, IDs, and tire pressures displayed on the TPM special tool match the corresponding scan tool parameters displayed.
   - If the scan tool does not match, replace the RCDLR.
4. Test drive the vehicle above 40 km/h (25 mph) for greater than 2 minutes. With the scan tool, observe the suspect Pressure Sensor Mode data parameter. Verify the sensor mode changes to Rolling.
   - If the Pressure Sensor Mode does not change, replace the suspect tire pressure sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for RCDLR replacement, programming, and setup

DTC C0775: LOW TIRE PRESSURE SYSTEM SENSORS NOT LEARNED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0775

Low Tire Pressure System Sensors Not Learned

Circuit/System Description

If the tire pressure sensor learn procedure has not been performed, the tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete. If equipped, the driver information center (DIC) will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The remote control door lock receiver (RCDLR) has not undergone the tire pressure sensor learn procedure.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the RCDLR has undergone the tire pressure sensor learn procedure and 1 ignition cycle has occurred.

Diagnostic Aids

A newly replaced RCDLR will set DTC C0775 on its initial ignition ON cycle. The tire pressure sensor learn procedure must be performed.

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the **Diagnostic System Check - Vehicle** , before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Tire Pressure**

Monitor Description and Operation.

Visual/Physical Inspection

- Inspect if tires are inflated per placard values.
- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Low Tire Pressure Indicator Malfunction** in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The remote control door lock receiver (RCDLR) receives a radio frequency (RF) transmission from each tire pressure sensor. Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the RCDLR memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the RCDLR continuously compares IDs in received transmission to its learned IDs to determine if all 4 sensors are present. If the RCDLR detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument panel cluster (IPC) requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center (DIC), if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the IPC bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** , . If the tire pressure monitor indicator icon flashes for 1 minute after the IPC bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the **Diagnostic System Check - Vehicle** to proceed with the proper diagnosis.
- Temperature can greatly effect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to turn ON. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon .
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment

wheels. When using the TPM special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.

- Aftermarket wheel value stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed or stray sensor transmissions have been received from other vehicles. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn**.

Special Tools

J 46079 Tire Pressure Monitor Diagnostic Tool

Circuit/System Verification

NOTE: **Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the IPC bulb check is completed. If equipped with a DIC, a check tire pressure type message will also be displayed. It is not necessary to perform the Learn procedure for a low tire condition.**

When a TPM DTC is set, the tire pressure monitor indicator icon will flash for 1 minute after the IPC bulb check is completed and then remains illuminated. If equipped with a DIC, a service tire monitor type message will also be displayed.

1. Verify all tires are inflated to the proper pressure Â±10%. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
    - If not within the specified range, adjust all tire pressures to specification and drive the vehicle over 40 km/h (25 mph) for greater than 2 minutes. Verify the tire pressure monitor indicator icon is OFF.
2. Using the **J 46079** tire pressure monitor diagnostic tool , activate each B2 Tire Pressure Sensor and record each sensor tire pressure reading. Check the tire pressures with a known accurate hand held tire pressure gauge. Verify that the pressure readings from the special tool do not differ more than 27.6 kPa (4 psi) from the actual tire pressure readings.
    - If not within the specified range, replace the appropriate B2 Tire Pressure Sensor.
3. Using a scan tool, enable the TPM learn mode. Use the **J 46079** tire pressure monitor diagnostic tool in simulate mode to learn 4 simulated sensor transmissions into the RCDLR. Observe tire pressures in the scan tool data display. Verify the simulated tire pressures do not differ more than +/-27.6 kPa (4 psi) of the scan tool reading.
    - If not within the specified range, replace the RCDLR.
4. Using a scan tool, perform the instrument panel special functions Lamp Test. Command the instrument panel warning lamps ON and OFF. Verify the tire pressure monitor indicator icon turns ON and OFF.
    - If the tire pressure monitor icon does not turn ON and OFF, replace the IPC.
5. Ignition ON, use the scan tool to setup the Tire Type/Pressure Selection in the RCDLR Module Setup menu. Refer to the **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . Drive the vehicle over 40 km/h (25 mph) for greater than 2 minutes. Verify the tire pressure monitor indicator icon is OFF.
    - If the tire pressure monitor indicator icon is ON, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for IPC or RCDLR replacement, setup, and programming

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise the vehicle on a suitable support. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire/wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation** .
3. Dismount the tire from the rim. Refer to **Tire Dismounting and Mounting** .

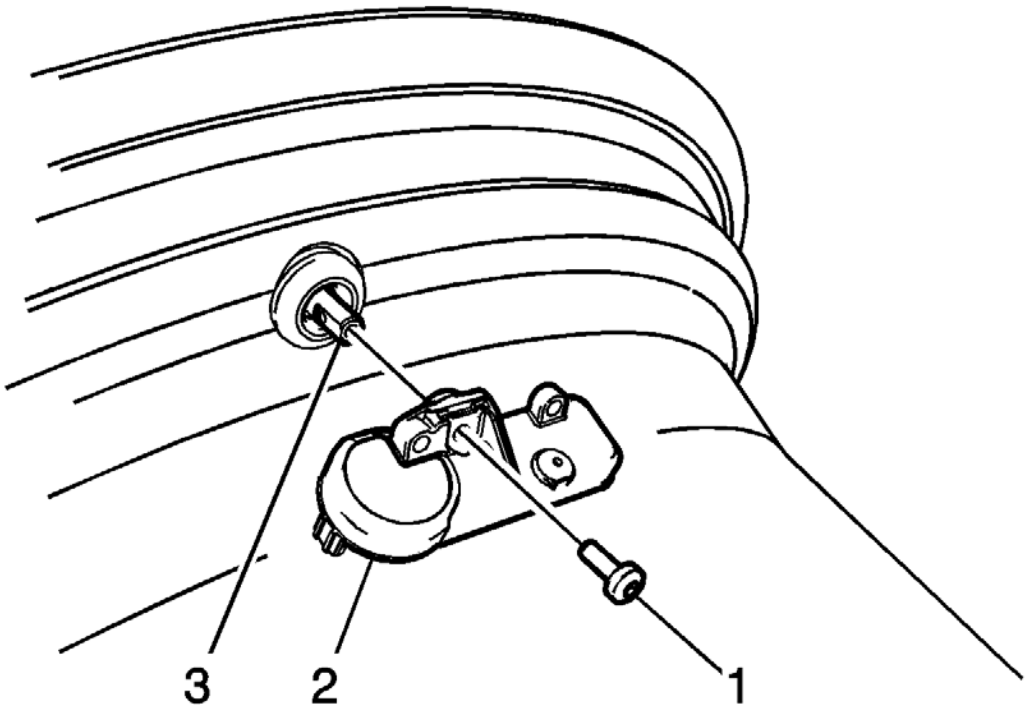

Fig. 1: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When servicing the tire pressure sensor always use a new SchraderÂ® tire pressure monitor (TPM) and a new TORX screw during installation.**

4. Remove the TORX screw (1) from the tire pressure sensor (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: **Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.**

5. Remove the tire pressure valve stem by pulling it through the rim.

Installation Procedure

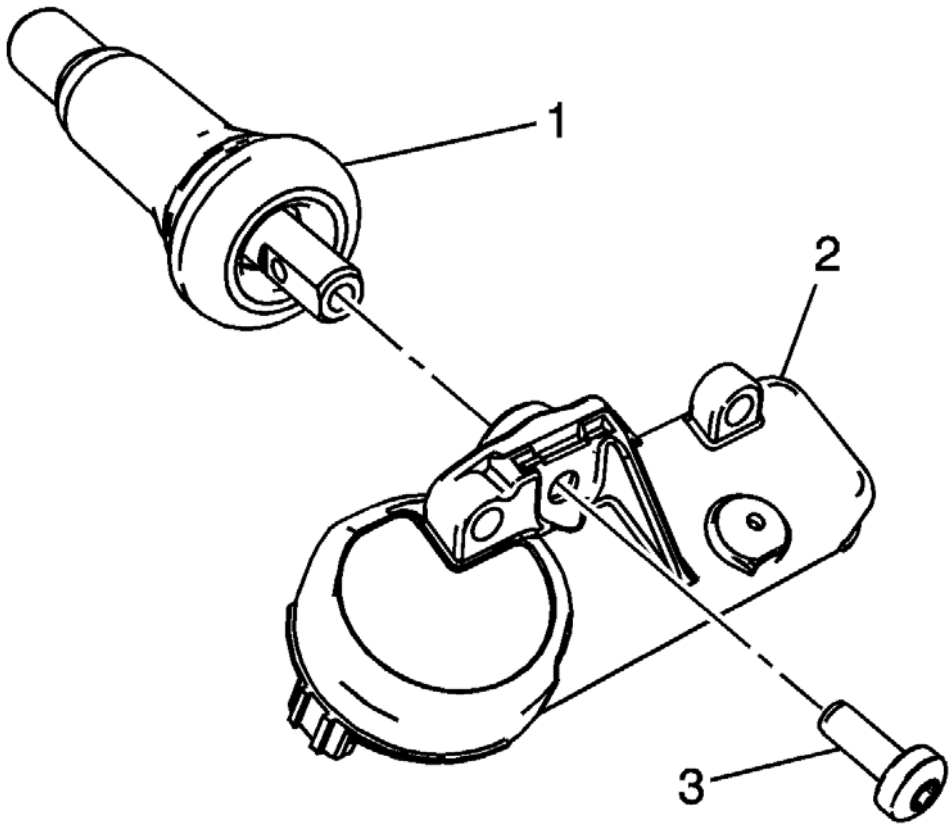

Fig. 2: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

NOTE:

- **Ensure the flat of the valve, lines up with the flats of the snap in the enclosure.**
- **TPM valves and TORX screws are one-time use only.**

1. Assemble the tire pressure sensor (2) to the valve stem and install the new TORX screw (3) and tighten to 1.3 N.m (11.5 lb in).

NOTE: **Use and approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A corrosive type compound can cause tire or rim deterioration.**

2. Apply tire soap to the rubber portion of the valve stem (1).

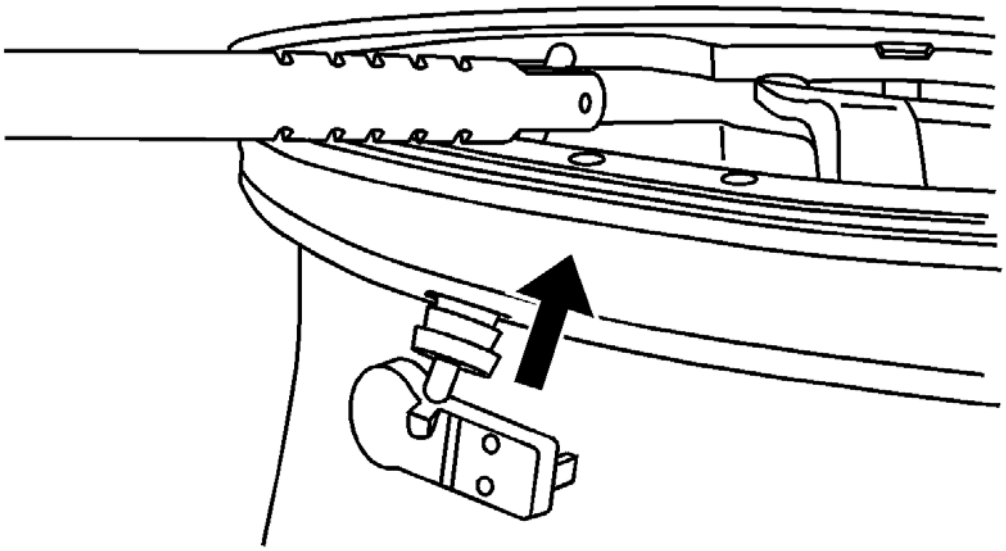

Fig. 3: View Of Tire Valve Stem Mounting Tool
Courtesy of GENERAL MOTORS COMPANY

3. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

NOTE: **Snap Fit TPM sensors are still shipped in the OFF mode. However, the TPM no longer needs to be spun to remove it from the OFF mode. The sensor will exit its OFF state when the tire is inflated. The technician can then program the vehicle as normal.**

4. Mount the tire to the rim. Refer to **Tire Dismounting and Mounting** .
5. Install the tire/wheel assembly on the vehicle. Refer to **Tire and Wheel Removal and Installation** .
6. Lower the vehicle.
7. Learn the tire pressure sensors. Refer to **Tire Pressure Indicator Sensor Learn**.

TIRE PRESSURE INDICATOR SENSOR LEARN

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool

or

- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to **Special Tools**.

Learn Mode Description

The tire pressure monitor (TPM) system uses the instrument panel cluster (IPC), body control module (BCM), remote control door lock receiver (RCDLR), keyless entry transmitter, 4 radio frequency transmitting pressure sensors, and the serial data circuit to perform the TPM learn mode functions. The sensor learn procedure must be performed after every tire rotation, RCDLR replacement, or sensor replacement. Once the learn mode has been enabled, each of the sensors unique identification codes can be learned into the RCDLR memory. When a sensor ID has been learned, the RCDLR sends a serial data message to the BCM to sound a horn chirp. This verifies the sensor has transmitted its ID and the RCDLR has received and learned it. The RCDLR must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the TPM special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in learn mode. When the RCDLR receives a learn mode transmission while in TPM learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the RCDLR memory.
- If equipped, the DIC will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the learn procedure to be repeated for the system to function properly.

TPM Learn Procedure

NOTE: **In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.**

TPM Learn Enable Methods

1. Ignition ON, initiate the TPM Learn Mode using one of the following procedures:
    - Using a scan tool, initiate the TPM Learn Mode. A double horn chirp will sound indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.
    - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. The left

front turn signal will also be illuminated.

- On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.

2. Starting with the left front tire, active the sensor by holding the antenna of the TPM special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the Activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.
3. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 2 for the remaining 3 sensors in the following order:
    1. Right front
    2. Right rear
    3. Left rear
4. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the RCDLR exits the learn mode.

DESCRIPTION AND OPERATION

TIRE PRESSURE MONITOR DESCRIPTION AND OPERATION

The tire pressure monitor (TPM) system warns the driver when a significant loss, or gain of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center (DIC).

The system uses the body control module (BCM), driver information center (DIC), instrument panel cluster (IPC), remote control door lock receiver (RCDLR), a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with a 10 year service life.

When the vehicle is stationary, the sensors internal accelerometer is inactive, which puts the sensors into a stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into rolling mode. In this mode, the sensors sample tire pressure once every 30 seconds and transmit in rolling mode once every 60 seconds. The RCDLR receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure. The RCDLR sends the tire pressure and tire location data to the DIC via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in re-measure mode if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a stationary or rolling state. When the TPM system detects a significant loss, or gain of tire pressure, the tire pressure monitor indicator icon is illuminated on the IPC and if equipped, a check tire pressure type message is displayed on the DIC. Both the indicator icon and DIC message can be cleared by adjusting the tire pressures to the recommended kPa/psi and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the RCDLR or if the vehicle battery is disconnected each TPM sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the RCDLR cannot assume that the tire

pressures were maintained over an unknown period of time. If equipped, the DIC will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the DIC to display the current tire pressures. The Tire Pressure Monitor Diagnostic Tool special tool or the pressure increase/decrease method may also be used to activate the sensors as well.

The RCDLR has the ability to detect malfunctions within the TPM system. In the event a DTC is set, the tire pressure monitor indicator icon on the IPC will flash for 1 minute and then remain illuminated after the ignition is turned ON and the IPC bulb check has been completed. Any malfunction detected will cause the DIC to display a service tire monitor system type message. For more information on other functions of the RCDLR, refer to **Keyless Entry System Description and Operation** .

2. High Speed Wipers Inoperative
3. Wipers Do Not Park
4. Wipers Always ON
5. Wiper Park Switch never ON
6. Wiper Park Switch always ON

Circuit/System Description

The body control module (BCM) monitors the control circuit of the WIPER PCB Relay. The voltage level should be low while the wiper relay is de-energized and near system voltage when the relay is energized. After the BCM receives a low, intermittent, or mist signal from the wiper/washer switch, it responds by applying

battery voltage through the wiper relay control circuit to the coil side of the relay, energizing the relay. Ground is supplied at all times to the coil side of the WIPER relay from G200.

Conditions for Running the DTC

This DTC can set only when the output is actively being requested by the BCM.

Conditions for Setting the DTC

If the BCM detects a short to ground in the wiper relay control circuit.

Action Taken When the DTC Sets

The BCM will not activate the output.

Conditions for Clearing the DTC

- The current DTC will become history when the request for the output is removed or when the condition for setting the fault is corrected.
- The history DTC will clear after 50 consecutive ignition cycles without a fault present.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X2 harness connector at the X50A underhood fuse block, ignition ON. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal B1 and ground.

- **If greater than 10 Ω**

1. Test for less than 2 Ω in the ground circuit end to end.
    - If greater than 2 Ω, repair the open/high resistance in the circuit.
    - If less than 2 Ω, repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Connect a test lamp between the control circuit terminal A1 and ground.
4. Verify the test lamp turns ON and OFF while commanding the Wiper Relay ON and OFF with a scan tool.
    - **If test lamp always OFF**

    1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If greater than 2 Ω, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 body control module.

    - **If test lamp always ON**

    1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If greater than 1 V, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K9 body control module.

    - **If test lamp turns ON and OFF**

5. Test or replace the underhood fuse block.

DTC B3873: FRONT WASHER RELAY CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3873 01

Front Washer Relay Control Circuit short to voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windshield Wiper Switch Signal	B3922 02	1	1	-
Windshield Washer Relay Control	-	1	B3873 01	-
Windshield Washer Fluid Pump Control	1	1	2	-
Windshield Wiper Switch Low Reference	-	1	-	-
Windshield Washer Pump Ground	-	1	-	-
1. Washers Inoperative 2. Washers Always ON				

Circuit/System Description

The windshield washer function is controlled by the body control module (BCM). When the washer switch is pressed, ground is applied through the switch contacts and the signal circuit to the BCM indicating the wash request. The BCM then applies ground through the control circuit to the coil side of the WS WASH relay energizing the relay. With the relay energized, battery voltage from the WPR fuse is applied through the switch contacts of the relay, the WSW fuse and the control circuit to the windshield washer fluid pump.

Conditions for Running the DTC

This DTC can set only when the output is actively being requested by the BCM.

Conditions for Setting the DTC

This DTC sets if the BCM detects a short to ground in the wiper high speed relay control circuit.

Action Taken When the DTC Sets

The BCM will not activate the output.

Conditions for Clearing the DTC

- The current DTC will become history when the request for the output is removed or when the condition for setting the fault is corrected.
- The history DTC will clear after 50 consecutive ignition cycles without a fault present.

Control Module References for Scan Tool Information

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block, ignition ON.
2. Connect a test lamp between the control circuit terminal C1 and battery voltage.
3. Verify the test lamp turns ON and OFF when commanding the Wiper High Speed Wiper ON and OFF with a scan tool.
    - **If test lamp is always OFF**
    1. Ignition OFF, remove the X5 harness connector from the K9 body control module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.

- If greater than 1 V, repair the short to voltage in the circuit.
- If less than 1 V

3. Ignition OFF.
4. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 body control module.

- **If test lamp is always ON**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground in the circuit.
    - If infinite resistance, replace the K9 body control module.

- **If test lamp turns ON and OFF**

4. Test or replace the underhood fuse block.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC B3922: WINDSHIELD WIPER LOW SPEED SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3922 02

Windshield Wiper Low Speed Signal Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windshield Wiper Switch Signal terminal L	B3922 02	1	1	-
Windshield Wiper Switch Signal terminal K	4	2	2	-
Windshield Wiper Relay Control	B3715 02	1, 2	4	-
Windshield Wiper High Speed Control Relay Control	B3875 02	2	B3875 01	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windshield Wiper Motor Control terminal D	2	2	4	-
Windshield Wiper Motor Control terminal C	1	1	4	-
Windshield Wiper Park Signal	6	5	-	-
Windshield Wiper Switch Low Reference	-	1, 2	1, 2	-
Windshield Wiper Motor Ground	-	1, 2, 3	-	-
Windshield Wiper Relay Ground	-	1, 2	-	-
1. Delay or Low Speed Wipers Inoperative 2. High Speed Wipers Inoperative 3. Wipers Do Not Park 4. Wipers Always ON 5. Wiper Park Switch never ON 6. Wiper Park Switch always ON				

Circuit/System Description

The body control module (BCM) monitors the windshield wiper switch low signal circuit. When the wiper switch is place in the low position, battery voltage is applied through the switch contacts, a series of resistors, and the wiper switch low signal circuit to the BCM. The BCM then applies battery voltage through the wiper relay control circuit to energize the WPR Relay. When energized, battery voltage from the WPR Fuse is applied through the switch side of the WPR relay then through the switch side of the WPR HI relay to the windshield wiper motor.

Conditions for Running the DTC

The ignition switch is in the ON position.

Conditions for Setting the DTC

The BCM detects a short to ground on the windshield wiper switch low signal circuit.

Action Taken When the DTC Sets

- The BCM will not activate the low speed output.
- The windshield wipers will only operate in the high speed mode.

Conditions for Clearing the DTC

- The DTC will clear the current status when the condition for setting the fault is corrected.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for Scan Tool Information

Circuit/System Testing

1. Ignition OFF, disconnect the X3 harness connector at the turn signal/multifunction switch, ignition ON.
2. Verify a test lamp illuminates between the low reference circuit terminal H and B+.
    - **If test lamp does not illuminate**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 body control module.
    - **If test lamp does illuminate**
3. Verify the scan tool Windshield Washer Switch parameter is not Active.
    - **If Active**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite , repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 body control module.
    - **If not Active**
4. Install a 3 A fused jumper wire between the signal circuit terminal L and the low reference circuit terminal H.
5. Verify the scan tool Windshield Washer Switch parameter is Active.
    - **If not Active**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite , repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 body control module.

- **If Active**

6. Test or replace the turn signal/multifunction switch.

Component Testing

IMPORTANT: If the switch tests open in any switch position other than Off, test the wiper/washer switch signal circuits for a short to voltage before replacing the switch.

Wiper Switch Values

Switch Position	Resistance
Off	Infinite
Mist	300-364 Ω
Delay 1	3.48K-4.25K Ω
Delay 2	2.52K-3.08K Ω
Delay 3	1.78K-2.18K Ω
Delay 4	1.17K-1.44K Ω
Delay 5	697-851 Ω
Low	300-364 Ω

Multifunction Switch

1. Ignition OFF, disconnect the X3 harness connector at the turn signal/multifunction switch.
2. Rotate the wiper switch and compare the resistance readings to the values in the Windshield Wiper Switch Values table above for MIST, each DELAY and LOW speed.
3. Verify the correct resistance readings between signal circuit terminal L and low reference circuit terminal H.
    - **If the resistance values are not within the specified range**

      Replace the turn signal/multifunction switch.

    - **If the resistance values are within the specified range**
4. Test for infinite resistance between signal circuit terminals L and K while rotating the wiper switch to MIST, each DELAY and LOW speed positions.
    - **If the less than infinite**

      Replace the turn signal/multifunction switch.

    - **If infinite resistance**
5. Test for less than 5 Ω of between the signal circuit terminal K and low reference circuit terminal H.
    - **If greater than 5 Ω**

Replace the turn signal/multifunction switch.

- **If less than 5 Ω**

6. Test for infinite resistance between signal circuit terminals J and low reference circuit terminal H.
   - **If less than infinite**

     Replace the turn signal/multifunction switch.

   - **If infinite resistance**

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Turn Signal Multifunction Switch Replacement**
- **Control Module References** for BCM replacement, setup, and programming

SYMPTOMS - WIPER/WASHER SYSTEMS

The following steps must be completed before using the symptom tables:

IMPORTANT:

1. Perform the **Diagnostic System Check - Vehicle** , in order to verify that all of the following conditions are true.
   - No DTCs are set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Wiper/Washer System Description and Operation**.

Visual/Physical Inspection

- Inspect the washer fluid reservoir for the proper fluid level and condition.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for aftermarket devices which could affect the operation of the Windshield Wiper/Washer System.

Intermittent

- If the wipers operate at low speed for approximately 3 seconds and then stop, the wiper motor park switch, or its signal circuit, may be malfunctioning.
- Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Windshield Wiper System Malfunction**
- **Low Washer Fluid Indicator Malfunction**

- **Washer Malfunction**

WINDSHIELD WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Front Wiper Relay Ground	-	1	-	-
1. Delay or Low Speed Wipers Inoperative 2. High Speed Wipers Inoperative 3. Wipers Do Not Park 4. Wipers Always ON				

Circuit/System Description

Wiper Mist, Delay 1-5, and Low are all low speed wiper motor functions that are controlled by the body control module (BCM). When the wiper switch is placed in one of the Low speed wiper modes, ground is applied through the switch contacts a series of internal resistors and the wiper switch low signal circuit to the BCM. In response to this signal, the BCM energizes the Wiper Relay by applying battery voltage through the wiper relay control circuit to the coil side of the relay. This allows battery positive voltage from the WPR fuse to flow through the switch input side of the wiper relay and out to the switch input side of the WIPER HIGH relay. Since the wiper high relay is de-energized and its switch contacts are normally closed to the low speed control

circuit of the windshield wiper motor, the motor will operate at low speed.

When the wiper switch is placed in the High speed position, ground is applied through the switch contacts and the wiper switch high signal circuit to the BCM indicating the wiper high speed request. The BCM then energizes WIPER relay as stated above and the WIPER HIGH relay by applying ground through the control circuit to the coil side of the relay. With the wiper high relay energized and its switch contacts closed to the high speed control circuit of the wiper motor, the motor will operate at high speed.

Diagnostic Aids

- A short to ground in the following circuits will open the WPR fuse:
  - Windshield wiper motor relay coil supply voltage
  - Windshield wiper motor low speed control
  - Windshield wiper motor high speed control
- A short to B+ on any of the wiper/washer switch signal circuits will open the ground trace in the wiper switch.

- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the windshield wipers operate when commanding the Windshield Wipers ON with a scan tool.
   - **If Wipers Do Not Operate**
   1. Verify the solenoid in the relays listed below turn on and off/clicks when commanding the Windshield Wipers ON and OFF with a scan tool.

- KR12B Windshield Wiper Relay
- KR12C Windshield Wiper Speed Control Relay
- If the solenoid does not turn on and off/clicks, refer to Circuit/System Testing - Windshield Wiper Dual Relays Test.
- If the solenoid does turn on and off/clicks

2. Verify the scan tool Windshield Wiper Switch parameter changes between OFF, LOW, and HIGH while turning the wiper switch to the OFF, LOW, and HIGH positions.
   - If the parameter does not change between OFF, LOW, and HIGH, refer to Circuit/System Testing - Windshield Wiper/Washer Switch Circuit Test.
   - If the parameter does change between OFF, LOW, and HIGH, Refer to, refer to Circuit/System Testing - Windshield Wiper Motor Circuit Test.

- **If Wipers Operate**

3. Verify the scan tool Windshield Wiper Switch parameter changes between OFF, LOW, and HIGH while turning the wiper switch to the OFF, LOW, and HIGH positions.
   - **If the parameter does not change between OFF, LOW, and HIGH**

     Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Circuit Test.

   - **If the parameter does change between OFF, LOW, and HIGH**
4. Verify the scan tool Windshield Wiper Switch parameter cycles from Delay 1 through Delay 5 while cycling through the INT delay adjustment positions with the wiper switch.
   - **If the parameter does not change from Delay 1 through Delay 5**

     Replace the S82 windshield wiper/washer switch.

   - **If the parameter changes from Delay 1 through Delay 5**
5. Verify the body control module Wiper Park Switch parameter is Active when the wipers are parked and Inactive when the wipers are ON or out of the park position.
   - **If the parameter is always Active or Inactive or the wipers do not park**

     Refer to Circuit/System Testing - Windshield Park Circuit Test.

   - **If the parameter changes between Active and Inactive and the wipers park**
6. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 windshield wiper/washer switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal H and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K9 body control module.
   2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K9 body control module.

- **If less than 10 Ω**

3. Ignition ON.
4. Verify the scan tool Windshield Wiper Switch parameter is Off.
    - **If not Off**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for infinite resistance between the signal circuit terminal L and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 body control module.
    - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal L and the low reference circuit terminal H.
6. Verify the scan tool Windshield Wiper Switch parameter is On.
    - **If not On**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 body control module.
    - **If On**
7. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.
    - **If not Inactive**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for infinite resistance between the signal circuit terminal K and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 body control module.
    - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal K and the low reference circuit terminal H.
9. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.
    - **If not Active**
    1. Ignition OFF, disconnect the harness connector at the K9 body control module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K9 body control module.

- **If Active**

10. Test or replace the S82 windshield wiper/washer switch.

Windshield Wiper Motor Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the M75 Windshield Wiper Motor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal A and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Connect a test lamp between the control circuit terminal D and the ground circuit terminal A .
5. Verify the test lamp turns ON and OFF when commanding the LOW speed wipers ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, test or replace the KR12C windshield wiper speed control relay.
   - **If the test lamp is always ON**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, test replace the KR12C windshield wiper speed control relay.
   - **If the test lamp turns ON and OFF**
6. Connect a test lamp between the B+ circuit terminal C and the ground circuit terminal A.
7. Verify the test lamp turns ON and OFF when commanding the HIGH speed wipers ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Ignition OFF.
4. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the KR12B windshield wiper relay.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, test or replace the KR12B windshield wiper relay.

- **If the test lamp turns ON and OFF**

8. Test or replace the M75 windshield wiper motor.

Wiper Park Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the M75 windshield wiper motor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal A and ground.
    - **If 10 Ω or greater**

    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ωor greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.

    - **If less than 10 Ω**

3. Ignition ON.
4. Verify the scan tool Windshield Wiper Park Switch parameter is Active.
    - **If not Active**

    1. Ignition OFF, disconnect the harness connector at the K9 body control module.
    2. Test for infinite resistance between the signal circuit terminal B and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 body control module.

    - **If Active**

5. Install a 3 A fused jumper wire between the signal circuit terminal B and the ground circuit terminal A.
6. Verify the scan tool Windshield Wiper Park Switch parameter is Inactive.
    - **If not Inactive**

    1. Ignition OFF, disconnect the harness connector at the K9 body control module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 body control module.
- **If Inactive**

7. Test or replace the M75 windshield wiper motor.

Windshield Wiper Dual Relays Test

1. Ignition OFF and all vehicle systems OFF, disconnect the KR12B Windshield Wiper Relay and the KR12C Windshield Wiper Speed Control Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuits listed below and ground.
    - Terminal 87A at the KR12B Windshield Wiper Relay
    - Terminal 86 at the KR12C Windshield Wiper Speed Control Relay
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuits listed below and ground.
    - Terminal 87 at the KR12B Windshield Wiper Relay
    - Terminal 85 at the KR12C Windshield Wiper Speed Control Relay
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the B+ circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the B+ circuits and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the B+ circuits and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the X50A underhood fuse block.
    - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85 at the

KR12B Windshield Wiper Relay.

6. Verify the test lamp turns ON and OFF when commanding the Windshield Wipers ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
7. Connect a test lamp between the control circuit terminal 85 and the ground circuit terminal 86 at the KR12C Windshield Wiper Speed Control Relay.
8. Verify the test lamp turns ON and OFF when commanding the Windshield Wipers ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
9. Ignition OFF, reconnect the KR12C Windshield Wiper Speed Control Relay and KR12B Windshield Wiper Relay.
10. Disconnect the X4 Harness connector at the K9 Body Control Module, ignition ON.
11. Connect a 3 A fused jumper wire between B+ and the control circuit terminal 16 at the KR12B

Windshield Wiper Relay.

12. Verify the M75 Windshield Wiper Motor is activated.
    - **If the M75 Windshield Wiper Motor does not activate**
    1. Ignition OFF, disconnect the KR12C Windshield Wiper Speed Control Relay and KR12B Windshield Wiper Relay.
    2. Test for less than 2 Ω in the control circuit between control circuit terminal 30 at the KR12C Windshield Wiper Speed Control Relay and the control circuit terminal 30 at the KR12B Windshield Wiper Relay.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Reconnect the KR12B Windshield Wiper Relay and the X4 harness connector at the K9 Body Control Module.
    4. Connect a test lamp between the control circuit terminal 30 and the control circuit terminal 87 at the KR12C Windshield Wiper Speed Control Relay, ignition ON.
    5. Verify the test lamp illuminates when commanding the Windshield Wipers ON.
        - If test lamp does not illuminate, test or replace the KR12C Windshield Wiper Speed Control Relay.
        - If test lamp illuminates, KR12B Windshield Wiper Relay.
    - **If the M75 Windshield Wiper Motor does activate**
13. All OK.

Component Testing

Relay Test

1. Ignition OFF, disconnect the appropriate relay.
2. Test for 60-200 Ω between terminals 85 and 86.
    - **If less than 60 or greater than 200**

      Replace the relay.

    - **If between 60-200 Ω**
3. Test for infinite resistance between the terminals listed below:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - **If less than infinite resistance**

      Replace the relay.

    - **If infinite resistance**
4. Test for less than 5 Ω between terminals 30 and 87A.

- **If 5 Ω or greater**

  Replace the relay.

- **If less than 5 Ω**

5. Install a 10 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
6. Test for less than 5 Ω between terminals 30 and 87.
   - **If 5 Ω or greater**

     Replace the relay.

   - **If less than 5 Ω**
7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Turn Signal Multifunction Switch Replacement**
- **Windshield Wiper Motor Replacement**
- **Accessory Wiring Junction Block Replacement**
- **Control Module References** for BCM replacement, setup, and programming

LOW WASHER FLUID INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Washer Fluid Indicator Signal	1	2	-	-
Windshield Washer Fluid Level Switch Ground	-	1	-	-
1. Low washer fluid indicator inoperative 2. Low washer fluid indicator always on				

Circuit/System Description

The low washer fluid indicator is located in the instrument cluster. Ground is applied at all times to the windshield washer fluid level switch and the low washer fluid indicator signal circuit to the instrument cluster. When the washer fluid is low, the switch opens and ground is removed from the low washer fluid indicator signal circuit to the instrument cluster. The instrument cluster then displays the Low Washer Fluid Level

message.

Scan Tool Reference

Control Module References for Scan Tool Information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Washer Fluid Level Switch parameter changes between On and Off when filling or depleting the windshield washer reservoir.
    - **If the parameter does not change**

      Refer to Circuit/System Testing

    - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B118B Windshield Washer Fluid Level Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal B and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, repair the open/high resistance in the ground connection.
- **If less than 10 Ω**

3. Ignition ON.
4. Verify the scan tool Washer Fluid Level Switch parameter is Off.
   - **If not Off**
   1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster.
   2. Test for infinite resistance between the signal circuit terminal A and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the P16 Instrument Cluster.
   - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal A and the ground circuit terminal B.
6. Verify the scan tool Washer Fluid Level Switch parameter is On.
   - **If not On**
   1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the P16 Instrument Cluster.
   - **If On**
7. Test or replace the B118B Windshield Washer Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Windshield Washer Solvent Level Switch Replacement**
- **Control Module References** for Instrument cluster replacement, setup, and programming

WASHER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windshield Washer Switch	2	1	3	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal				
Windshield Washer Pump Control	1	1	2	-
Windshield Washer Relay Control	2	1	B3873 00	-
Windshield Washer Pump Ground	-	1	-	-
Windshield Wiper Switch Ground	-	3	-	-
1. Washers Inoperative 2. Washers Always On 3. Windshield Wiper System Malfunction				

Circuit/System Description

The windshield washer function is controlled by the body control module (BCM). When the washer switch is pressed, ground is applied through the switch contacts and the signal circuit to the BCM indicating the wash request. The BCM then applies ground through the control circuit to the coil side of the WS WASH relay energizing the relay. With the relay energized, battery voltage is applied through the switch contacts of the relay, the WSW fuse, and the control circuit to the windshield washer fluid pump.

Control Module References for Scan Tool Information

Circuit/System Testing

Washers Inoperative Starting Point

Ignition ON, with a test lamp connected to ground, probe each of the test points on the WSW fuse while activating the Windshield Washer Switch. The test lamp should illuminate at one or both of the fuse test points.

- If the test lamp does not illuminate at either test point, refer to the Washer Switch Test .
- If the test lamp illuminates, refer to the Washer Fluid Pump Test.

Washer Switch Test

1. Ignition ON, observe the scan tool Windshield Washer Switch parameter while pressing the Washer Switch. The reading should change between Inactive and Active.
    - If not Active, test the following:
    - Perform the multifunction switch component test.
    - Test the windshield washer switch signal circuit for an open/high resistance. If the washer switch and circuit test normal, test or replace the body control module.
2. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
3. Connect a test lamp between the washer relay control circuit terminal H6 and battery voltage.
4. Ignition ON, command the Wiper Washer Motor ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always OFF, test the control circuit terminal H6 for a short to voltage or an open/high resistance. If the circuit tests normal, replace the body control module.
5. If all circuits test normal, test or replace the underhood fuse block.

Washer Fluid Pump Test

1. Ignition OFF, disconnect the harness connector at the windshield washer fluid pump.
2. Test for less than 1 ohm of resistance between the ground circuit terminal B and ground.
    - If greater than 1 ohm, repair the ground circuit for an open/high resistance.
3. Connect a test lamp between the washer pump control circuit terminal A and ground.
4. Ignition ON, command the Wiper Washer Motor ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp does not illuminate, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the underhood fuse block.
5. If all the circuits test normal, test or replace the windshield washer fluid pump.

Washers Always On

1. Remove the WSW fuse from the underhood fuse block. The washer pump should turn OFF.
    - If the washer pump does not turn OFF, repair the short to voltage on the washer pump control circuit.
2. Ignition ON, verify the scan tool Windshield Washer Switch parameter is Inactive.
    - If not Inactive, test the following:
    - Perform the multifunction switch component test.

- Test the windshield washer switch signal circuit for a short to ground. If the washer switch and circuit test normal, replace the body control module.

3. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
4. Ignition ON, verify that a test lamp does not illuminate between the windshield washer relay control circuit terminal H6 and battery voltage.
    - If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the body control module.
5. If all circuits test normal, test or replace the underhood fuse block.

Component Testing

Multifunction Switch

1. With the ignition OFF, disconnect the X3 harness connector at the turn signal/multifunction switch.
2. Test the resistance between terminals H and L. Rotate the wiper switch and compare the resistance readings to the values in the Windshield Wiper Switch Values table below for MIST, each DELAY and LOW speed.
    - If the resistance is not within the specified range, replace the turn signal/multifunction switch.
3. Test for infinite resistance with the wiper switch in the High speed position.
    - If less than infinite ohms, replace the turn signal/multifunction switch.
4. Test for infinite resistance between terminals H and K while rotating the wiper switch to MIST, each DELAY and LOW speed positions.
    - If the less than infinite, replace the turn signal/multifunction switch.
5. Test for less than 5 ohms of resistance with the wiper switch in the High speed position. .
    - If greater than 5 ohms, replace the turn signal/multifunction switch.
6. Test for infinite resistance between terminals H and J while rotating the wiper switch to MIST, each DELAY and LOW speed positions.
    - If less than infinite, replace the turn signal/multifunction switch.
7. Test for less than 5 ohms of resistance while pressing the WASHER switch.
    - If greater than 5 ohms, replace the turn signal/multifunction switch.

IMPORTANT: If the switch tests open in any switch position other than Off, test the wiper/washer switch signal circuits for a short to voltage before replacing the switch.

Wiper Switch Values

Switch Position	Resistance
Off	Infinite
Mist	300-364 Ω
Delay 1	3.48K-4.25K Ω
Delay 2	2.52K-3.08K Ω
Delay 3	1.78K-2.18K Ω
Delay 4	1.17K-1.44K Ω
Delay 5	697-851 Ω

Switch Position	Resistance
Low	2.52K-3.08K Ω

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Windshield Wiper Motor Replacement**
- **Washer Pump Replacement**
- **Control Module References** for BCM replacement, setup, and programming

REPAIR INSTRUCTIONS

WINDSHIELD WASHER HOSE REPLACEMENT (IMPALA LIMITED)

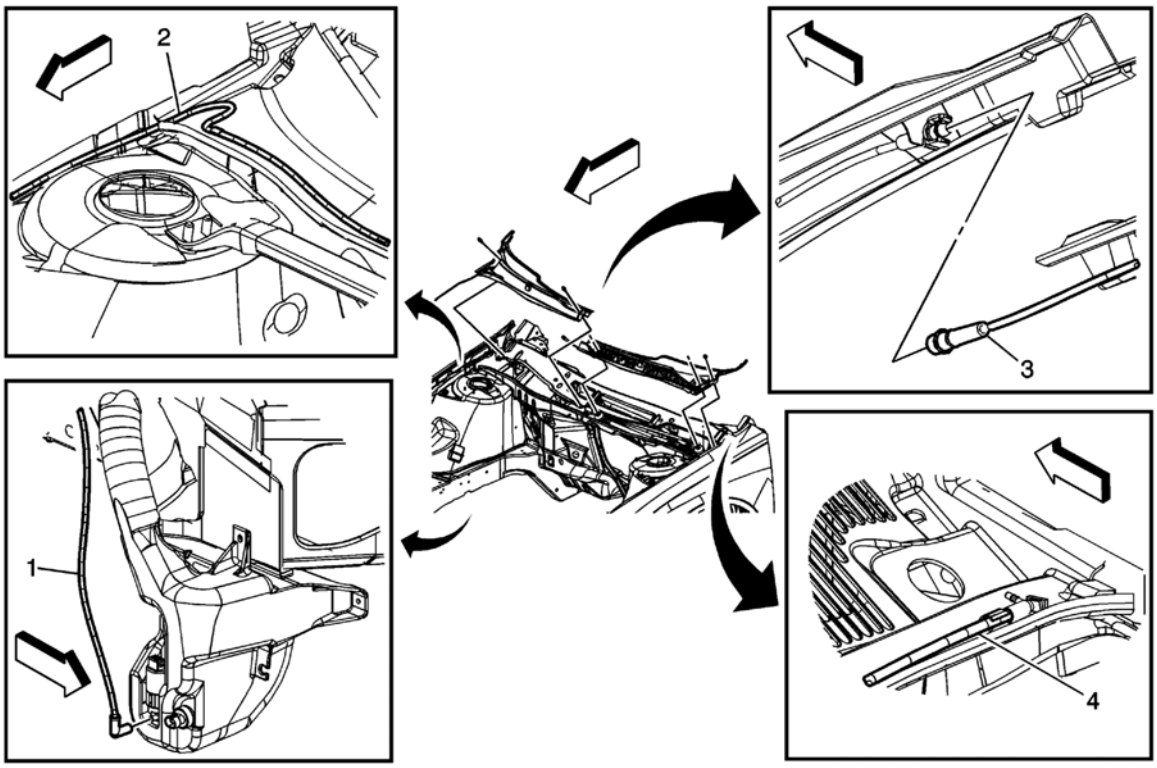

Fig. 2: Windshield Washer Hose (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures	

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the washer hose from the washer pump spout.
3. Remove the right fender liner. Refer to **Front Fender Liner Replacement** .
4. Drain the washer solvent into a suitable container.
5. Lower the vehicle.

Callout	Component Name
6. Open the hood. 7. Remove the passenger side wiper arm. Refer to **Windshield Wiper Arm Replacement**. 8. Remove the passenger side air inlet grille panel. Refer to **Air Inlet Grille Panel Replacement**.	
1	Windshield Washer Hose to Washer Pump Connection
2	Washer Pump Hose **TIP:** Note the routing of the washer hose to the air inlet grille panel.
3	Windshield Washer Solvent Pump to Driver Side Washer Hose **TIP:** Ensure washer hose is re-connected upon passenger side air inlet grille installation.
4	Windshield Washer Container Hose **TIP:** Remove the washer hose from the large hole in behind the right front headlamp and fender assembly bracket.

WINDSHIELD WASHER SOLVENT CONTAINER REPLACEMENT

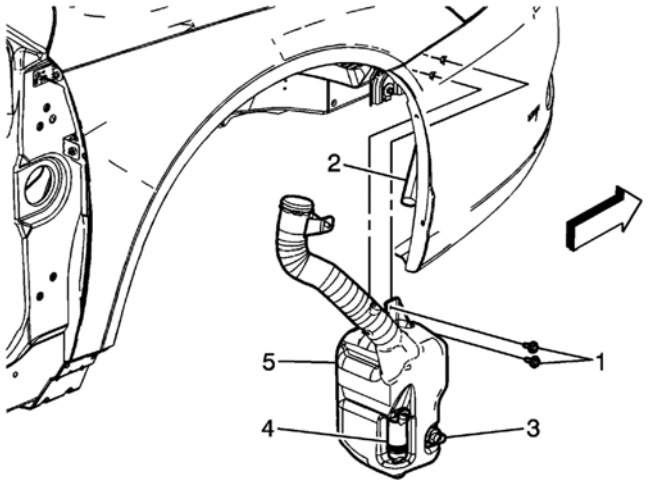

Fig. 3: Washer Solvent Container
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the right front wheelhouse panel liner. Refer to **Front Fender Liner Replacement** . 2. Disconnect the electrical connector from the windshield washer solvent level sensor switch. 3. Disconnect the electrical connector at the windshield washer pump. 4. Lower the vehicle. 5. Remove the screw from the filler neck at the RF fender flange. 6. Remove the washer solvent container filler cap.	
1	Windshield Washer Solvent Container Bolt (Qty: 2) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **TIP:** Transfer the cap and lower mounting bracket on the container to the new washer solvent container. **Tighten** 6 N.m (53 lb in)
2	Windshield Washer Pump Hose Assembly **TIP:** Disconnect the hose from the windshield washer pump spout and drain washer solvent into a suitable clean container.
3	Windshield Washer Level Sensor Switch
4	Windshield Washer Pump **TIP:** Discard old grommet and replace with a new grommet. Transfer the old pump to the new container.
5	Windshield Washer Container Assembly **TIP:** Lower the windshield washer container from RH chassis rail in between the RF fender bracket and bumper fascia.

WASHER PUMP REPLACEMENT

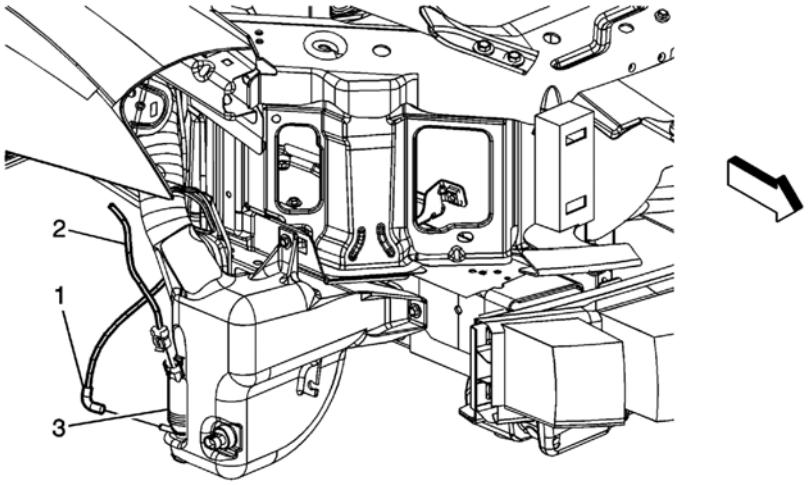

Fig. 4: Washer Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to Fastener Specifications. **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the right front wheelhouse panel liner. Refer to Front Fender Liner Replacement .	

Callout	Component Name
3. Drain the washer solvent into a suitable clean container.	
1	Hose, Windshield Washer Pump
2	Connector, Washer Pump Electrical **TIP:** Disconnect and position out of the way.
3	Pump, Windshield Washer **Tip** 1. Use two flat-bladed tools and pry upward in order to release the washer pump from the washer solvent container grommet. 2. Discard the old washer pump grommet. 3. Install a new grommet into the washer solvent container prior to installing the new washer pump. 4. Lubricate the new grommet with straight washer fluid. 5. Secure the new pump to the washer solvent container.

WINDSHIELD WASHER SOLVENT LEVEL SWITCH REPLACEMENT

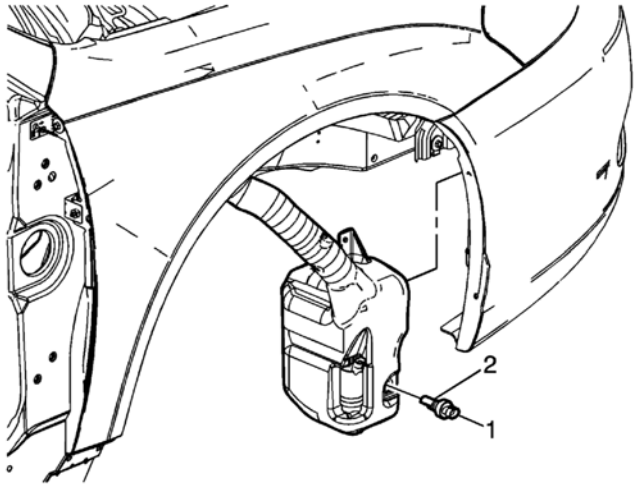

Fig. 5: Washer Solvent Container Level Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** 1. Remove the right front wheelhouse panel liner. Refer to **Front Fender Liner Replacement** . 2. Remove the windshield washer solvent container. Refer to **Windshield Washer Solvent Container Replacement**. 3. Drain the washer solvent into a suitable clean container.	

AIR INLET GRILLE PANEL REPLACEMENT

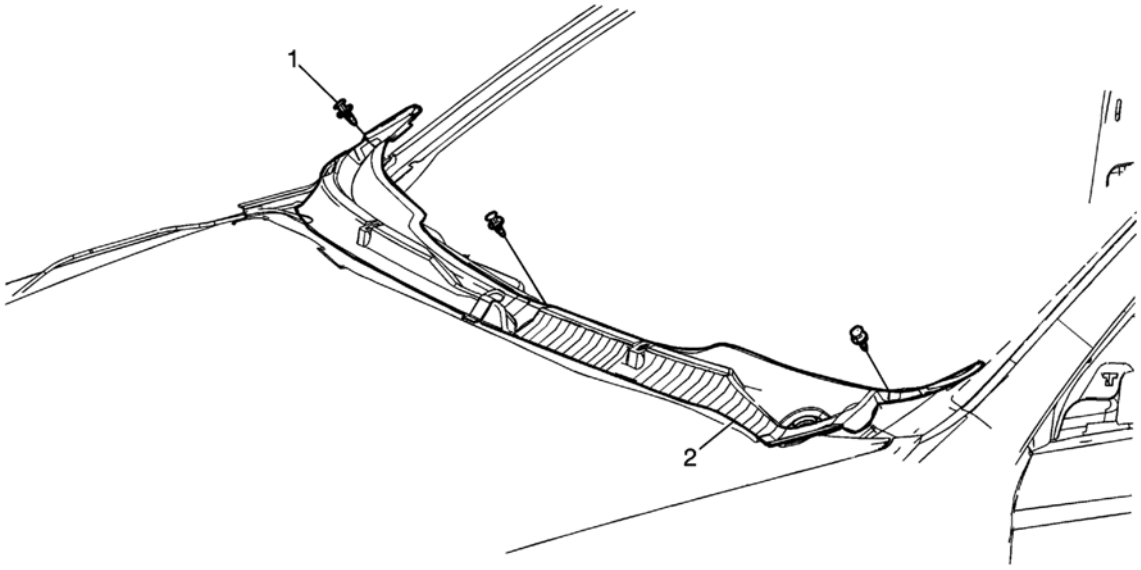

Fig. 6: Air Inlet Grille Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** . **Preliminary Procedure** Remove the wiper arms. Refer to **Windshield Wiper Arm Replacement**.	
1	Retainers, Air Inlet Grille (Qty: 4)
2	Grille, Air Inlet

WINDSHIELD WIPER ARM REPLACEMENT

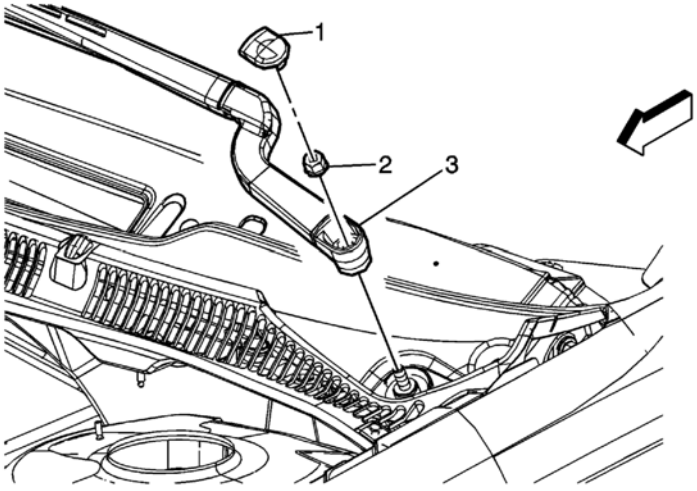

Fig. 7: Wiper Arm
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the wiper arm blades. Refer to **Windshield Wiper Blade Replacement (Impala Limited)**.	
1	Windshield Washer Transmission Nut Cap **TIP:** Use a small flat-bladed tool to remove the transmission cap.
2	Windshield Washer Transmission Support Nut **CAUTION:** **Refer to Fastener Caution .** **TIP:** Hold the wiper arm blade tip to the target points in the lower blackout area of the windshield while tightening the nut. **Tighten** 32 N.m (24 lb ft)
3	Windshield Washer Arm Assembly **TIP:** Use a **J 39637** Wiper Arm Puller or slightly rock the arm on the wiper pivot shaft to remove. **Special Tools** **J 39637** Wiper Arm Puller

WINDSHIELD WIPER BLADE REPLACEMENT (IMPALA LIMITED)

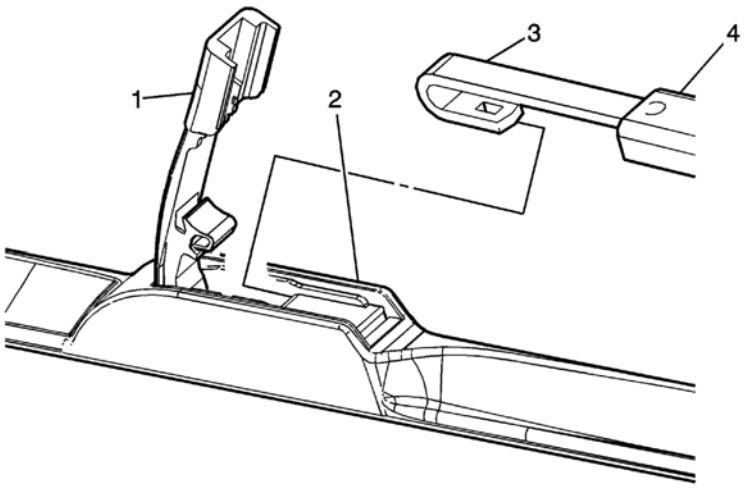

Fig. 8: Wiper Arm Blade (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	

Callout	Component Name
Preliminary Procedures 1. Raise the wiper arm off the glass, service up. 2. Do not let the wiper arm strike the glass without the blade attached.	
1	Retention Clip, Windshield Wiper Blade **TIP:** Lift the locking tab away from the wiper arm hook in order to disengage the wiper arm from the wiper blade.
2	Blade, Windshield Wiper Arm
3	Hook, Wiper Arm Sheep **TIP:** Push the wiper blade assembly onto the hook, pull the blade outward then secure the locking tab to the arm assembly.
4	Arm Assembly, Windshield Wiper

WIPER BLADE ELEMENT REPLACEMENT

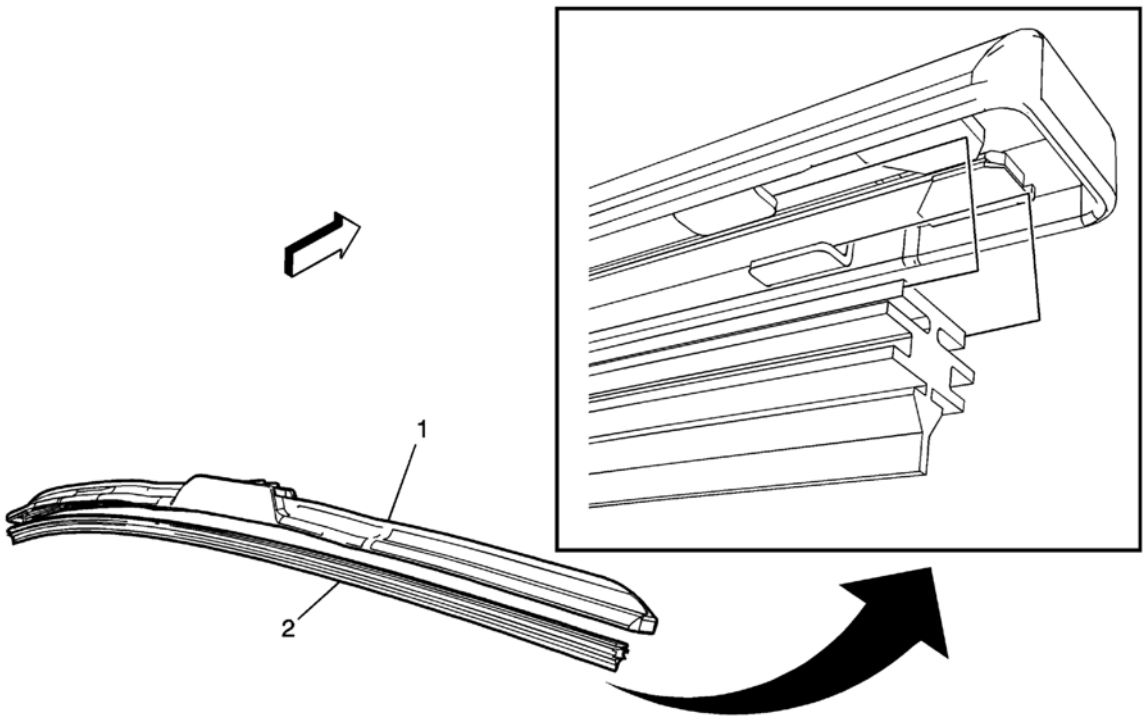

Fig. 9: Wiper Blade Element
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** 1. Position the wiper blade at a mid-wipe on the windshield. 2. Cycle the ignition key to the OFF position.	

Callout	Component Name
3. Raise the wiper blade off the glass.	
1	Blade Assembly, Windshield Washer
2	Element Assembly, Windshield Washer **TIP:** With a small pair of needle-nose pliers, secure the end of the wiper element and pull outward from the wiper blade claws in order to remove the element.

WINDSHIELD WIPER MOTOR REPLACEMENT

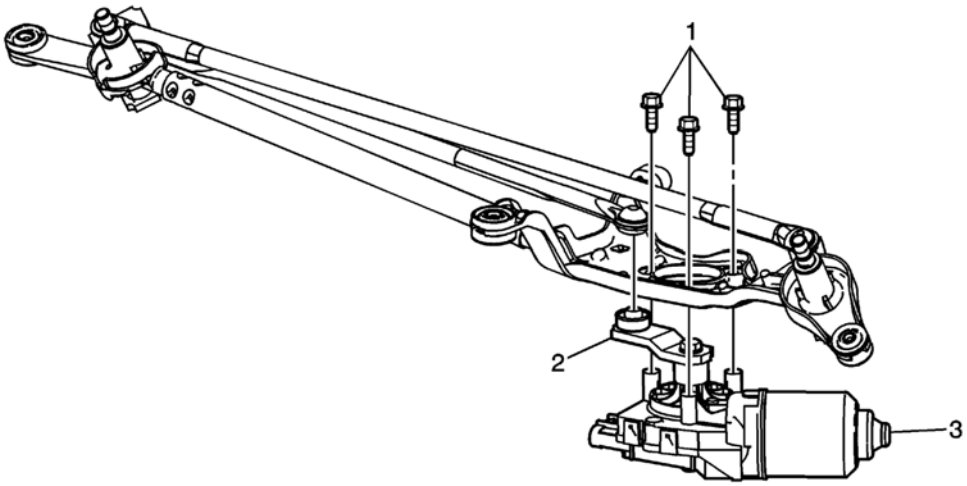

Fig. 10: Wiper Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the wiper arms. Refer to **Windshield Wiper Arm Replacement**. 2. Remove the air inlet grille panel. Refer to **Air Inlet Grille Panel Replacement**. 3. Remove the wiper drive system module. Refer to **Windshield Wiper System Module Replacement (Impala Limited)**.	
1	Windshield Wiper Motor Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 8 N.m (71 lb in)
2	Windshield Wiper Motor Crank Arm

Callout	Component Name
	Procedure 1. Use the **J 39232** Wiper Linkage Separator or equivalent to separate the transmission arm from the wiper motor crank arm pivot. 2. Use the **J 39529** Wiper Linkage Installer or equivalent to install the transmission arm onto the wiper motor crank arm pivot. **Special Tools** • **J 39232** Wiper Linkage Separator • **J 39529** Wiper Linkage Installer
3	Windshield Wiper Motor

WINDSHIELD WIPER SYSTEM MODULE REPLACEMENT (IMPALA LIMITED)

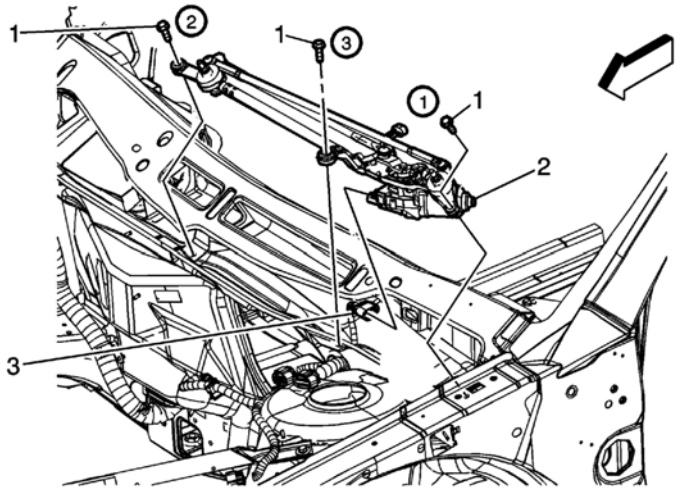

Fig. 11: Wiper Drive System Module (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the wiper arms. Refer to **Windshield Wiper Arm Replacement**. 2. Remove the air inlet grille panels. Refer to **Air Inlet Grille Panel Replacement**.	
1	Windshield Wiper Module Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Procedure Tighten bolts in sequence as shown upon installation. **Tighten** 9 N.m (80 lb in)
2	Windshield Washer System Module Assembly 1. Raise the forward edge of the windshield washer module assembly out of the plenum panel first followed by disconnecting the wiper motor electrical connector. 2. Upon installation of the windshield washer module, turn the module 180 degrees, slide the module under the hood and align the rear locator to the backside of the plenum. 3. Tighten the bolts in sequence as shown.
3	Windshield Wiper Motor Connector **TIP:** Connect the electrical connector to the wiper motor prior to installing the module assembly back into the plenum.

WINDSHIELD GLASS CLEANING

Exterior:

Clean the windshield with windshield cleaner, GM P/N 19287404 (18 oz.) or 19259280 (6 oz.) (Canadian P/N 88865156) or equivalent. The cleaner should not harm the paint finish or scratch the glass. The glass is clean when the water no longer beads, but sheets across the entire glass surface.

Interior:

The interior glass should be cleaned with plain water only applied with a clean terry cloth towel. Water only eliminates any film or haze on the window and helps prevent fogging.

WIPER BLADE ELEMENT CLEANING

Lift each blade assembly off of the windshield and clean the element with a cloth saturated with full strength washer solvent. Then rinse the blade assemblies with clear water.

WIPER CHATTER REPAIR

Some vehicles may exhibit a condition where the windshield wipers chatter and/or wipe unevenly. Several items may contribute to this condition. To completely repair this condition, ALL of the items listed should be tested and repaired as necessary.

- Clean the windshield glass. Refer to **Windshield Glass Cleaning**.
- Clean the wiper blade elements. Refer to **Wiper Blade Element Cleaning**.
- Clean and inspect the wiper blade element set. Refer to **Wiper Blade Element Cleaning**.

DESCRIPTION AND OPERATION

WIPER/WASHER SYSTEM DESCRIPTION AND OPERATION

Wiper/Washer System Components

The Wiper/Washer System consists of the following components:

- Windshield wiper/washer switch
- Body control module (BCM)
- Wiper PCB relay
- Wiper high PCB relay
- Windshield wiper motor
- Windshield washer fluid pump
- Windshield washer fluid level switch
- WPR fuse 25 A
- WSW fuse 10 A

Refer to **Master Electrical Component List** .

Power and Grounds

With the ignition in the ON position, accessory voltage is supplied through the 25A WPR fuse to the WIPER PCB relay, the WIPER HIGH PCB relay and the WS WASH PCB relay that are all located in the underhood fuse block. Refer to **Wiper/Washer Schematics**.

G200 provides ground for the windshield wiper motor and the WIPER PCB relay. G100 provides ground for the windshield washer fluid pump and the windshield washer fluid level switch.

Low Speed Operation

When the wiper switch is in the low speed position, ground is applied through the switch internal resistor and the wiper switch low signal circuit to the body control module (BCM). In response to this signal, the BCM energizes the WIPER PCB relay by applying battery voltage through the wiper relay control circuit to the coil side of the relay. This allows battery positive voltage from the WPR fuse to flow through the switch input side of the WIPER PCB relay and out to the switch input side of the WIPER HIGH PCB relay. Since the wiper high relay is de-energized and its switch contacts are normally closed to the low speed control circuit of the windshield wiper motor, the motor will operate at low speed.

Wiper motor low speed operation and the wiper PCB relay can also be commanded ON/OFF by using a scan tool. Refer to **Control Module References** .

Mist Operation

Windshield wiper/washer system MIST operation is identical to wiper Low operation, except that the mist switch is a press and release type switch. When the wiper switch is moved to the mist position and released, low speed wiper motor operation is started and will continue until 1 wipe cycle is complete. If the wiper switch is moved to the mist position and held, the wiper motor will operate in the low mode until the switch is released.

Delay Operation

Windshield wiper delay operation is a low speed wiper motor function with a variable delay interval between the wiper motor cycles. The delay interval is determined by a series of 6 resistors within the wiper/washer

switch. The body control module (BCM) monitors the wiper switch low signal circuit to determine the delay interval between the low speed wiper motor wipe cycles.

High Speed Operation

When the wiper switch is in the high speed position, ground is applied through the windshield wiper switch high signal circuit to the body control module (BCM) indicating the wiper high speed request. In response to this signal, the BCM then energizes the wiper PCB relay, as stated above, and the wiper high PCB relay by applying ground through the control circuit to the coil side of the relay. With the wiper high relay energized and its switch contacts closed to the high speed control circuit of the wiper motor, the motor will operate at high speed.

Wiper motor high speed operation and the wiper high speed PCB relay can also be commanded ON/OFF by using a scan tool. Refer to **Control Module References** .

Wash Operation

When the windshield Wash switch is pressed, ground is applied through the switch contacts and the windshield washer switch signal circuit to the body control module (BCM) indicating the windshield wash request. The BCM then energizes the wiper PCB relay, as stated above, and the WS WASH PCB relay by applying ground through the control circuit to the coil side of the relay. With the wash relay energized, battery voltage from the WPR fuse is applied through the switch side of the relay and out to the control circuit of the windshield washer fluid pump. The washer fluid pump and the wiper motor will operate for 2 wipe cycles after the wash switch is released.

The WS WASH PCB relay can also be commanded ON/OFF by using a scan tool. Refer to **Control Module References** .

Park Position Operation

Windshield wiper motor park operation is controlled by the body control module (BCM) using an input from the park switch that is located within the wiper motor assembly. The BCM monitors the windshield wiper motor park switch signal circuit, to determine if the windshield wiper blades are at the bottom of the glass. During wiper operation, each time the wiper blades are at the bottom of the glass, the park switch is momentarily closed to ground signaling the BCM the wiper position. When the wiper switch is turned to the OFF position while the wiper motor is somewhere in mid-cycle, the BCM will continue to operate the motor until the wipers reach the park position. If the ignition is turned OFF while the wipers are in mid-cycle, the wipers will stop immediately where they are. The BCM will park the wipers the next time the ignition is turned ON.

REPAIR INSTRUCTIONS

GMLAN AND MEDIA ORIENTED SYSTEMS TRANSPORT (MOST) WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to Special Tools .

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE: **When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.**

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to **Data Link Communications Description and Operation** .

GMLAN Connector Terminal Repair

NOTE: **A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.**

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to **Connector Repairs** for the appropriate connector repair procedure.

GMLAN Wire Repair

NOTE: **Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.**

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm^2 , 0.8 mm^2 , 1.0 mm^2 etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves** .

Media Oriented Systems Transport (MOST) Wiring Repair

NOTE: **If harness repair/analysis is performed, MOST bus Twist Pair unshielded wire should be 0.35 mm^2 (22 AWG) wire with at least one twist per each 1 45/64 inch (45 mm) and must not be untwisted for more than 3 15/16 of an inch (10 cm).**

The following conditions need to be met to ensure a valid continuity:

- Untwisted length for all MOST 50 circuits at each wire harness connector should be no longer 50 mm max (25 mm preferred).
- When wire repairs are made, a minimum 25 twists/meter for all MOST 50 circuits.
- MOST 50 has specific receive and transmit I/O.

The transmit of one module is connected to receive of the next module in ring topology.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

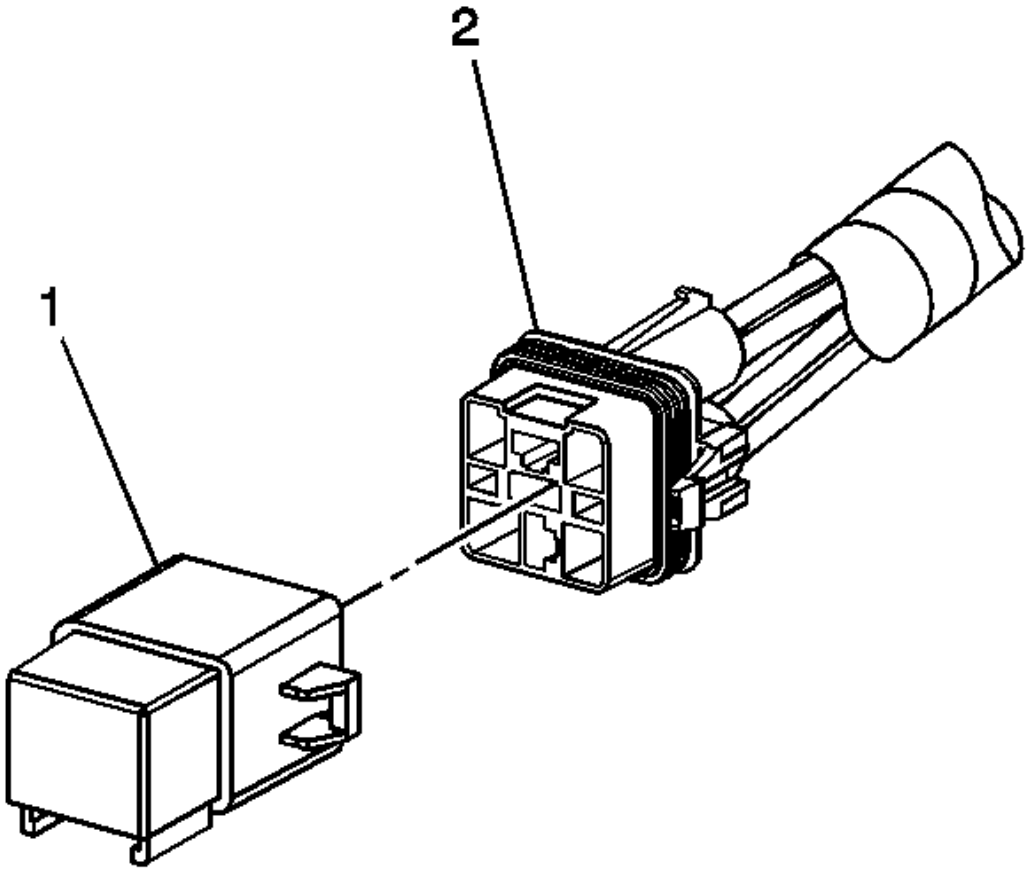

Fig. 1: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the **Master Electrical Component List** to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: **Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.**

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

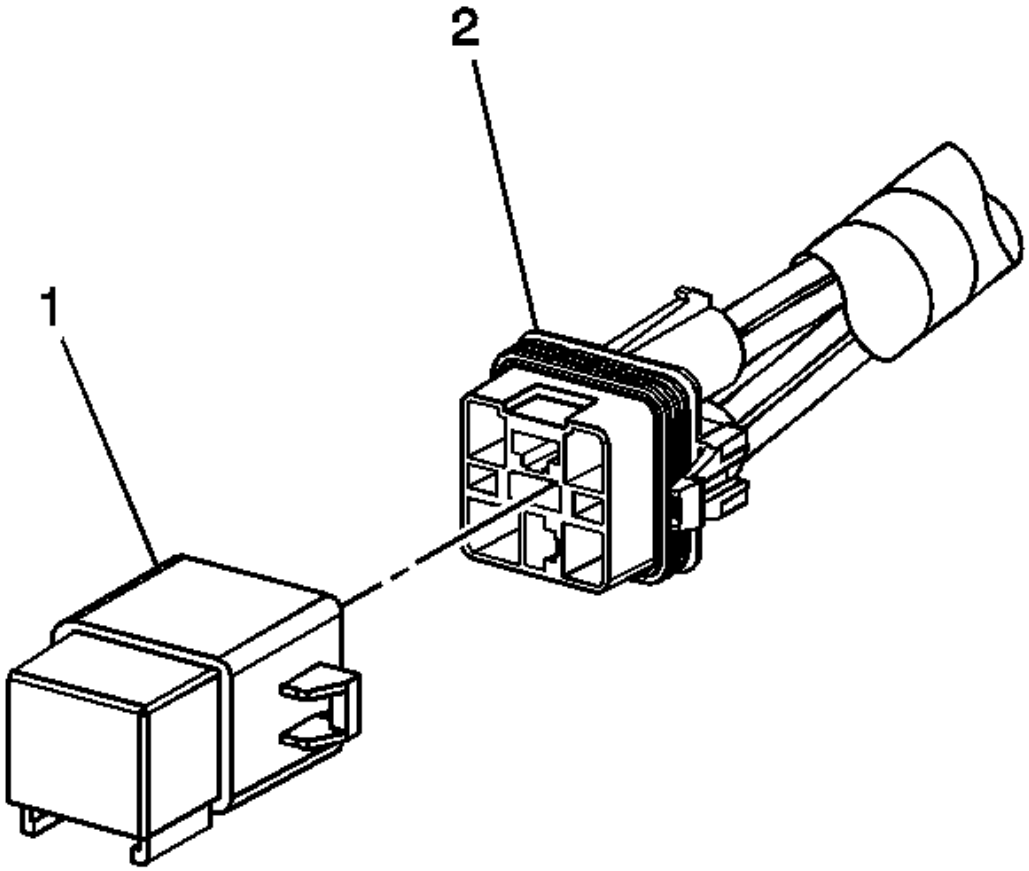

Fig. 2: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- **Always note the orientation of the relay.**
- **If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in**

the same location.

- **Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.**

2. Locate the relay. Refer to **Electrical Center Identification Views** to locate the electrical center where the relay exists.

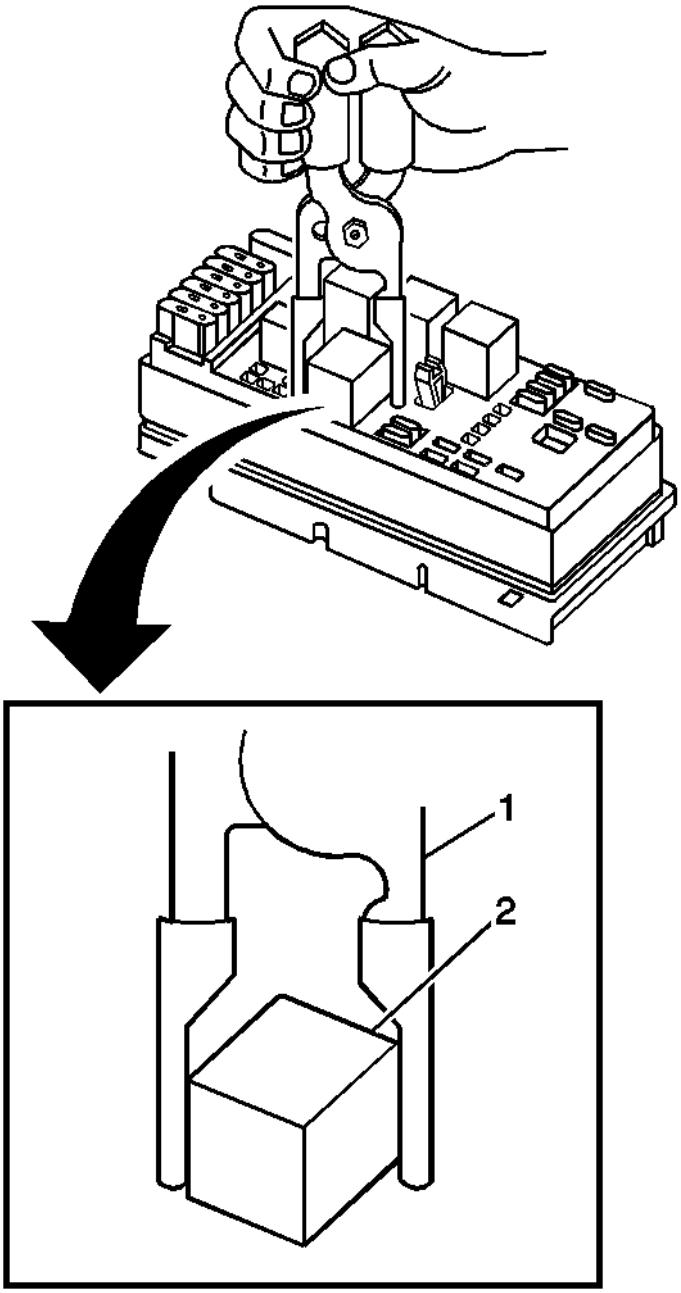

Fig. 3: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure

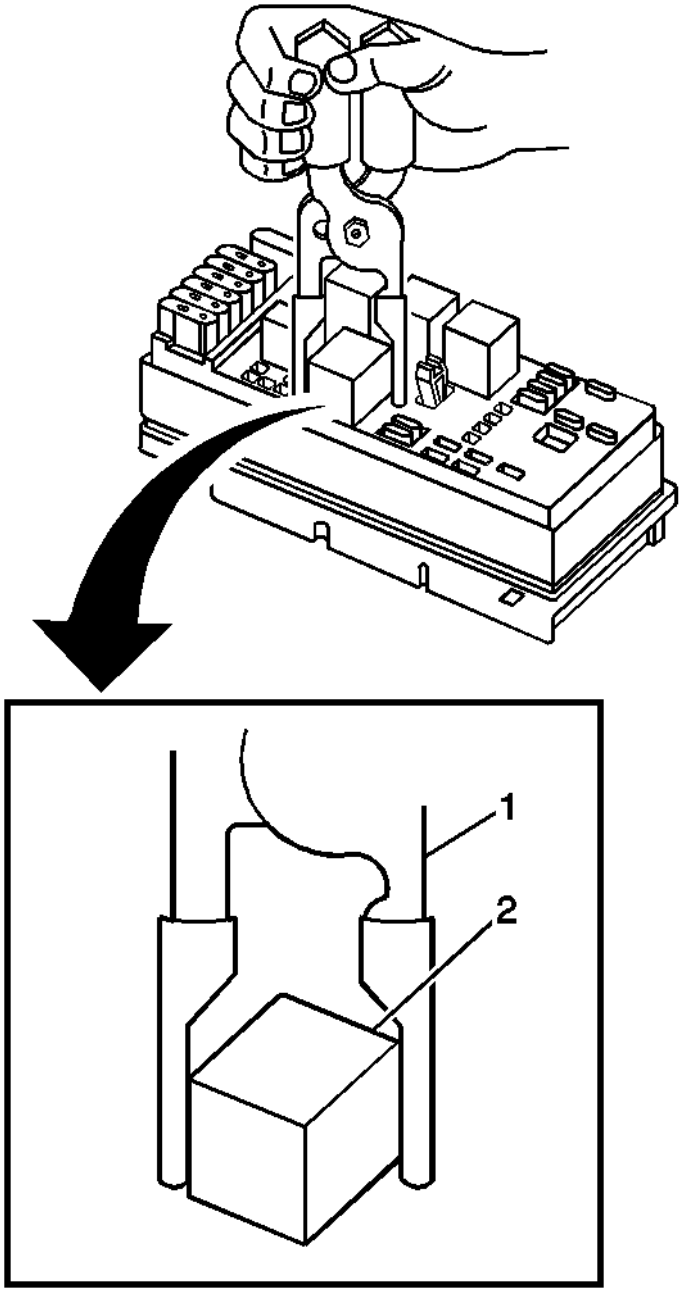

Fig. 4: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

GROUND REPAIR

Electrical Grounds

Proper electrical system function relies on secure, positive, corrosion-free ground connections. Loose, stripped, or corroded connections increase the possibility of improper system function and loss of module communication. These conditions may also lead to unnecessary repairs and component replacements.

In general, electrical ground connections are accomplished using one, or a combination of, three attachment methods:

- Welded M6 stud and nut
- Welded M6 nut and bolt
- Welded M8 nut and bolt

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

Determine which attachment method is used, and carry out the appropriate repair.

M6 Weld Stud Replacement

1. Select a location adjacent the damaged or missing M6 ground stud having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the M6 rivet stud flange.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

   NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

3. Drill a 10 mm (0.40 in) diameter hole through the panel.
4. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.

   CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

5. Select a replacement conductive M6 rivet stud. Refer to GM parts catalog for the correct part number and application.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

   NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the

rivet stud threads.

11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new rivet stud.
16. Select a new, conductive M6 nut. Refer to GM parts catalog for the correct part number and application.

CAUTION: Refer to Fastener Caution .

17. Install the M6 nut and tighten to 8 (71 lb in).
18. Check for proper system operation.

M6 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M6 weld nut at the electrical ground location is damaged or stripped, a new, conductive self-threading M7 bolt may be used to secure the ground terminal. Refer to GM parts catalog for the correct part number and application.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the weld nut and allow to dry.
3. Remove any loose metal particles from the damaged or stripped weld nut with a stiff brush.
4. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive, self-threading M7 bolt threads.
5. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
6. Install the electrical ground terminal to the new, conductive M7 bolt.

CAUTION: Refer to Fastener Caution .

7. Install the M7 bolt and tighten to 9 (80 lb in).
8. Check for proper system operation.

M6 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the electrical ground location is accessible from both sides of the panel, a conductive M6 bolt and a conductive M6 nut may be used to secure the electrical ground terminal. Refer to GM parts catalog for

the correct part number and application.

2. Select a location adjacent the damaged M6 weld nut having 20 mm (0.79) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M6 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M6 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M6 nut and tighten to 8 (71 lb in).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is accessible from both sides of the panel, a conductive M8 bolt and a conductive M8 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.
2. Select a location adjacent to M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is

visible.

6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M8 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M8 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M8 nut and tighten to 22 (16 lb ft).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is not accessible from both sides of the panel, a conductive M6 rivet stud and a conductive M6 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.
2. Select a location adjacent the damaged M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new, conductive M6 rivet stud flange.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the

rivet stud threads.

11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new, conductive M6 rivet stud.

CAUTION: Refer to Fastener Caution .

16. Install the conductive M6 nut and tighten to 8 (71 lb in).
17. Check for proper system operation.

Securing Loose Electrical Ground Connections

If the electrical ground connection is loose and the ground attachments are not damaged, properly securing the loose electrical ground may be all that is necessary. Carry out the following procedure to secure loose electrical ground connections.

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. Using GM approved residue-free solvent or equivalent, thoroughly clean the ground stud threads and allow to dry.
2. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
3. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the ground stud threads.
4. Install the ground wire terminal to the ground stud.

CAUTION: Refer to Fastener Caution .

5. Install the ground stud nut.
   - M6 ground stud nut: Tighten to 9 (80 lb in)
   - M8 ground stud nut: Tighten to 22 (16 lb ft)
   - M10 ground stud nut: Tighten to 45 (33 lb ft)
6. Check for proper system operation.

FRONT COMPARTMENT FUSE BLOCK FUSE REPLACEMENT (MIDI-FUSE)

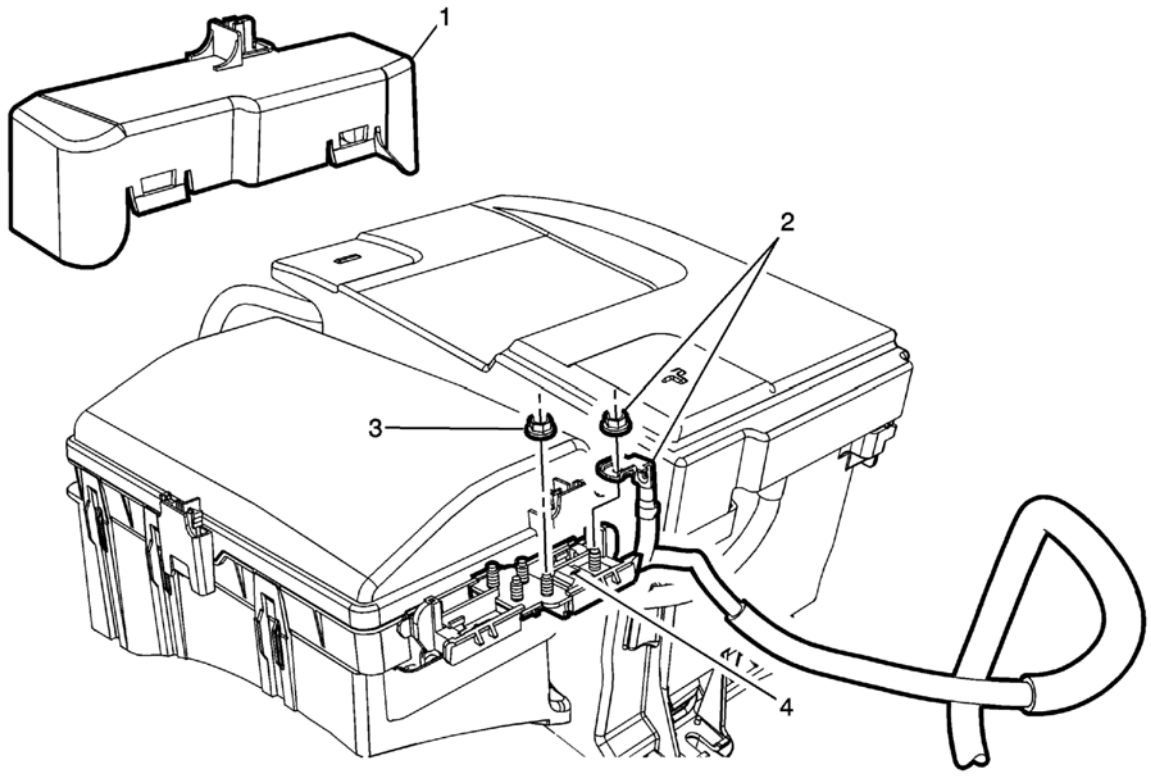

Fig. 5: Front Compartment Fuse Block Fuse (MIDI-Fuse)

Callout	Component Name
Preliminary Procedure Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .	
1	Fuse Block Fuse Cover
2	Battery Positive Cable and Nut **CAUTION:** **Refer to** **Fastener Caution** . **Procedure** Disconnect the battery positive cable(s) from the fuse. **Tighten** 4.7 (42 lb in)
3	Fuse Block Fuse Holder Nut - MIDI-Fuse **Tighten** 4.7 (42 lb in)
4	Fuse Block Fuse - MIDI-Fuse

INSTRUMENT PANEL ELECTRICAL CENTER OR JUNCTION BLOCK REPLACEMENT - RIGHT

SIDE (IMPALA LIMITED)

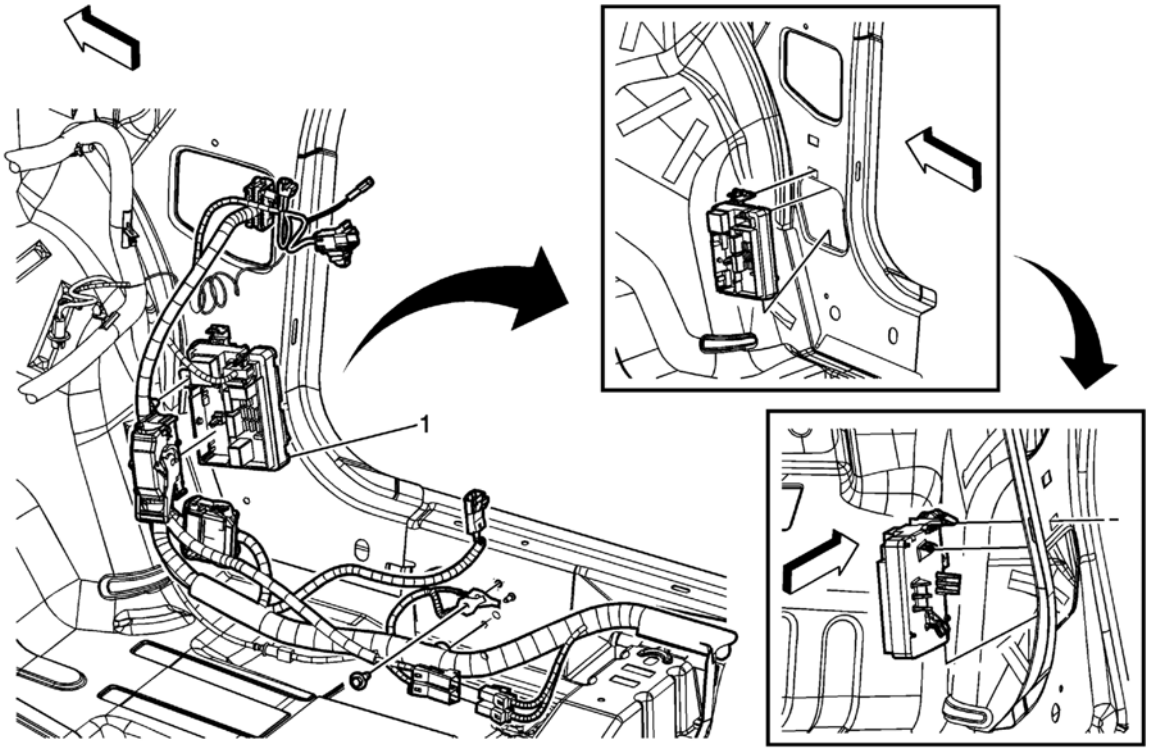

Fig. 6: Exploded View Of Junction Block - Right Side (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** . **Preliminary Procedure** Remove right side carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .	
1	Body and I/P Wiring Harness Junction Block 1. Pull back carpet to reveal junction block. 2. Press release tab to pull block out.

ACCESSORY WIRING JUNCTION BLOCK REPLACEMENT

Removal Procedure

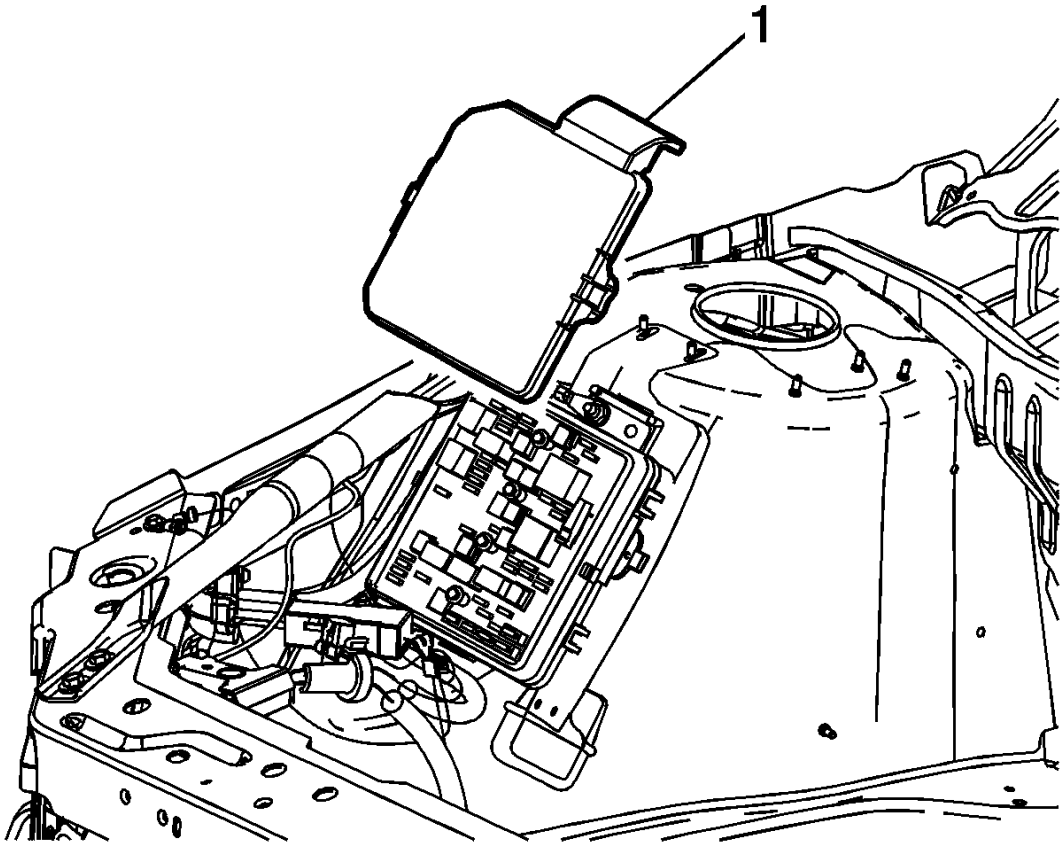

Fig. 7: Identifying Electrical Center Cover
Courtesy of GENERAL MOTORS COMPANY

1. Remove the electrical center cover (1).
2. Disconnect the positive battery cable from junction box. Refer to **Battery Positive and Negative Cable Replacement** .

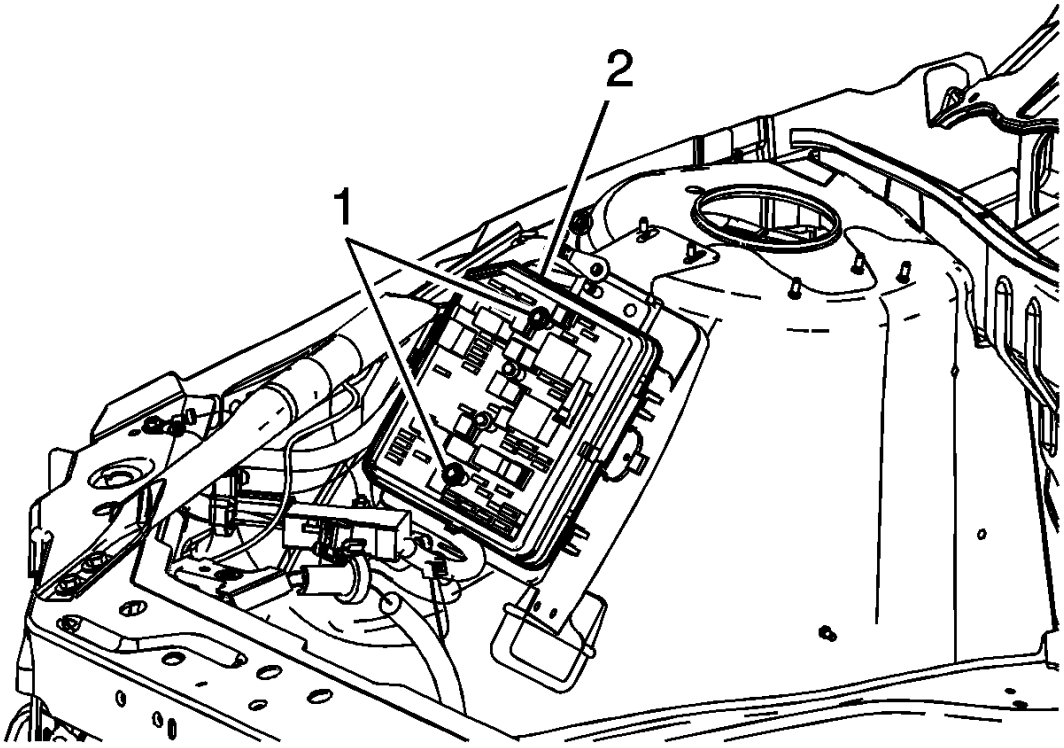

Fig. 8: Identifying Fasteners & Electrical Center Board
Courtesy of GENERAL MOTORS COMPANY

3. Remove the fasteners (1) securing the electrical center board (2).
4. Unlock the tabs on the electrical center board.
5. Lift up on the electrical center board.

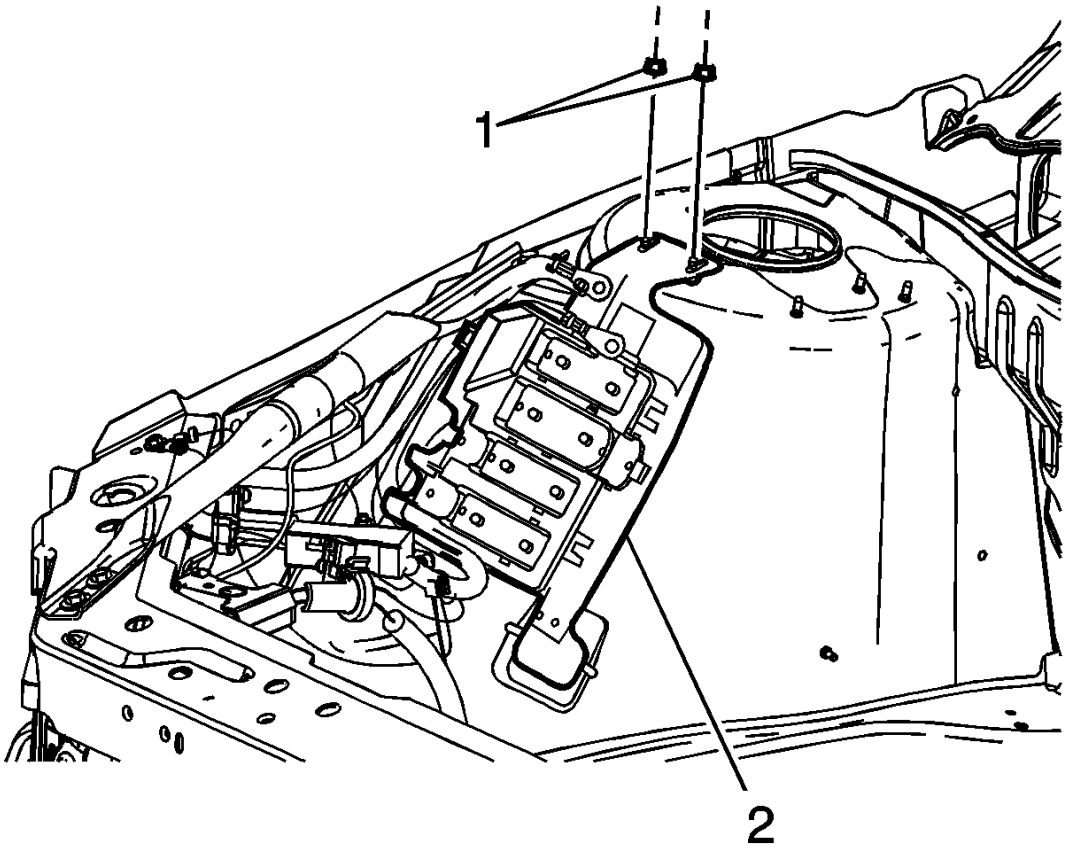

Fig. 9: Identifying Fasteners & Electrical Center Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Remove the fasteners (1) securing the electrical center bracket (2) to vehicle.

Installation Procedure

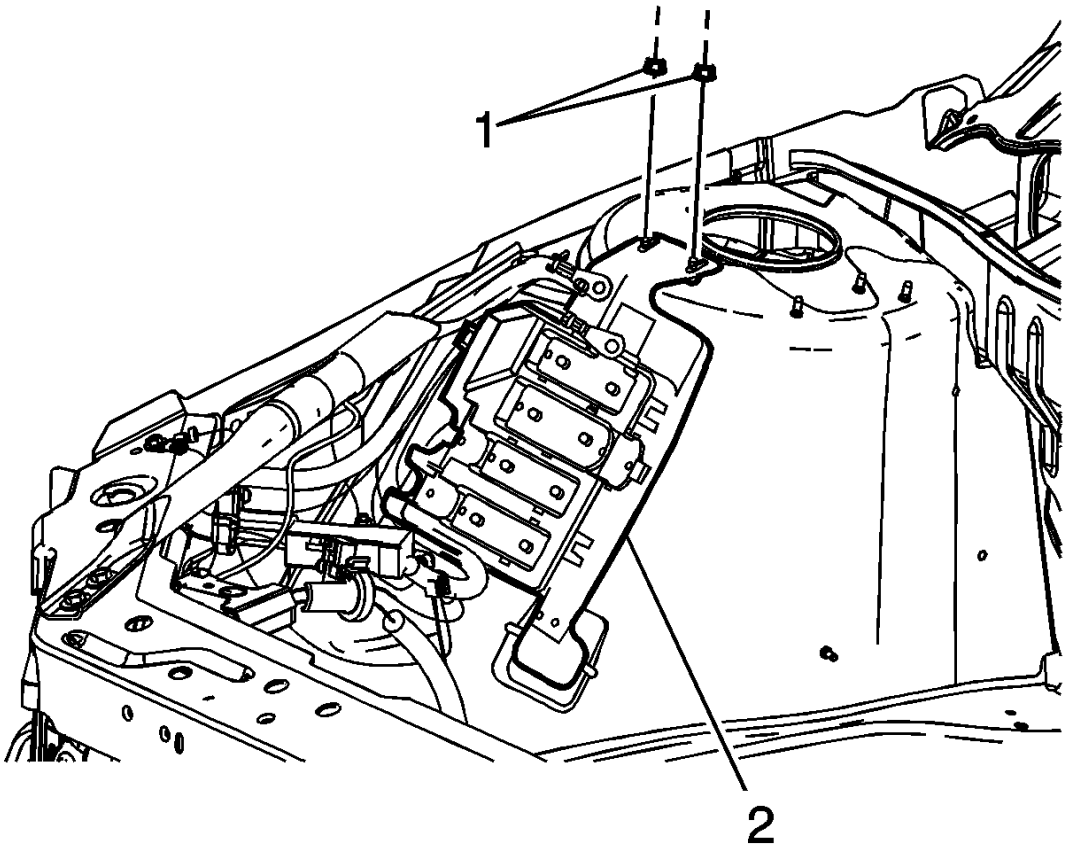

Fig. 10: Identifying Fasteners & Electrical Center Bracket
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install fasteners (1) securing the electrical center (2) to vehicle.

   Tighten

   Tighten the fasteners to 10 N.m (86 lb in).

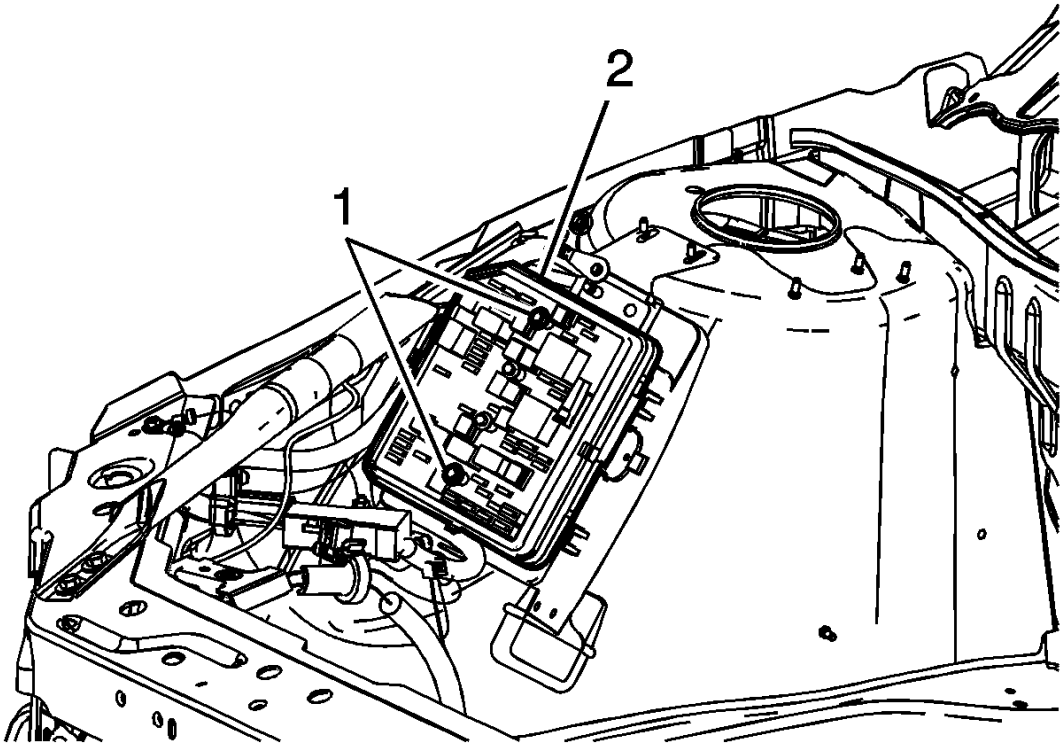

Fig. 11: Identifying Fasteners & Electrical Center Board
Courtesy of GENERAL MOTORS COMPANY

2. Install the fasteners (1) securing the electrical center board (2).

   Tighten

   Tighten the fasteners to 7 N.m (62 lb in).

3. Connect the positive battery cable. Refer to **Battery Positive and Negative Cable Replacement** .

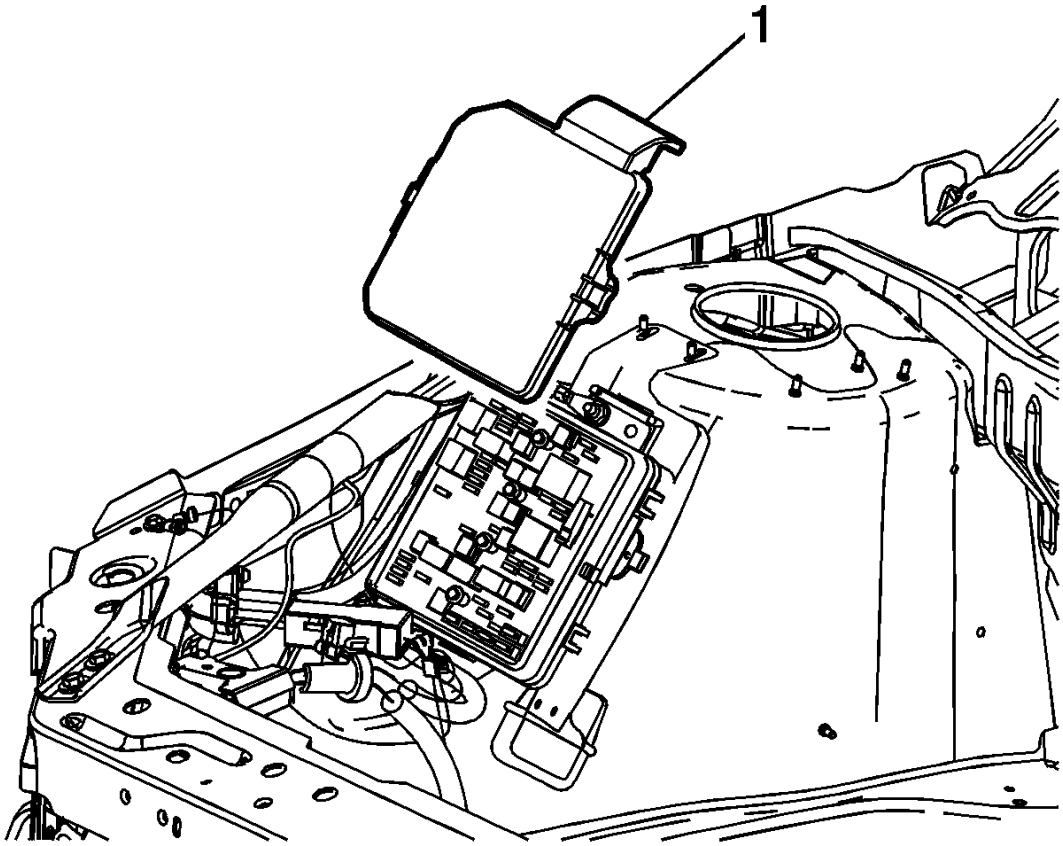

Fig. 12: Identifying Electrical Center Cover
Courtesy of GENERAL MOTORS COMPANY

4. Install the electrical center cover (1).

IGNITION LOCK CYLINDER REPLACEMENT

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

WARNING: Refer to SIR Warning .

2. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
3. Remove the tilt lever. Refer to **Steering Column Tilt Wheel Release Lever Replacement** .
4. Remove the steering wheel. Refer to **Steering Wheel Replacement** .
5. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement** .
6. Rotate the ignition lock cylinder to the crank position.

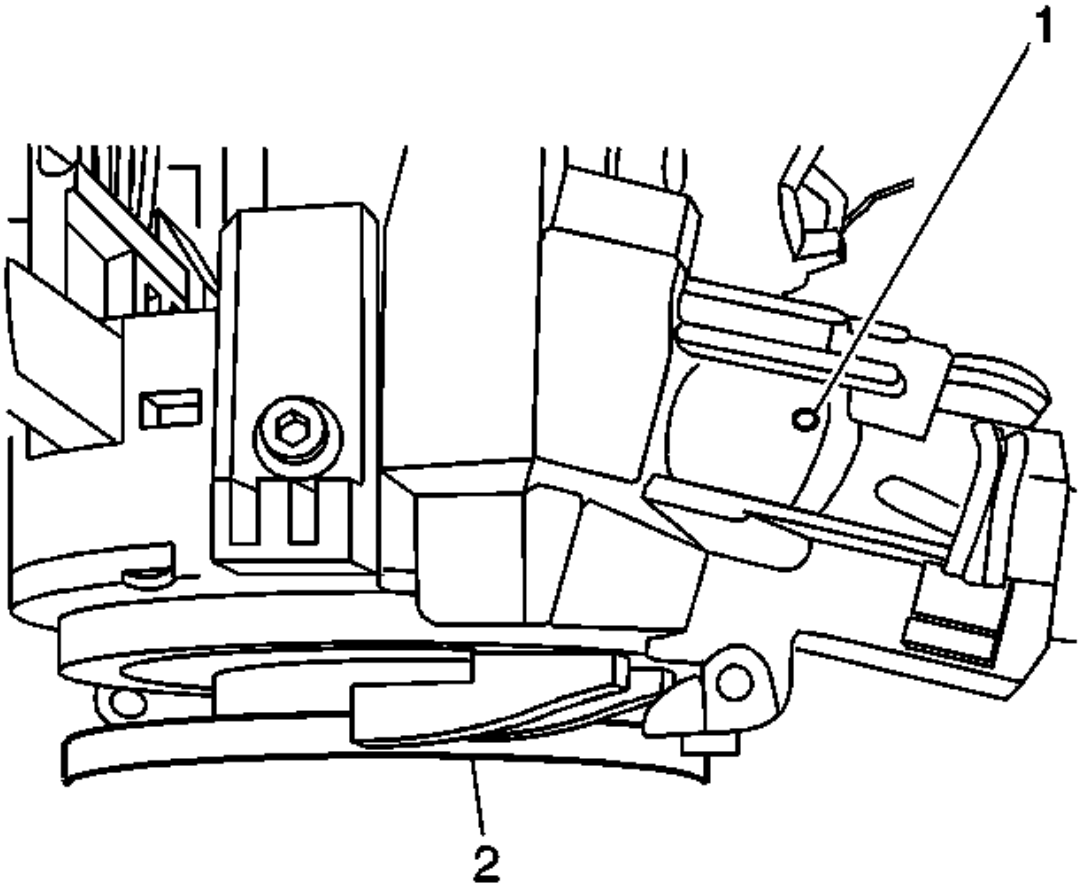

Fig. 13: Locating Ignition Lock Cylinder Release Access Hole
Courtesy of GENERAL MOTORS COMPANY

7. Use a suitable tool in order to push down and hold the lock cylinder retaining pin through the access hole (1) in the ignition lock cylinder case .
8. Release the ignition lock cylinder to the run position.

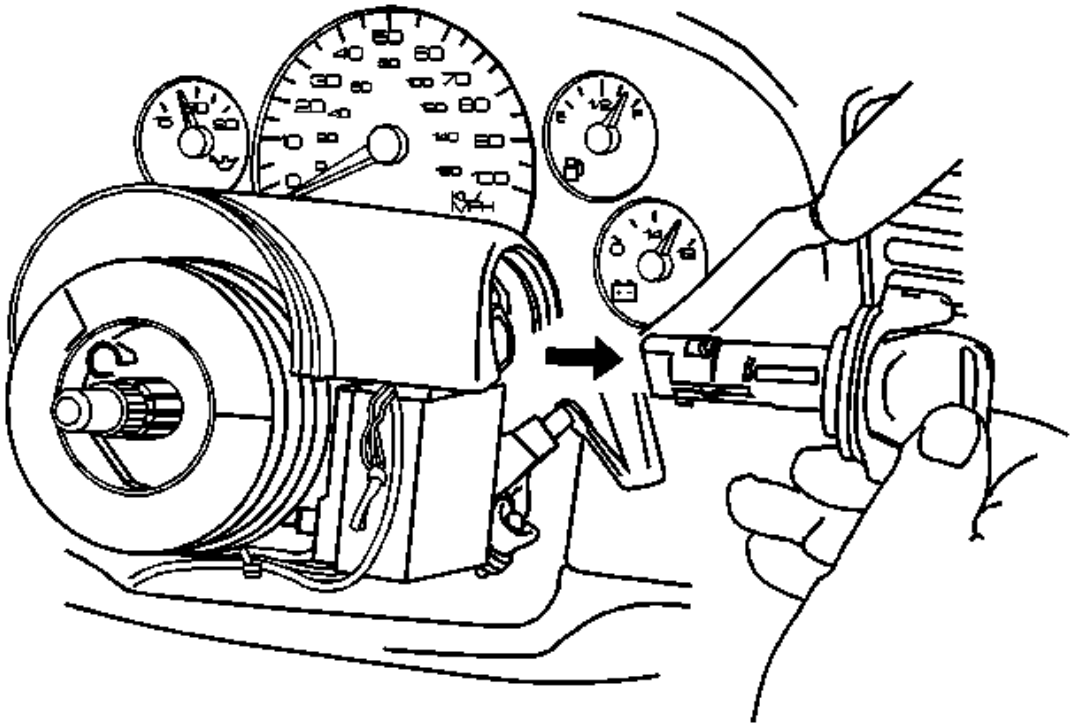

Fig. 14: View of Ignition Lock Cylinder, Ignition Lock Cylinder Case Assembly, and Steering Column

Courtesy of GENERAL MOTORS COMPANY

9. Remove the ignition lock cylinder from the steering column.

Installation Procedure

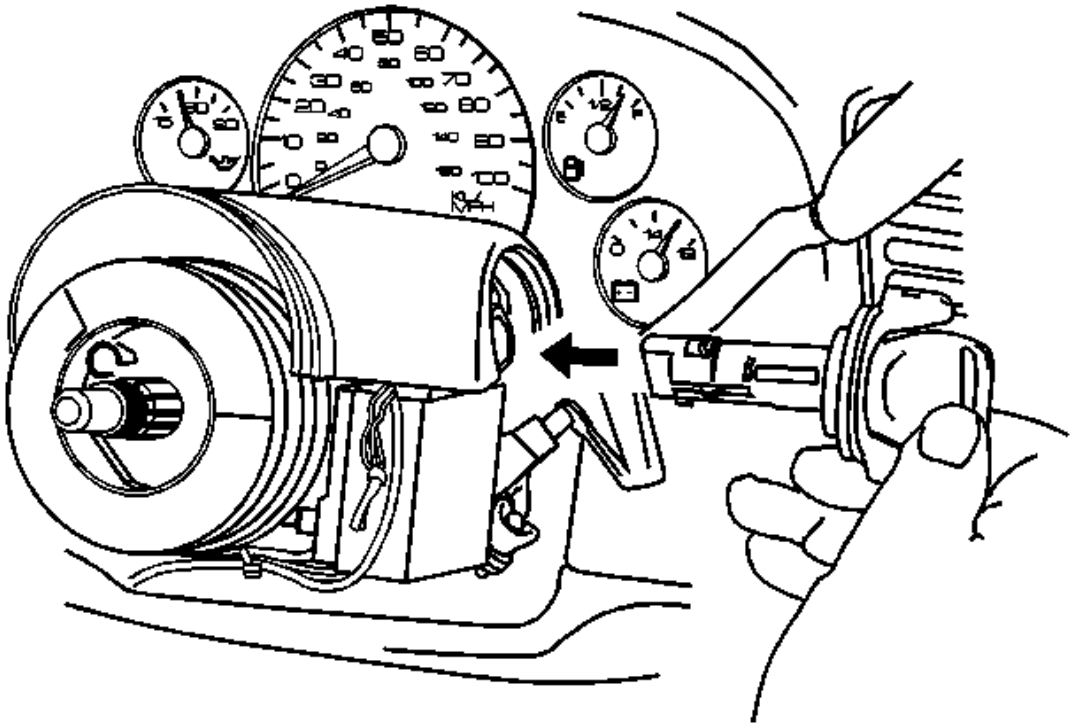

Fig. 15: View of Ignition Cylinder Lock, Ignition Lock Cylinder Case Assembly and Upper Steering Column

Courtesy of GENERAL MOTORS COMPANY

1. Align the lock cylinder retaining pin with the access hole in the ignition lock cylinder case.
2. Push the ignition lock cylinder into the ignition lock cylinder case. Ensure the lock cylinder retaining pin engages the access hole.
3. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement** .
4. Install the steering wheel. Refer to **Steering Wheel Replacement** .
5. Install the tilt lever. Refer to **Steering Column Tilt Wheel Release Lever Replacement** .
6. Enable the SIR system. Refer to **SIR Disabling and Enabling** .
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

IGNITION AND START SWITCH REPLACEMENT

Removal Procedure

WARNING: Refer to SIR Warning .

1. Disable the SIR system **SIR Disabling and Enabling** .
2. Remove the upper and lower trim covers. Refer to **Steering Column Trim Cover Replacement** .
3. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.

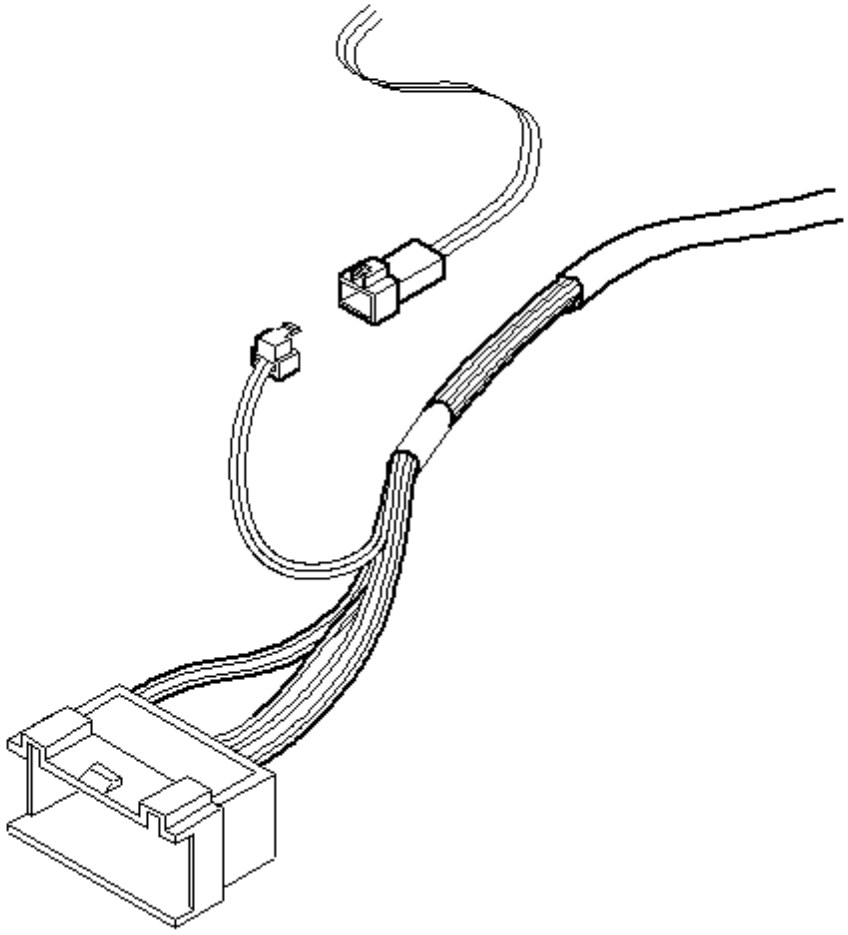

Fig. 16: Theft Deterrent Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the theft deterrent control module connector.
5. Disconnect the fused jumper assembly connector.

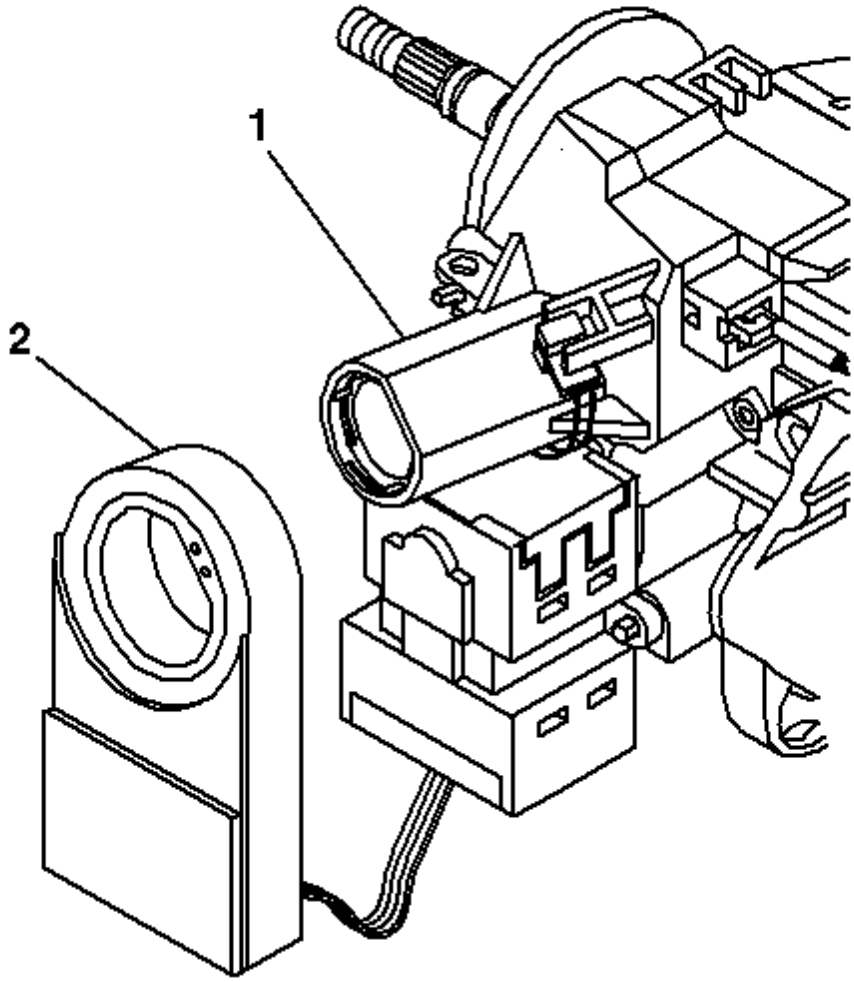

Fig. 17: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Slide the theft deterrent control module (2) from the ignition lock cylinder case (1).

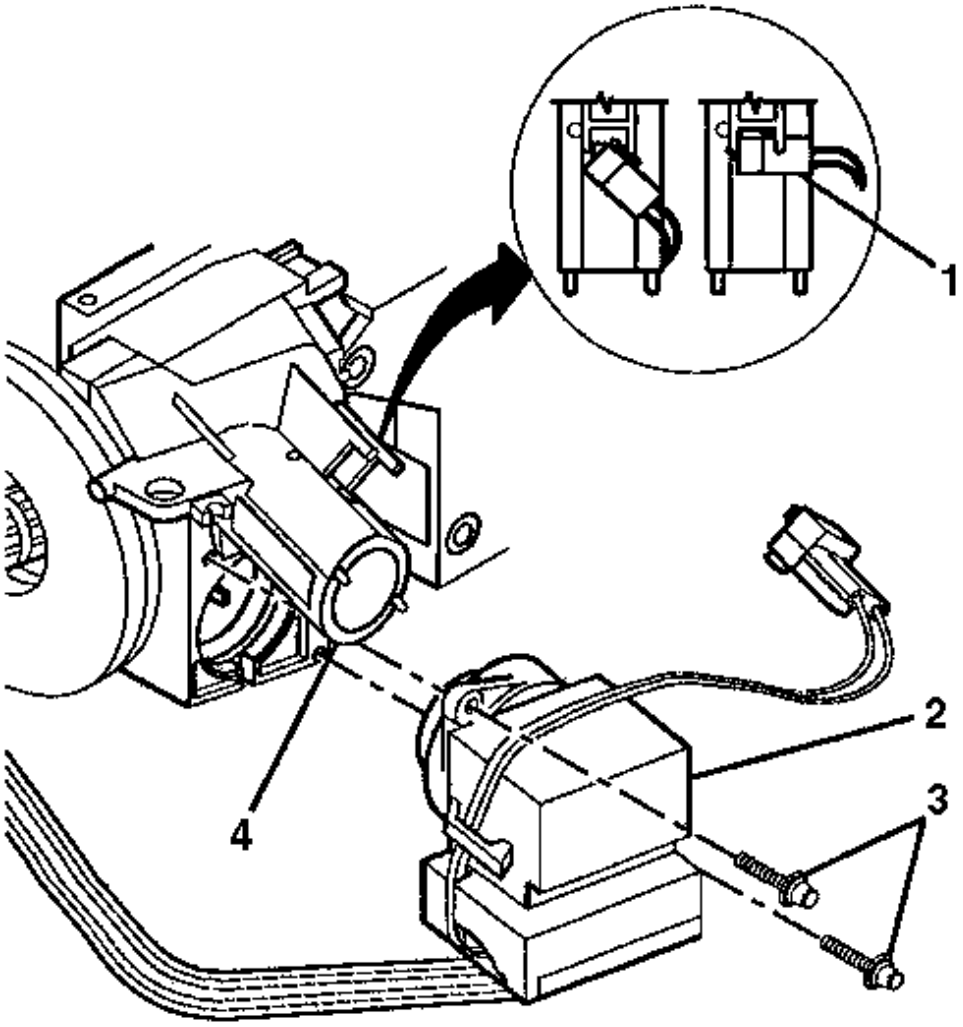

Fig. 18: Key Alarm Connector To/From Ignition Lock Cylinder Case
Courtesy of GENERAL MOTORS COMPANY

7. Remove the key alarm connector (1) from the ignition lock cylinder case (4).
8. Remove the 2 tapping screws (3) from the ignition switch assembly (2).

Installation Procedure

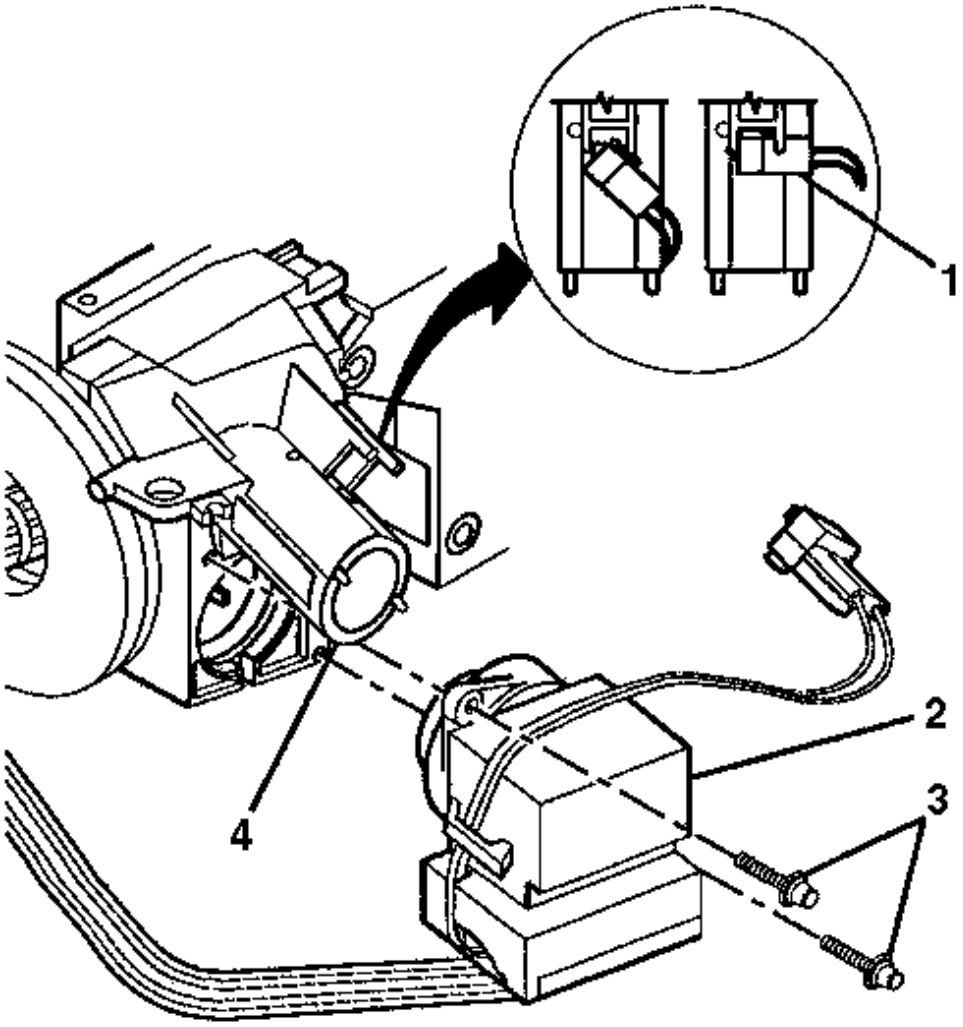

Fig. 19: Key Alarm Connector To/From Ignition Lock Cylinder Case
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the ignition switch assembly (2) and secure by using 2 tapping screws (3).

   Tighten

   Tighten the screws to 7 N.m (62 lb in).

2. Install the ignition switch assembly connector (1) onto the ignition lock cylinder case (4).

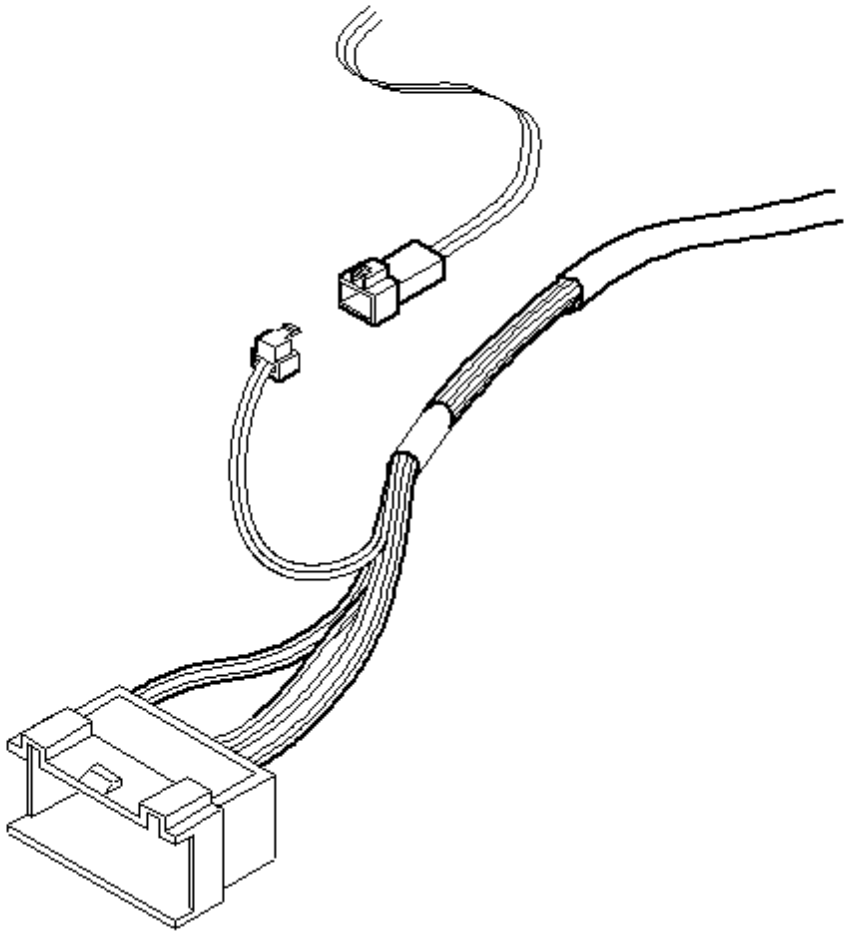

Fig. 20: Theft Deterrent Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

3. Connect the theft deterrent control module connector.
4. Connect the fused jumper assembly connector.

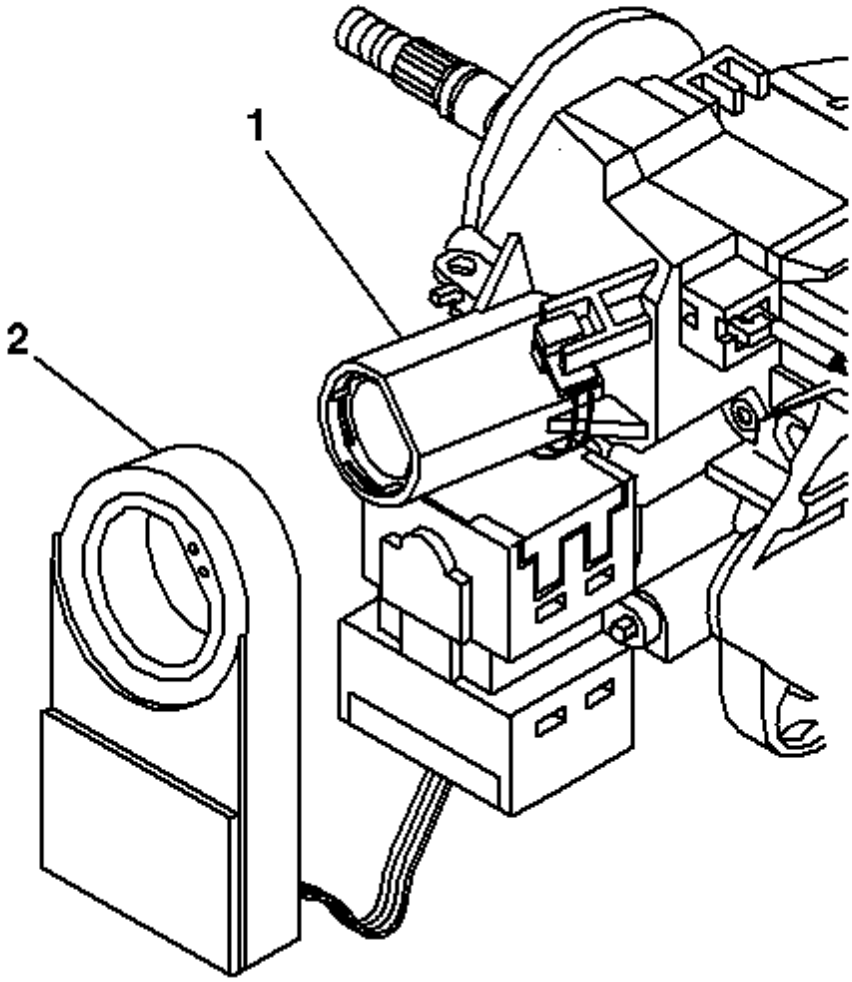

Fig. 21: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Install the theft deterrent control module (2) onto the ignition lock cylinder case (1).
6. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
7. Install the upper and lower trim covers. Refer to **Steering Column Trim Cover Replacement** .
8. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

IGNITION LOCK CYLINDER CASE REPLACEMENT

Removal Procedure

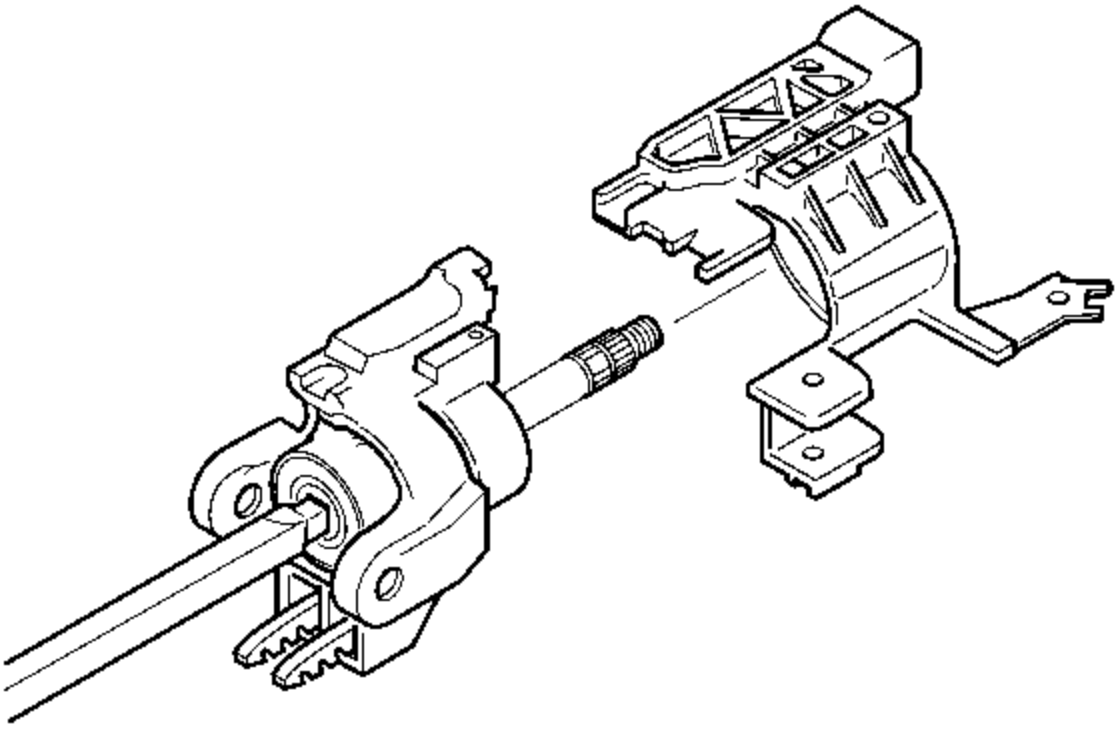

Fig. 22: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to SIR Warning .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
3. Remove the ignition switch. Refer to **Ignition and Start Switch Replacement**.
4. Remove the steering column tilt head components. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement** .
5. Remove the turn signal switch housing. Refer to **Turn Signal Switch Housing Replacement** .
6. Remove the turn signal and multifunction switch assembly only. Refer to **Turn Signal Multifunction Switch Replacement** .

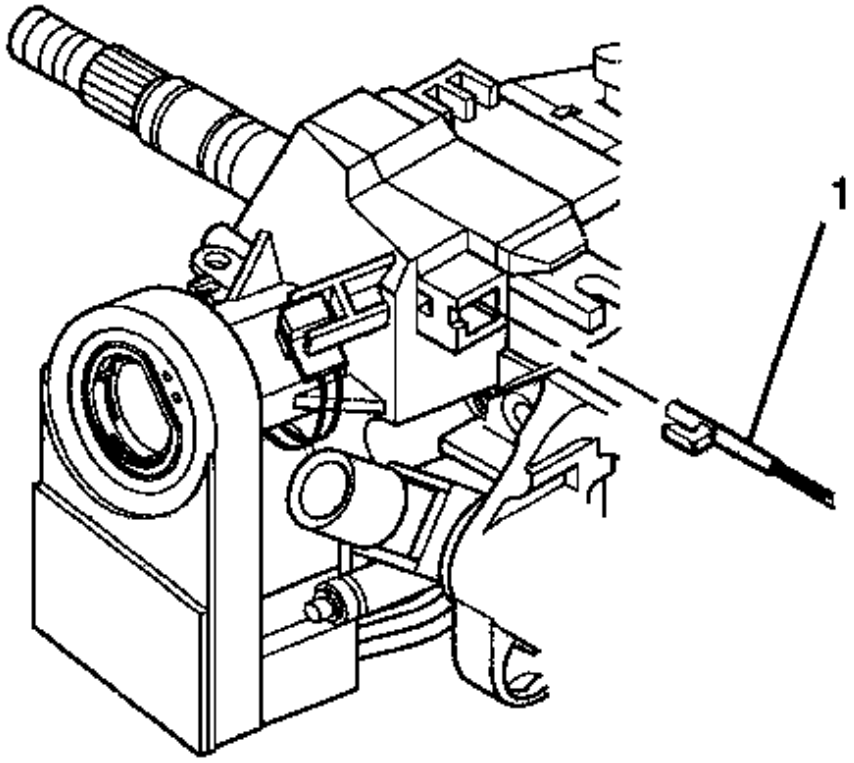

Fig. 23: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

7. Remove the park lock cable assembly (1) from the ignition lock cylinder case in the following way:
    1. Use a small blade to push against the locking tab on the end of the park lock cable assembly (1).
    2. Disconnect the park lock cable assembly (1) from the ignition lock cylinder case.

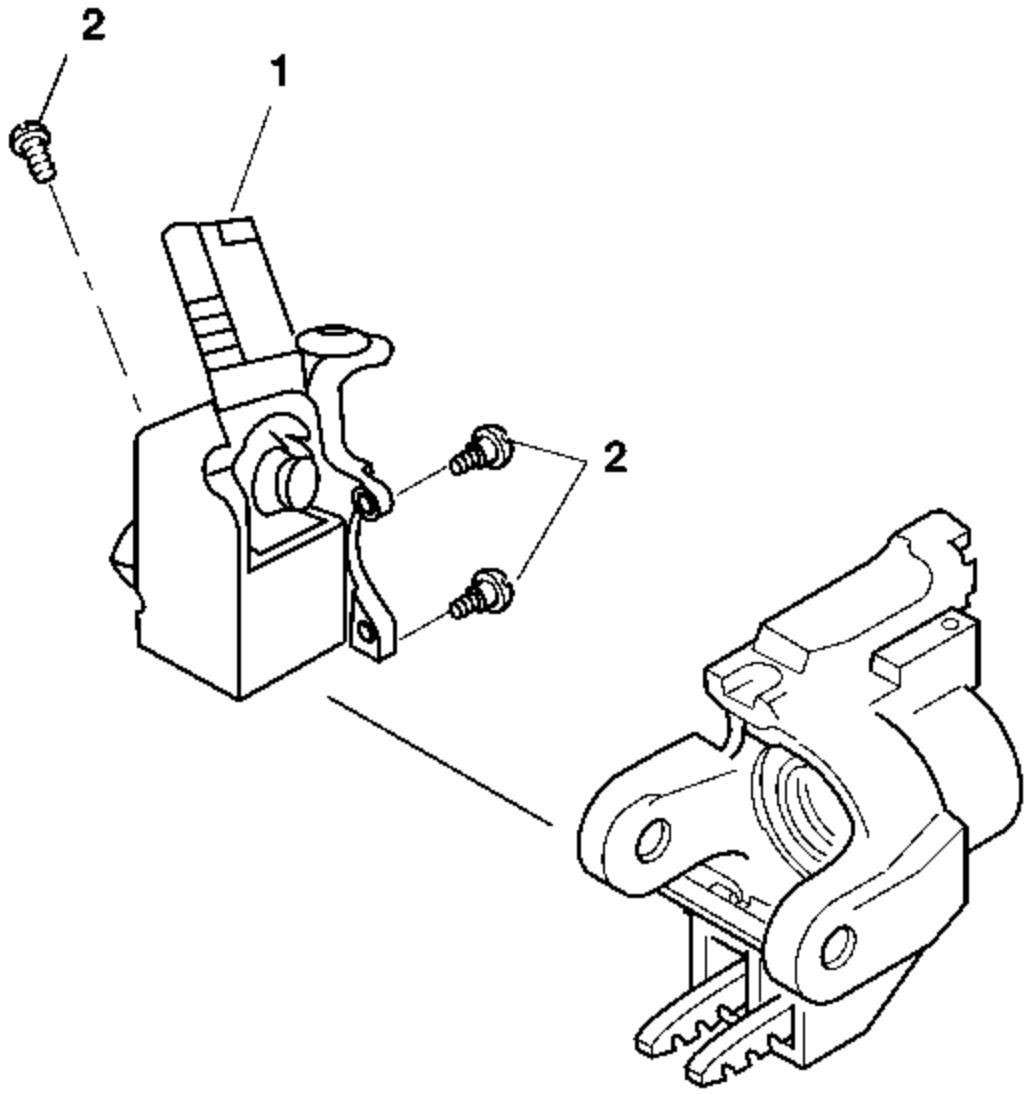

Fig. 24: View Of Ignition Lock Cylinder Case Assembly & Screws
Courtesy of GENERAL MOTORS COMPANY

8. Remove the 3 TORXÂ® screws (2) from the ignition lock cylinder case (1).
9. Remove the ignition lock cylinder case (1) from the steering column tilt head assembly.

Installation Procedure

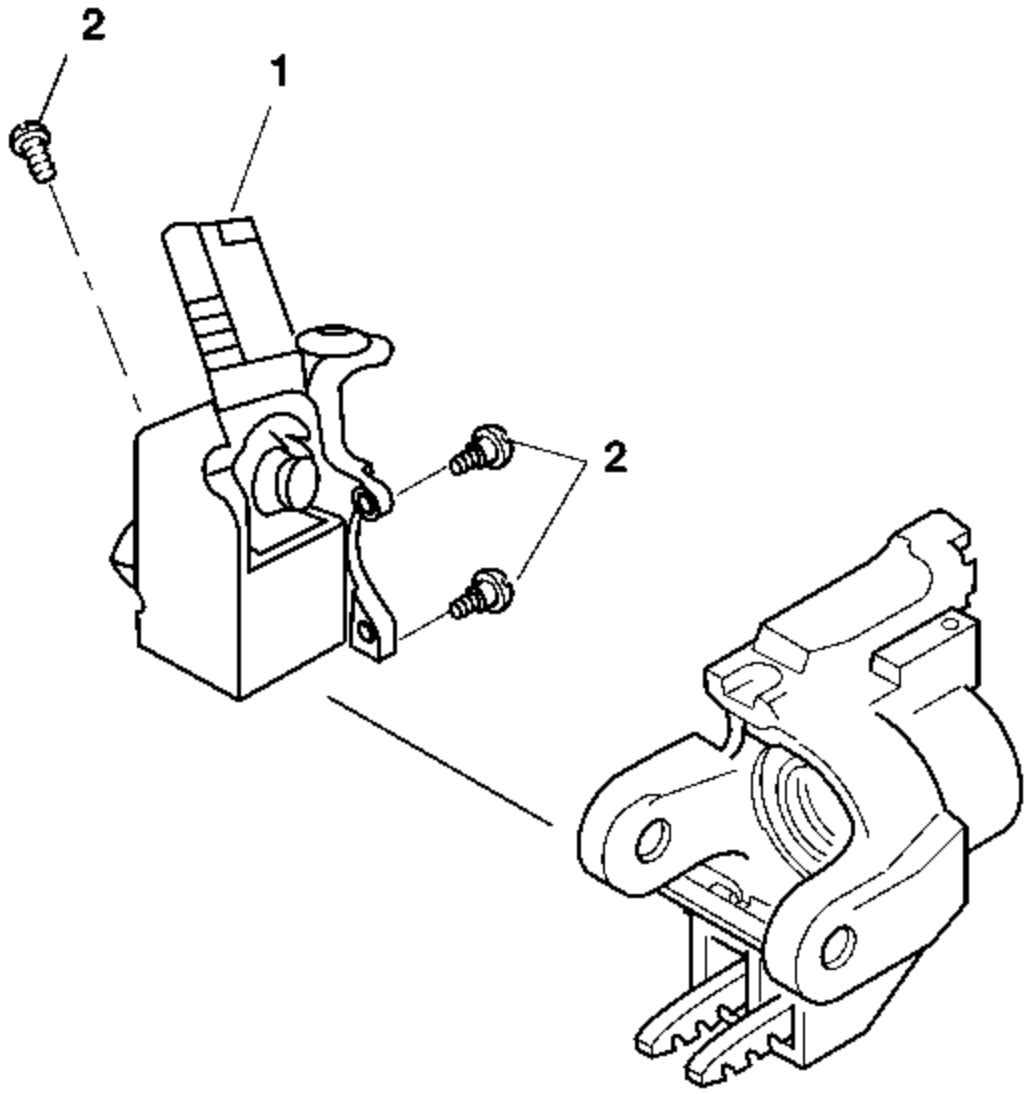

Fig. 25: View Of Ignition Lock Cylinder Case Assembly & Screws
Courtesy of GENERAL MOTORS COMPANY

1. Align the ignition lock cylinder case (1) with the steering column tilt head assembly.

CAUTION: Refer to Fastener Caution .

2. Screw the 3 TORXÂ® screws (2) into the ignition lock cylinder case (1).

Tighten

Tighten the 3 TORXÂ® screws to 7 N.m (62 lb in).

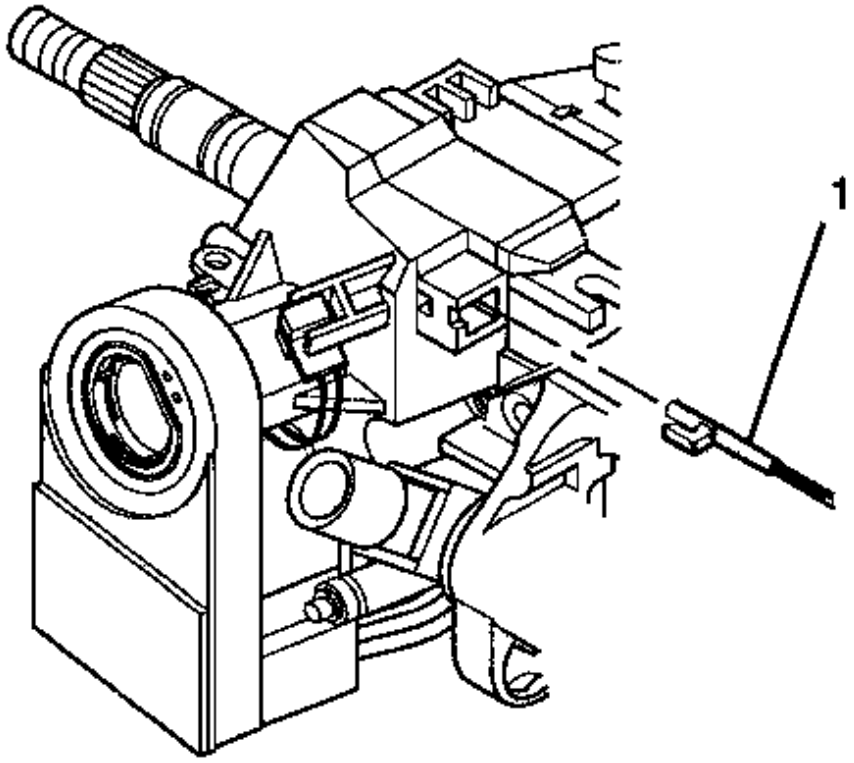

Fig. 26: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

3. Press the locking tab on the end of the park lock cable assembly (1) into the slot in the ignition lock cylinder case.

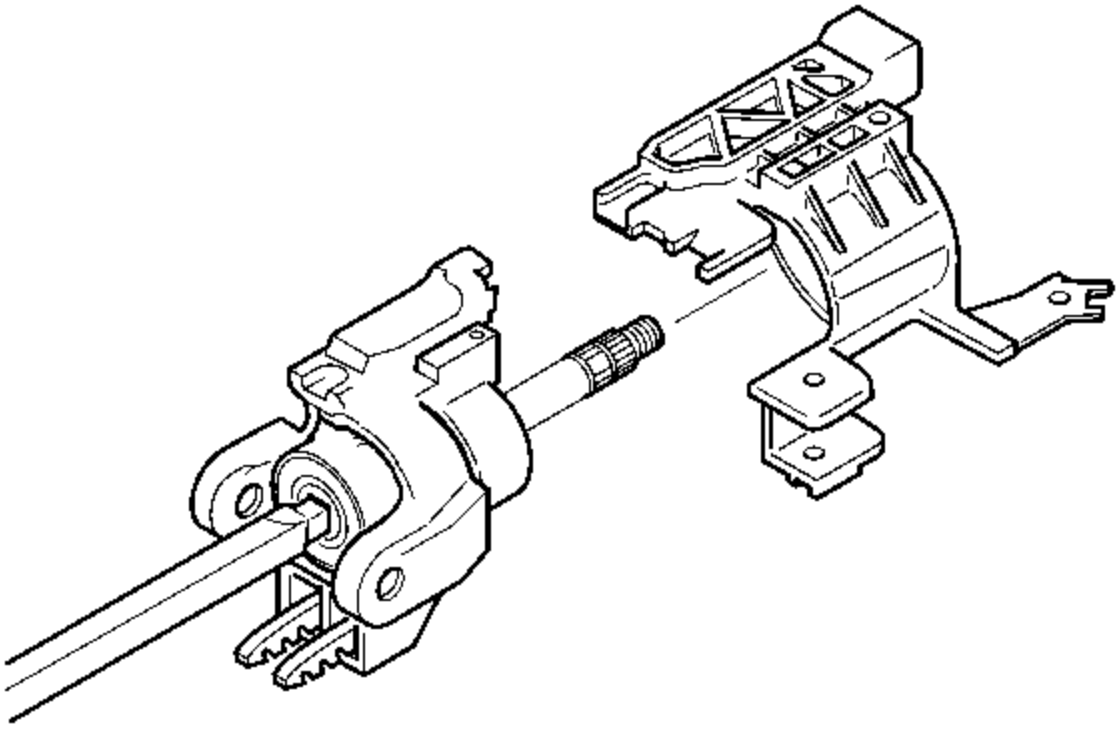

Fig. 27: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Press the turn signal switch housing firmly against the steering column tilt head in order for the screws from the turn signal and multifunction switch assembly to align.**

4. Install the turn signal switch housing. Refer to **Turn Signal Switch Housing Replacement** .
5. Install the turn signal and multifunction switch assembly only. Refer to **Turn Signal Multifunction Switch Replacement** .
6. Install the steering column tilt head components. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement** .
7. Install the ignition switch only. Refer to **Ignition and Start Switch Replacement**.
8. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
9. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

Article GUID: A00737178

GENERAL INFORMATION

Air/Wind Noise - Impala

DIAGNOSTIC INFORMATION AND PROCEDURES

AIR/WIND NOISE

Special Tools

- **CH-39570** Chassis Ear
- **GE-41416** Ultrasonic Leak Detector

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Assistant Driving Warning .

To analyze a reported windnoise condition, test drive the vehicle to determine the origin of the noise.

Choose a regular route with smooth and straight streets that run in all 4 directions: North, South, East, and West. The area should have little traffic or little noise in order to eliminate interference with the test.

NOTE: Often there is one primary leak source and one or more secondary leaks that contribute to the noise condition. Repairing only one of the contributing leak sources may not completely repair the total condition but only reduce the condition.

Drive the vehicle at the speed in which the noise was noticed, or until the noise is heard. Maintain safe and legal speeds.

Many of the waterleak diagnosis tests are also used for the windnoise diagnosis.

Most windnoise is caused either by leaking seals or by misaligned body surfaces. You can diagnose the following types of windnoise with the aid of **CH-39570** ear or **GE-41416** detector.

- Wind whistle
- Wind roar
- Wind rush

When moving at highway speeds, air pressure inside the vehicle becomes greater than the air pressure outside. When a leak occurs, the escaping air causes a hiss or a whistle.

Wind roar occurs when air passes over or through an opening between the 2 body surfaces. To correct the condition, adjust the alignment to the body surfaces.

Wind rush occurs when air presses over the vehicle's body, and is related to the aerodynamics of the vehicle. Wind whistle and wind roar are repairable. Rule out wind whistle and wind roar before concluding that the wind noise is due to wind rush.

Use the following inspections in order to aid in diagnosing wind whistle or wind roar:

1. Note the details for wind noise:
    - The perceived location
    - The location where the noise is loudest
    - When the noise occurs
    - The vehicle speed
    - The interior fan speed
    - The position of the windows
    - What the noise sounds like
2. Inspect the vehicle for the possible cause of the windnoise.
3. Test drive the vehicle and determine if the windnoise is external or internal.
4. Perform a visual inspection of the following components:
    - Loose fasteners
    - Torn weatherstrips
    - Broken weld joints
    - Sealer and/or adhesive skips

TRACING POWDER OR CHALK TEST

Clean the weatherstrips and the contact surfaces with cleaning solvent.

1. Apply powder or chalk in an unbroken line to the contact surface of the weatherstrip surrounding the perimeter of the suspected areas.
2. Close the panel completely without slamming the panel. Closing the panel completely presses the weatherstrip firmly against the mating surface.
3. Inspect the applied line on the weatherstrip. The applied line is marred where contact is good. A corresponding imprint is on the mating surfaces.
4. Gaps or irregularities in the powder or the chalk line on the mating surfaces indicate the areas with a poor seal.

AIR PRESSURE TEST

1. Mask off both the pressure relief valves.
2. Close all the windows.
3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Listen for escaping air along the door and the window seals with a stethoscope or a length of heater hose.

SOAP SUDS OR BUBBLE TEST

1. Mask off the pressure relief valves.
2. Close all the windows and the doors.

3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Apply the soap solution to the potential leak areas.
6. Look for bubbles revealing escaping air.

REPAIR INSTRUCTIONS

EXTERIOR WINDNOISE

WARNING: Refer to Assistant Driving Warning .

Exterior windnoise is louder when the vehicle is driven with one or more windows down. Exterior windnoise occurs when air passes over the body panels, the seams, or the openings. Use the following items during the test drive in order to aid in the detection of leaks:

- Mechanic's stethoscope or heater hose
- Masking tape-51 mm (2 in) width
- Strip caulk
- A water soluble marking pencil

1. While driving, determine the location of the exterior windnoise by lowering one window at a time. If the location corresponds with the condition in step 2, pull over and make a temporary repair with 51 mm (2 in) wide masking tape.
2. Tape over the gaps and the moldings one at a time. Test between each taping. Taping over the gaps and moldings will correct the condition.
3. Temporarily repair the condition with masking tape. Adjust the tape when needed.
4. Continue testing in order to determine if the noise has been eliminated or other leak areas exist.
5. When all the reported leak conditions are located, make permanent repairs using the proper alignment techniques and the sealing materials.

INTERIOR WINDNOISE

WARNING: Refer to Assistant Driving Warning .

Interior windnoise is not heard when the window is lowered. Interior windnoise is caused by the air leaving the inside of the vehicle through a seal or a seam.

1. Tape over the relief valves to cause added air pressure within the vehicle.
2. Test drive the vehicle and listen for windnoise or a whistle.
3. Pull the vehicle over and make the temporary repairs using masking tape. If you cannot determine the source of the windnoise, perform one or more of the following diagnostic tests:
    - **Air Pressure Test**
    - **Soap Suds or Bubble Test**
    - **Tracing Powder or Chalk Test**

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B3006: HOOD AJAR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3006 5A

Hood Ajar Circuit Plausibility Failure

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal

	Ground	Resistance	Voltage	Performance
Hood Ajar Switch Signal	B3006 5A	B3006 5A	B3006 5A	-
Hood Closed Switch Signal	B3006 5A	B3006 5A	B3006 5A	-
Ground	B3006 5A	B3006 5A	-	-

Circuit/System Description

The body control module (BCM) monitors the voltage input of the hood open switch signal circuit and the hood open closed switch signal circuit. With the hood open, the hood ajar portion of the switch is closed, grounding the hood ajar switch signal circuit from the BCM, and the hood closed portion of the switch is open. With the hood closed, the hood closed portion of the switch is closed, grounding the hood closed switch signal circuit from the BCM, and the hood ajar portion of the switch is open. During proper operation, the two separate voltage signals at the BCM should never be at the same voltage.

Conditions for Running the DTC

The BCM continuously monitors for this DTC

Conditions for Setting the DTC

Both the hood open switch signal circuit and the hood closed switch signal circuit are simultaneously in an active or inactive state.

Action Taken When the DTC Sets

- Remote start functions will be disabled.
- The hood ajar switch inputs will be ignored by content theft deterrent (CTD).

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool BCM Hood Open Switch and Hood Closed Switch parameters. With the hood open, the Hood Open Switch parameter should read Active and the Hood Closed Switch parameter should read Inactive. With the hood closed, the Hood Open Switch parameter should read Inactive and the Hood Closed Switch parameter should read Active.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. Ignition OFF, test for less than 5 ohms between the ground circuit terminal C and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal A and ground.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal B and ground.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the hood ajar switch.

Component Testing

Hood Ajar Switch

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. With the switch in the hood closed position, test for infinite resistance between the ground terminal C and the signal terminal A.
    - If not infinite, replace the hood ajar switch.
3. Test for less than 2.0 ohms between the ground terminal C and the signal terminal B.
    - If greater than the specified range, replace the hood ajar switch.
4. With the switch in the hood open position, test for infinite resistance between the ground terminal C and the signal terminal B.
    - If not infinite, replace the hood ajar switch.
5. Test for less than 2.0 ohms between the ground terminal C and the signal terminal A.

- If greater than the specified range, replace the hood ajar switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Hood Primary and Secondary Latch Replacement**
- **Control Module References** for BCM replacement, programming and setup

SYMPTOMS - BOLTED EXTERIOR BODY PANELS AND CLOSURES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Hood Ajar Indicator Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Hood Ajar Indicator/Message Malfunction** in order to diagnose the symptom.

HOOD AJAR INDICATOR/MESSAGE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hood Ajar Switch Signal	1	1	1	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hood Closed Switch Signal	1	1	1	-
Ground	-	1	-	-
1. Hood ajar switch malfunction				

Circuit/System Description

The body control module (BCM) monitors the voltage input of the hood open switch signal circuit and the hood open closed switch signal circuit. With the hood open, the hood ajar portion of the switch is closed, grounding the hood ajar switch signal circuit from the BCM, and the hood closed portion of the switch is open. With the hood closed, the hood closed portion of the switch is closed, grounding the hood closed switch signal circuit from the BCM, and the hood ajar portion of the switch is open. During proper operation, the two separate voltage signals at the BCM should never be at the same voltage.

Reference Information

Schematic Reference

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool BCM Hood Open Switch and Hood Closed Switch parameters. With the hood open, the Hood Open Switch parameter should read Active and the Hood Closed Switch parameter should read Inactive. With the hood closed, the Hood Open Switch parameter should read Inactive and the Hood Closed Switch parameter should read Active.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. Ignition OFF, test for less than 5 ohms between the ground circuit terminal C and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal A and ground.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition ON, test for 11.5-12.0 volts between the signal circuit terminal B and ground.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the hood ajar switch.

Component Testing

Hood Ajar Switch

1. Ignition OFF, disconnect the harness connector at the hood ajar switch.
2. With the switch in the hood closed position, test for infinite resistance between the ground terminal C and the signal terminal A.
    - If not infinite, replace the hood ajar switch.
3. Test for less than 2 ohms between the ground terminal C and the signal terminal B.
    - If greater than the specified range, replace the hood ajar switch.
4. With the switch in the hood open position, test for infinite resistance between the ground terminal C and the signal terminal B.
    - If not infinite, replace the hood ajar switch.
5. Test for less than 2 ohms between the ground terminal C and the signal terminal A.
    - If greater than the specified range, replace the hood ajar switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Hood Primary and Secondary Latch Replacement**
- **Control Module References** for BCM or instrument cluster replacement, programming and setup

REPAIR INSTRUCTIONS

FRONT FENDER UPPER DIAGONAL BRACE REPLACEMENT

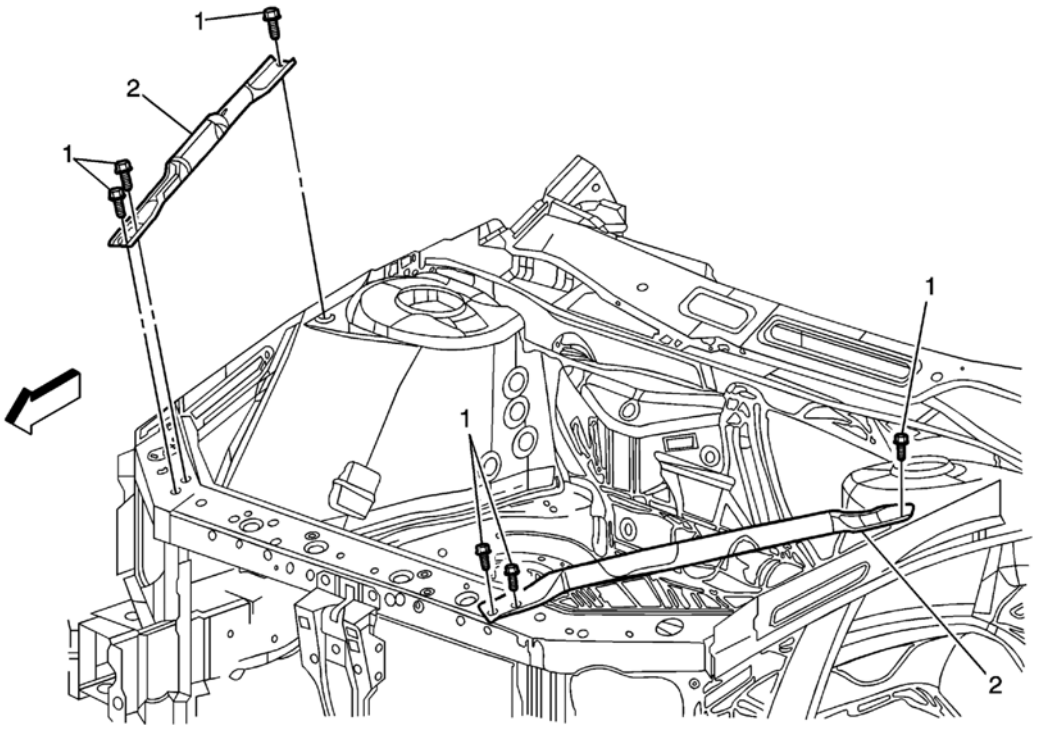

Fig. 1: Front Fender Upper Diagonal Brace
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Fender Upper Brace Bolts (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Fender Upper Diagonal Brace

HOOD PRIMARY LATCH RELEASE CABLE REPLACEMENT

Removal Procedure

1. Open the hood.
2. Remove the hood latch. Refer to **Hood Primary and Secondary Latch Replacement**.

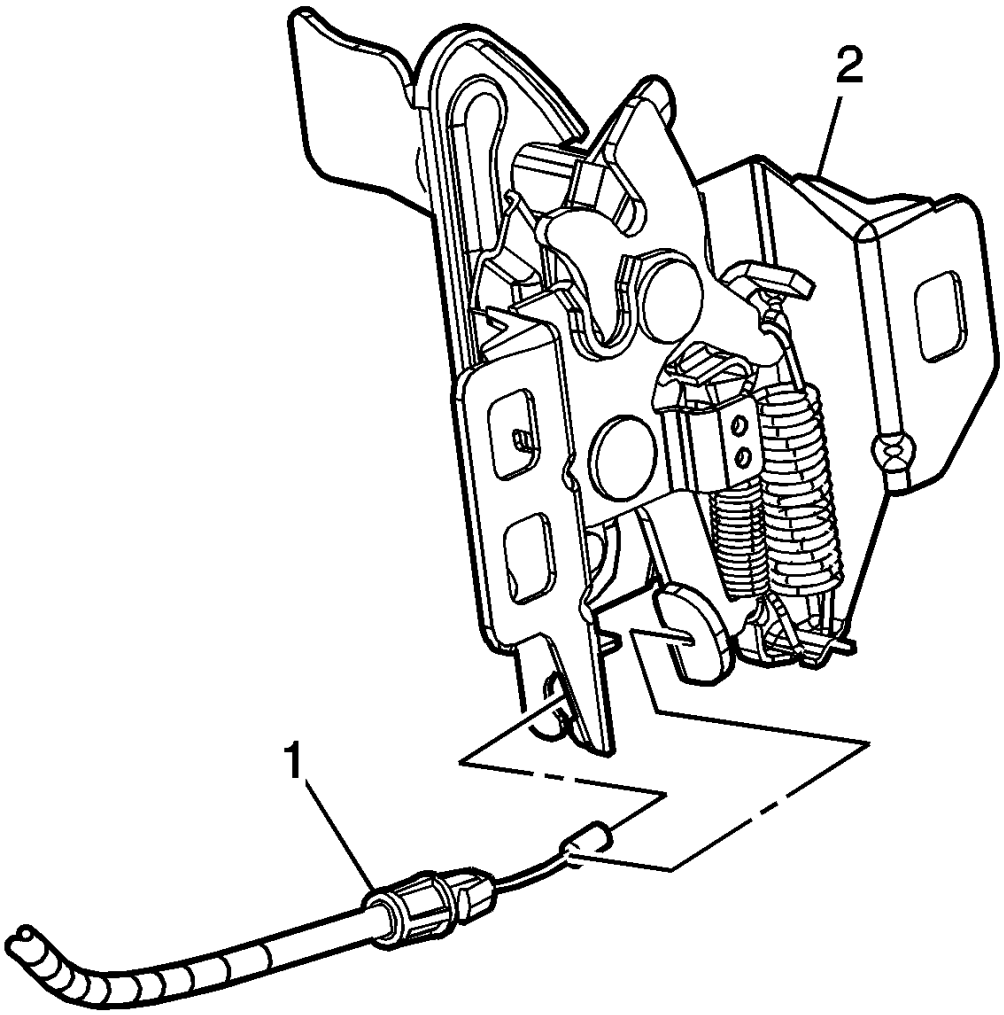

Fig. 2: Identifying Hood Latch Release Cable
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the hood release cable (1) from the hood latch (2).
4. Remove the carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .
5. Disconnect the hood release cable from the hood release handle.
6. Tie a piece of string around the hood release cable. This will ease the installation of the hood release cable through the passenger compartment.

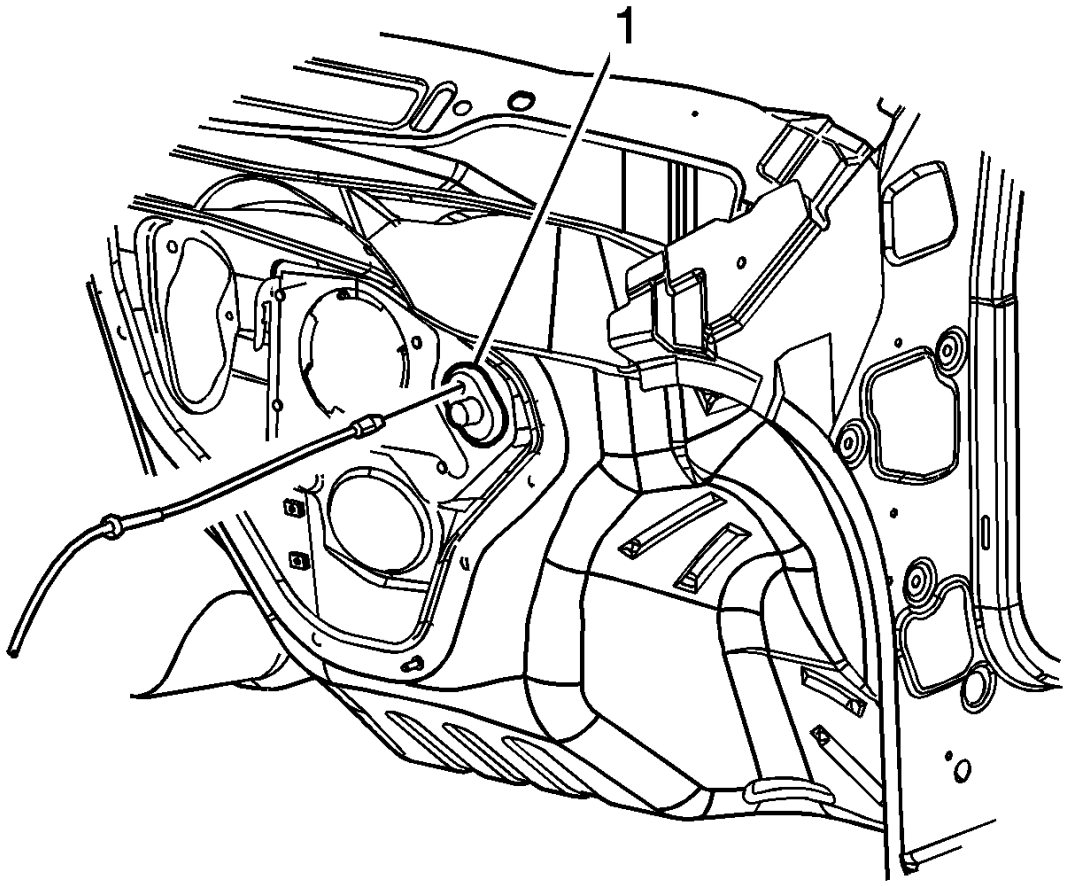

Fig. 3: Hood Release Cable Grommet At Dash Panel
Courtesy of GENERAL MOTORS COMPANY

7. Remove the hood release cable grommet (1) from the dash panel.
8. Note routing of cable.
9. Remove the hood release cable from the vehicle.

Installation Procedure

1. Transfer the string to either end of the new hood release cable.

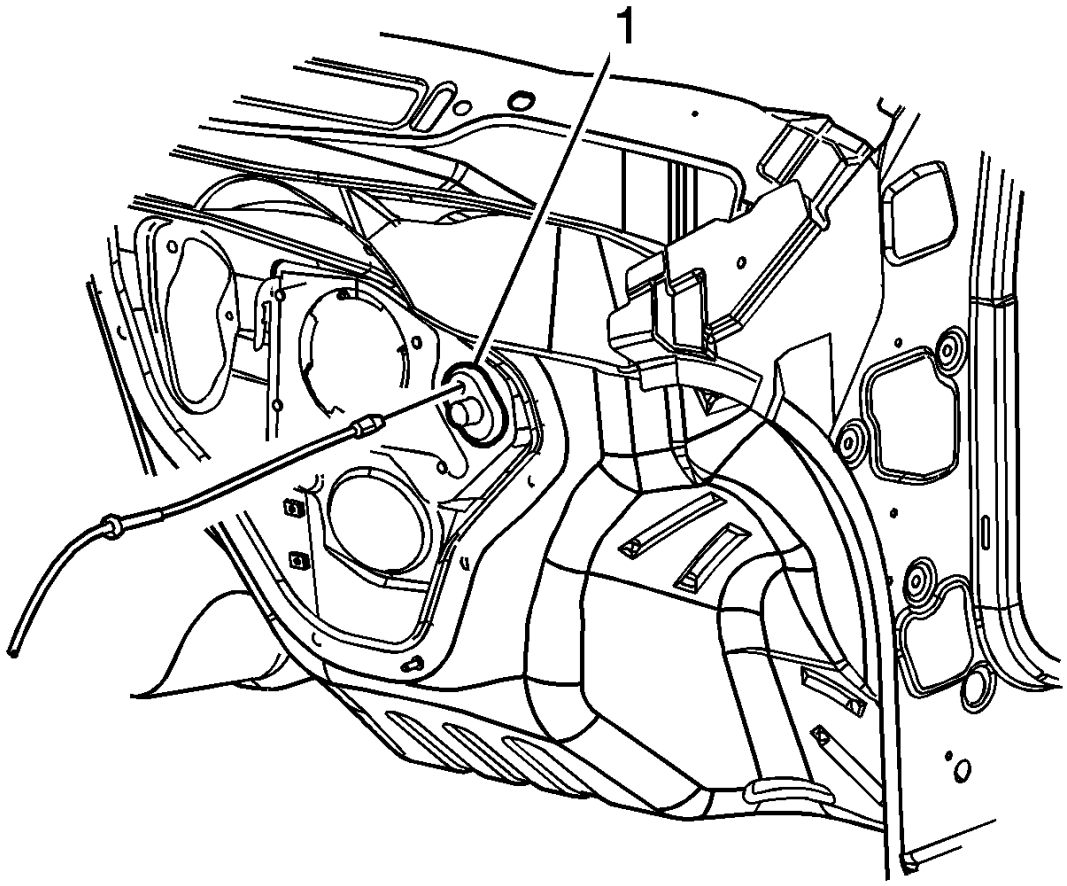

Fig. 4: Hood Release Cable Grommet At Dash Panel
Courtesy of GENERAL MOTORS COMPANY

2. Route the string and the hood release cable into the passenger compartment.
3. Remove the string from the hood release cable.
4. Seat the hood release cable grommet (1) into the cowl.
5. Connect the hood release cable to the hood release handle.
6. Install the carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .

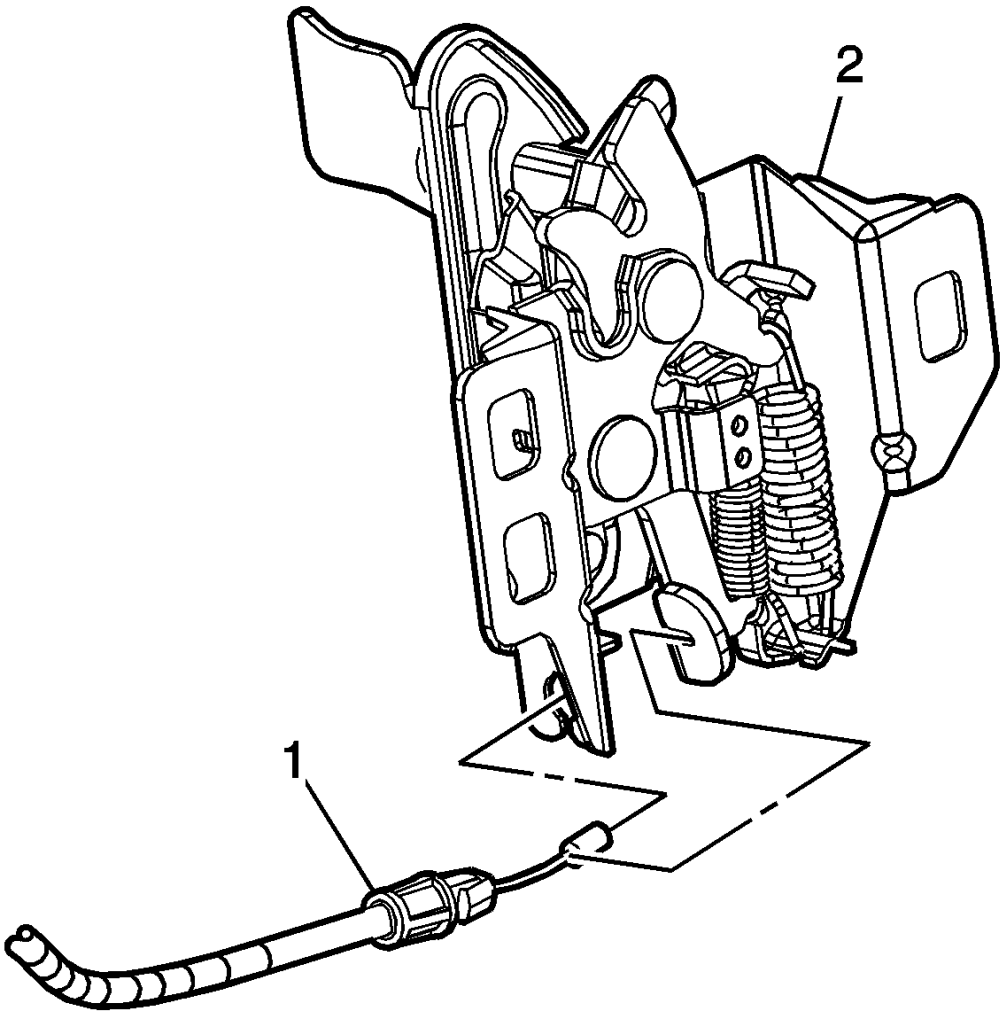

Fig. 5: Identifying Hood Latch Release Cable
Courtesy of GENERAL MOTORS COMPANY

7. Remove the string from the hood release cable.
8. Install the hood release cable (1) from the hood latch (2).
9. Install the hood latch. Refer to **Hood Primary and Secondary Latch Replacement**.
10. Close the hood.
11. Pull the string and the hood release cable into the engine compartment.

FRONT SIDE DOOR WIRING CONDUIT REPLACEMENT (IMPALA LIMITED)

Removal Procedure

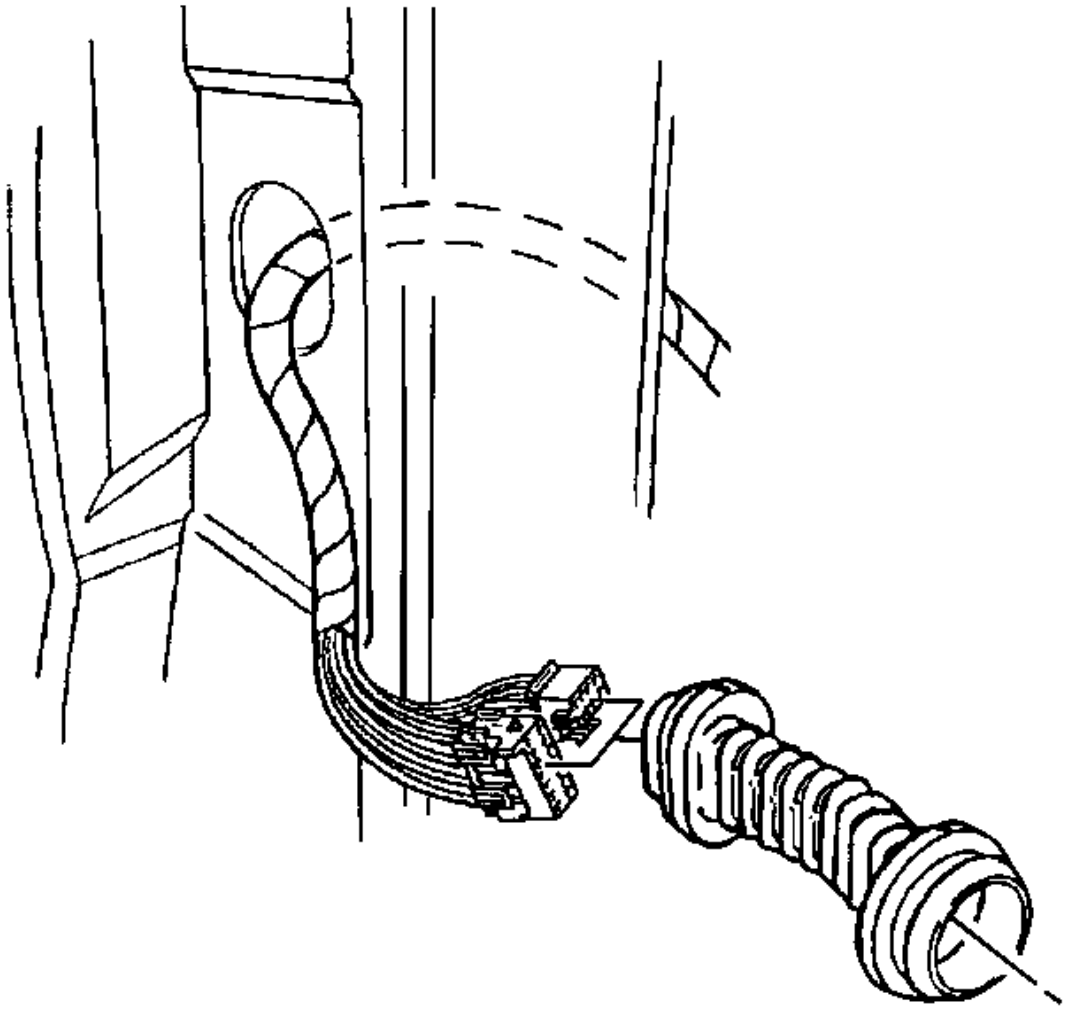

Fig. 6: Front Door Rubber Conduit
Courtesy of GENERAL MOTORS COMPANY

1. Remove the right instrument panel insulator if removing the right conduit. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** .
2. Remove the door rubber conduit from where it attaches at the windshield pillar.
3. Disconnect the body harness electrical connector from the front door wiring harness.
4. Remove the conduit from the front door.
5. Remove the front door wiring harness out from the rubber conduit.

Installation Procedure

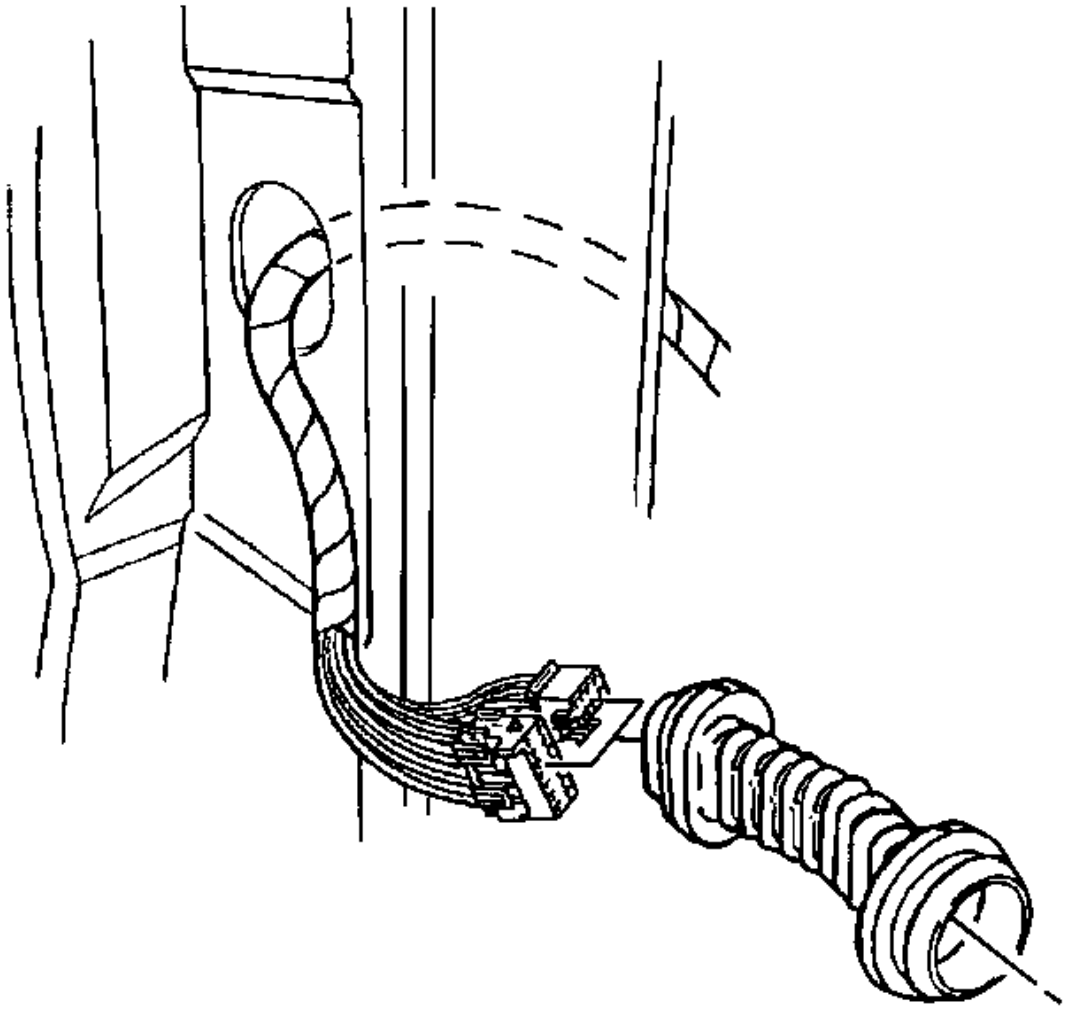

Fig. 7: Front Door Rubber Conduit
Courtesy of GENERAL MOTORS COMPANY

1. Install the wiring harness to the front door through the rubber conduit.
2. Install the rubber conduit to the front door.
3. Install the rubber conduit to the windshield pillar.
4. Connect the front door wiring harness electrical connector to the body harness.
5. Install the right instrument panel insulator if required. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** .

REAR SIDE DOOR WIRING CONDUIT REPLACEMENT

Removal Procedure

IMPORTANT: Mark the location and the color of the wires to the electrical socket before removing the wires.

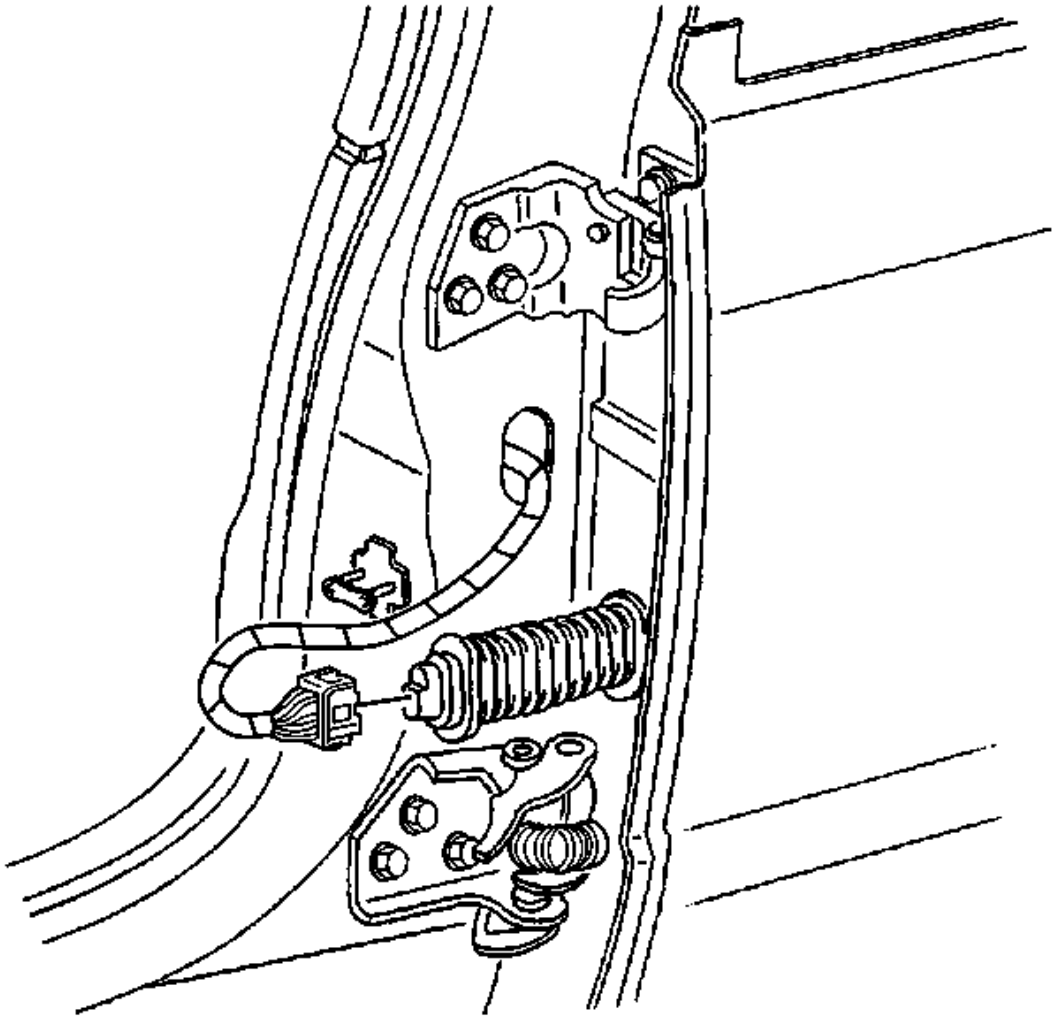

Fig. 8: View Of Rear Door Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

1. Remove the conduit from the center pillar.
2. Disconnect the rear door wiring harness electrical connector from the body harness.
3. Disconnect the wire harness retainer from the wiring harness socket.
4. Remove the wiring harness wiring one at a time from the socket.
5. Remove the rubber conduit from the rear door.
6. Remove the wiring harness wiring from the rubber conduit.

Installation Procedure

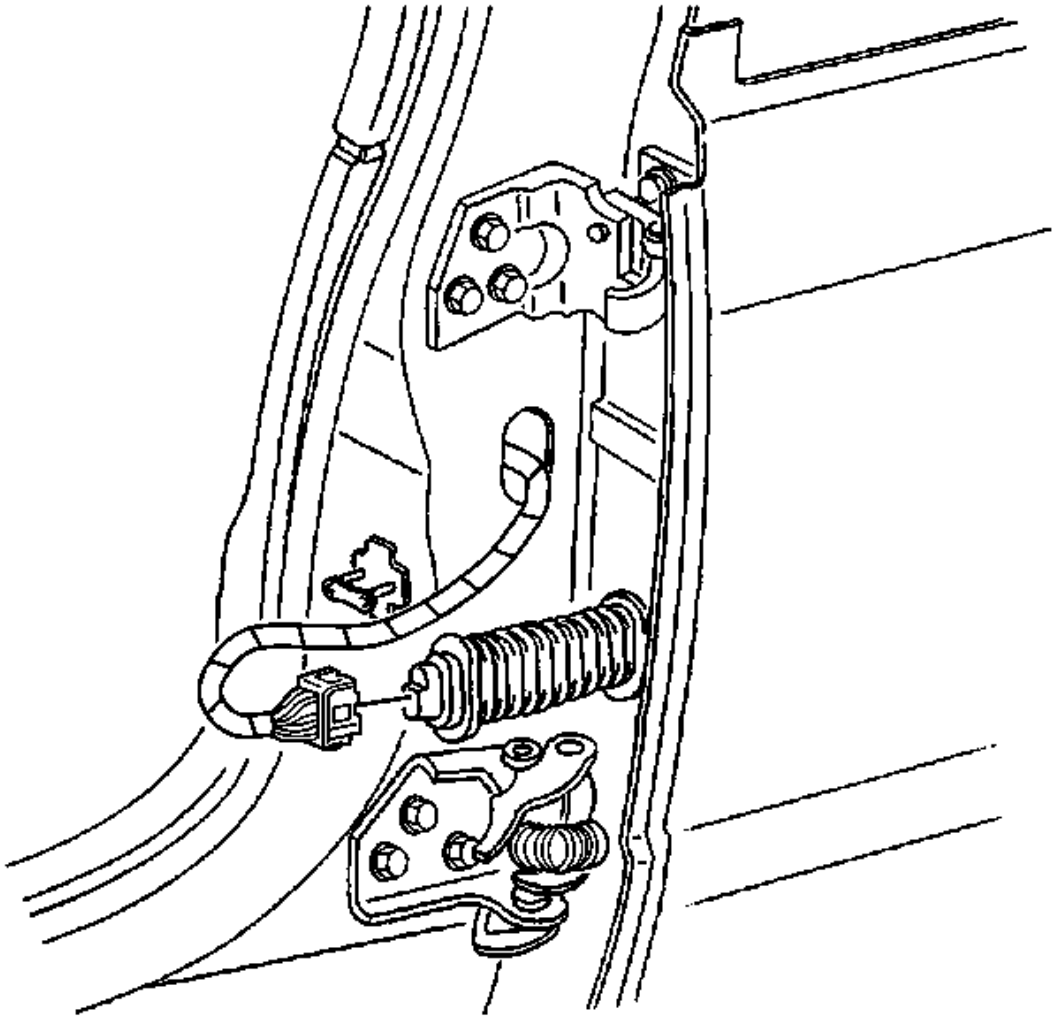

Fig. 9: View Of Rear Door Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear door electrical harness through the rubber conduit.
2. Install the rear door wiring harness wires to the electrical socket.
3. Connect the rear door wiring harness electrical connector.

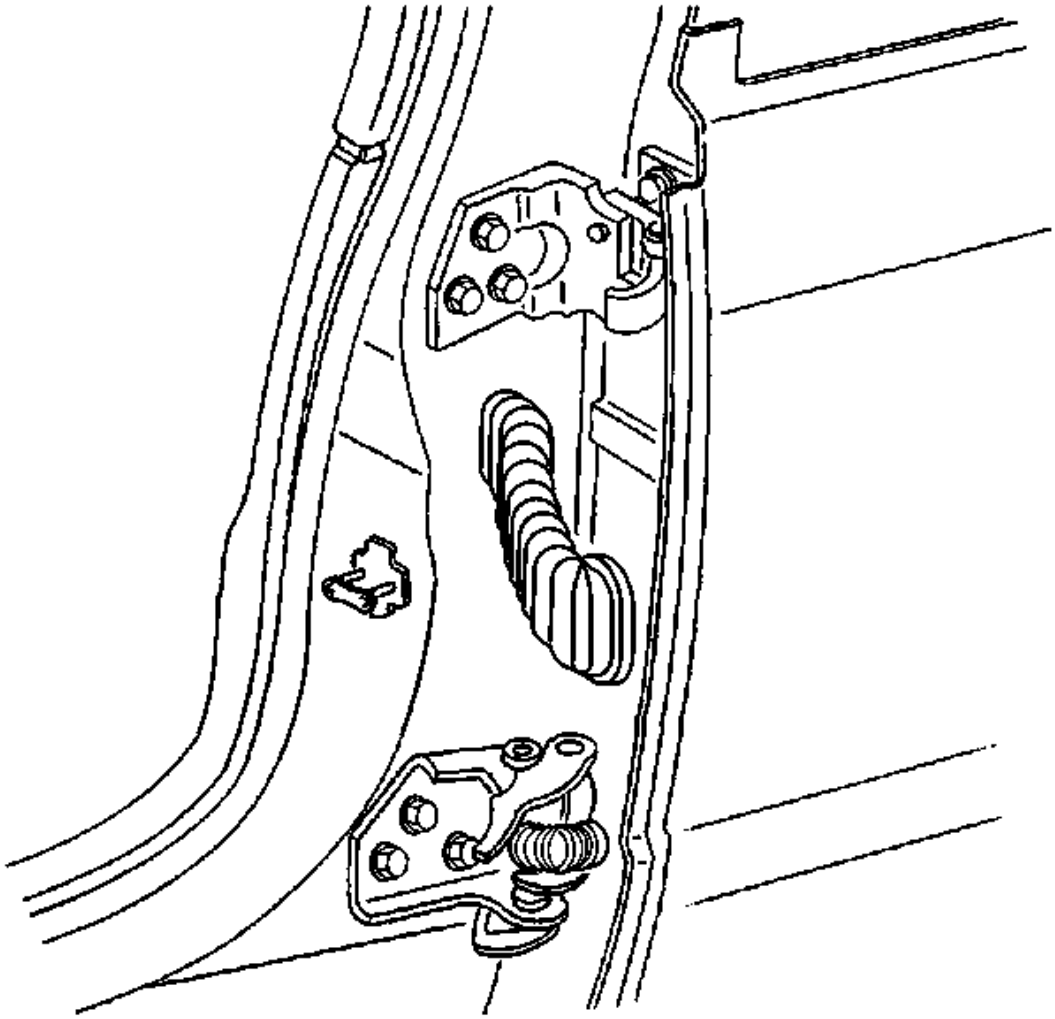

Fig. 10: Identifying Rear Door Rubber Conduit
Courtesy of GENERAL MOTORS COMPANY

4. Install the rubber conduit to the rear door.
5. Install the rubber conduit to the center pillar.

FRONT SIDE DOOR ADJUSTMENT

Up/Down or In/Out Adjustment

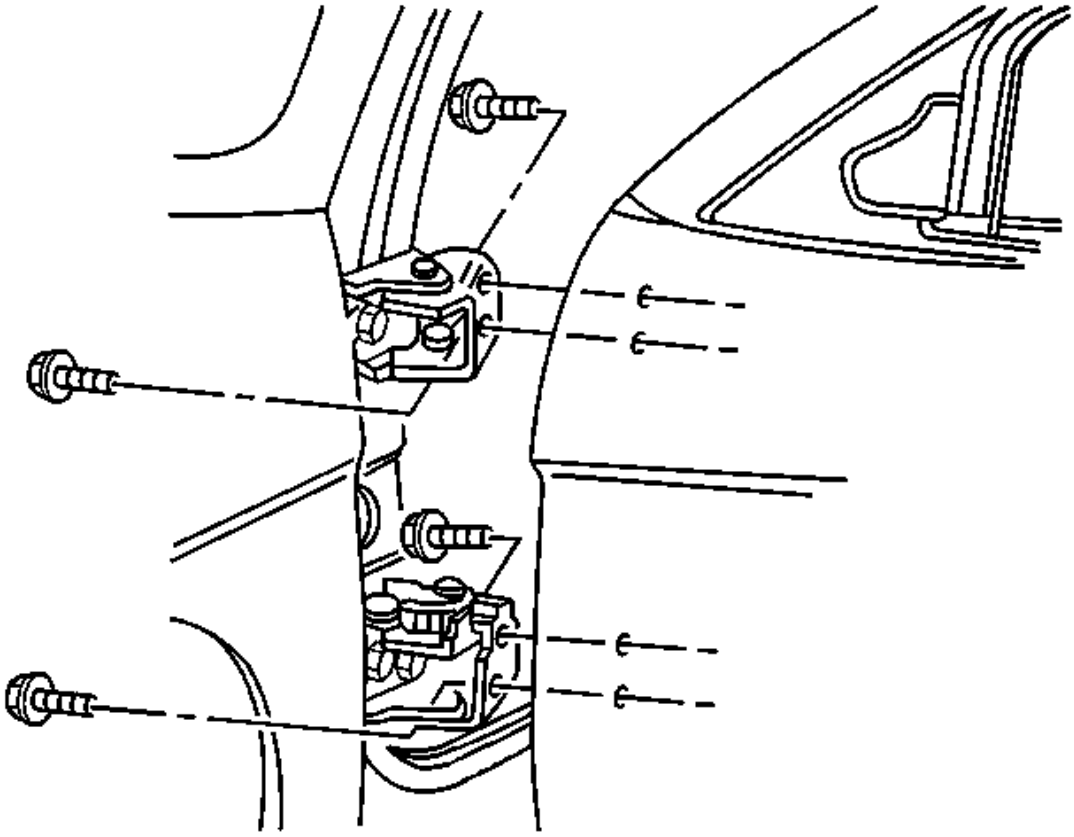

Fig. 11: Front Door Hinges
Courtesy of GENERAL MOTORS COMPANY

1. Open the font door to access the front door hinge bolts.

NOTE: **Do not remove the front door hinge bolts.**

2. Loosen the front door side hinge bolts.

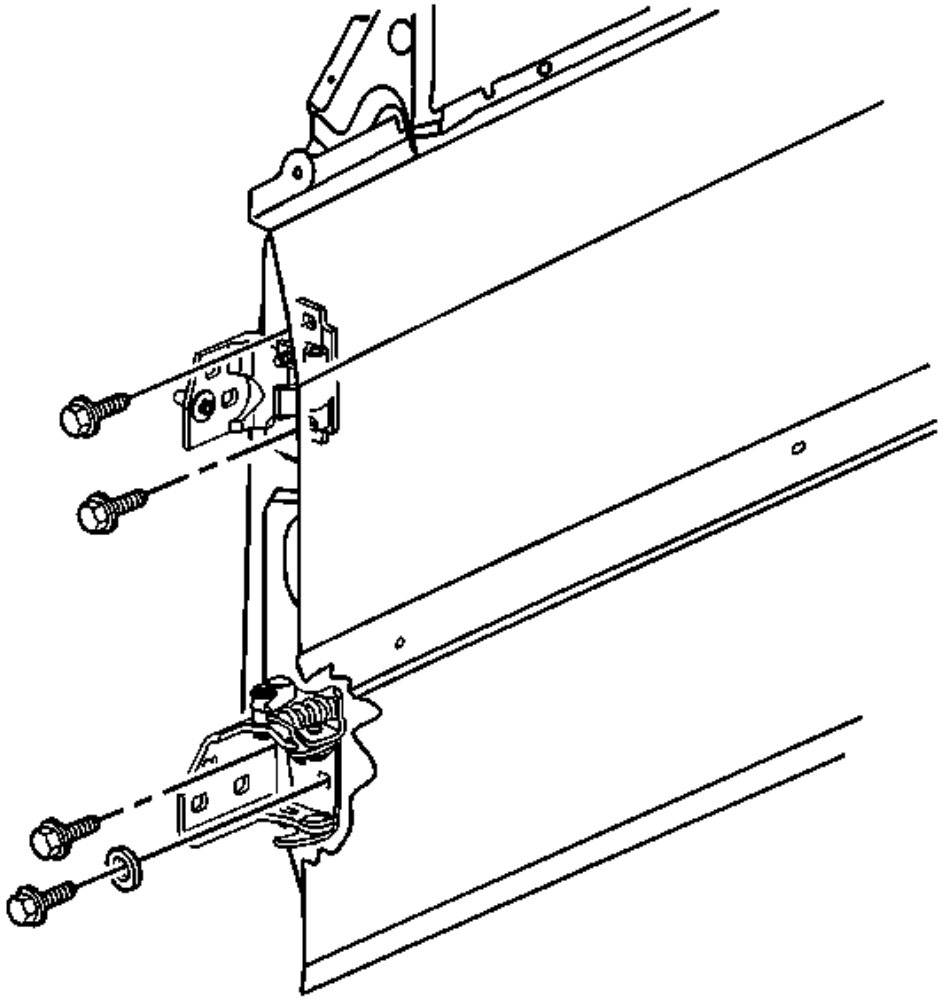

Fig. 12: Front Door Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Pry off the washer from the lower bolt on the lower hinge.

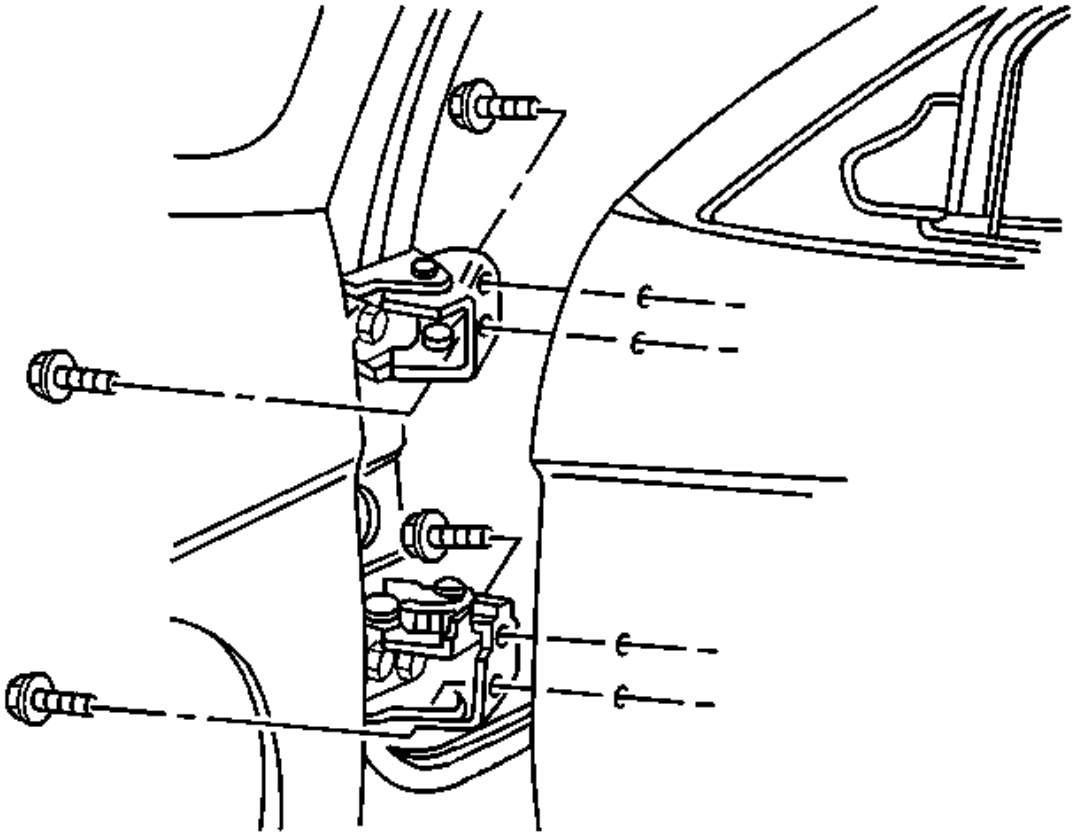

Fig. 13: Front Door Hinges
Courtesy of GENERAL MOTORS COMPANY

4. Adjust the front door up or down and in and out as required.

CAUTION: Refer to Fastener Caution .

5. Tighten the door side hinge bolts to 33 N.m (24 lb ft).

Fore/Aft Adjustment

NOTE: Do not remove the bolts.

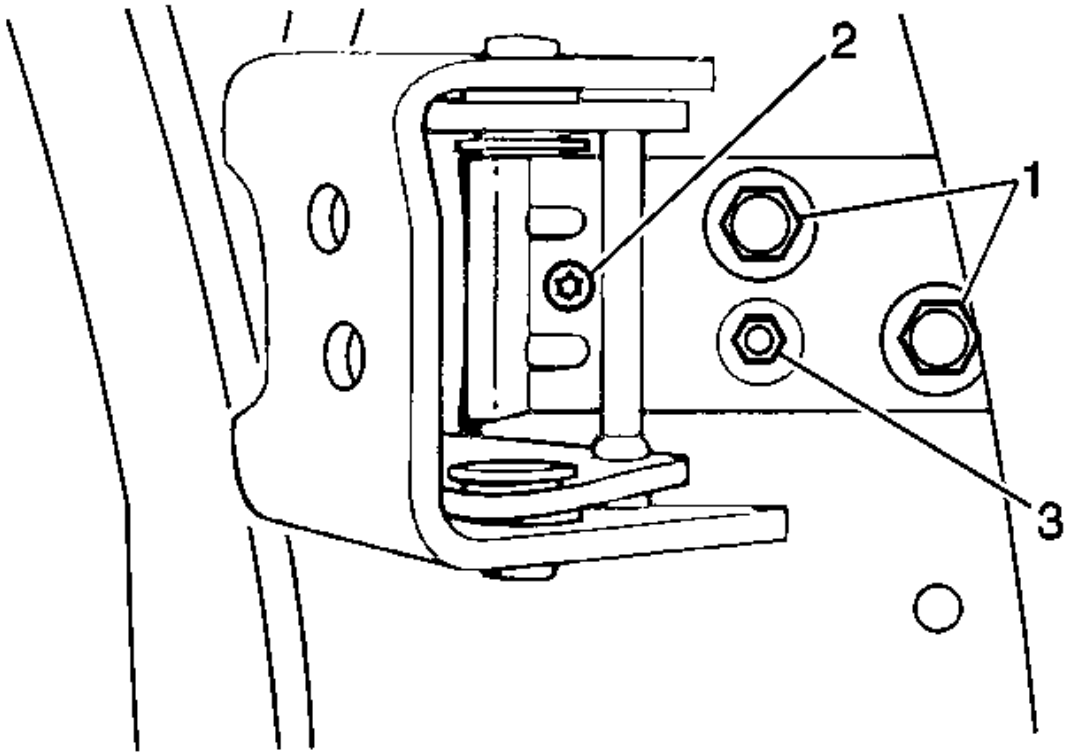

Fig. 14: Front Door Hinge & Components
Courtesy of GENERAL MOTORS COMPANY

1. Loosen the body side hinge bolts (1).
2. Adjust the door fore and aft as required.
3. Tighten the body side hinge bolts (1) to 33 N.m (24 lb ft).

REAR SIDE DOOR ADJUSTMENT

Up/Down or In/Out Adjustment

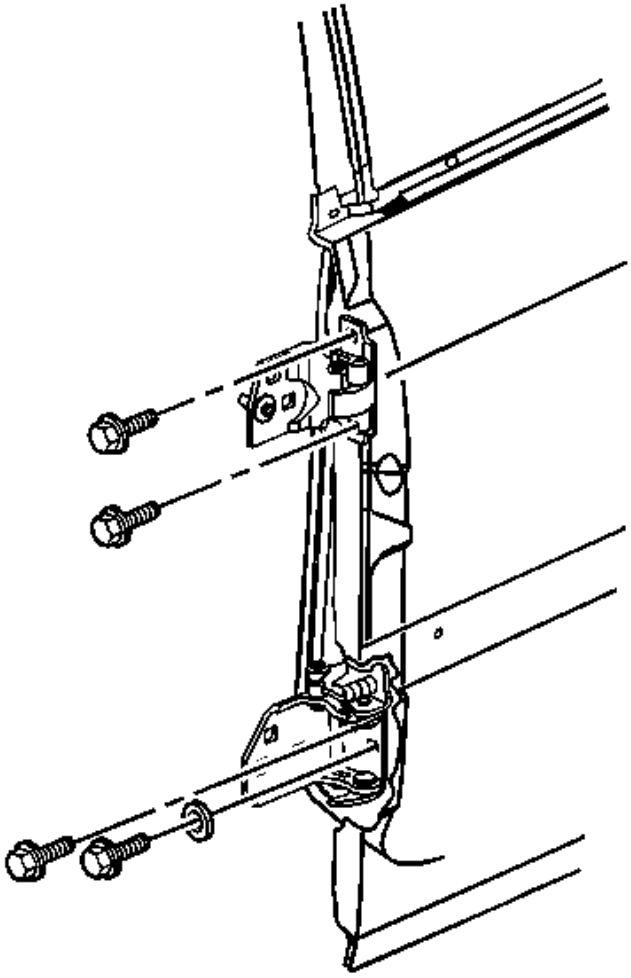

Fig. 15: Locating Door Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Open the front door to access the rear door hinge bolts.

NOTE: **Do not remove the rear door hinge bolts.**

2. Loosen the rear door side hinge bolts.
3. Pry off the washer from the lower bolt on the lower hinge.
4. Adjust the rear door up or down and in and out as required.

CAUTION: **Refer to Fastener Caution .**

5. Tighten the door side hinge bolts.

Tighten

Tighten the rear door hinge to door bolts to 33 N.m (24 lb ft).

FRONT SIDE DOOR REPLACEMENT

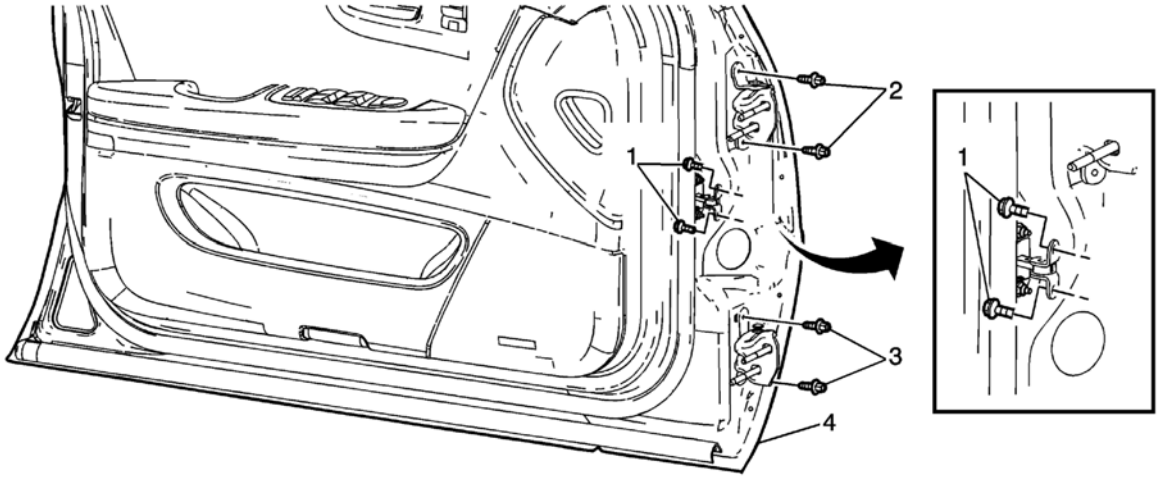

Fig. 16: Front Side Door Bolts
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **Preliminary Procedures** 1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling** . 2. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement** .	
1	Front Side Door Check Link Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 20 N.m (15 lb ft)
2	Front Side Door Upper Hinge Bolt (Qty: 2) **Procedure** 1. Remove the water deflector. 2. Support the door before removing the hinge bolts. 3. Disconnect the electrical connector, if equipped. 4. With the aid of an assistant, remove the door.

Callout	Component Name
	Tighten 35 N.m (26 lb ft)
3	Front Side Door Lower Hinge Bolt (Qty: 2) **Tighten** 33 N.m (24 lb ft)
4	Front Side Door Assembly **Procedure** When replacing the door it is necessary to transfer all of the internal components.

REAR SIDE DOOR REPLACEMENT

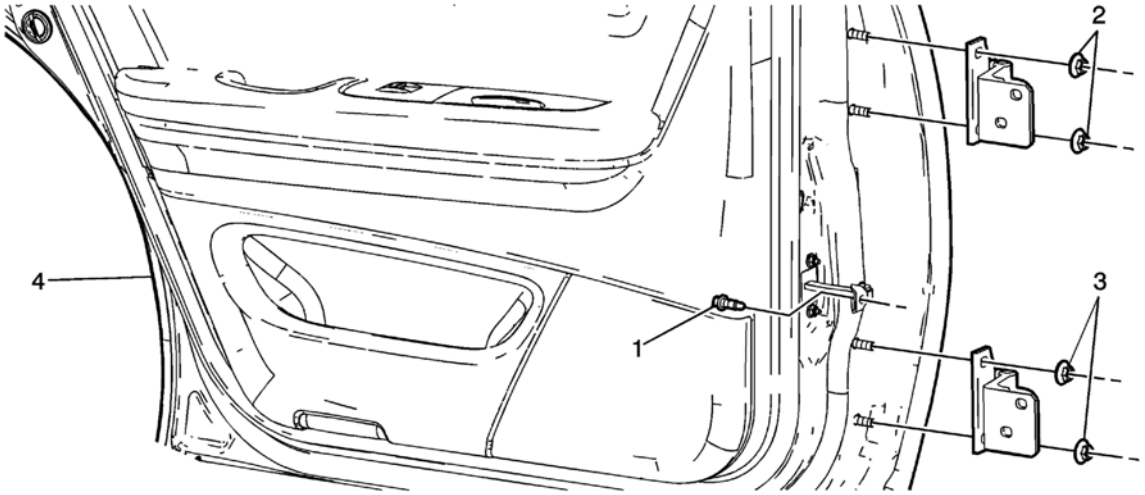

Fig. 17: Rear Side Door Bolts & Nuts
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **Preliminary Procedures** 1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling** . 2. Remove the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement** .	

Callout	Component Name
1	Rear Side Door Check Link Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 20 N.m (15 lb ft)
2	Rear Side Door Hinge Upper Bolt (Qty: 2) **Procedure** 1. Remove the water deflector. 2. Support the door before removing the hinge bolts. 3. Disconnect the electrical connector, if equipped. 4. With the aid of an assistant, remove the door. **Tighten** 26 N.m (19 lb ft)
3	Rear Side Door Hinge Lower Bolt (Qty: 2) **Tighten** 26 N.m (19 lb ft)
4	Rear Side Door Assembly **Procedure** When replacing the door it is necessary to transfer all of the internal components.

FRONT FENDER REPLACEMENT

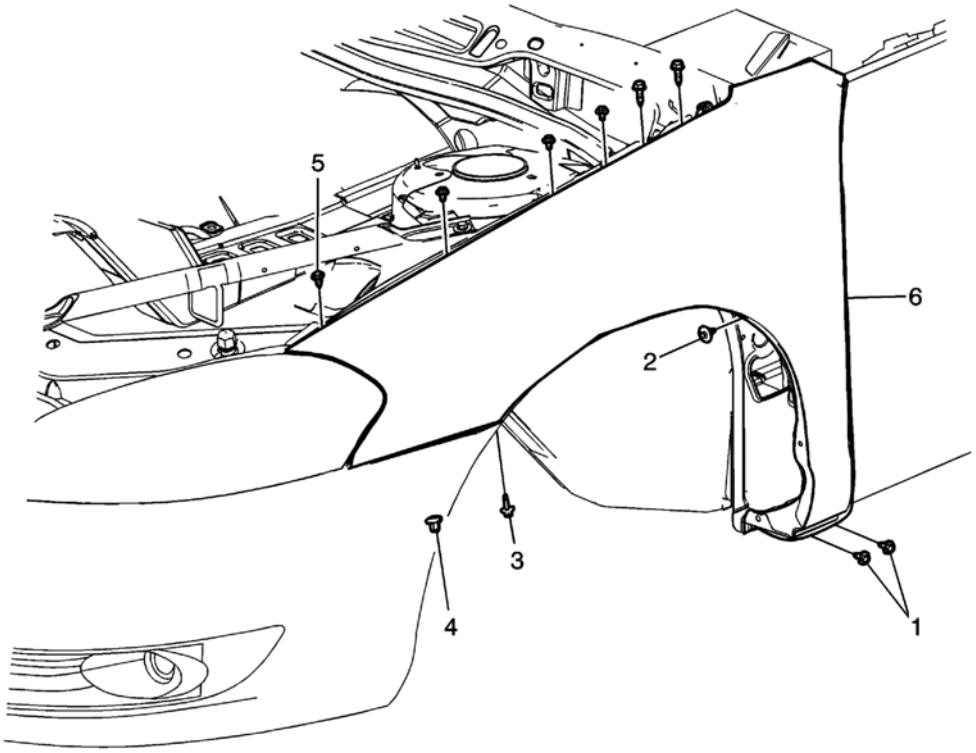

Fig. 18: Front Fender
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Fender Bolts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Front Fender Bolt **Tighten** 10 N.m (89 lb in)
3	Front Fender Bolt **Tighten** 10 N.m (89 lb in)
4	Front Fender Nut **Tighten** 10 N.m (89 lb in)
5	Front Fender Bolts (Qty: 6) **Tighten** 10 N.m (89 lb in)

Callout	Component Name
6	Front Fender

HOOD PRIMARY LATCH RELEASE CABLE HANDLE REPLACEMENT

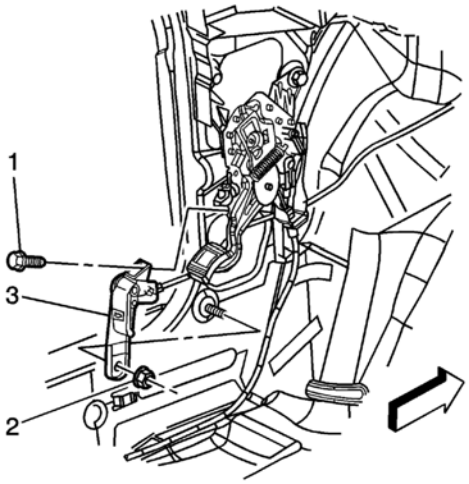

Fig. 19: Hood Latch Release Handle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .	
1	Hood Release Handle Screw **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 10 N.m (89 lb in)
2	Hood Release Handle Nut **Tighten** 10 N.m (89 lb in)
3	Hood Release Handle **TIP:** Disconnect the cable from the handle.

FRONT SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

Removal Procedure

NOTE: **In order to minimize door realignment, do not remove both door hinges at the same time. Do each door hinge separately, and replace the broken door hinge**

first.

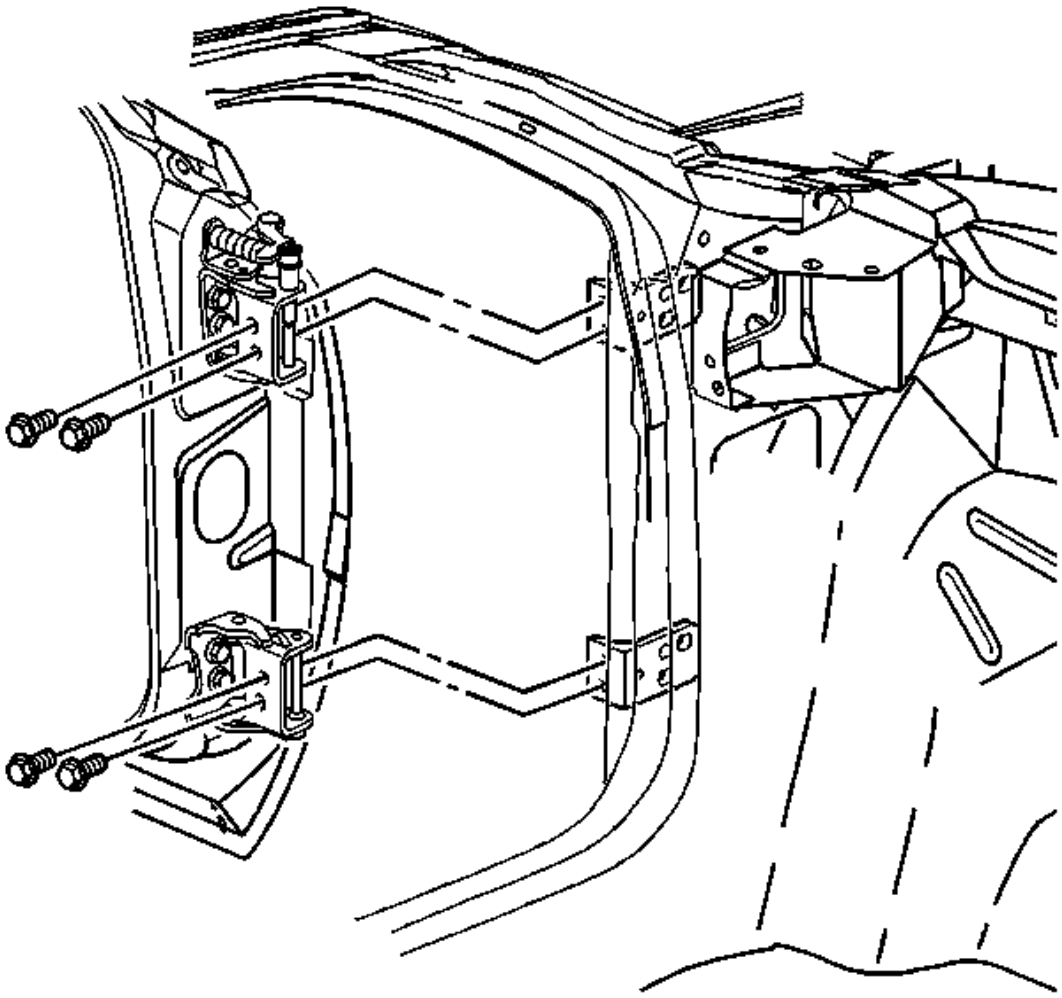

Fig. 20: Front Door Hinges
Courtesy of GENERAL MOTORS COMPANY

1. Open the front door.
2. Support the front door.
3. Remove the intermediate hinge bolts from the front door hinge.
4. Move the door as far as the rubber conduit will allow.
5. Clean the mounting surfaces of the hinges with a clean rag and mark the front door hinge locations on each surface with a grease pencil or other suitable marker.
6. Remove the bolts from the front doorside hinge.
7. Remove the doorside hinge.
8. Remove the bolts from the bodyside hinge.
9. Remove the bodyside hinge.

Installation Procedure

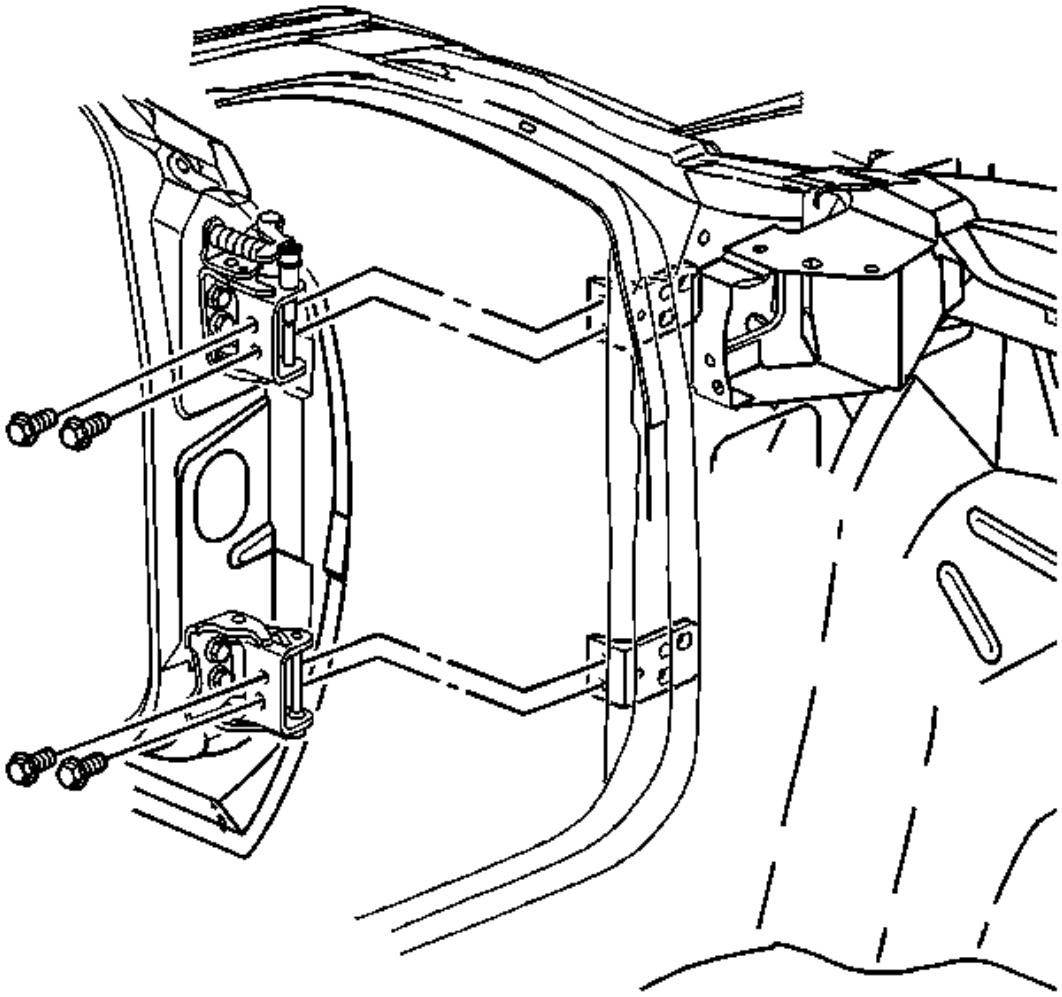

Fig. 21: Front Door Hinges
Courtesy of GENERAL MOTORS COMPANY

1. Position the bodyside hinge to the alignment marks.

CAUTION: **Refer to Fastener Caution .**

2. Install the bolts to the bodyside hinge.

Tighten

Tighten the bolts to the bodyside hinge to 33 N.m (24 lb ft).

3. Position the doorside hinge to the bodyside hinge.
4. Install the intermediate hinge bolts to the front door hinge.

Tighten

Tighten the bolts to the intermediate hinge to 33 N.m (24 lb ft).

5. Install the doorside hinge bolts.

   Tighten

   Tighten the bolts to the doorside hinge to 33 N.m (24 lb ft).

6. Remove the door support.
7. Inspect the door for proper operation and alignment. Refer to **Front Side Door Adjustment**.

HOOD HINGE REPLACEMENT

Removal Procedure

WARNING: When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

1. Remove the hood. Refer to **Hood Replacement**.
2. Remove the rear hood side seal. Refer to **Hood Rear Outer Seal Replacement**.
3. Remove the hood assist rod. Refer to **Hood Open Assist Rod Replacement**.

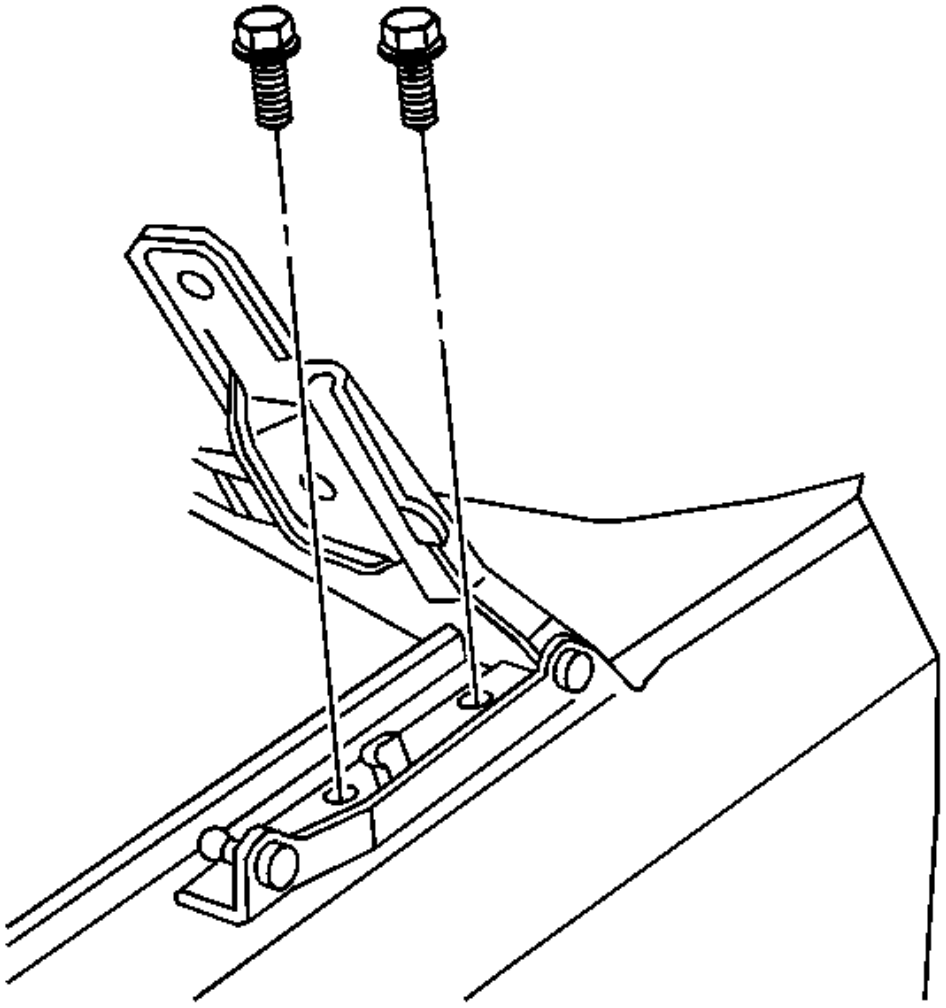

Fig. 22: Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Loosen the hood hinge to fender bolts, but do not remove the bolts.

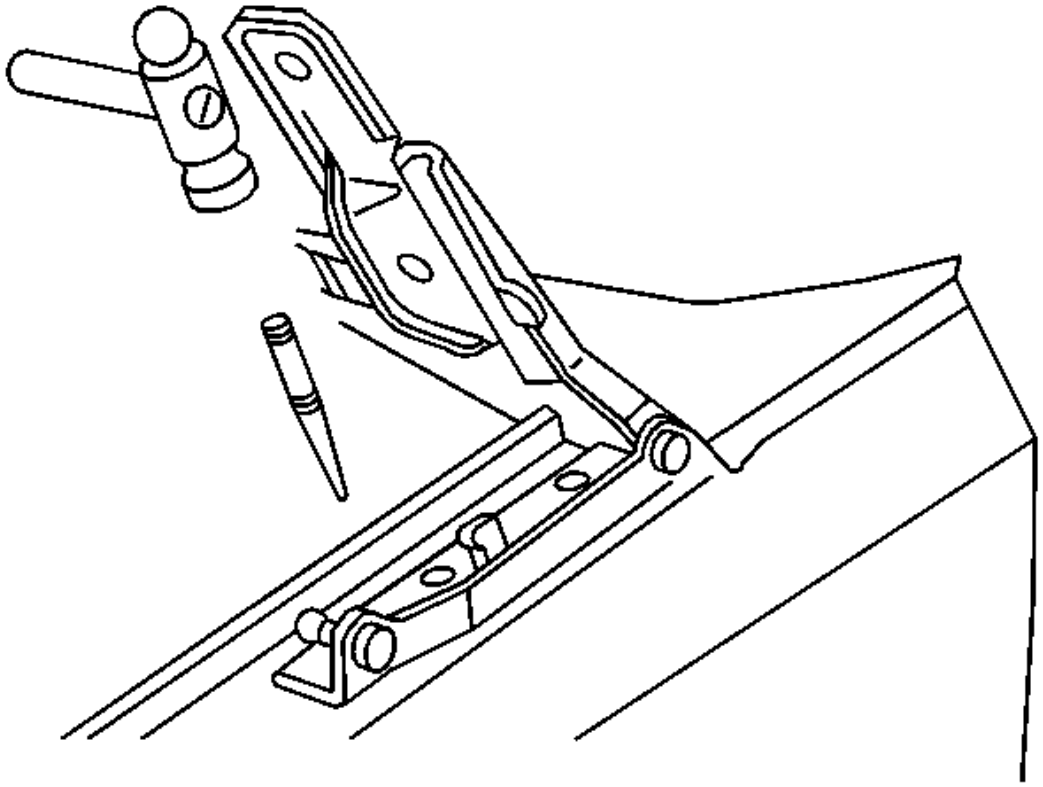

Fig. 23: Center Punching Hood Hinge Spot Weld
Courtesy of GENERAL MOTORS COMPANY

5. Center punch the spot weld

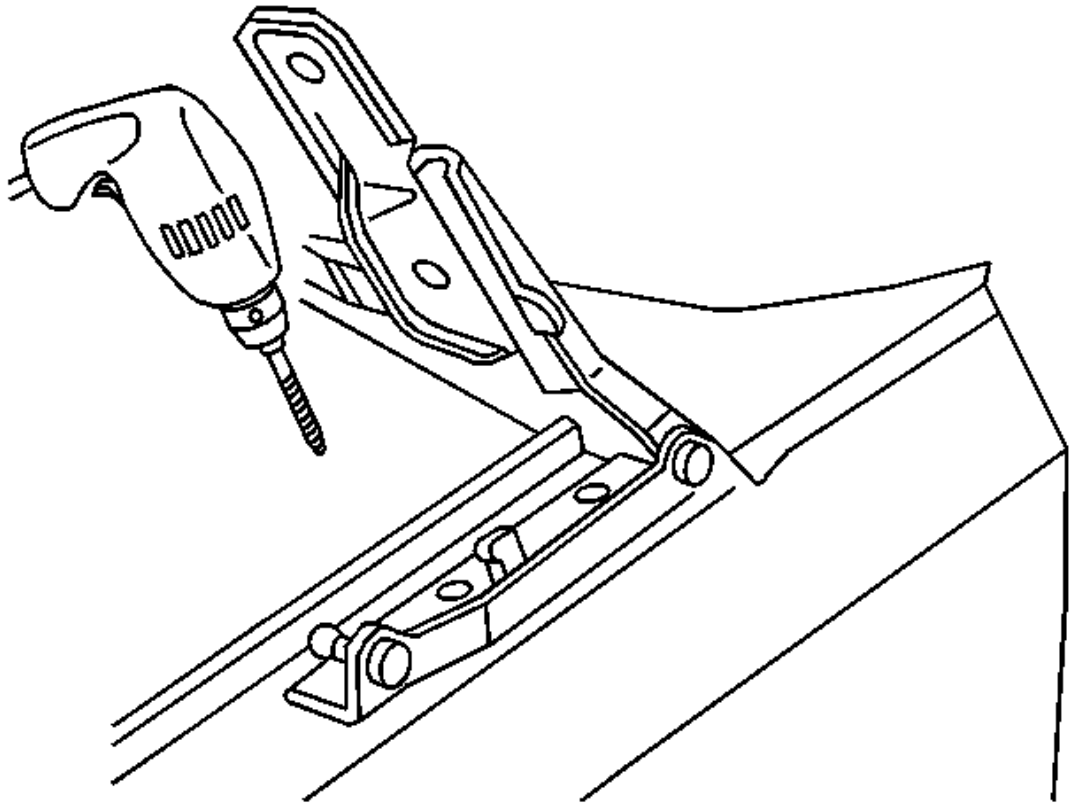

Fig. 24: Drilling Hood Hinge Spot Weld
Courtesy of GENERAL MOTORS COMPANY

6. Drill out the spot weld using a 9.5 mm (3/8 in) drill bit.
7. Remove the hood hinge to fender bolts.
8. Remove the hood hinge from the fender.
9. Repair the paint on the fender where the hood hinge was removed. Refer to **Anti-Corrosion Treatment and Repair** .

Installation Procedure

NOTE: **Weld on body side is an assembly plant assembly aid only. Weld is not required when installing a replacement hinge.**

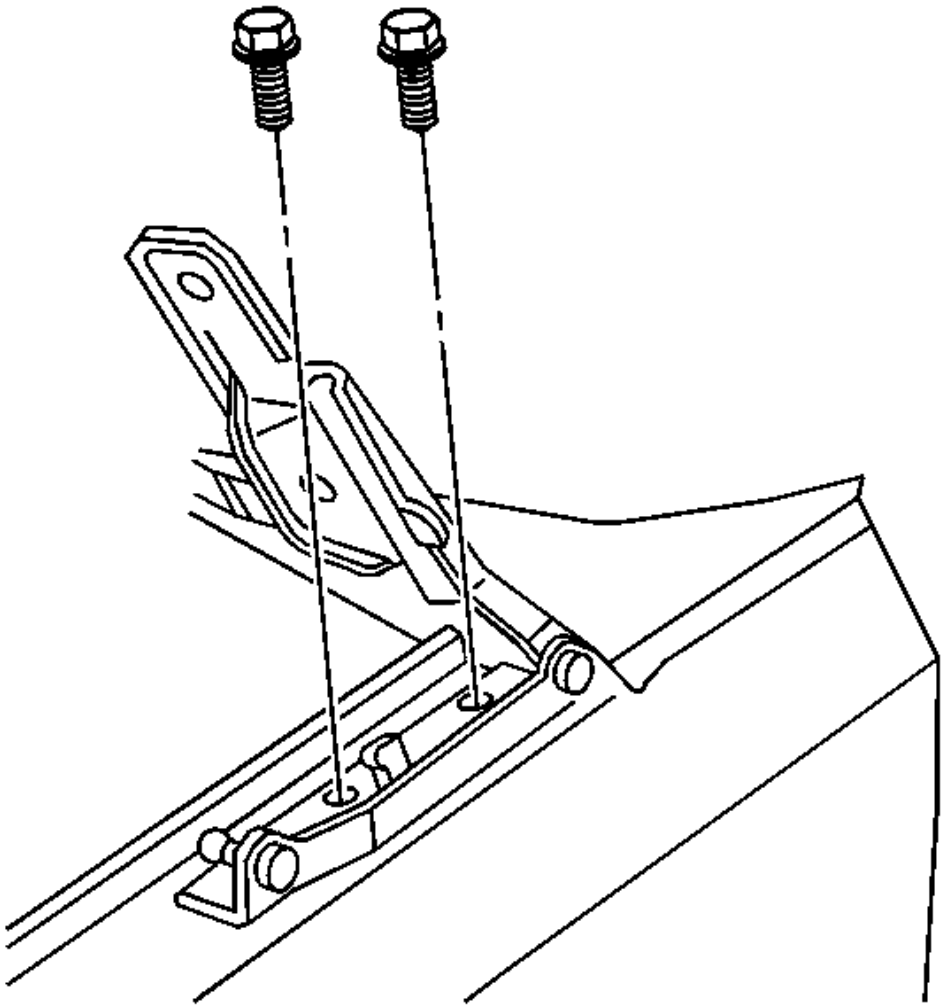

Fig. 25: Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the hood hinge to the fender.

CAUTION: **Refer to Fastener Caution .**

2. Install the hood hinge to the fender bolts.

Tighten

Tighten the hood hinge to fender bolts to 25 N.m (18 lb ft).

3. Install the rear hood side seal. Refer to **Hood Rear Outer Seal Replacement**.
4. Install the hood assist rod. Refer to **Hood Open Assist Rod Replacement**.
5. Install the hood. Refer to **Hood Replacement**.
6. Adjust the hood as required. Refer to **Hood Adjustment**.

REAR COMPARTMENT LID HINGE REPLACEMENT

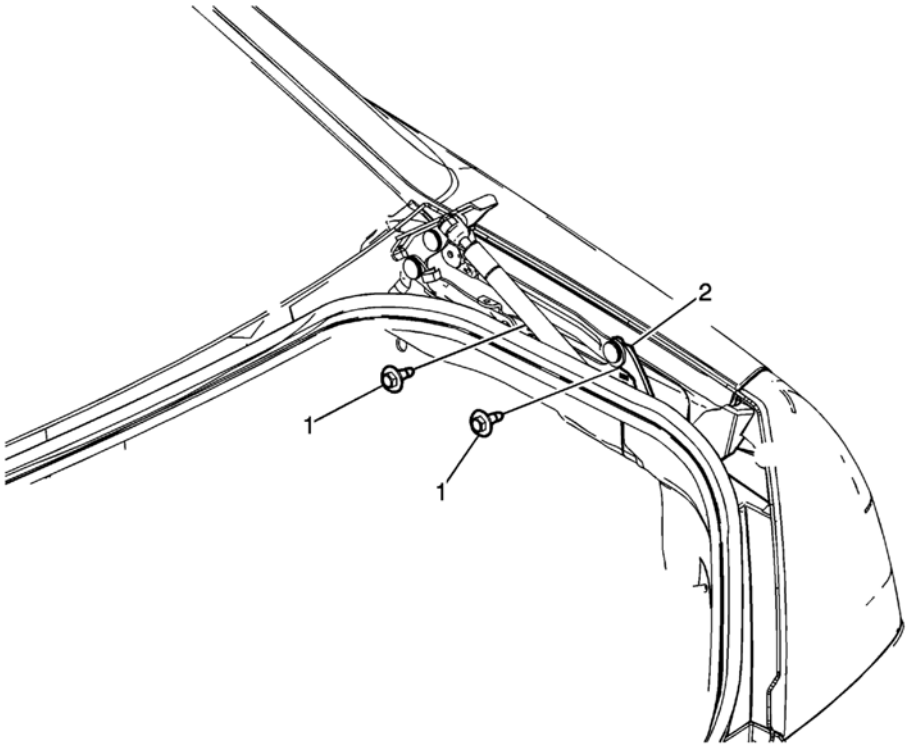

Fig. 26: Rear Compartment Lid Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove rear compartment lid. Refer to **Rear Compartment Lid Replacement**.	
1	Rear Compartment Lid Hinge Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (19 lb ft)
2	Rear Compartment Hinge

REAR SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

Removal Procedure

NOTE: **This procedure is completed with the rear door closed at all times. Do each door hinge separately, and replace the broken door hinge first.**

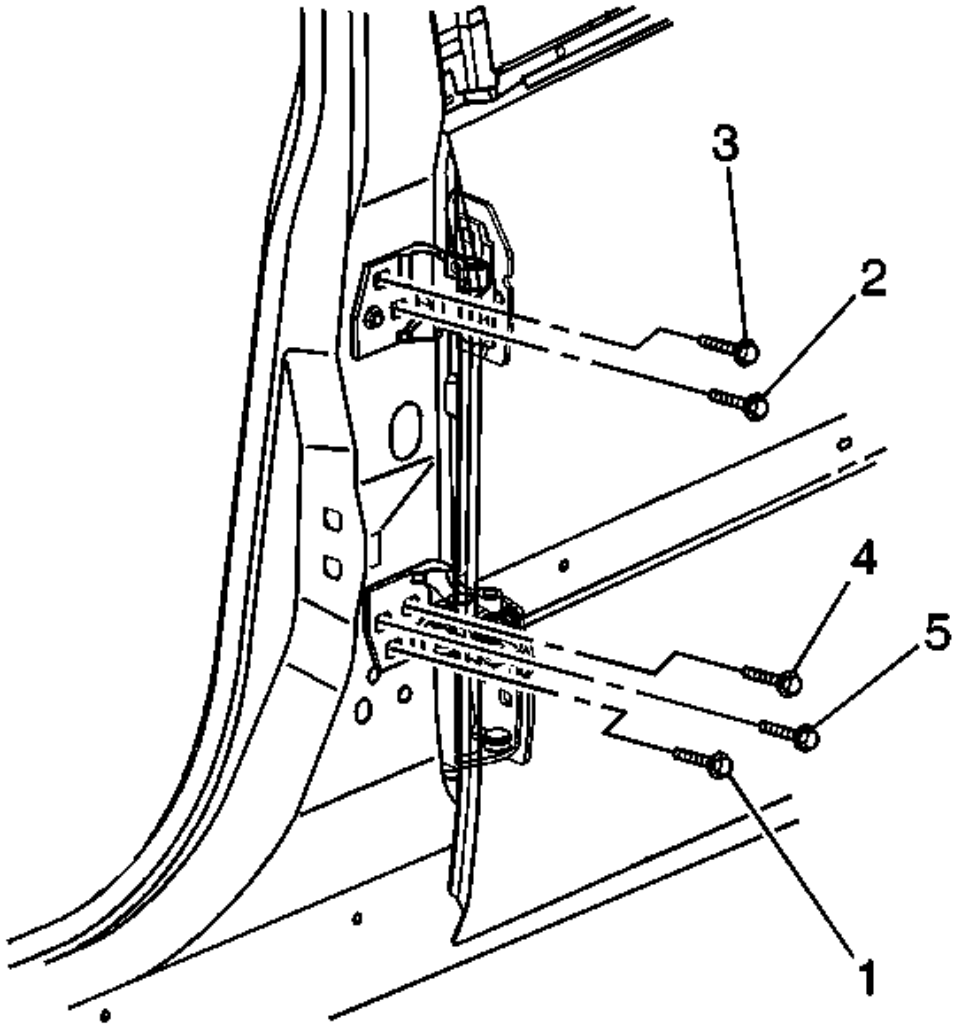

Fig. 27: Body Side Rear Door Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Open the front door in order to remove the rear door hinges.
2. Clean the mounting surfaces with clean a rag and mark the rear door hinge locations on each surface with a grease pencil or other suitable marker.
3. Remove the bolts from the doorside rear door hinge.
4. Remove the bolts (1-5) from the bodyside rear door hinge.
5. Remove the rear door hinge from the vehicle.

Installation Procedure

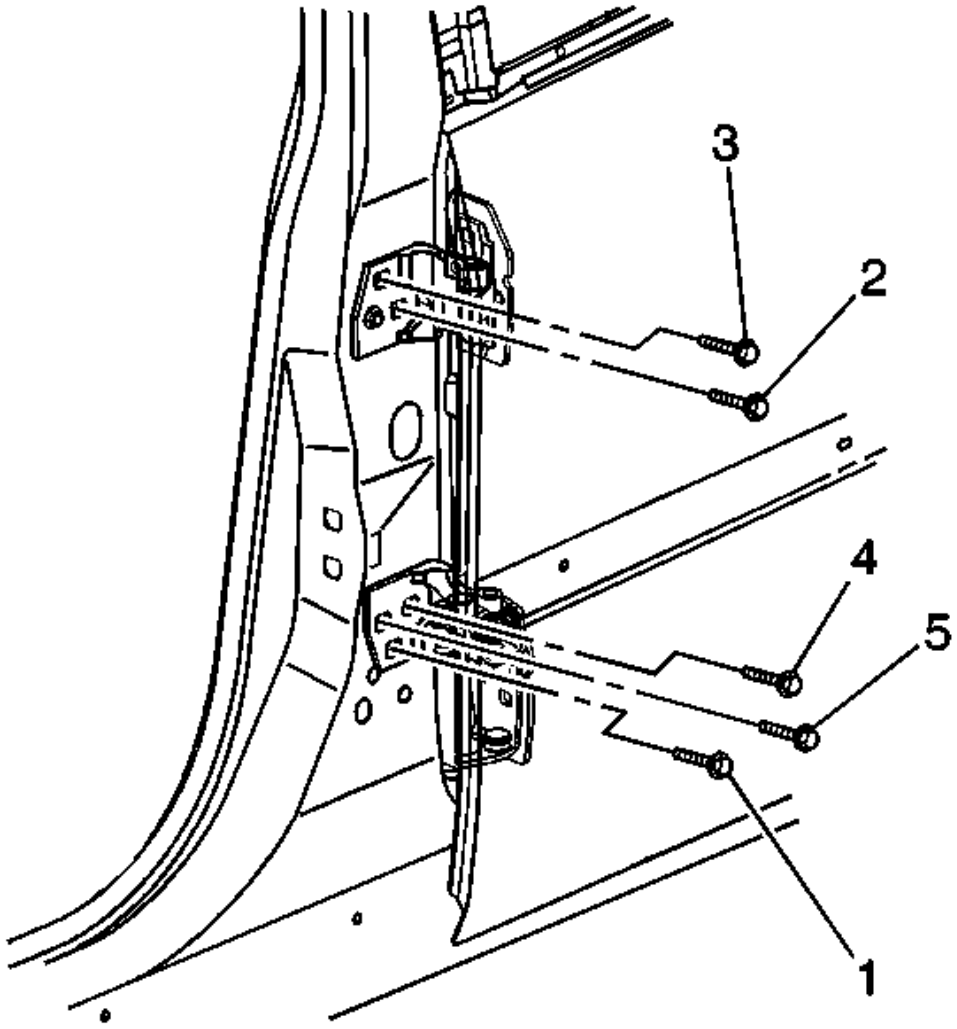

Fig. 28: Body Side Rear Door Hinge Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear door hinge to the alignment marks.

CAUTION: **Refer to Fastener Caution .**

2. Install the bolts (1-5) to the bodyside rear door hinge.

Tighten

Tighten the bodyside rear door hinge bolts to 33 N.m (24 lb ft).

3. Install the bolts to the doorside rear door hinge.

Tighten

Tighten the doorside rear door hinge bolts to 33 N.m (24 lb ft).

4. Close the rear door.

5. Inspect the rear door for proper operation and alignment. Refer to **Rear Side Door Adjustment**.

HOOD ADJUSTMENT

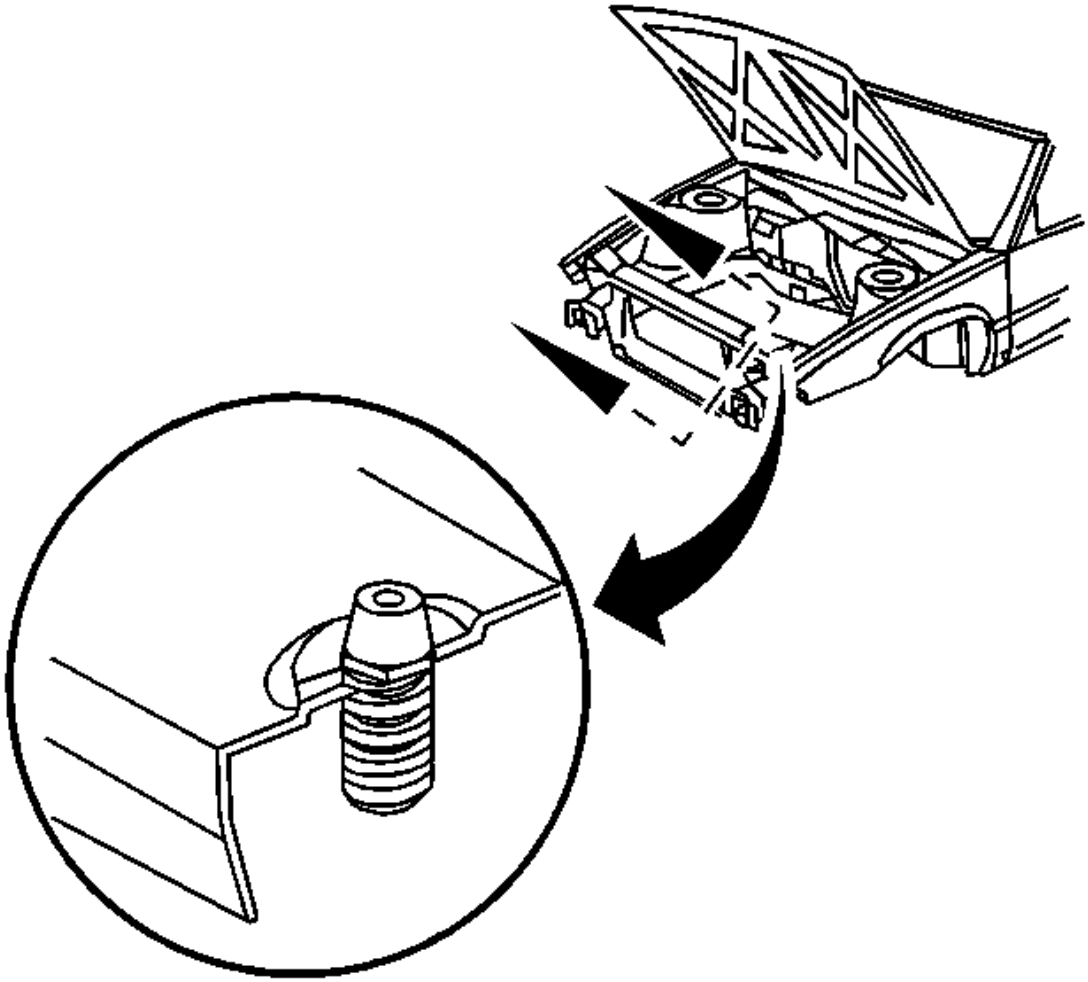

Fig. 29: View Of Hood Bumpers (Front)
Courtesy of GENERAL MOTORS COMPANY

1. The hood hinges are bolted to the fender and to the hood.
2. Make fore and aft adjustments by elongating the hood-side hinge holes.
3. Make vertical adjustment at the front by adjusting the hood bumpers up or down.

Specification

- Gap tolerances are 2-6 mm (0.08-0.22 in).
- Flush tolerances are 0-2 mm (0-0.08 in).

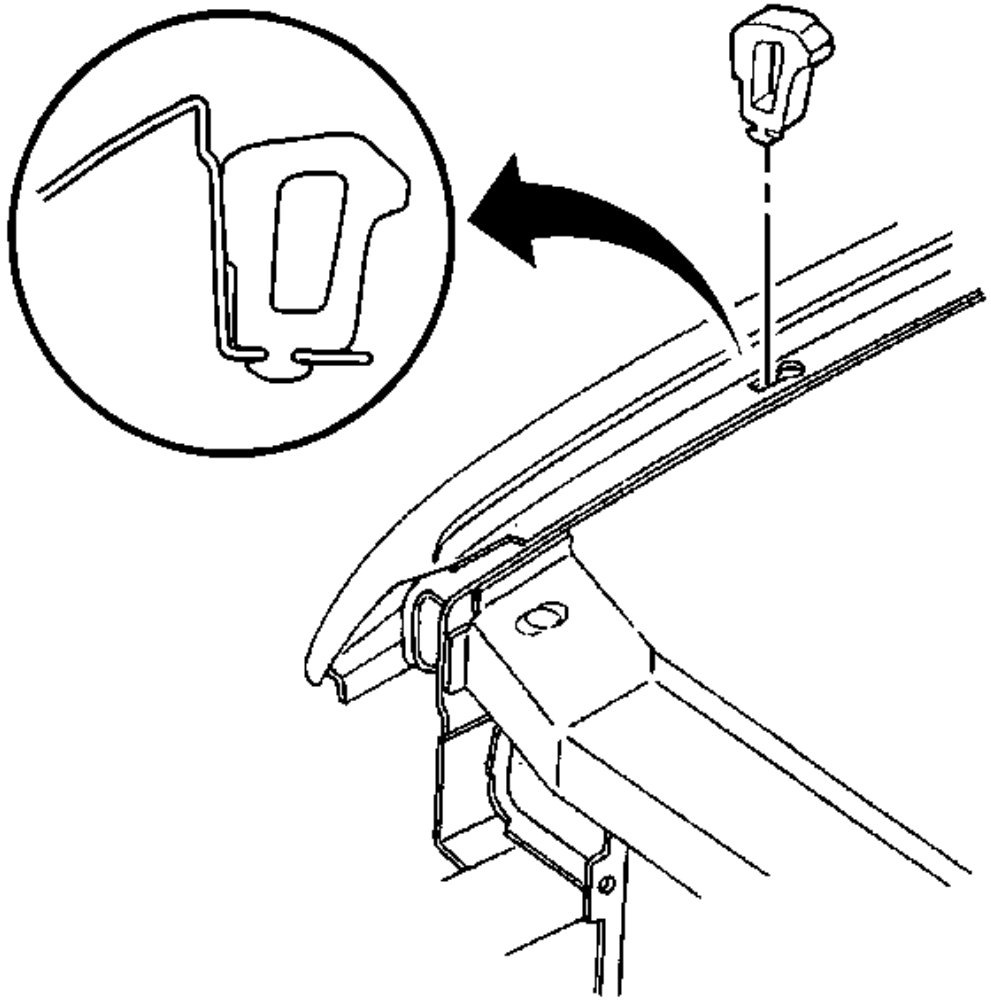

Fig. 30: Identifying Hood Bumpers (Side)
Courtesy of GENERAL MOTORS COMPANY

4. Open the hood.
5. Loosen the hinge to hood bolts. Refer to **Hood Replacement**.
6. Adjust the hood to the fender position.
7. Close the hood.
8. Check the hood alignment.
9. Open the hood.
10. Adjust the hood as needed.

CAUTION: Refer to Fastener Caution .

11. Install the hood-to-hinge bolts with an assistant.

Tighten

Tighten the upper hood hinge bolts to 27 N.m (20 lb ft).

12. Adjust the hood bumpers.
13. Close the hood.

HOOD REPLACEMENT

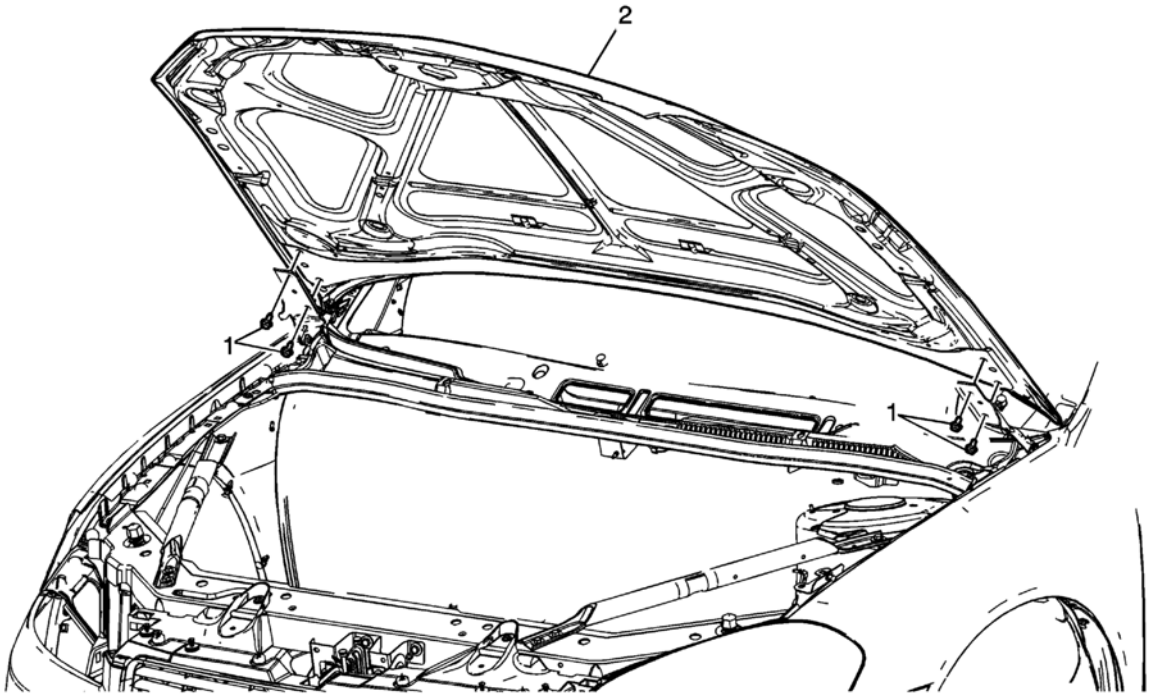

Fig. 31: Hood
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the hood open assist rod. Refer to **Hood Open Assist Rod Replacement**.	
1	Hood Hinge Bolts (Qty: 4) **WARNING:** **When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle**

Callout	Component Name
	or personal injury. **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (19 lb ft)
2	Hood

HOOD INSULATOR REPLACEMENT (IMPALA LIMITED)

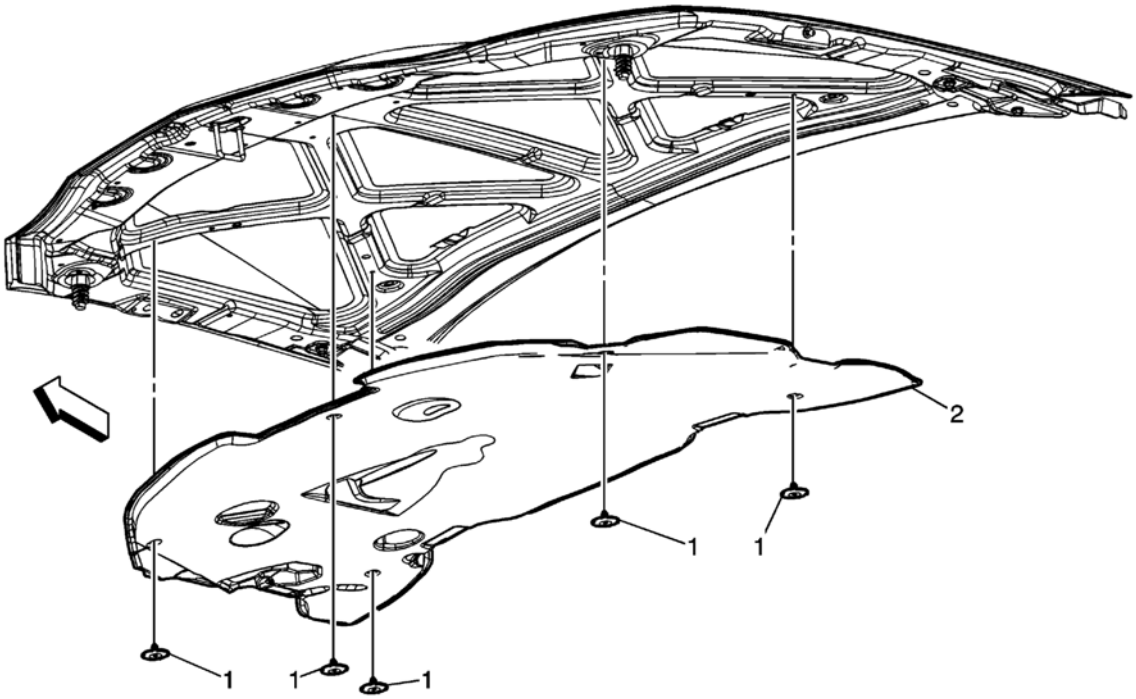

Fig. 32: Hood Insulator Pad & Retainers
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Fastener Specifications	
1	Retainers, Hood Insulator Pad (Qty: 5)
2	Pad, Hood Insulator

HOOD PRIMARY AND SECONDARY LATCH REPLACEMENT

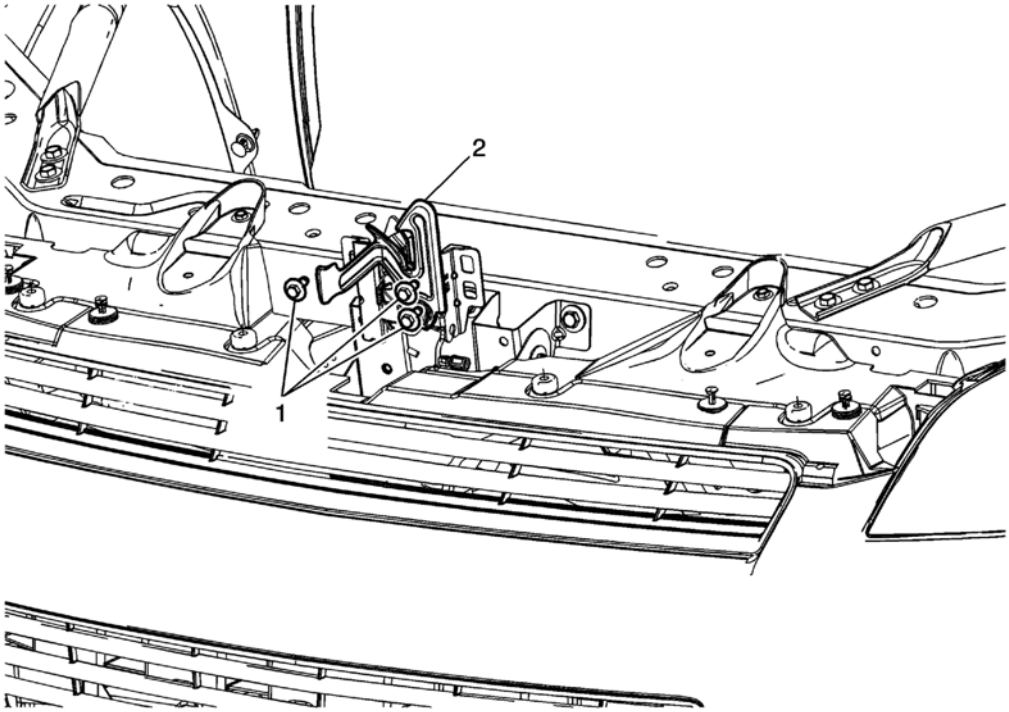

Fig. 33: Replacing Hood Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Latch Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (19 lb ft)
2	Hood Latch • Disconnect the release cable. • Disconnect the electrical connector for the remote start, if equipped.

REAR COMPARTMENT LID REPLACEMENT

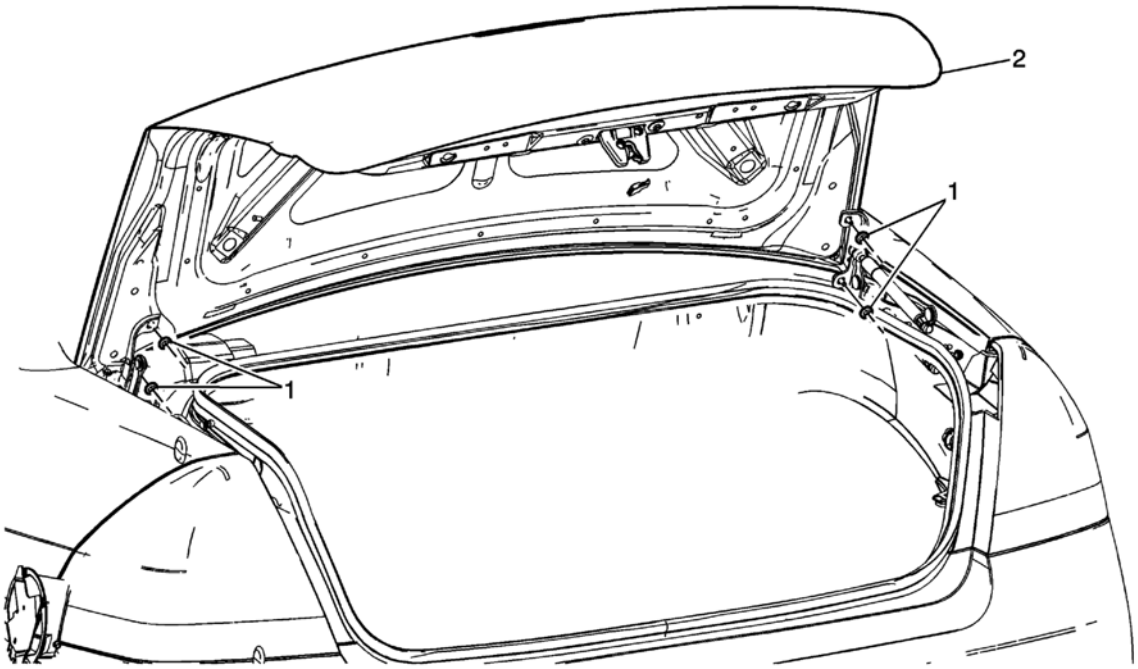

Fig. 34: Rear Compartment Lid
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Compartment Lid Nut (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 25 N.m (19 lb ft)
2	Rear Compartment Lid **TIP:** Disconnect the electrical connector.

REAR COMPARTMENT LID LOCK CYLINDER ROD REPLACEMENT

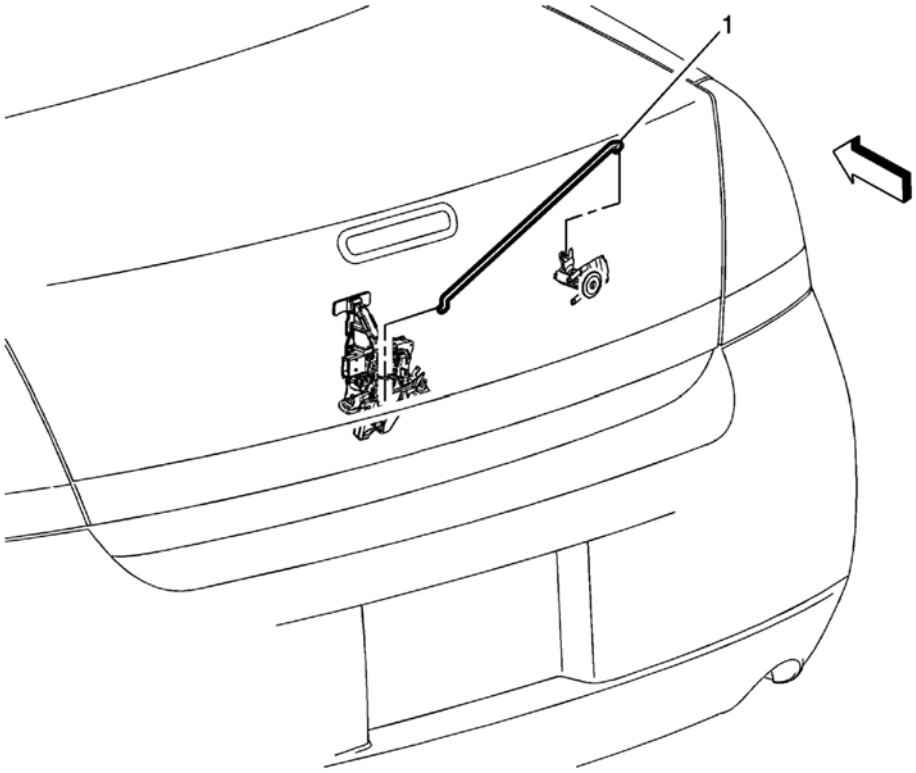

Fig. 35: Rear Compartment Lid Lock Cylinder Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Compartment Lid Lock Cylinder Rod **Procedure** 1. Disconnect the lock cylinder rod from the rear compartment latch and the lock cylinder. 2. Inspect the lock cylinder rod attachment points. 3. Ensure the lock cylinder rod is installed properly. 4. Inspect the lock cylinder for proper operation by closing and opening the rear compartment.

FUEL TANK FILLER DOOR REPLACEMENT

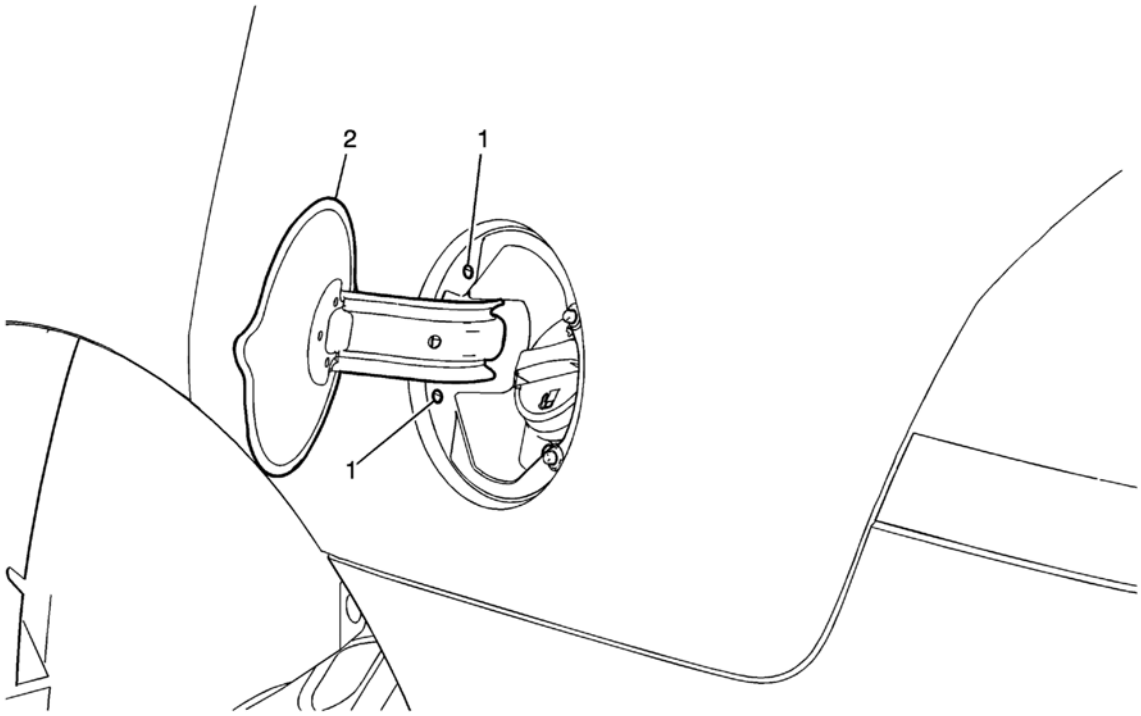

Fig. 36: Fuel Filler Door
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Fuel Filler Door Rivet (Qty: 2) **WARNING:** **Eye protection must be worn when drilling rivets to reduce the chance of personal injury.**
2	Fuel Filler Door

FUEL TANK FILLER PIPE HOUSING REPLACEMENT

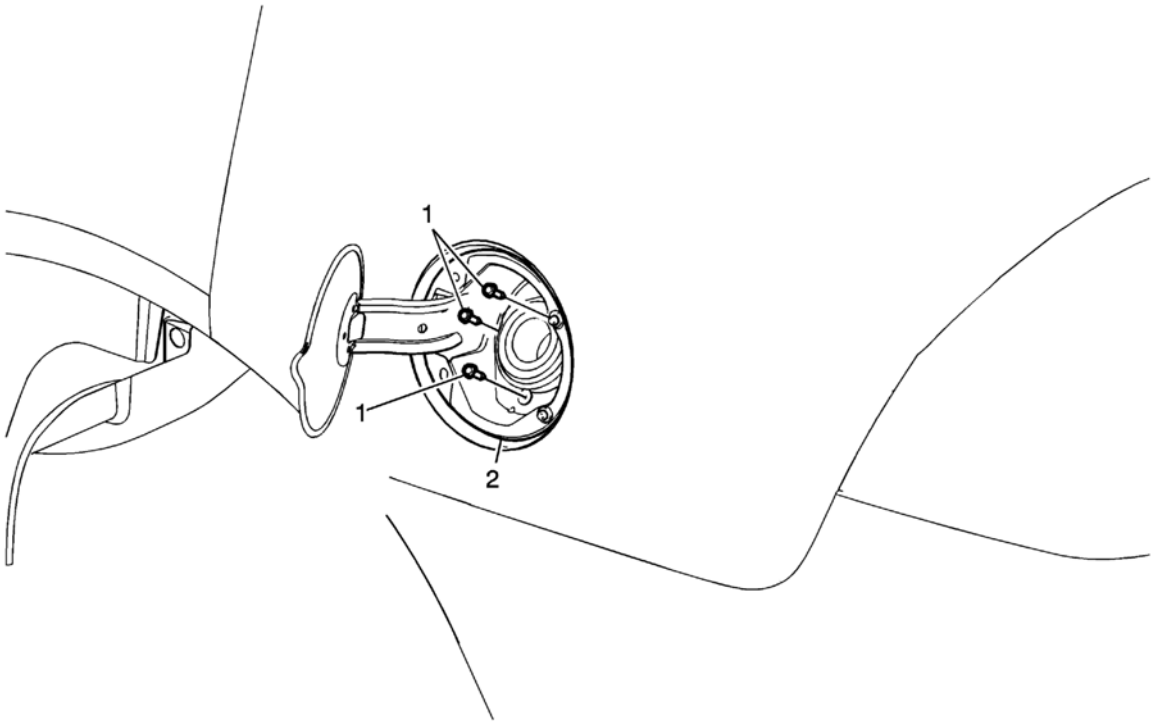

Fig. 37: Fuel Filler Pocket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Fuel Filler Door Pocket Bolt (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution .** **TIP:** Remove fuel filler cap. **Tighten** 10 N.m (89 lb in)
2	Fuel Filler Door Pocket

HOOD OPEN ASSIST ROD REPLACEMENT

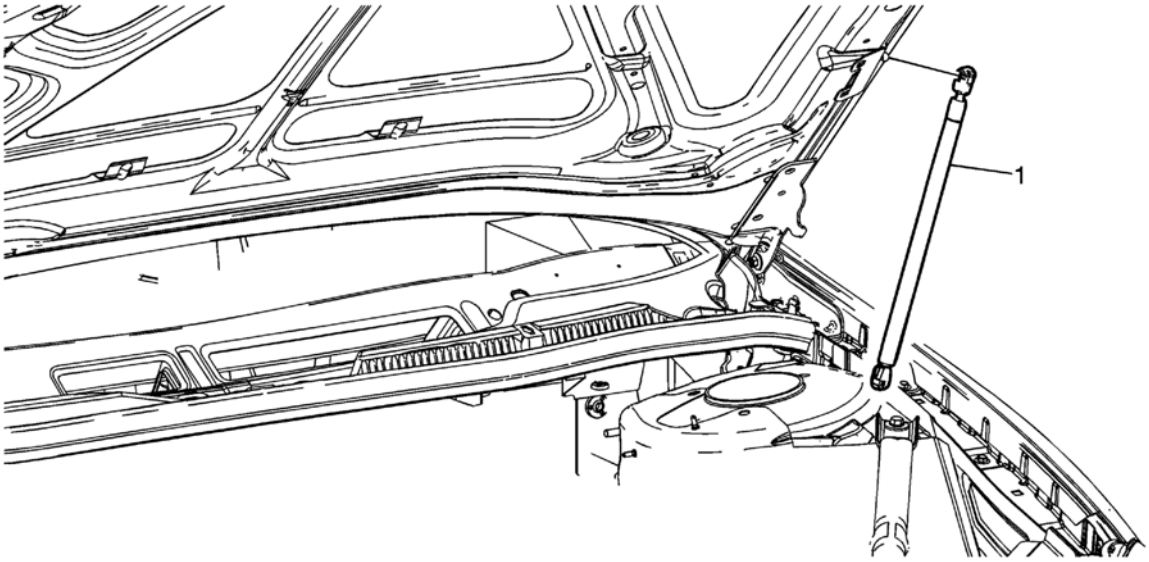

Fig. 38: Hood Assist Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Strut Assembly **WARNING:** **When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.** **CAUTION:** **Apply pressure only at the**

Callout	Component Name
	end of the liftgate/hood assist rod that you are removing or attaching. Do NOT apply pressure to the middle of the rod because damage or bending will result. **TIP:** Remove the metal clip at the ends of the assist rod, then pull away from the stud.

HOOD REAR SEAL REPLACEMENT

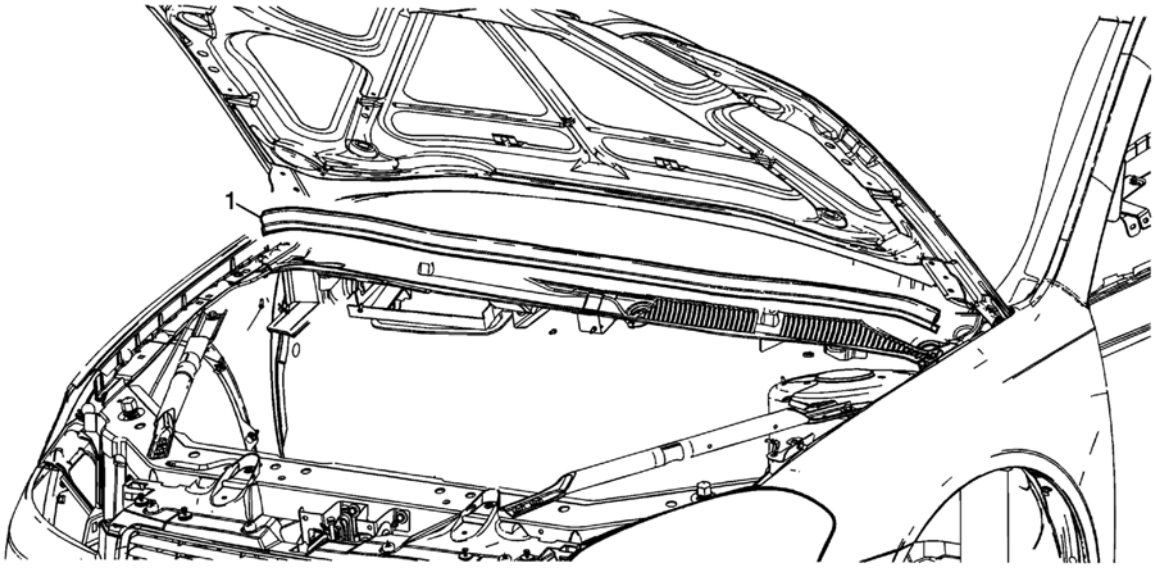

Fig. 39: Hood Rear Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	

Callout	Component Name
1	Weatherstrip, Rear

HOOD REAR OUTER SEAL REPLACEMENT

Removal Procedure

1. Open the hood.

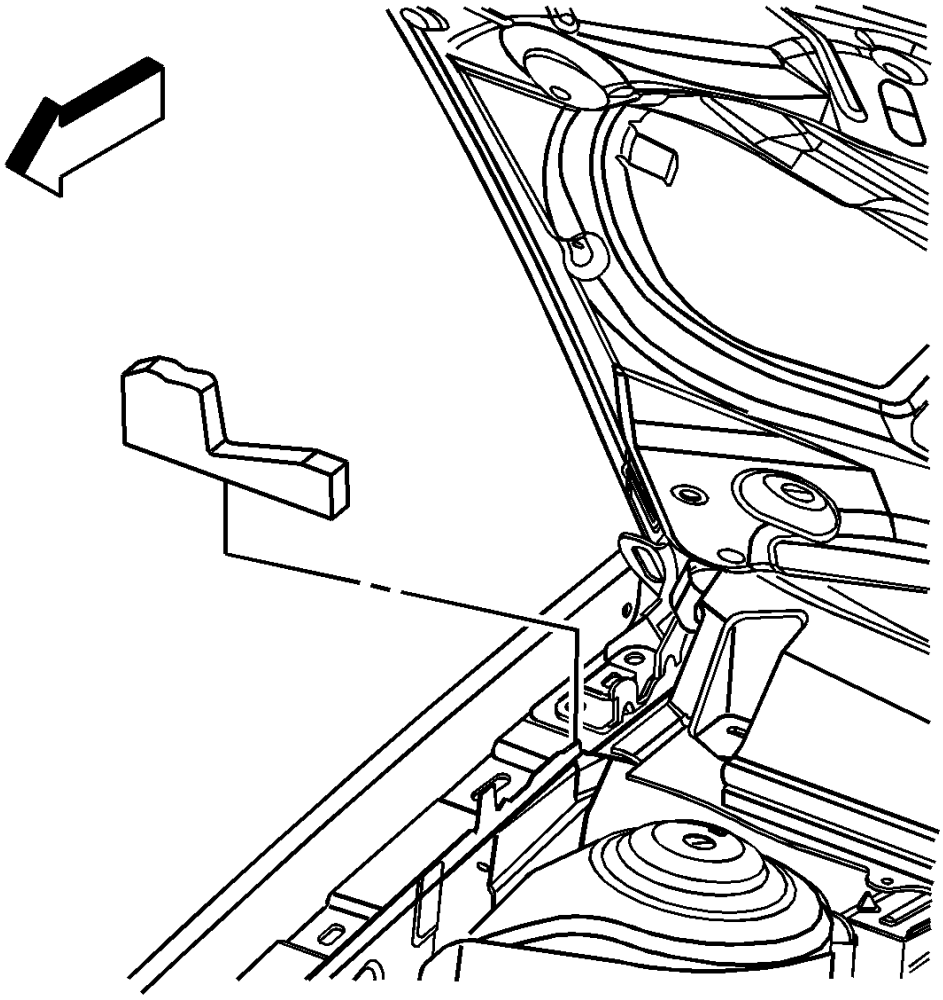

Fig. 40: View Of Rear Side Hood Seal
Courtesy of GENERAL MOTORS COMPANY

2. Pull the rear side hood seal, located at the end of the plenum to hood seal, from the fender.
3. Remove the seal from the vehicle.
4. Clean any adhesive from the pinch-weld flange and hood hinge using 3M™ P/N 8984.

Installation Procedure

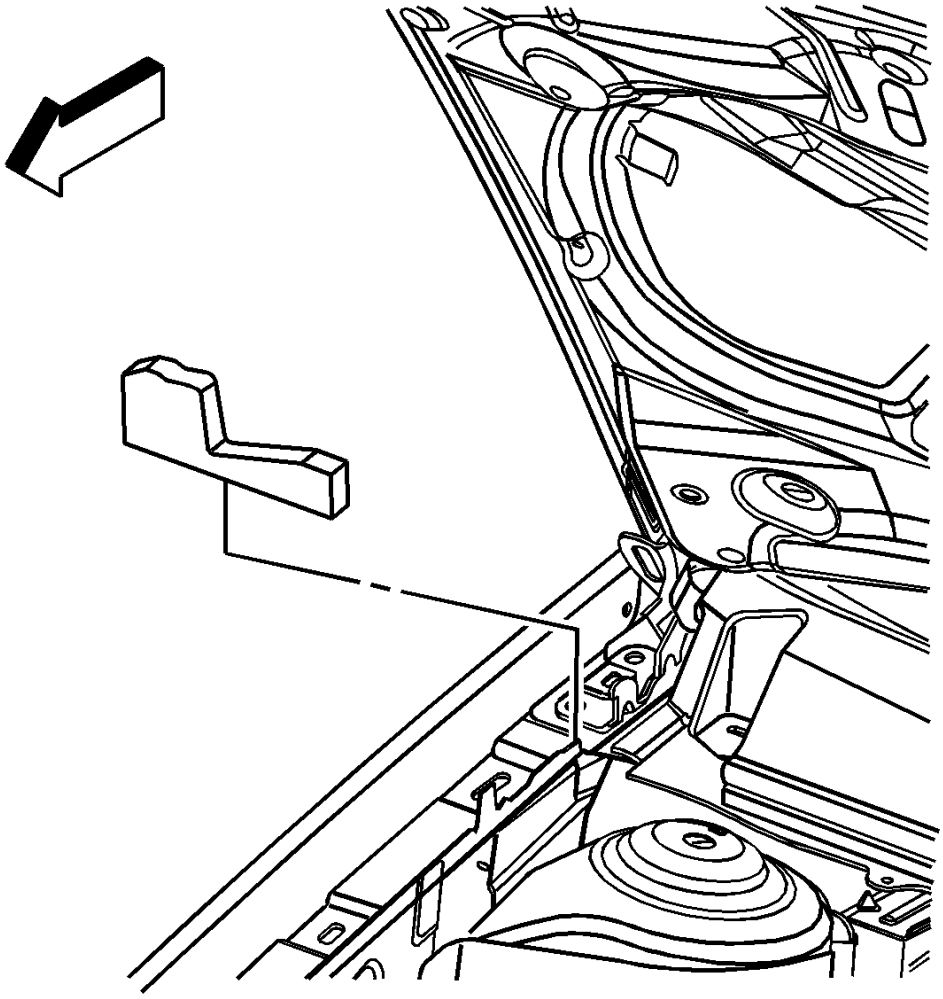

Fig. 41: View Of Rear Side Hood Seal
Courtesy of GENERAL MOTORS COMPANY

1. Remove the protective backing paper from the adhesive on the rear side hood seal.
2. With the rear side hood seal butted to the plunum to hood seal, press the side hood seal until the adhesive is fully adhered.
3. Close the hood.

FRONT SIDE DOOR HINGE SPRING REPLACEMENT

Tools Required

J 36604 Door Hinge Spring Compressor

Removal Procedure

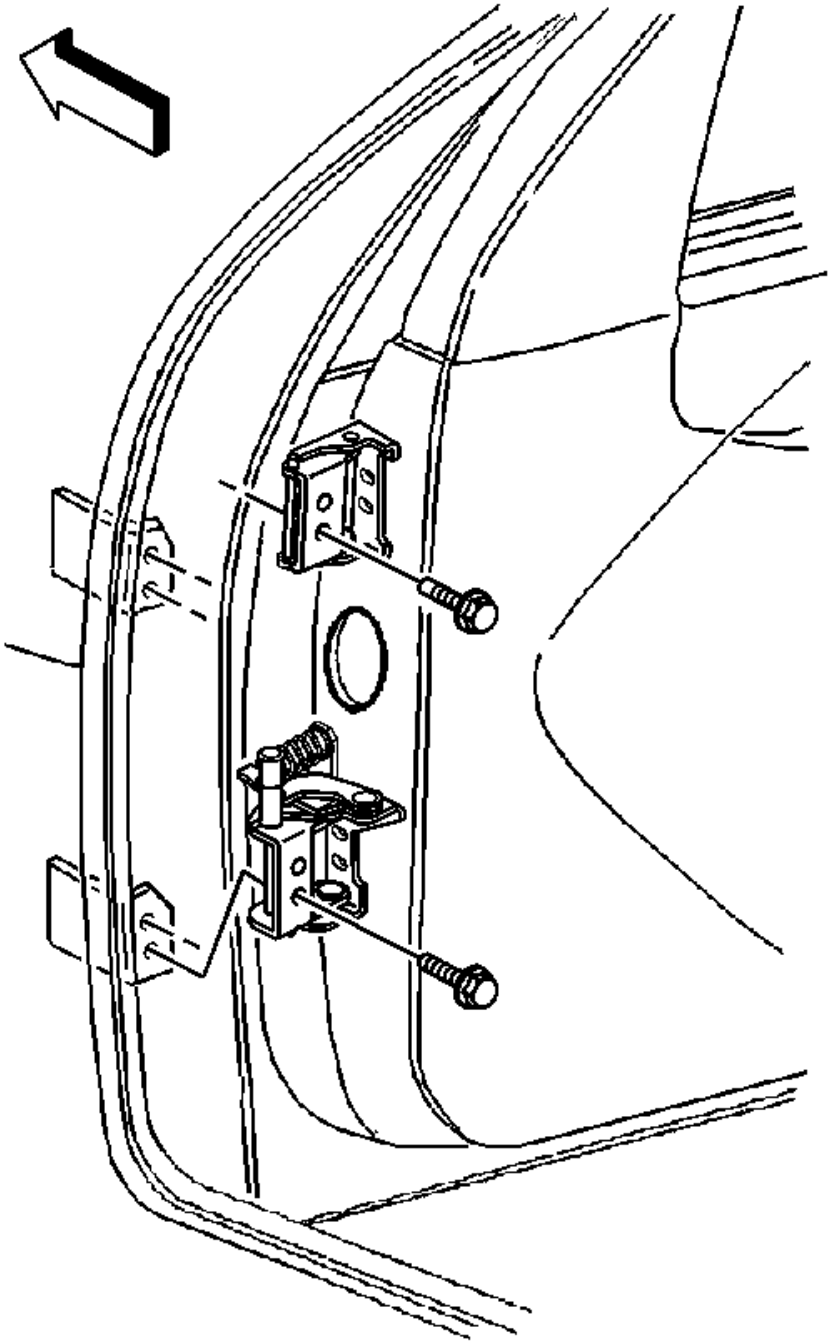

Fig. 42: Front Door Hinge
Courtesy of GENERAL MOTORS COMPANY

1. Open the door.
2. Using **J 36604** compressor , remove the door hinge spring from the door hinge.
3. Remove the door hinge spring from the vehicle.

Installation Procedure

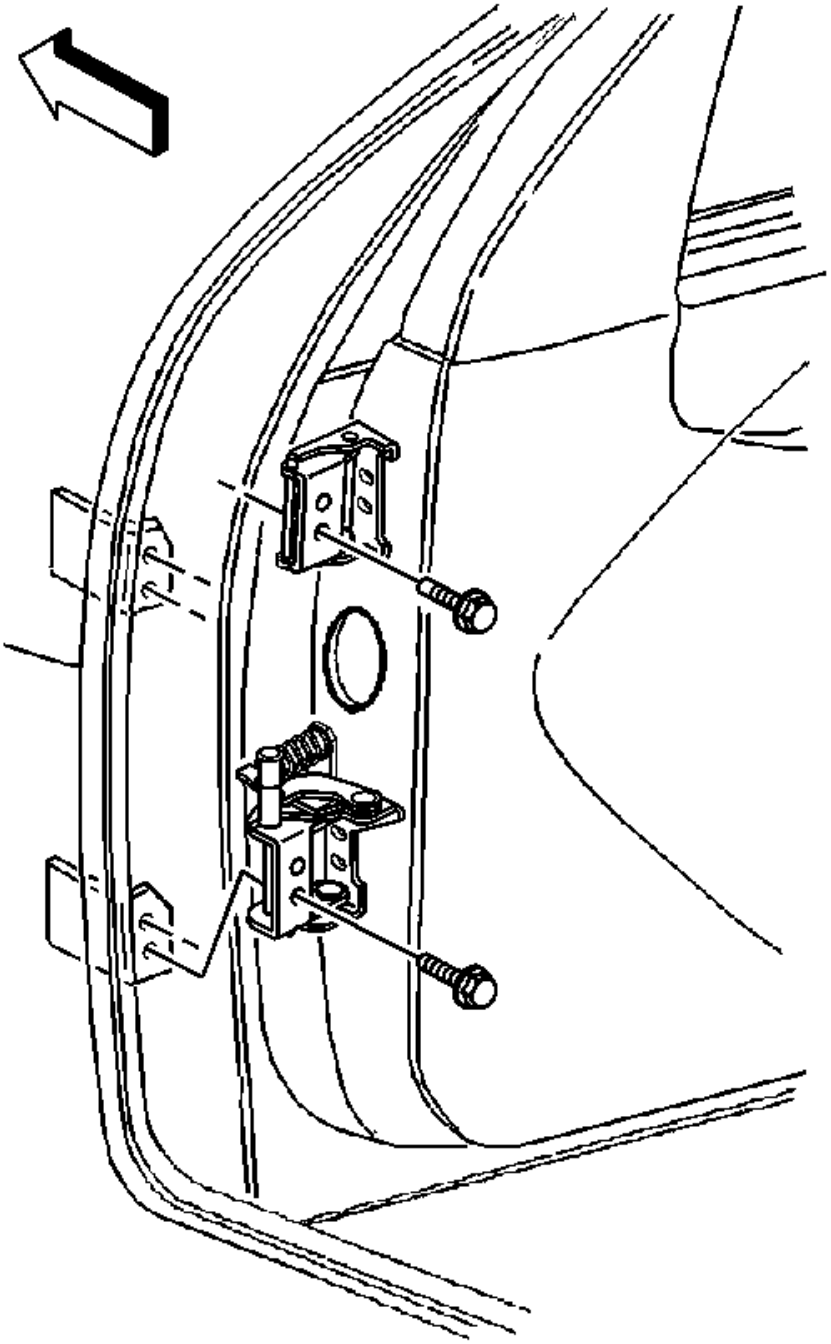

Fig. 43: Front Door Hinge
Courtesy of GENERAL MOTORS COMPANY

1. Using **J 36604** compressor , install the door hinge spring to the door hinge.
2. Close the door.

REAR COMPARTMENT LID STRUT REPLACEMENT

Removal Procedure

WARNING: When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

CAUTION: Apply pressure only at the end of the liftgate/hood assist rod that you are removing or attaching. Do NOT apply pressure to the middle of the rod because damage or bending will result.

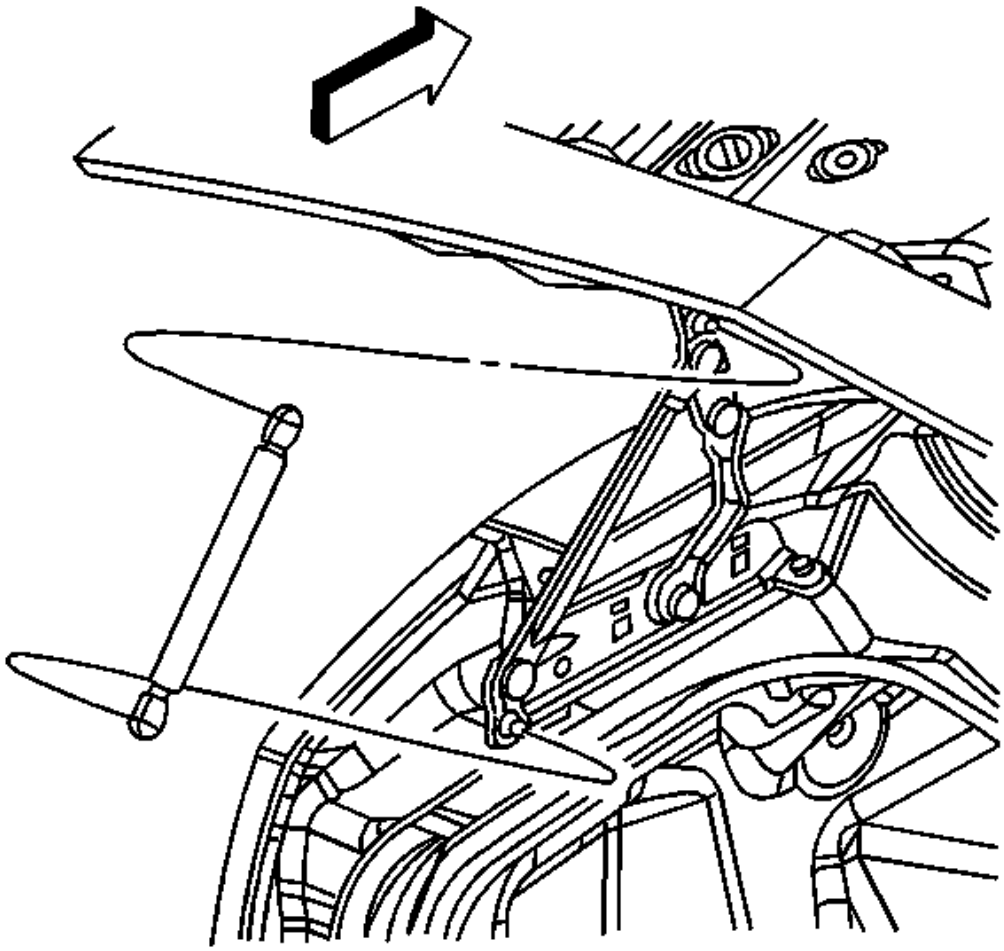

Fig. 44: Rear Compartment Lid Strut
Courtesy of GENERAL MOTORS COMPANY

1. Open and support the rear compartment lid.
2. Using a small flat-bladed tool, release the clip retaining the rear compartment lid assist rod to the lower assist rod ball stud.
3. Using a small flat-bladed tool, release the clip retaining the rear compartment assist rod to the upper assist rod ball stud.
4. Remove the rear compartment lid assist rod from the vehicle.

Installation Procedure

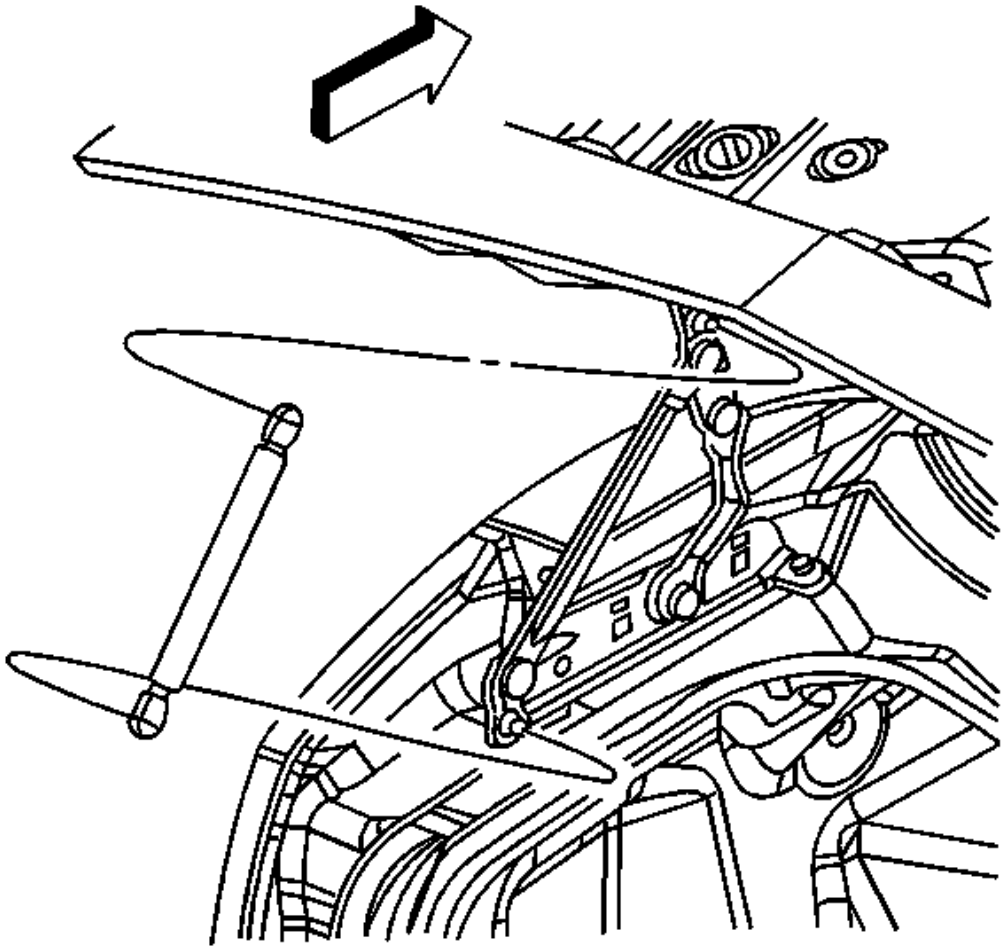

Fig. 45: Rear Compartment Lid Strut
Courtesy of GENERAL MOTORS COMPANY

1. Press the rear compartment lid assist rod onto the upper rear compartment lid assist rod ball stud.
2. Press the rear compartment lid assist rod onto the lower assist rod ball stud.
3. Ensure that both clips are fully seated on the rear compartment assist rod.
4. Close the rear compartment.

HOOD LATCH SUPPORT REPLACEMENT

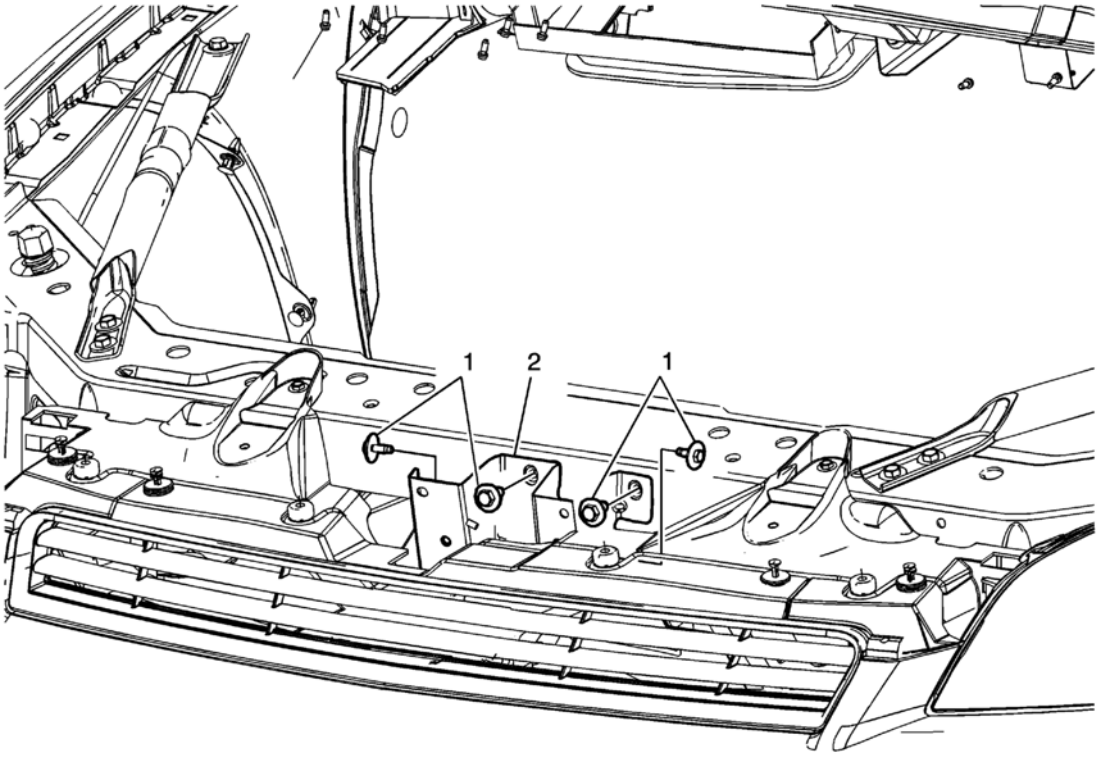

Fig. 46: Hood Latch Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Latch Support Bolts (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Hood Latch Support

FRONT OR REAR SIDE DOOR LOWER WEATHERSTRIP REPLACEMENT (50TH ANNIVERSARY EDITION)

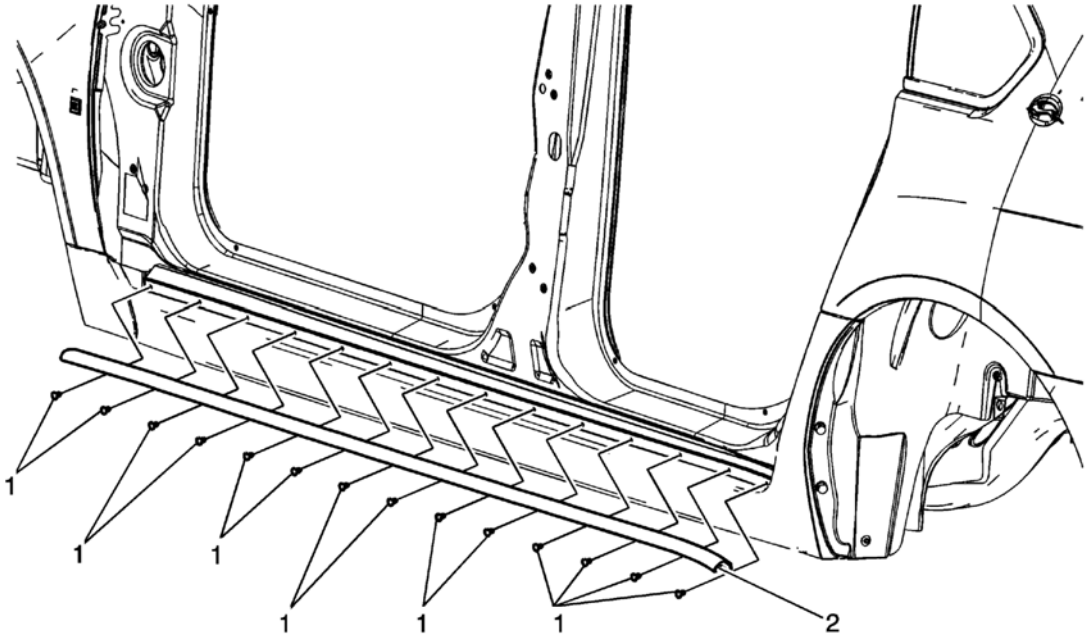

Fig. 47: Front or Rear Side Door Lower Weatherstrip (50th Anniversary Edition)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open both the front and rear side door on the same side the front and rear side door lower weather-strip is to be replaced. 2. Use an appropriate trim release tool in order to release the retainers from the rear rocker molding assembly.	
1	Front and Rear Side Door Lower Weather-strip Retainer (Qty: 14) **TIP:** Replace any broken or damaged retainer prior to installation of the lower weather-strip.
2	Front and Rear Side Door Lower Weather-strip

FRONT SIDE DOOR WEATHERSTRIP REPLACEMENT (IMPALA LIMITED)

Removal Procedure

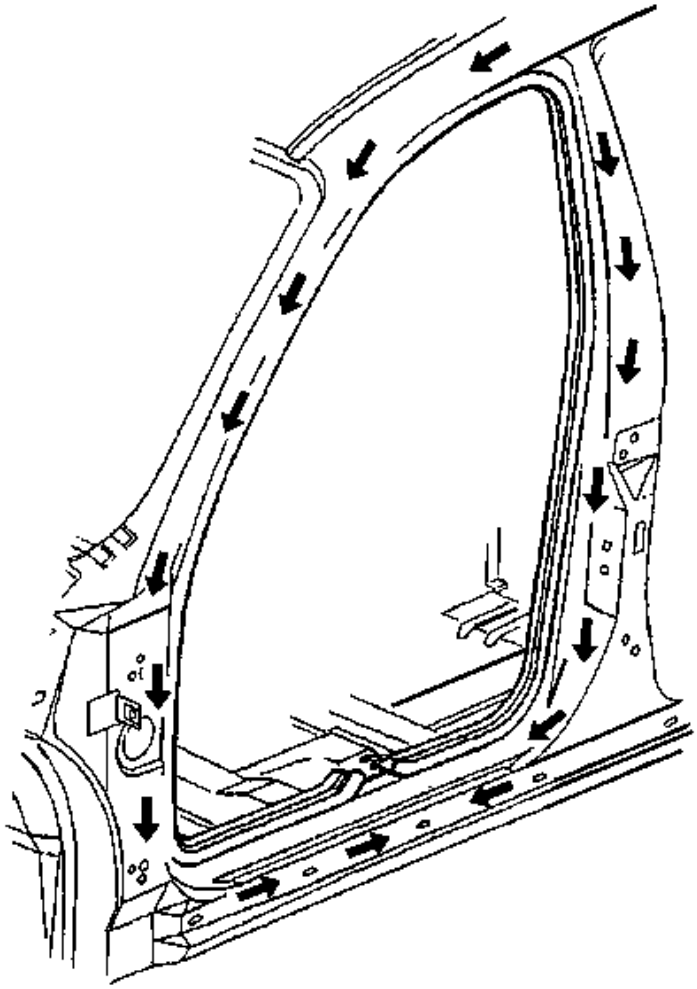

Fig. 48: Front Door Weatherstrip Positioning (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Open the front door.
2. Remove the carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .
3. Remove the windshield garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** .
4. Remove the upper center pillar trim panel. Refer to **Center Pillar Upper Trim Panel Replacement** .
5. Remove the center lower trim panel. Refer to **Center Pillar Lower Trim Panel Replacement** .
6. Remove the front door opening weatherstrip by pulling it off the pinch-weld flange.

Installation Procedure

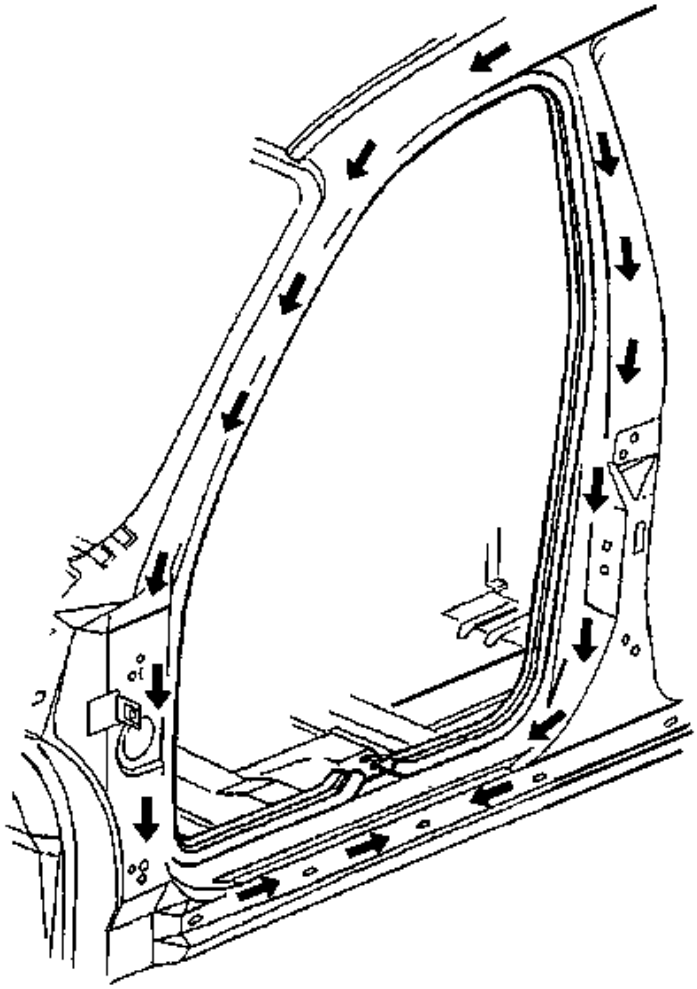

Fig. 49: Front Door Weatherstrip Positioning (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Position the front door opening weatherstrip to the pinch-weld flange.

   Starting at the center of the rocker panel area and moving in a clockwise direction press the front door opening weatherstrip to the pinch-weld flange until fully seated.

   IMPORTANT: The joint butt ends must have no gap and be located in the center of the of the rocker panel area.

2. Install joint butt ends together.
3. Install the carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .
4. Install the windshield garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** .
5. Install the upper center pillar trim panel. Refer to **Center Pillar Upper Trim Panel Replacement** .
6. Install the center lower trim panel. Refer to **Center Pillar Lower Trim Panel Replacement** .
7. Close the front door.

REAR COMPARTMENT LID WEATHERSTRIP REPLACEMENT

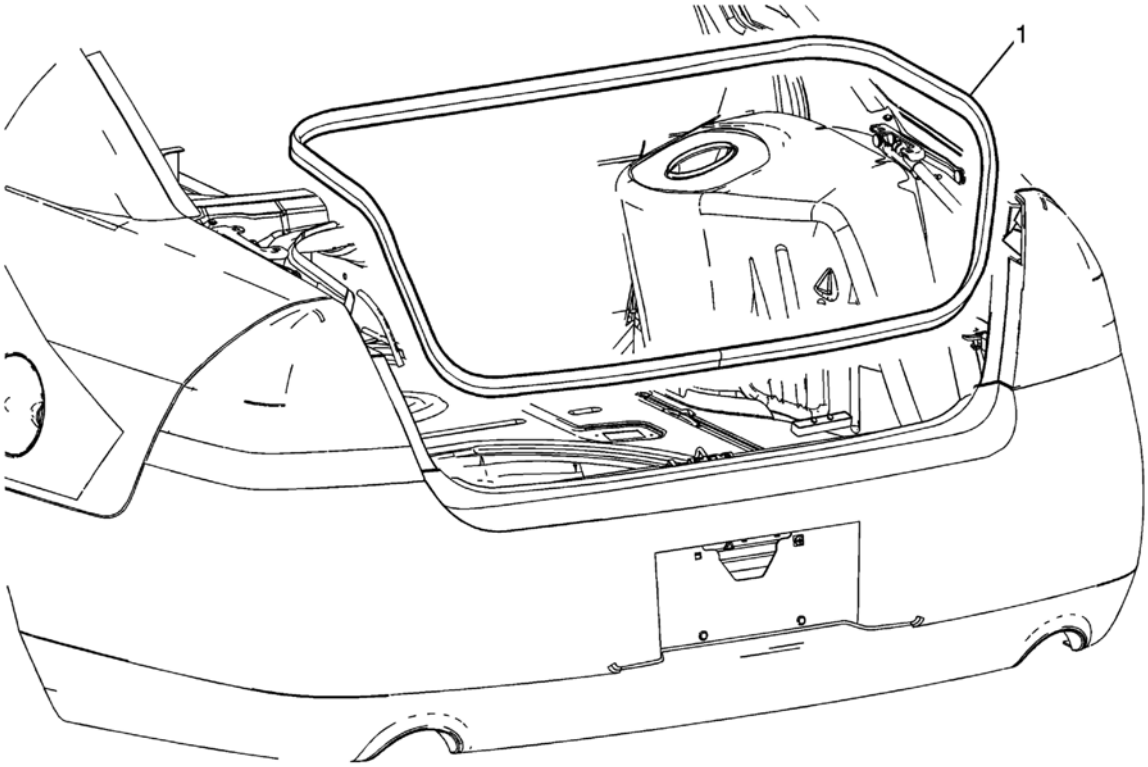

Fig. 50: Rear Compartment Opening Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Compartment Lid Weatherstrip

REAR DOOR OPENING WEATHERSTRIP REPLACEMENT

Removal Procedure

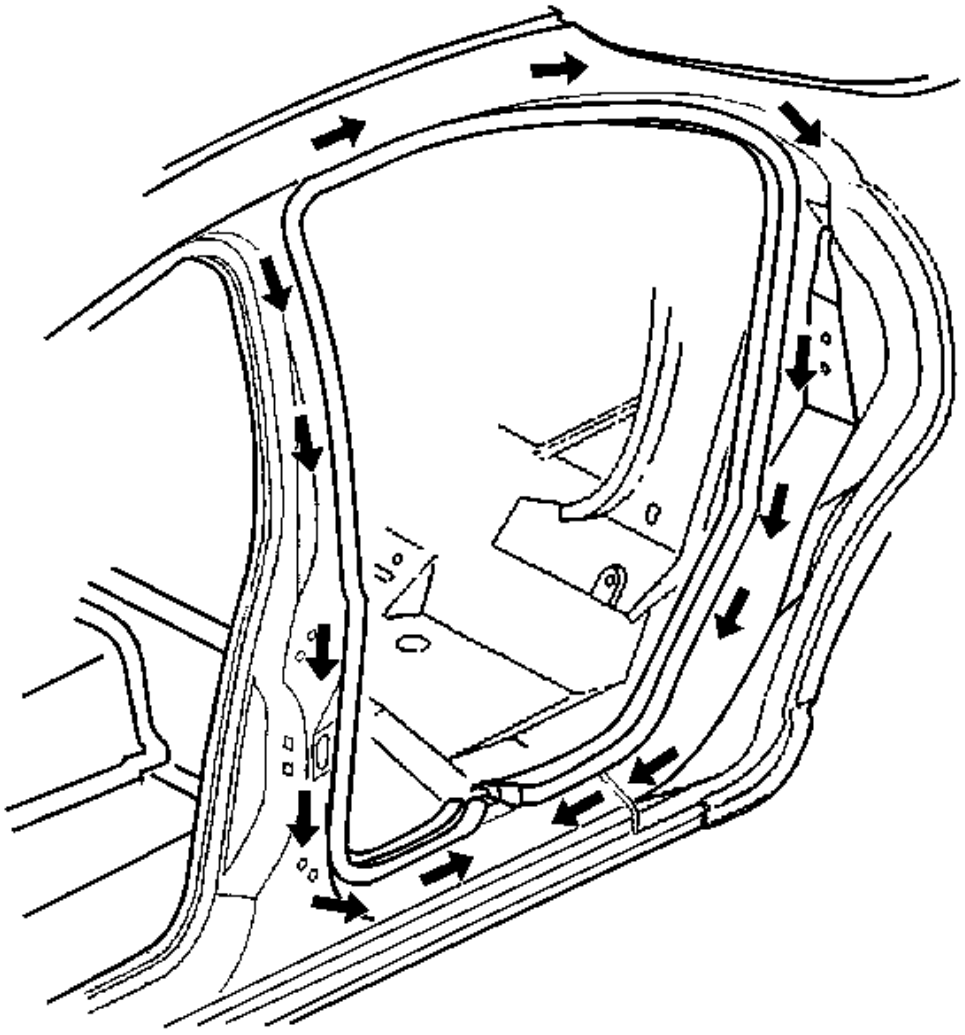

Fig. 51: Rear Door Weatherstrip Positioning
Courtesy of GENERAL MOTORS COMPANY

1. Open the rear door.
2. Remove the trim panels. Refer to the following procedures:
   - **Quarter Lower Rear Trim Panel Replacement (Impala Limited)**
   - **Quarter Upper Trim Panel Replacement**
   - **Center Pillar Upper Trim Panel Replacement**
   - **Center Pillar Lower Trim Panel Replacement**
3. Remove the weatherstrip from the rear door opening by pulling the weatherstrip off the pinchweld flange.

Installation Procedure

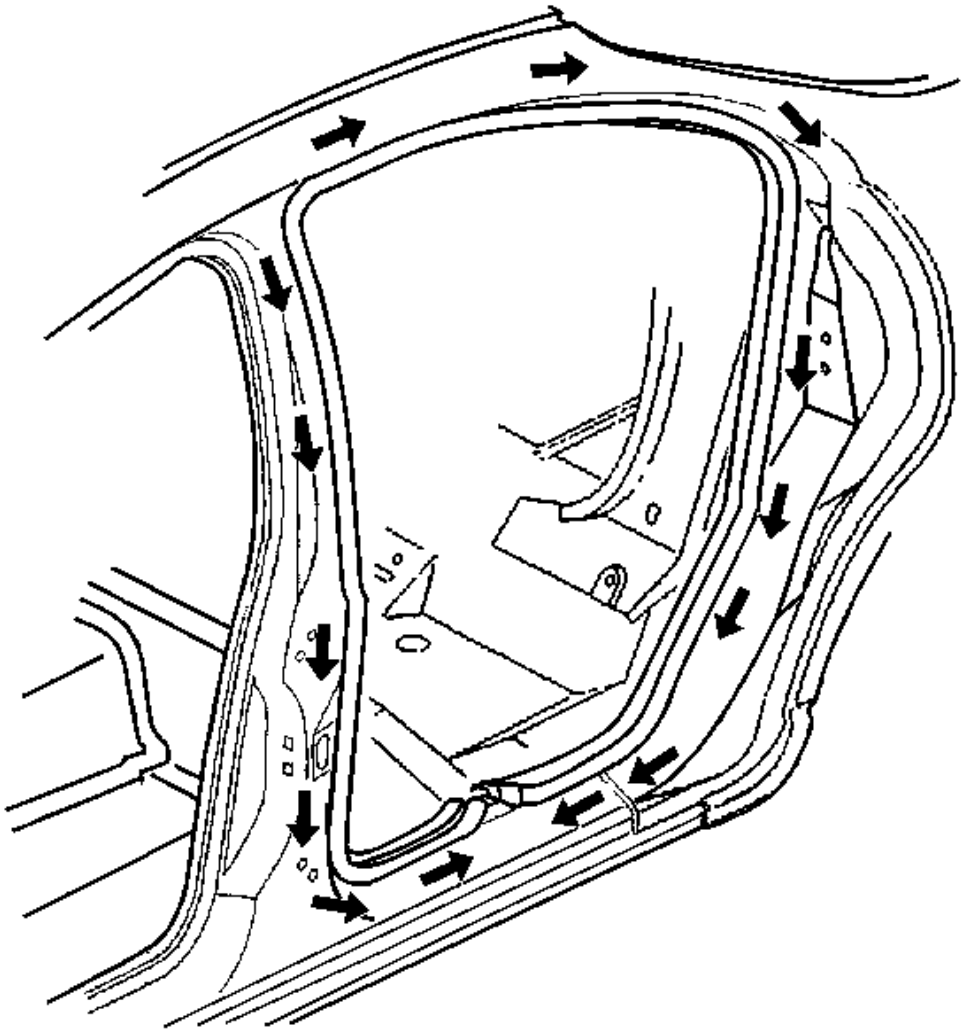

Fig. 52: Rear Door Weatherstrip Positioning
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear door opening weatherstrip to the pinchweld flange.

   Starting at the center of the rocker panel area and moving in a clockwise direction, press the weatherstrip to the pinchweld flange until fully seated.

   IMPORTANT: The joint butt ends must have no gap and must be located in the center of the of the rocker panel area.

2. Install the joint butt ends together.
3. Install the trim panels. Refer to the following procedures:
   - **Quarter Lower Rear Trim Panel Replacement (Impala Limited)**
   - **Quarter Upper Trim Panel Replacement**
   - **Center Pillar Upper Trim Panel Replacement**
   - **Center Pillar Lower Trim Panel Replacement**
4. Close the rear door.

DESCRIPTION AND OPERATION

HOOD AJAR INDICATOR DESCRIPTION AND OPERATION

Hood Ajar Switch

The hood ajar switch provides closure status of the hood to the body control module (BCM). The switch is integrated into the hood latch assembly. The hood ajar switch provides two separate inputs to the BCM. These separate inputs allow the BCM to actively monitor for a hood ajar switch fault.

The BCM uses the hood ajar switch as a content theft deterrent alarm trigger.

Hood Ajar Indicator/Message

When the hood is ajar, a message is displayed on the driver information center (DIC) or the hood ajar indicator will be illuminated.

Article GUID: A00737191

Bumpers and Fascias - Impala

SPECIFICATIONS

FASTENER SPECIFICATIONS

Application	Specification	
	Metric	English
Center Support Bracket Bolts	10 N.m	89 lb in
Front Bumper Fascia Bolts	7 N.m	62 lb in
Front Bumper Impact Bar at Frame Bolts	25 N.m	18 lb ft
Front Fascia Bolts	2 N.m	18 lb in
Front Fascia Nuts	7 N.m	62 lb in
Rear Bumper Fascia Bolts	10 N.m	89 lb in
Rear Bumper Fascia Top Center Nuts	10 N.m	89 lb in
Rear Bumper Impact Bar at Frame Bolts	25 N.m	18 lb ft
Rear Wheelhouse Splash Shield to Body Bolts	10 N.m	89 lb in

REPAIR INSTRUCTIONS

FRONT BUMPER FASCIA ENERGY ABSORBER REPLACEMENT

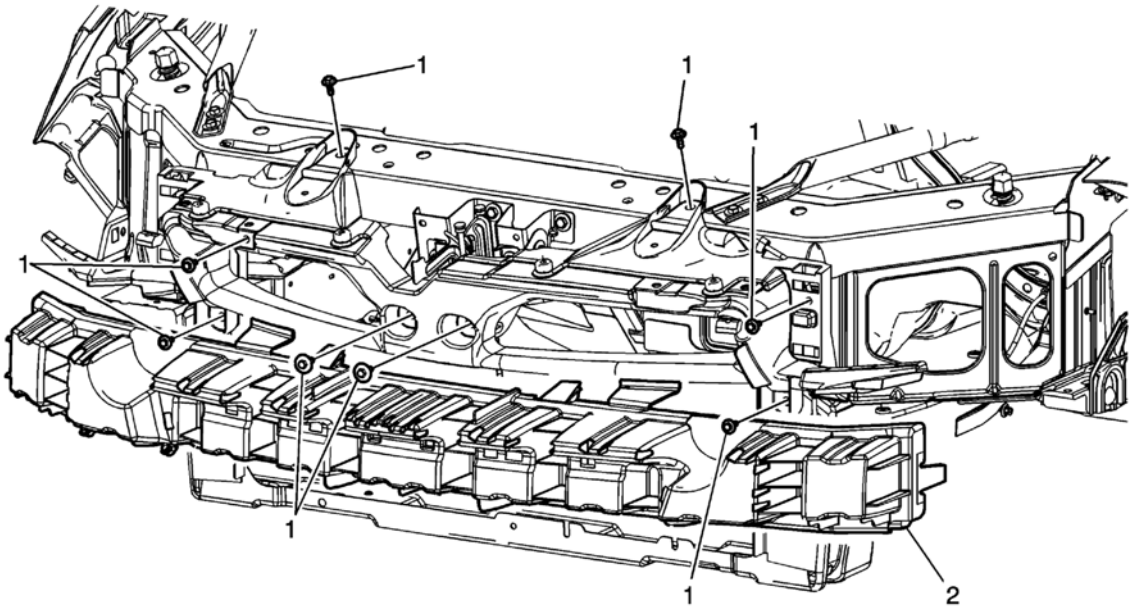

Fig. 1: Front Bumper Energy Absorber

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front fascia. Refer to **Front Bumper Fascia Replacement**.	
1	Energy Absorber Bolt (Qty: 8) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 8 N.m (70 lb in)
2	Energy Absorber

FRONT BUMPER IMPACT BAR REPLACEMENT

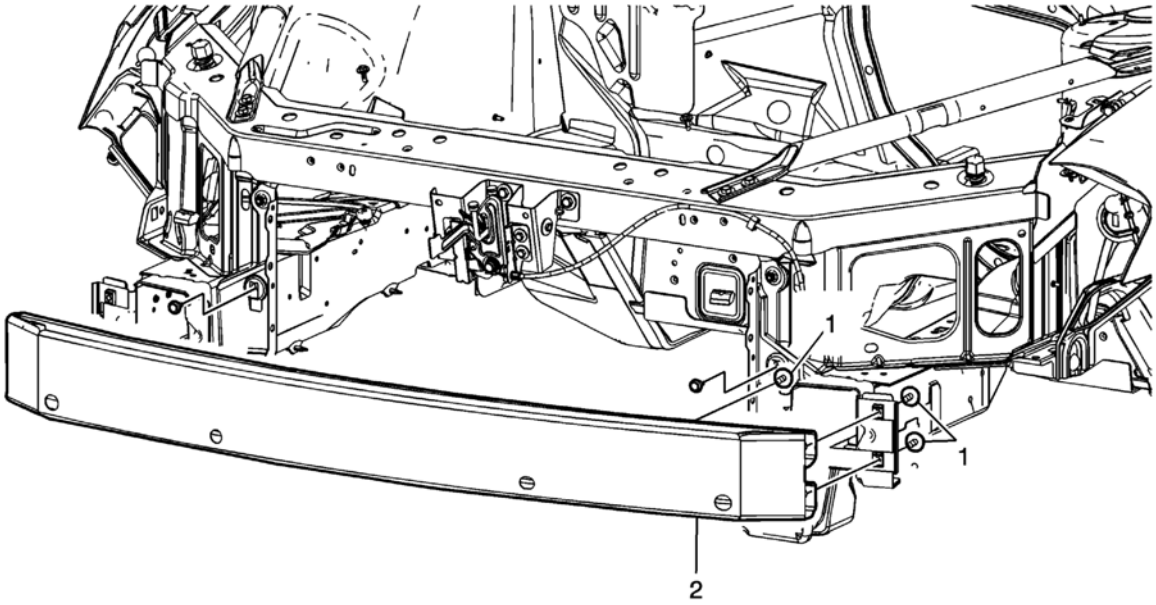

Fig. 2: Front Bumper Impact Bar
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the front fascia. Refer to **Front Bumper Fascia Replacement**. 2. Remove the energy absorber. Refer to **Front Bumper Fascia Energy Absorber Replacement**.	

FRONT BUMPER FASCIA REPLACEMENT

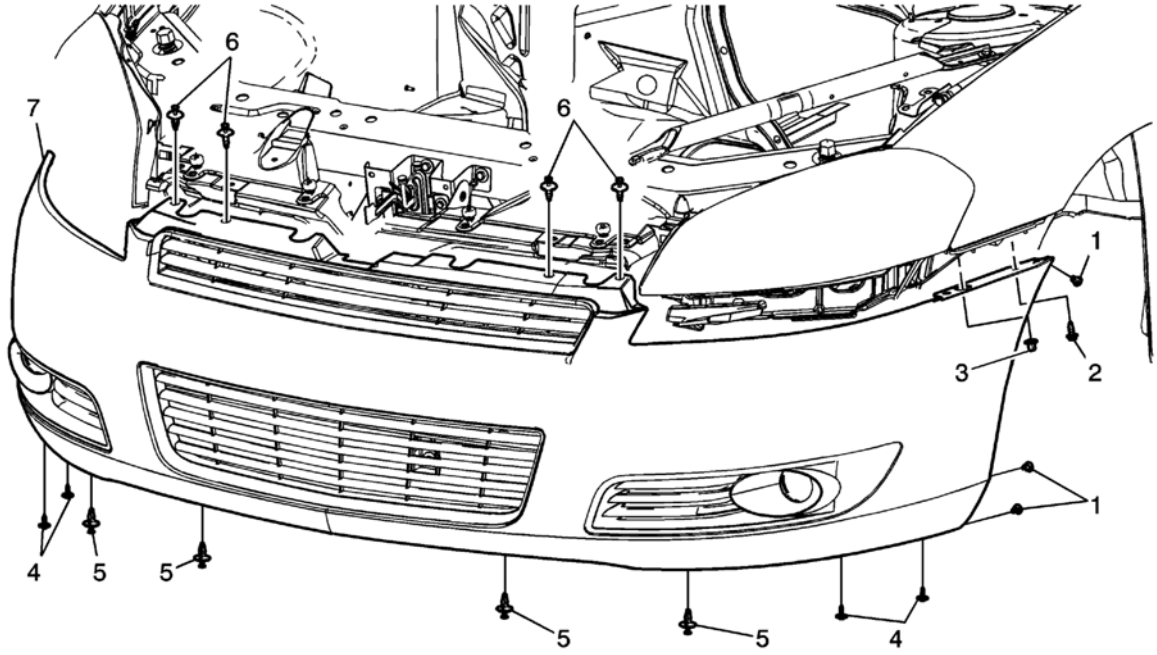

Fig. 3: Front Bumper Fascia
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Fascia Retainer (Qty: 6)
2	Front Fascia Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 6 N.m (53 lb in)
3	Front Fascia Nut (Qty: 2) **Tighten** 6 N.m (53 lb in)
4	Front Fascia Bolt (Qty: 4) **Tighten** 2 N.m (18 lb in)
5	Front Fascia Retainer (Qty: 6)
6	Front Fascia Retainer (Qty: 4)
7	Front Fascia

REAR BUMPER FASCIA REPLACEMENT

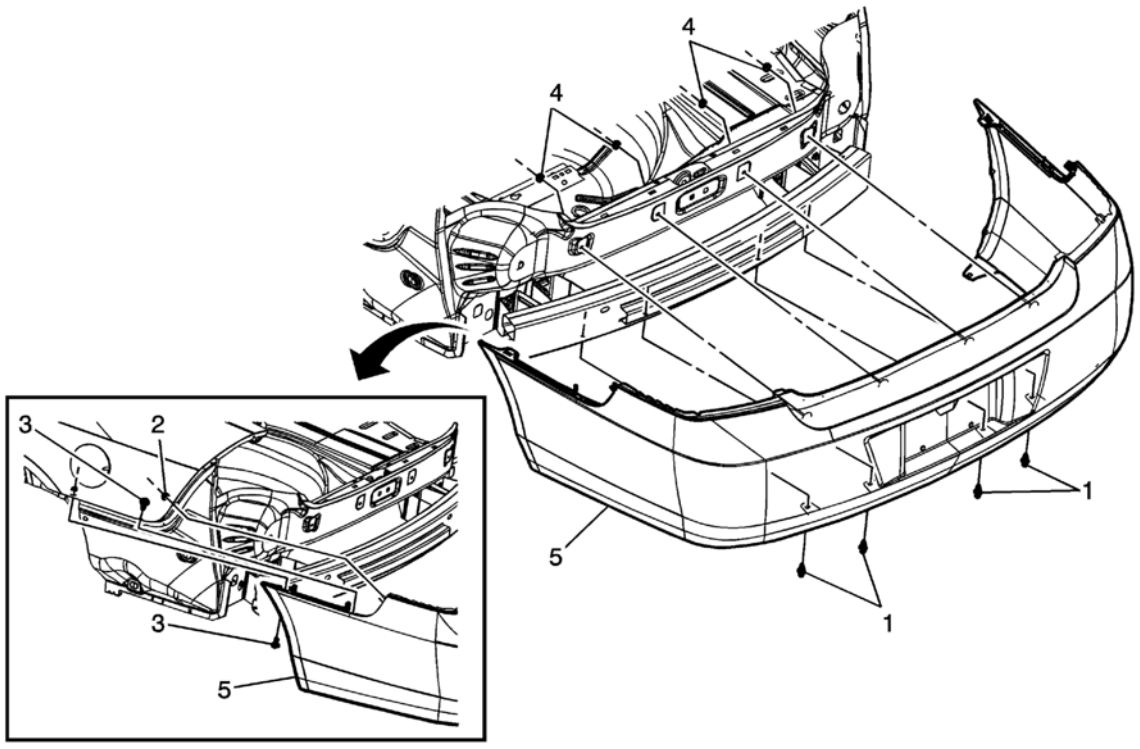

Fig. 4: Rear Bumper Fascia
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the rear wheel liner bolts to the rear fascia. Refer to **Rear Wheelhouse Liner Replacement** . 2. Remove the rear trim sill plate. Refer to **Rear Compartment Sill Trim Plate Replacement** . 3. Remove the license the lamp. Refer to **Rear License Plate Lamp Replacement (Impala)** .	
1	Rear Fascia Retainer (Qty: 4)
2	Rear Fascia Retainer (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
3	Rear Fascia Bolt (Qty: 6) **Tighten** 10 N.m (89 lb in)

Callout	Component Name
4	Rear Fascia Top Center Nut (Qty: 4) **Tighten** 10 N.m (89 lb in)
5	Rear Fascia **TIP:** Disconnect the electrical connector.

REAR ENERGY ABSORBER REPLACEMENT

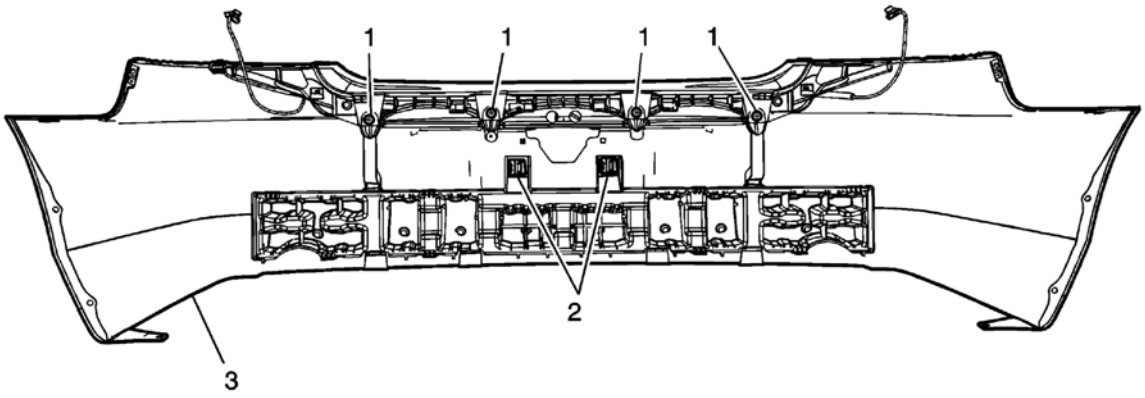

Fig. 5: Identifying Rear Energy Absorber
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear fascia. Refer to **Rear Bumper Fascia Replacement**.	
1	Rear Fascia Absorber Nut (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 6 N.m (53 lb in)
2	Rear Fascia Absorber Retainer (Qty: 2)
3	Rear Fascia Absorber • Disconnect/reposition the electrical harness. • Pry the energy absorber out of the fascia from the bottom.

REAR BUMPER IMPACT BAR REPLACEMENT

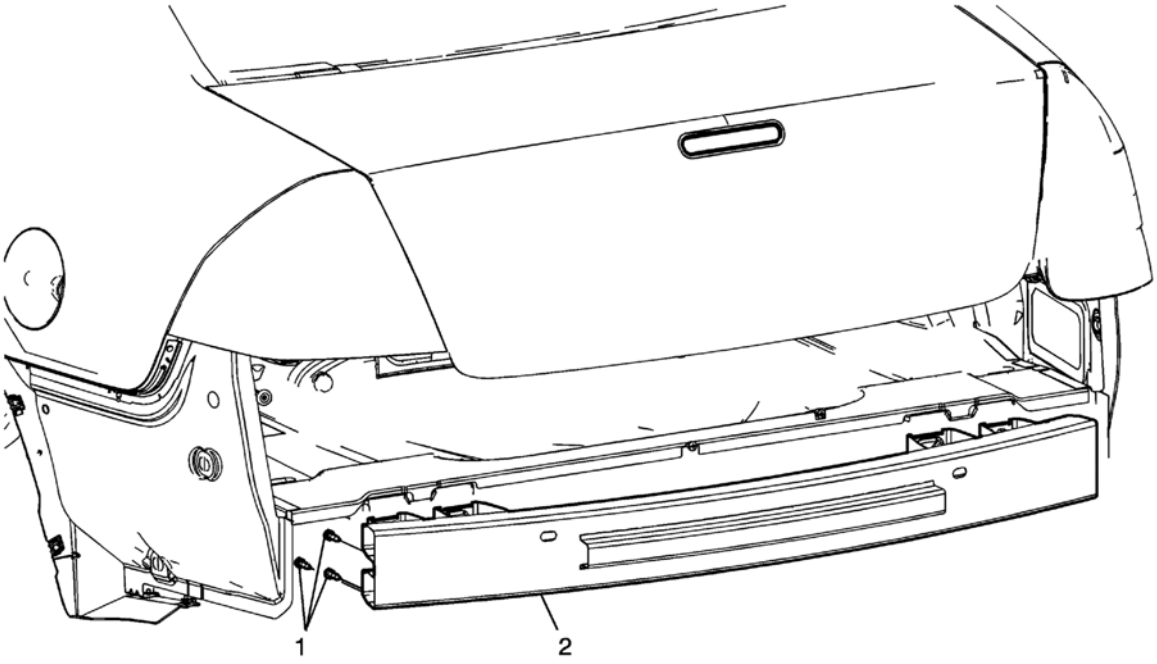

Fig. 6: Rear Bumper Impact Bar
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear fascia. Refer to **Rear Bumper Fascia Replacement**. 2. Remove the rear energy absorber. Refer to **Rear Energy Absorber Replacement**.	
1	Rear Impact Bar Bolt (Qty: 6) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
2	Rear Impact Bar

SPECIFICATIONS

DIMENSIONS - BODY

Point to Point Measurements

Point-to-point measurements are for reference only. All Measurements are given in millimeters. Use these measurements for diagnosing and estimating. Point-to-point measurements are duplicated with tram bar pointers set at equal lengths. All die marks, holes, slots, and fasteners are measured to the center. All dimensions are symmetrical unless otherwise specified.

REPAIR INSTRUCTIONS

FRONT WHEELHOUSE PANEL REPLACEMENT

Removal Procedure

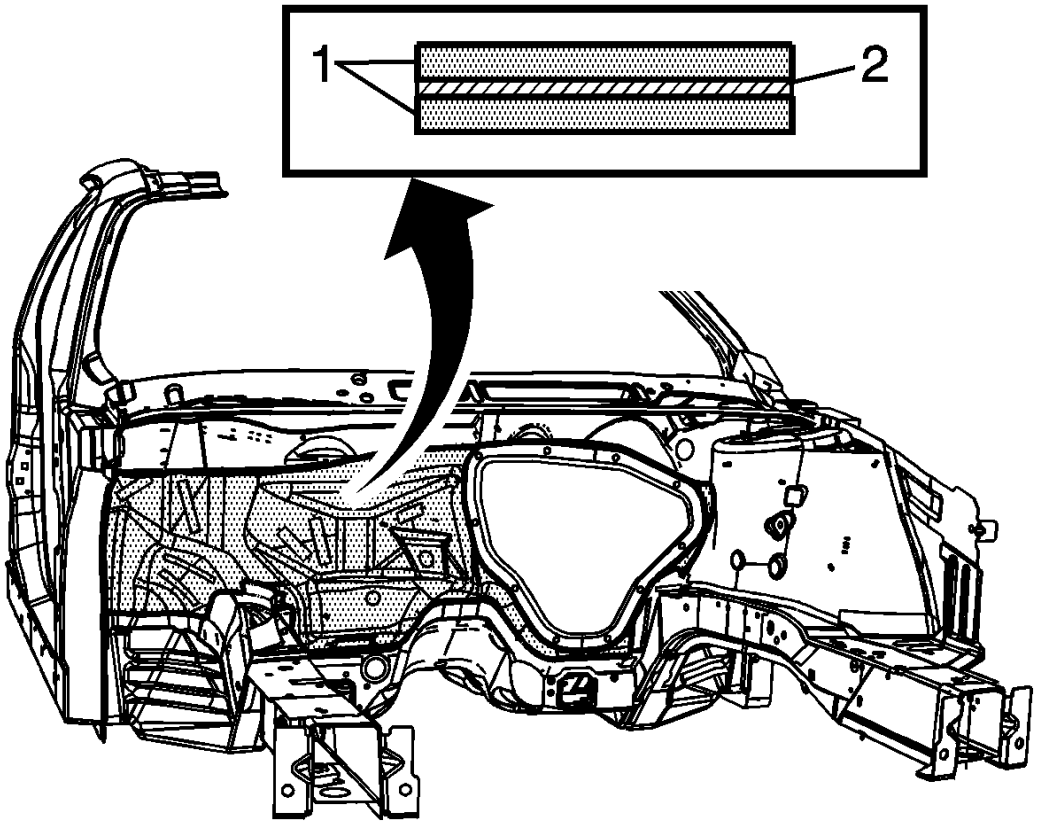

Fig. 3: View Of Laminated Steel
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

WARNING: **Refer to Foam Sound Deadeners Warning .**

NOTE:

- **Model year 2004 and prior vehicles are not manufactured with laminated steel in front of the dashes. Therefore, the front wheelhouse assembly can be metal inert gas (MIG) welded instead of the rivet and bonding process, as stated in these instructions.**

  The front of the dash panel is formed from laminated steel. This steel is constructed by bonding 2 pieces of cold rolled steel (1) with a viscoelastic layer of adhesive (2). MIG welding laminated steel does not meet GM Corporate standards for structural integrity. As an alternative, all factory welds will be replaced by using the rivet and adhesive bond method described in the installation portion of this procedure. The rivet and adhesive bond method must only be used in the areas, as described in this procedure.

- **Failure to follow this procedure will compromise the structural integrity of the vehicle.**

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

WARNING: Refer to Collision Sectioning Warning .

3. Remove all related panels and components.
4. Repair as much of the damage as possible.
5. Remove the sealers and the anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

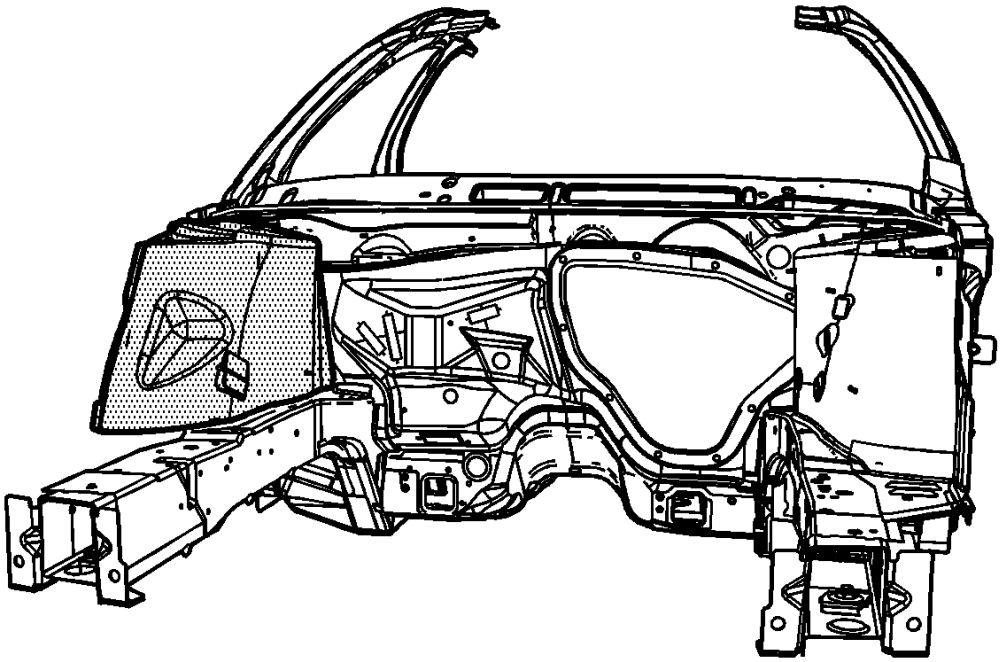

Fig. 4: View Of Full Wheelhouse Service Part
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the number and location of the factory welds for installation of the

full wheelhouse service part.

6. Remove the radiator support assembly. Refer to **Radiator Support Replacement**.
7. Remove the upper fender rail. Refer to **Upper Rail Replacement**.

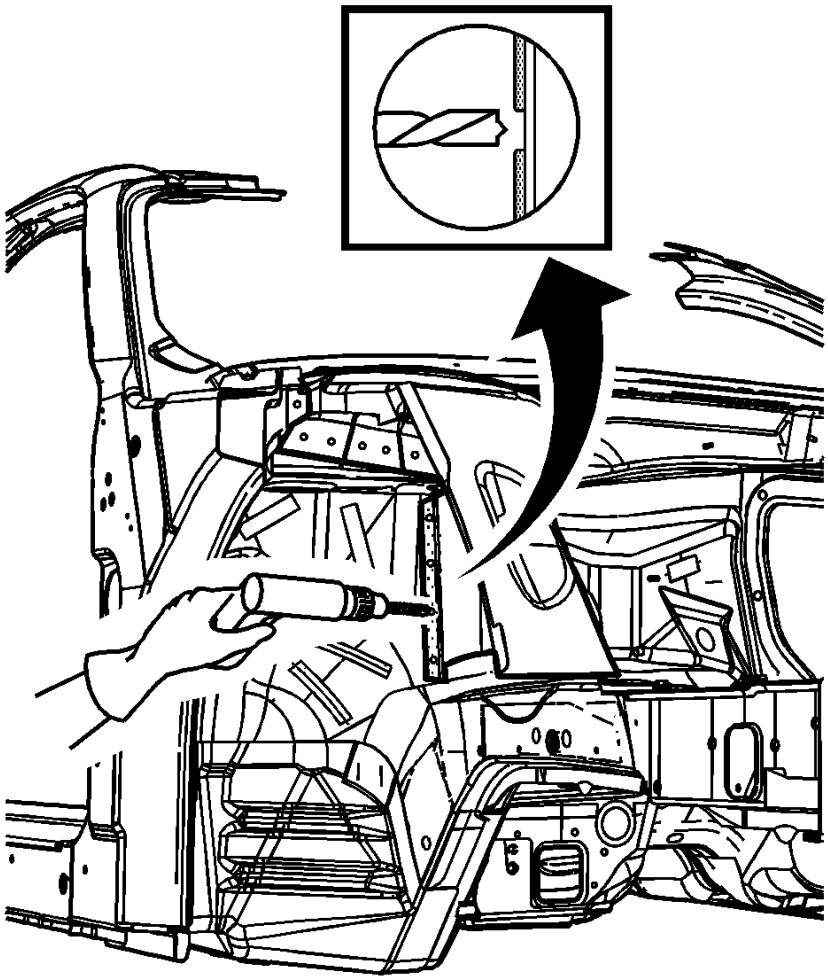

Fig. 5: Drilling Through Wheelhouse Flange Only
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Drill through the wheelhouse flange only. Do NOT drill into the dash panel or the inner reinforcements.**

8. Using an 8-mm (5/16-in) spot weld remover, locate and drill out the factory welds on the weld flange connecting the wheelhouse to the dash panel.

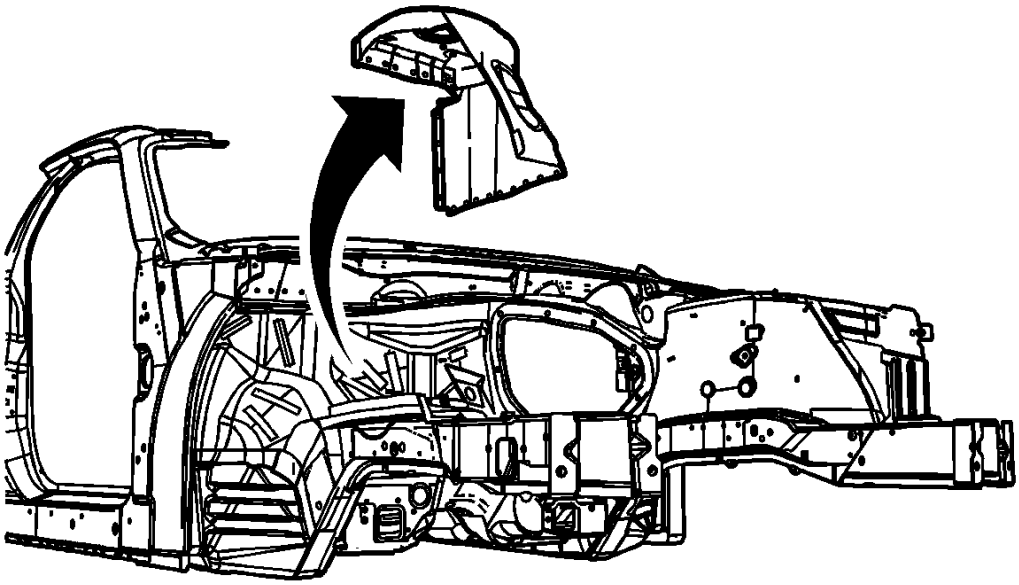

Fig. 6: Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

9. Remove the wheelhouse.

Installation Procedure

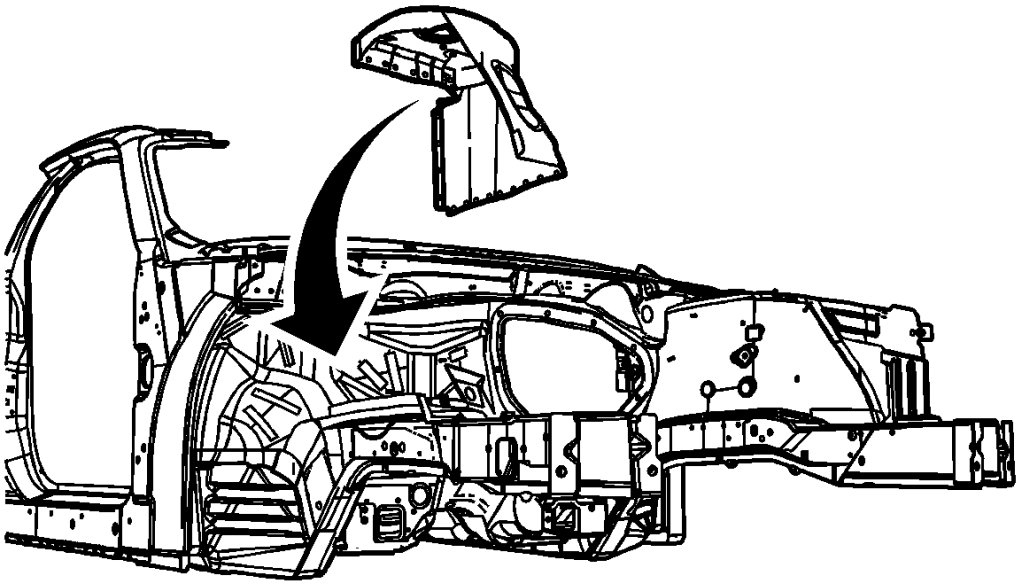

Fig. 7: Positioning Service Wheelhouse To Vehicle
Courtesy of GENERAL MOTORS COMPANY

1. Position the service wheelhouse to the vehicle using 3-dimensional measuring equipment.
2. Clamp the wheelhouse in place.

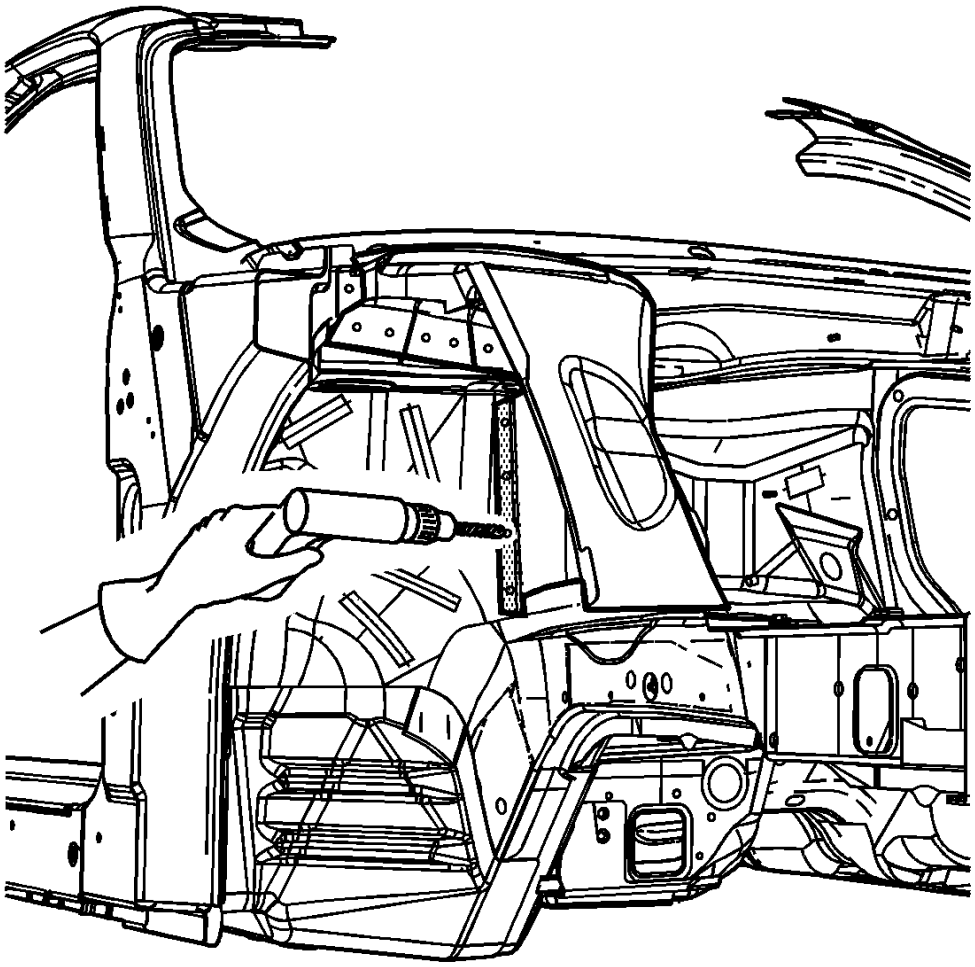

Fig. 8: Drilling Service Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

3. Using a 7-mm (17/64-in) bit, drill the rivet attachment holes through the service wheelhouse and the dash panel, in the exact locations as noted from the factory wheelhouse.

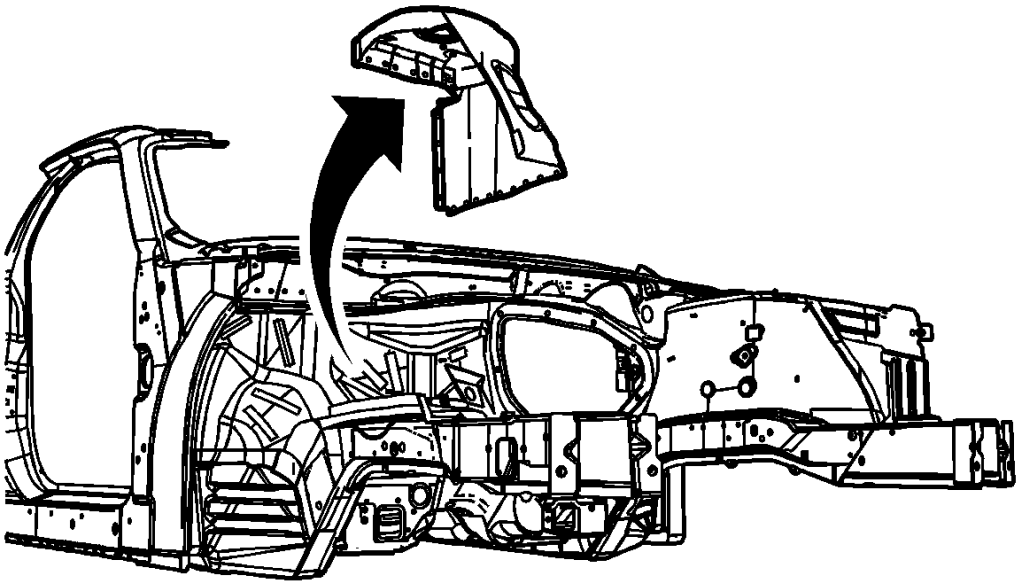

Fig. 9: Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

4. Remove the service wheelhouse.

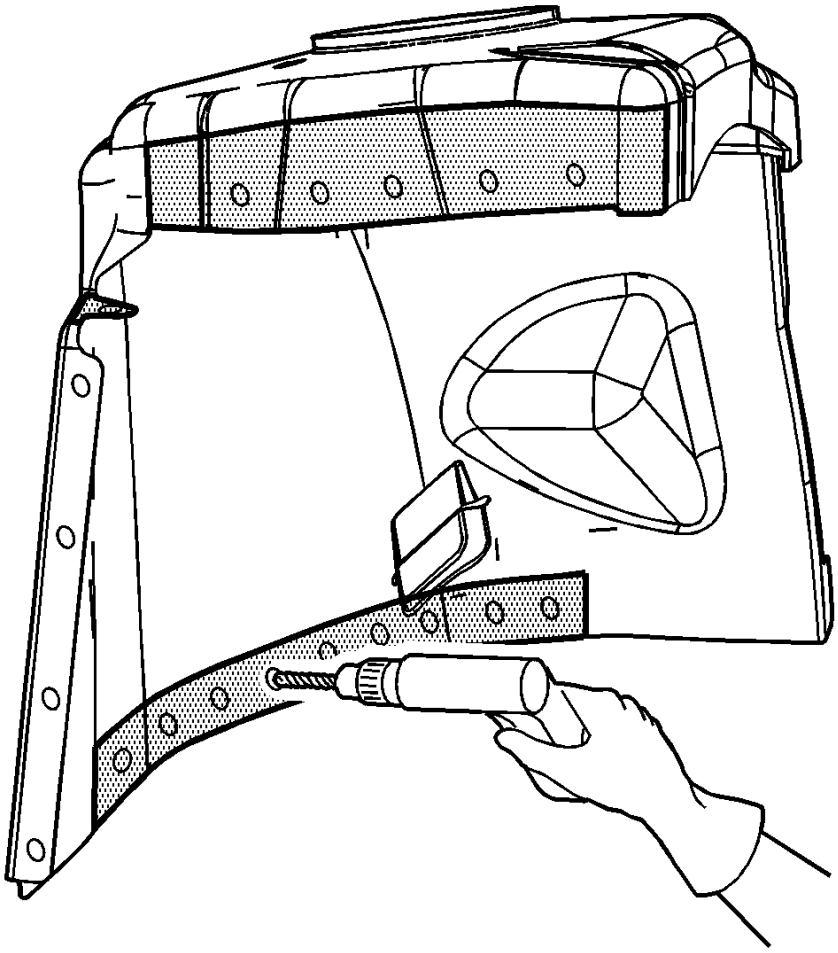

Fig. 10: Drilling Plug Weld Holes In Service Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1.5 in) apart.**

5. Drill 8-mm (5/16-in) plug weld holes in the service wheelhouse, as necessary, in the remaining locations noted from the original wheelhouse.
6. Prepare the plug weld mating surfaces, as necessary.
7. Apply 3MÂ® Weld-Thru Coating P/N 05913 or equivalent to the plug weld mating surfaces.

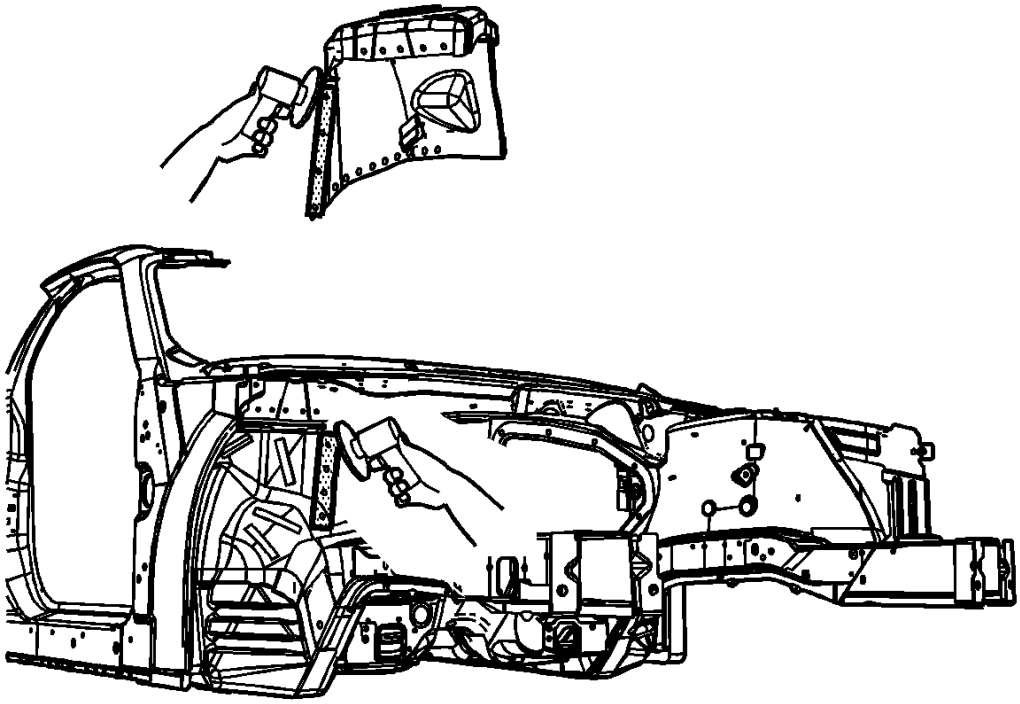

Fig. 11: Grinding Body Mating And Service Part Flanges
Courtesy of GENERAL MOTORS COMPANY

8. Prepare the bond mating areas by grinding the body mating and the service part flanges to bare steel. Do NOT damage the corners or thin the metal during the grinding process.
9. Clean the mating surfaces.

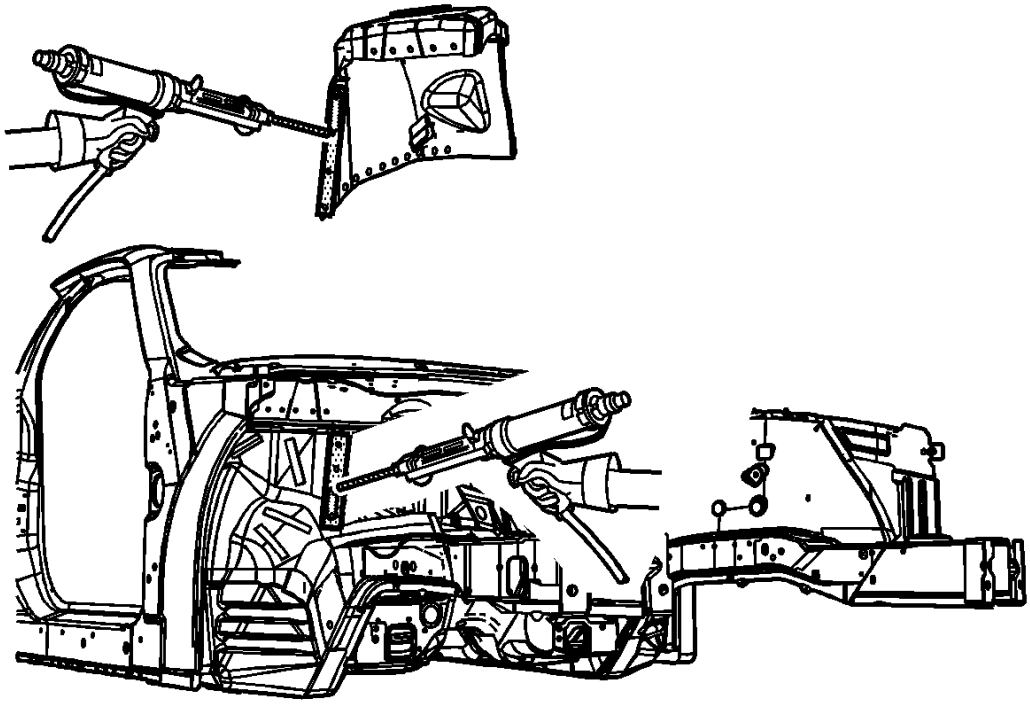

Fig. 12: Applying Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The adhesive has a 40-50 minute working time. Do NOT allow the adhesive to cure prior to installing the service wheelhouse.**

10. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to both of the mating surfaces.

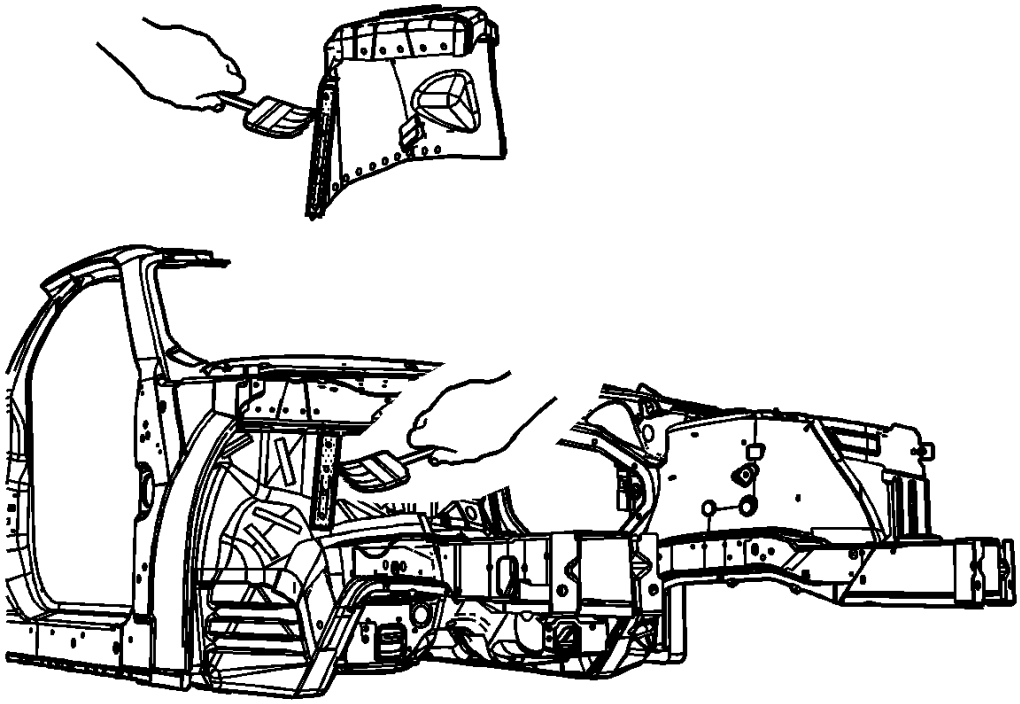

Fig. 13: Spreading Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

11. Using a small acid brush, spread a coat of adhesive to both of the mating surfaces. Cover all of the bare metal to ensure corrosion protection.

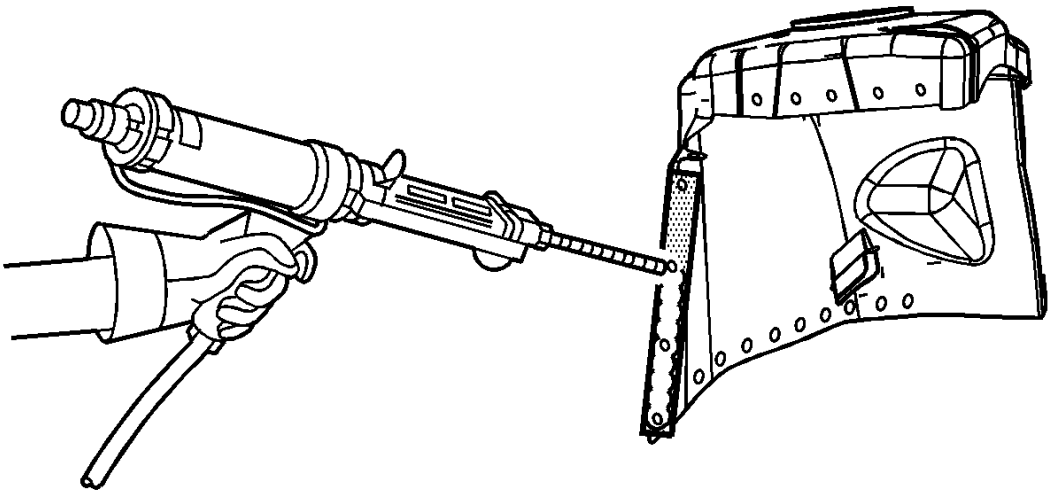

Fig. 14: Applying Bead Of Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

12. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to the mating surface of the service wheelhouse.

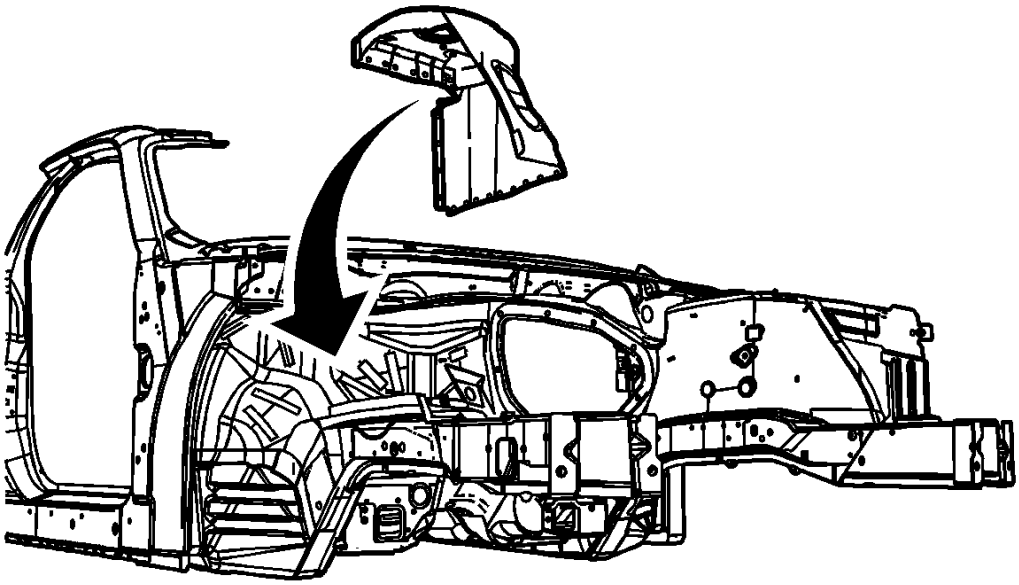

Fig. 15: Positioning Service Wheelhouse To Vehicle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT pull the wheelhouse off of the dash after adhesion. To align the parts, slide the wheelhouse against the front of the dash.**

13. Position the service wheelhouse to the vehicle using 3-dimensional measuring equipment.
14. Clamp the wheelhouse in place.

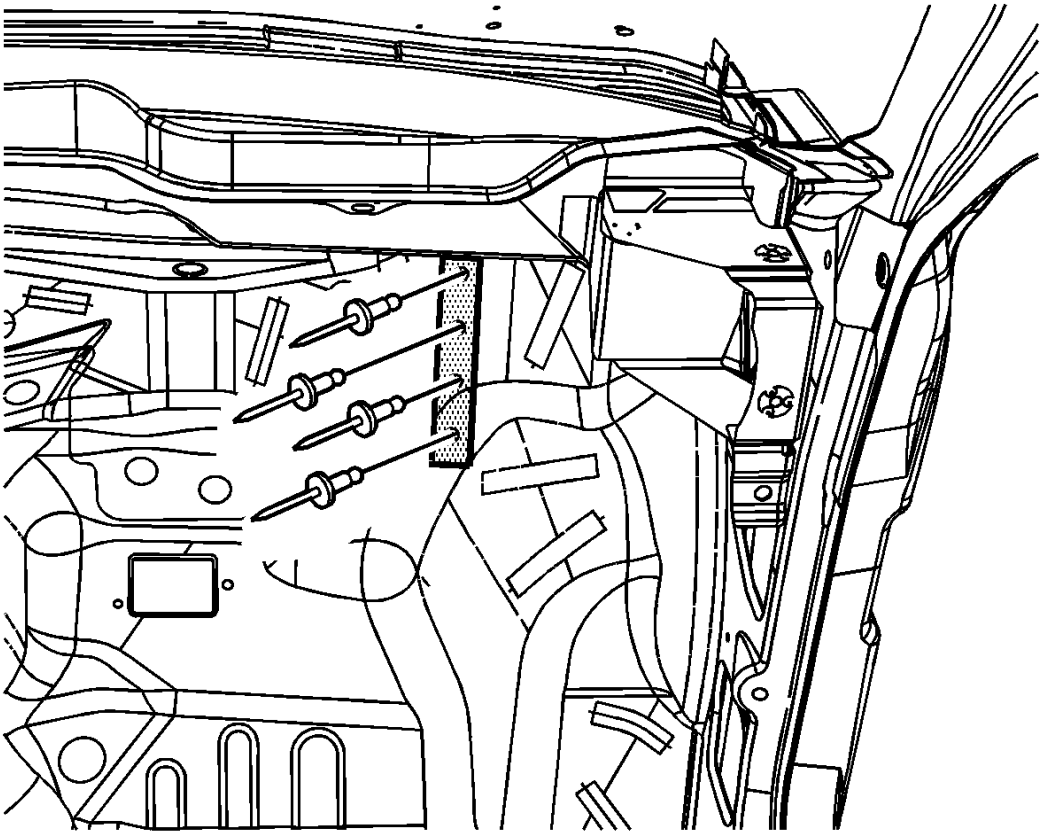

Fig. 16: Riveting Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify proper positioning of the service wheelhouse prior to riveting and welding.

15. Install the 9 mm (11/32 in) long rivets so that the rivet head contacts the passenger compartment side of the dash.
16. Remove the excess adhesive from the wheelhouse area.

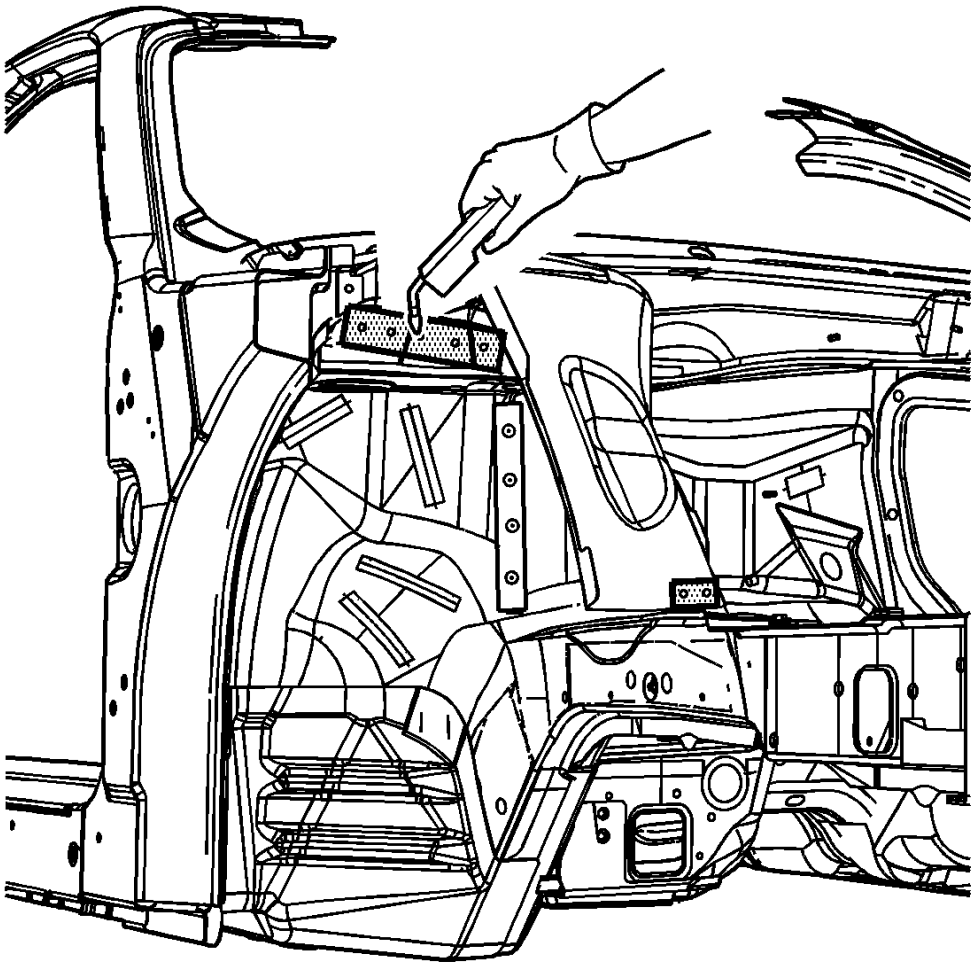

Fig. 17: Plug Welding Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

17. Plug weld the remaining holes accordingly.
18. Clean and prepare all of the welded surfaces.
19. Install the radiator support assembly. Refer to **Radiator Support Replacement**.
20. Install the upper fender rail. Refer to **Upper Rail Replacement**.
21. Apply the sealers and anti-corrosion materials to the repaired area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
22. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
23. Install all of the related panels and components.
24. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
25. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT WHEELHOUSE EXTENSION REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

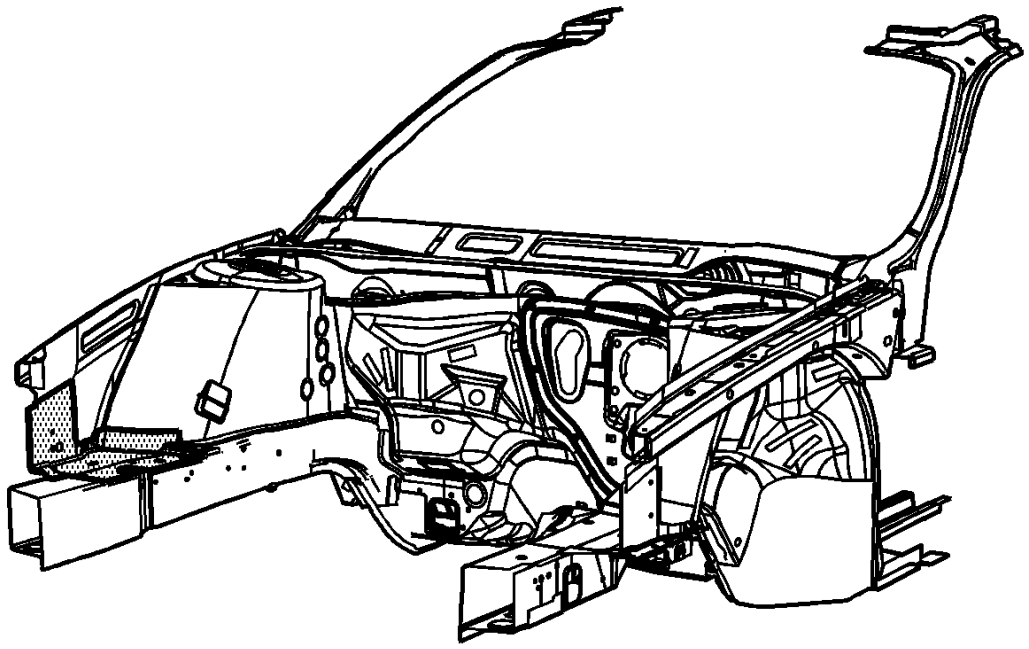

Fig. 18: View Of Front Wheelhouse
Courtesy of GENERAL MOTORS COMPANY

3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications. Refer to **Dimensions - Body**.

WARNING: Refer to Foam Sound Deadeners Warning .

5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
6. Remove the radiator support. Refer to **Radiator Support Replacement**.

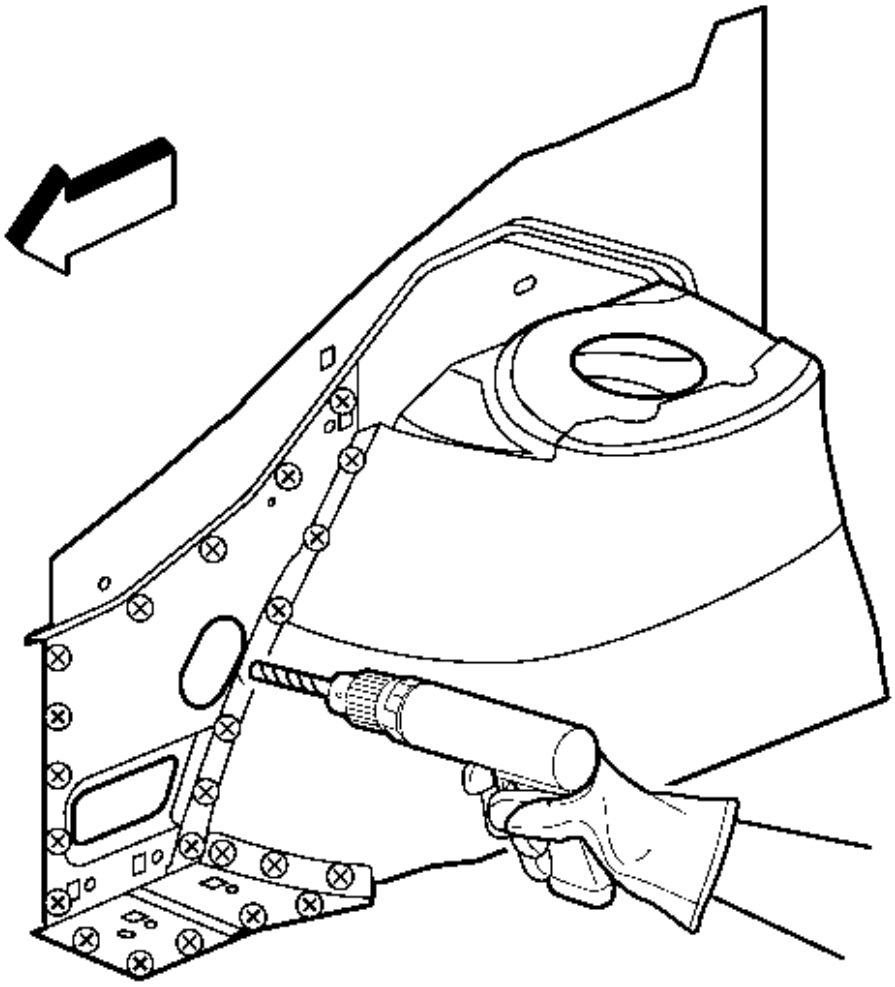

Fig. 19: Locating Factory Welds For Drilling
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not damage any inner panels or reinforcements.**

7. Locate and drill out all factory welds. Note the number and location of welds for installation of the service part.

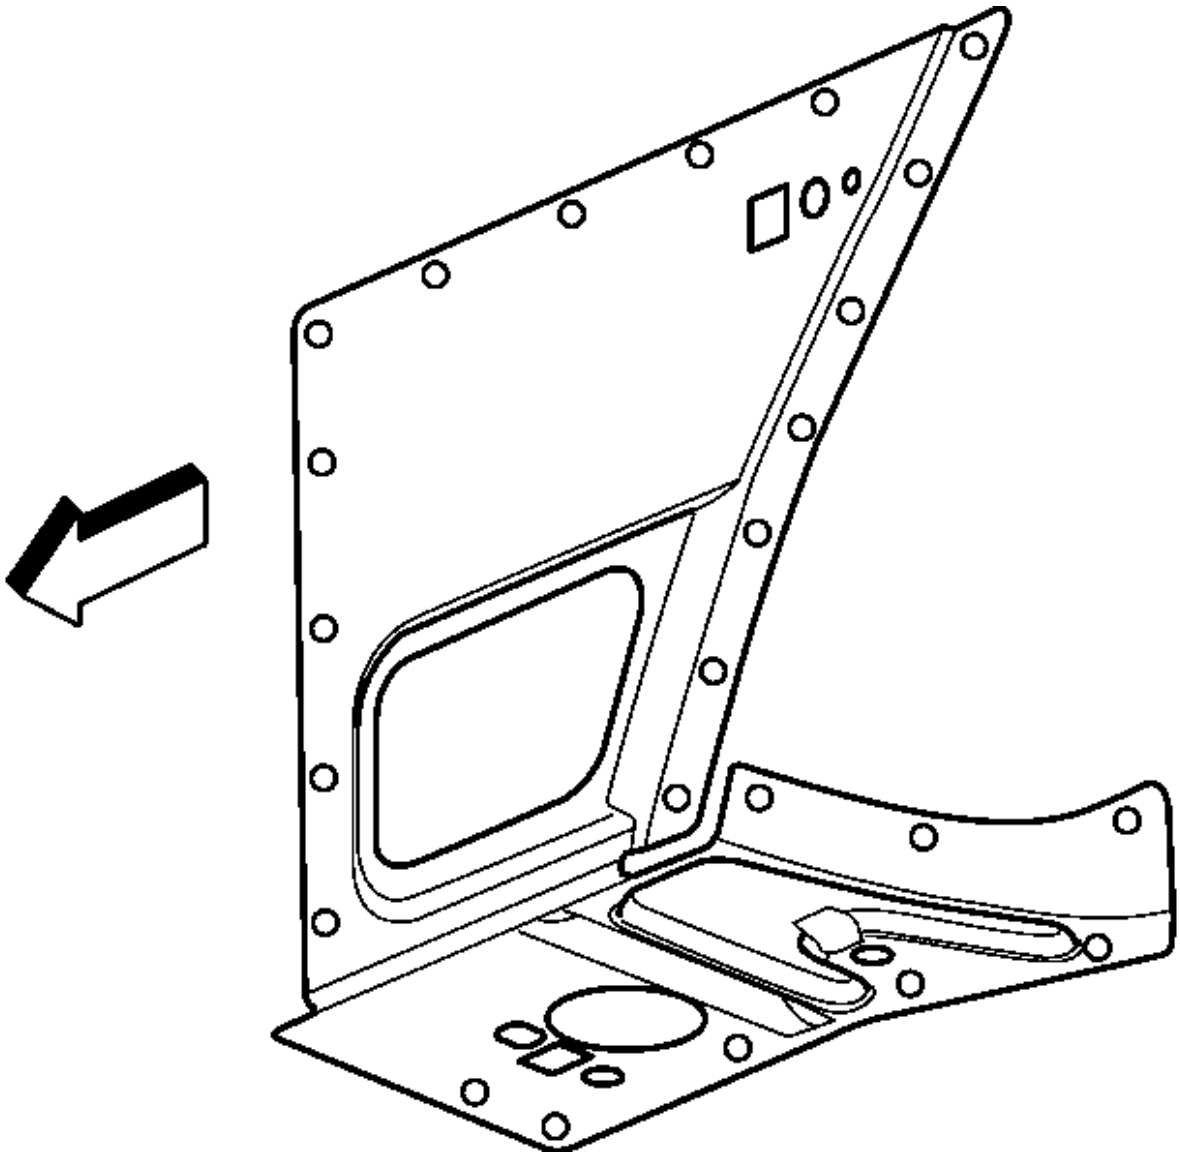

Fig. 20: Identifying Apron Extension
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged apron extension.

Installation Procedure

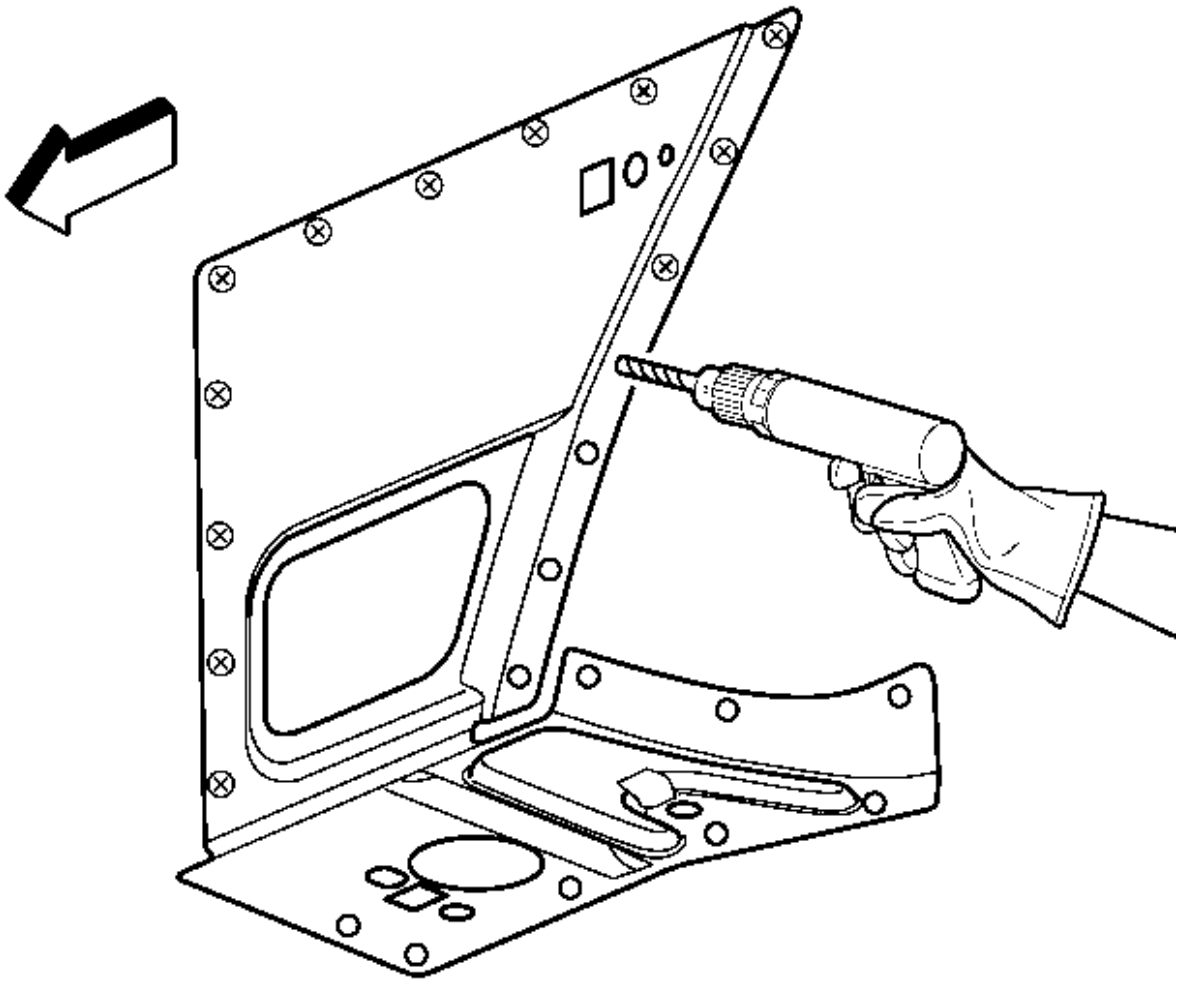

Fig. 21: Drilling Out Plug Weld Holes
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the location of the original plug weld holes can not be determined, or if structural weld-thru adhesive is present, space the plug weld holes every 40 mm (1 1/2 in) apart.**

1. Drill 8 mm (5/16 in) plug weld holes in the service part as necessary in the locations noted from the original panel and along the sectioning cut.
2. Prepare all mating surfaces as necessary.
3. Apply 3MÂ® Weld-Thru coating P/N 05916 or equivalent to all mating surfaces

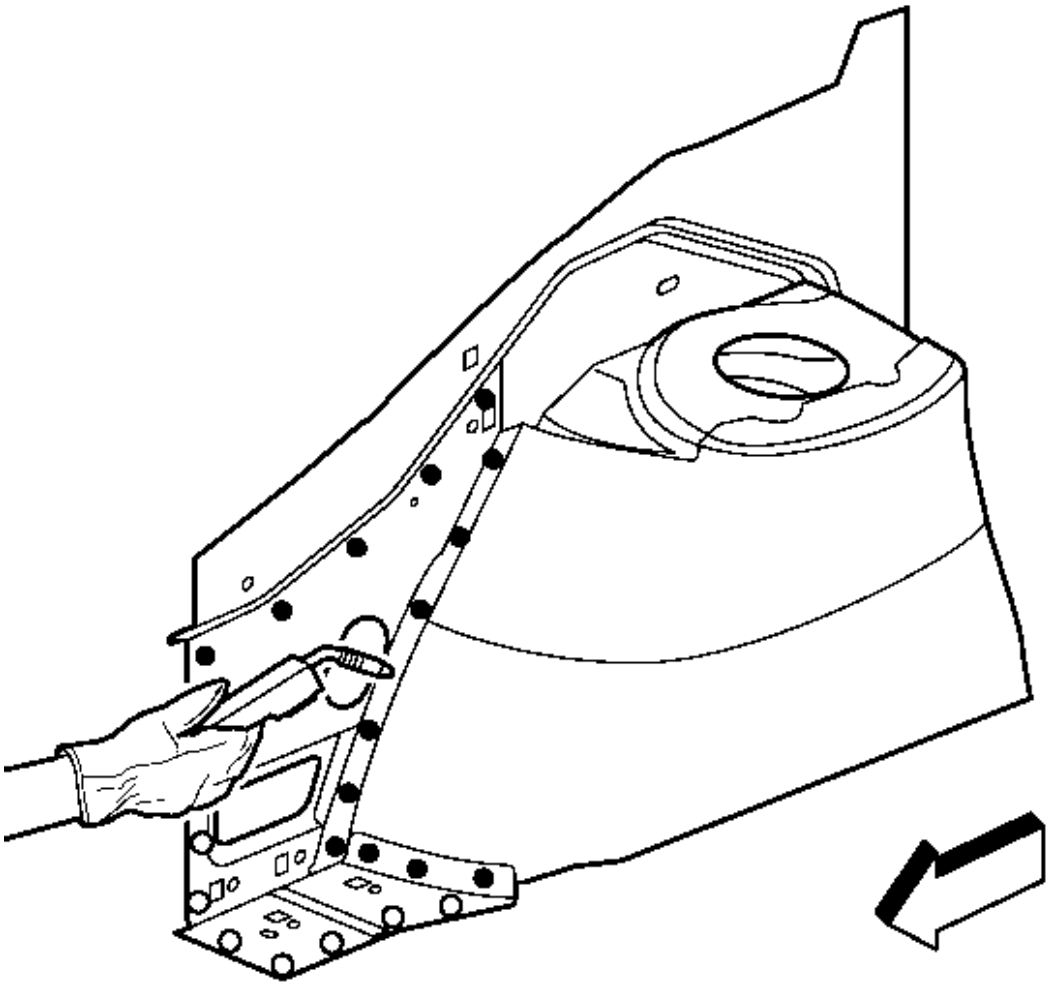

Fig. 22: Applying Weld-Thru Primer To Apron Extension
Courtesy of GENERAL MOTORS COMPANY

4. Position the apron extension.
5. Plug weld accordingly.
6. Replace the radiator support. Refer to **Radiator Support Replacement**.
7. Clean and prepare all welded surfaces.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
9. Paint and repair the area. Refer to **Basecoat/Clearcoat Paint Systems** .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
12. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT COMPARTMENT SIDE RAIL REAR EXTENSION REPLACEMENT

Removal Procedure

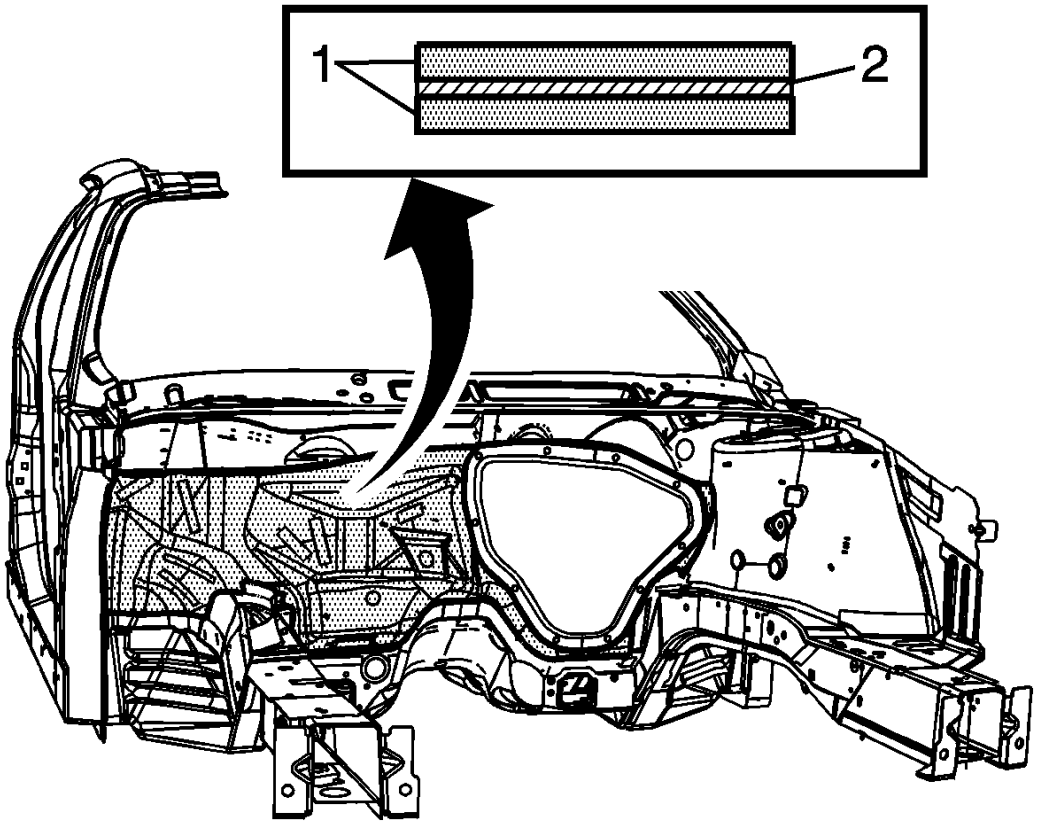

Fig. 23: View Of Laminated Steel
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

WARNING: **Refer to Foam Sound Deadeners Warning .**

NOTE:

- **Model year 2004 and prior vehicles are not manufactured with laminated steel in front of the dashes. Therefore, the front lower rail extension can be metal inert gas (MIG) welded instead of the rivet and bonding process, as stated in these instructions.**

  The front of the dash panel is formed from laminated steel. This steel is constructed by bonding 2 pieces of cold rolled steel (1) with a viscoelastic layer of adhesive (2). MIG welding laminated steel does not meet GM Corporate standards for structural integrity. As an alternative, all factory welds will be replaced by using the rivet and adhesive bond method, described in the installation portion of this procedure. The rivet and adhesive bond method must only be used in the areas as described in this procedure.

- **Failure to follow this procedure will compromise the structural integrity of the vehicle.**

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

WARNING: Refer to Collision Sectioning Warning .

3. Remove all related panels and components.
4. Repair as much of the damage as possible.
5. Remove the sealers and the anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

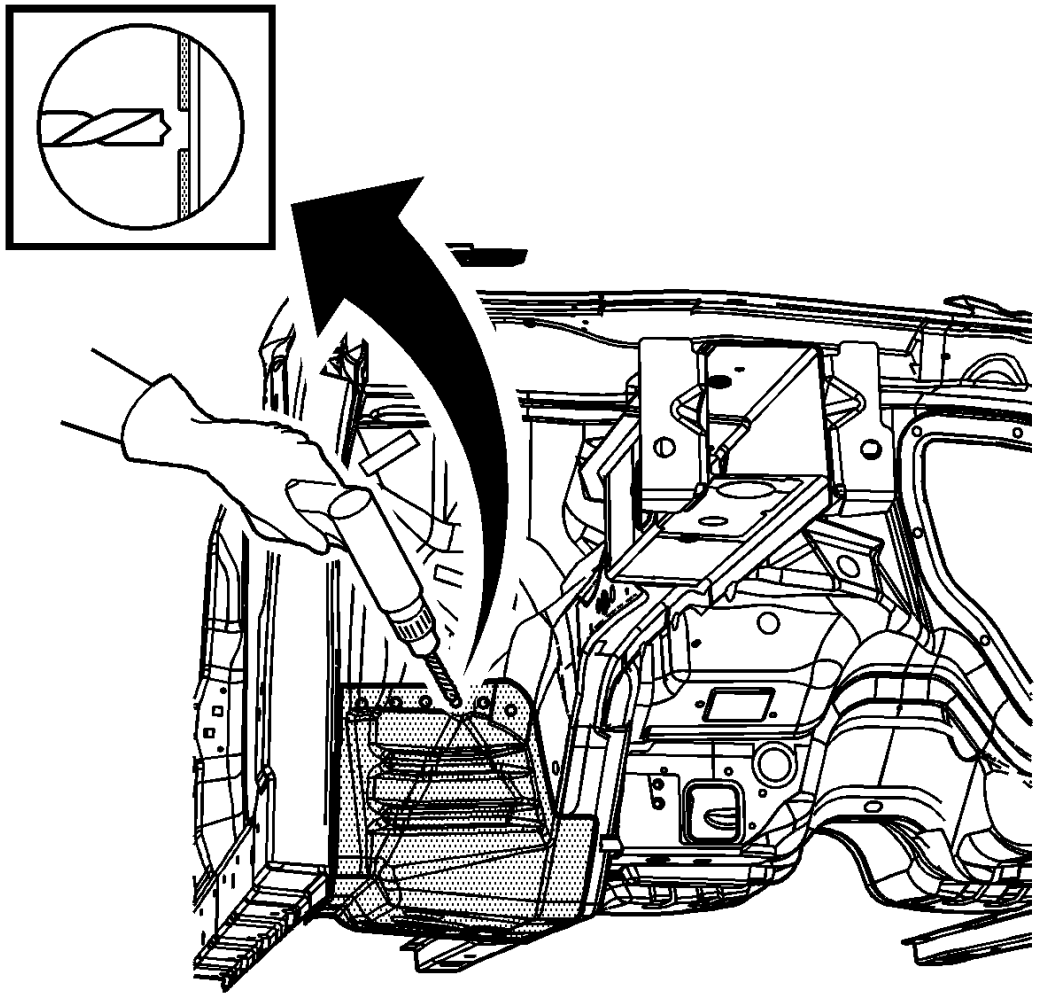

Fig. 24: Drilling Through Rail Side Extension Flange
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Note the number and location of the factory welds, for installation of**

the rail side extension service part.

- **Drill through the rail side extension flange only. Do NOT drill into the dash panel or the inner reinforcements.**

6. Using an 8-mm (5/16-in) spot weld remover, locate and drill out the factory welds on the weld flange connecting the lower rail side extension to the vehicle structure.

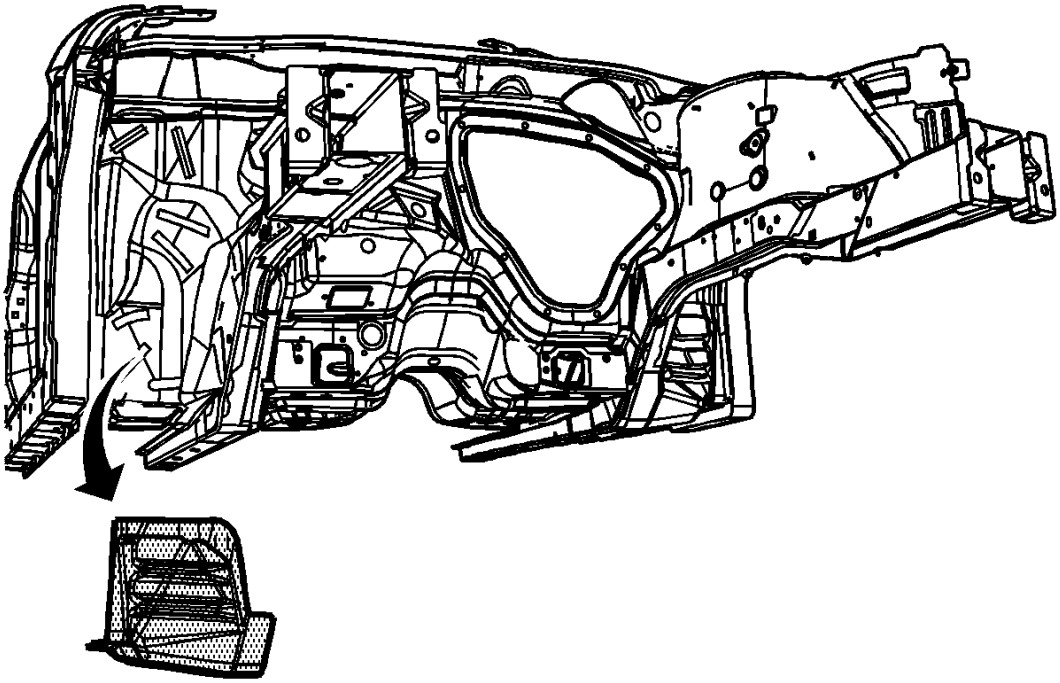

Fig. 25: Rail Side Extension
Courtesy of GENERAL MOTORS COMPANY

7. Remove the rail side extension.

Installation Procedure

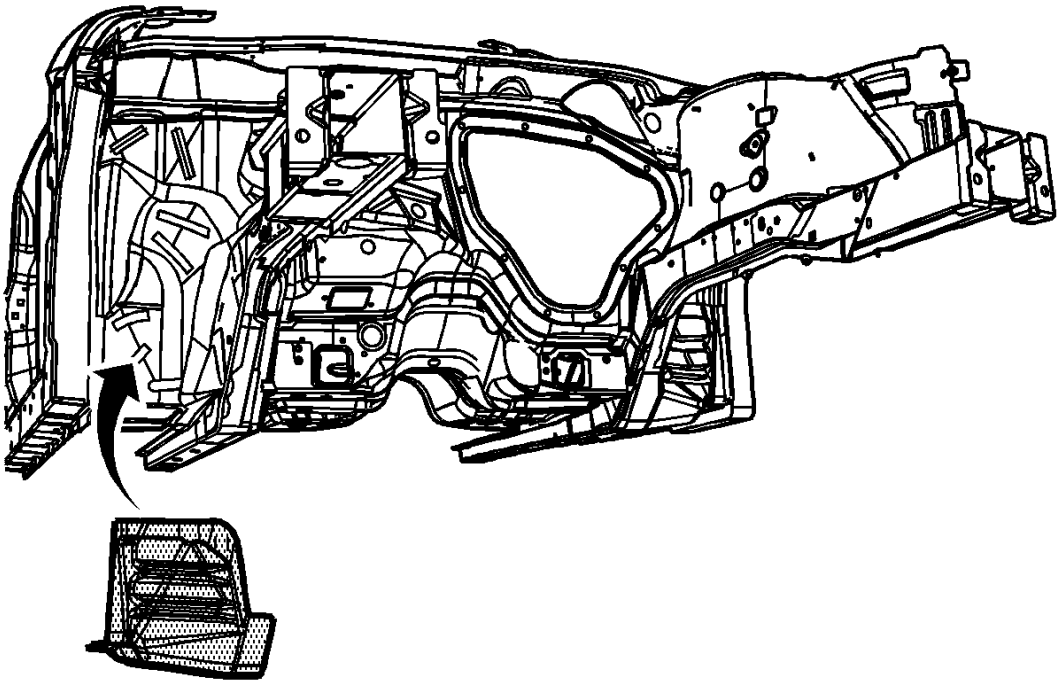

Fig. 26: Positioning Service Rail Side Extension To Vehicle
Courtesy of GENERAL MOTORS COMPANY

1. Position the service rail side extension to the vehicle.
2. Clamp the rail in place.

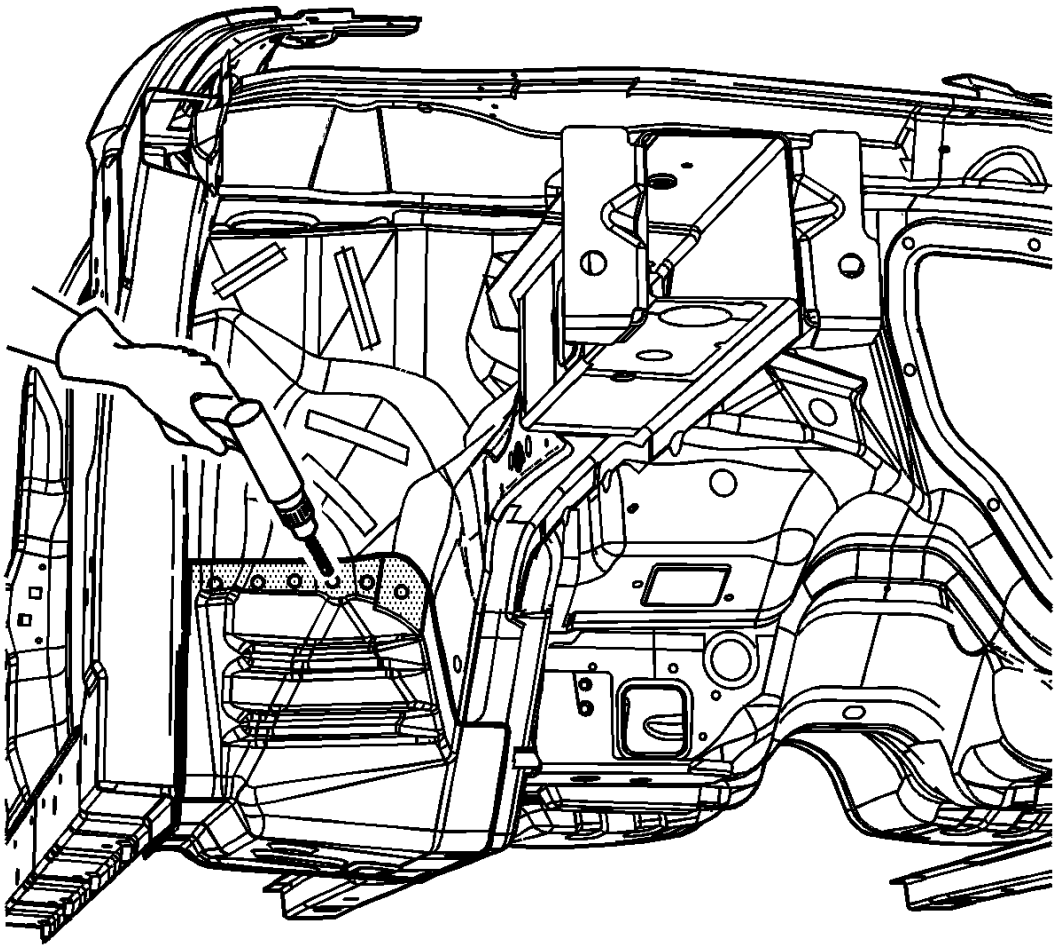

Fig. 27: Drilling Plug Weld Holes
Courtesy of GENERAL MOTORS COMPANY

3. Using a 7-mm (17/64-in) bit, drill the rivet attachment holes through the service rail side extension and the dash panel, in the exact locations, as noted from the factory rail side extension.

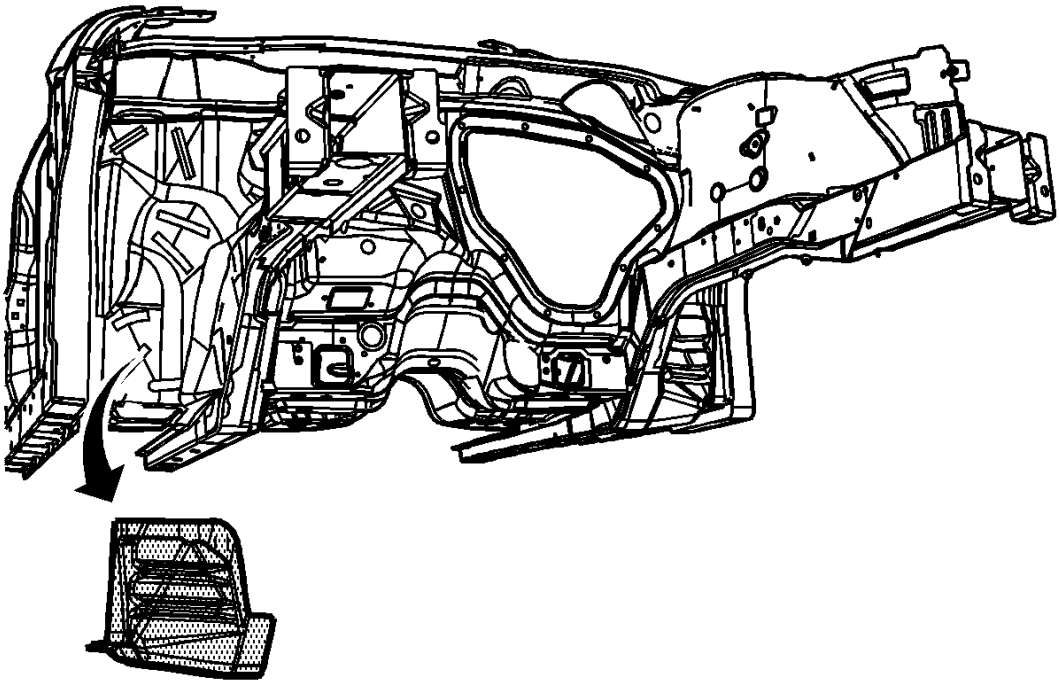

Fig. 28: Removing The Rail Side Extension
Courtesy of GENERAL MOTORS COMPANY

4. Remove the service rail side extension.

NOTE: **If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1.5 in) apart.**

5. Drill 8-mm (5/16-in) plug weld holes in the service rail side extension as necessary, in the remaining locations noted from the original rail side extension.
6. Prepare the plug weld mating surfaces, as necessary.
7. Apply 3MÂ® Weld-Thru Coating P/N 05913 or equivalent to the plug weld mating surfaces.

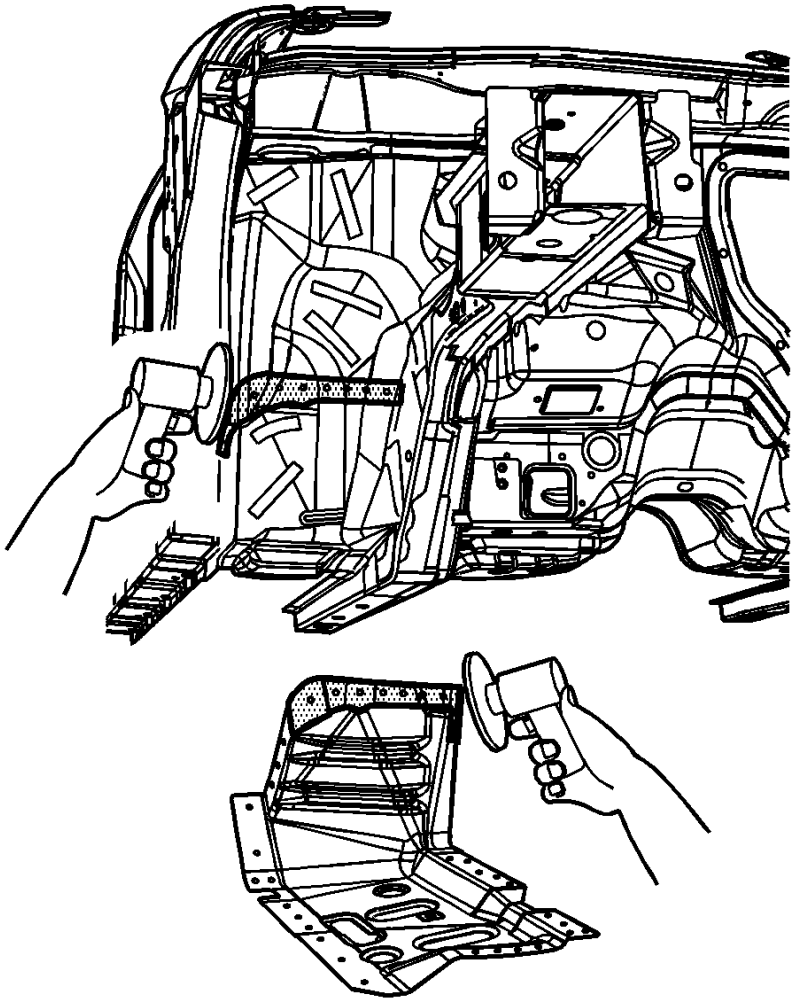

Fig. 29: Grinding Body Mating And Service Part Flanges
Courtesy of GENERAL MOTORS COMPANY

8. Prepare the bond mating areas by grinding the body mating and the service part flanges to bare steel. Do NOT damage the corners or thin the metal during the grinding process.
9. Clean the mating surfaces.

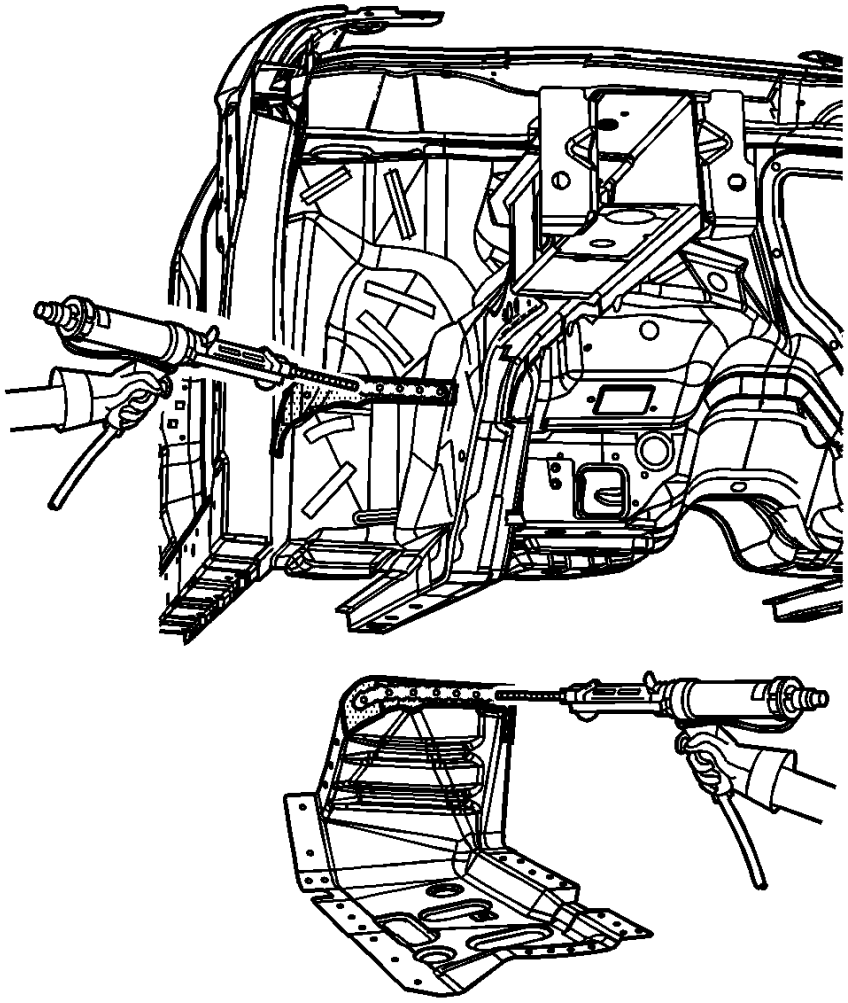

Fig. 30: Applying Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

NOTE: The adhesive has a 40-50 minute working time. Do NOT allow the adhesive to cure prior to installing the service rail side extension.

10. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to both of the mating surfaces.

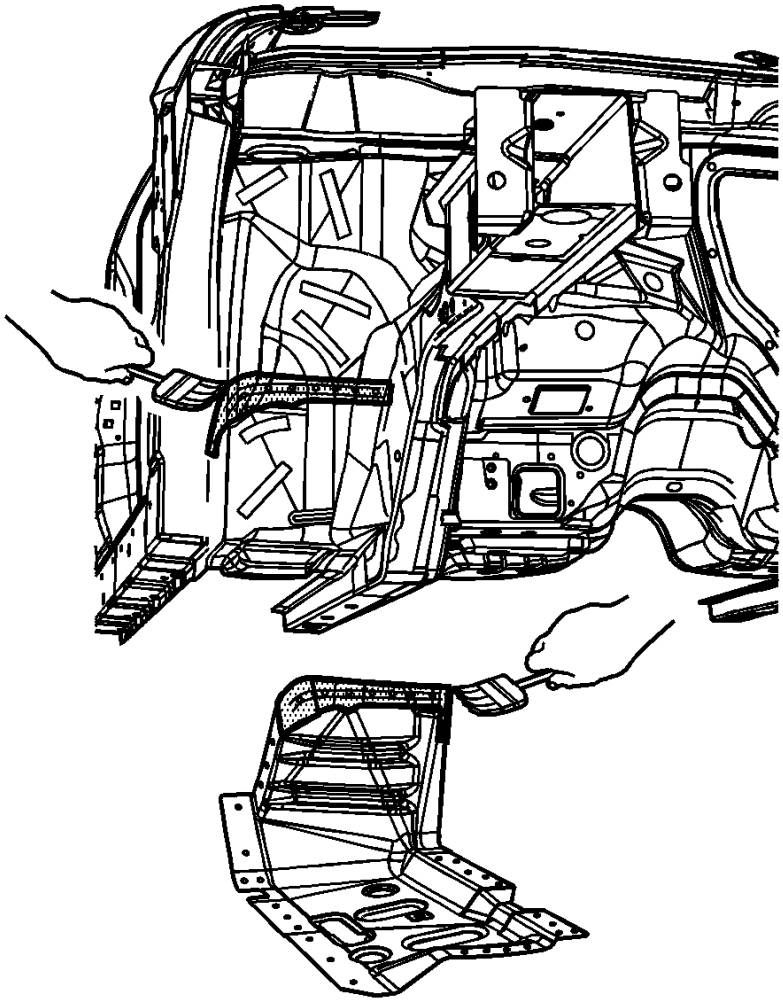

Fig. 31: Spreading Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

11. Using a small acid brush, spread a coat of adhesive to both of the mating surfaces. Cover all of the bare metal to ensure corrosion protection.

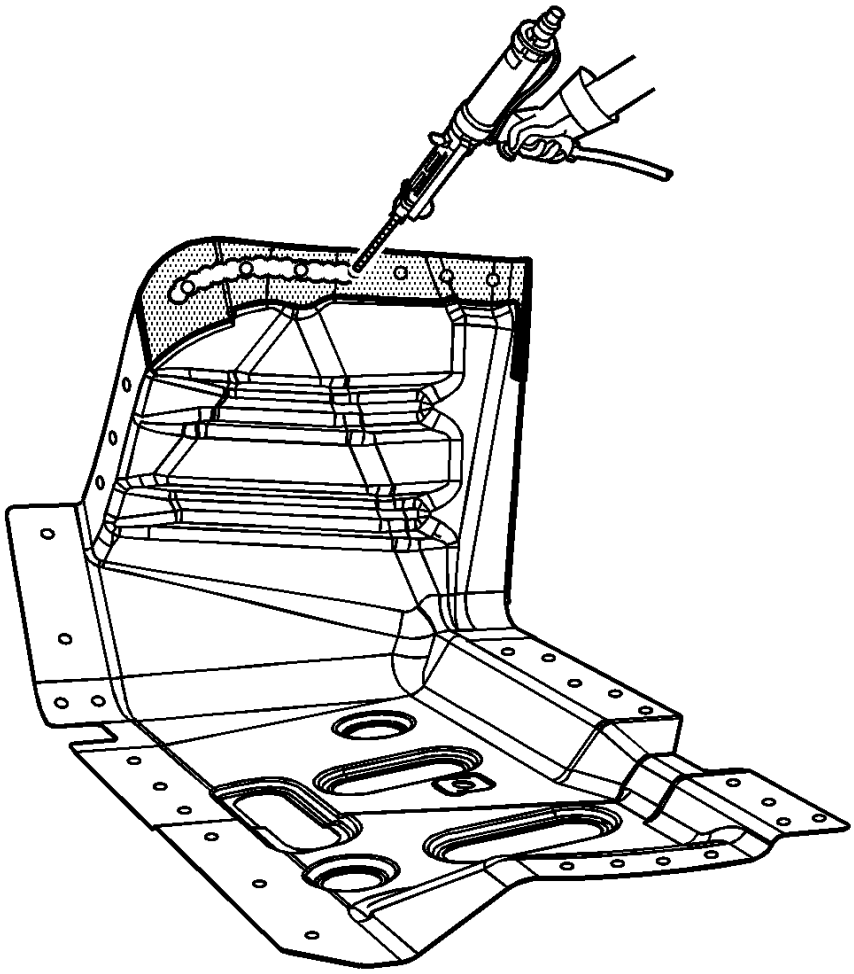

Fig. 32: Applying Bead Of Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

12. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to the mating surface of the service rail side extension.

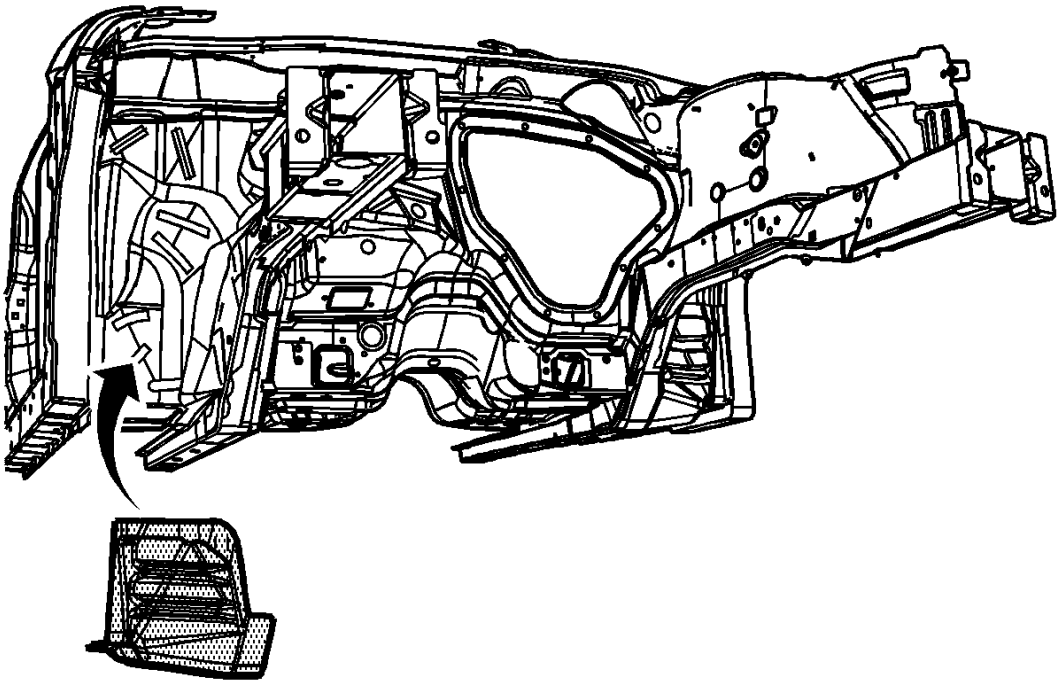

Fig. 33: Positioning Service Rail Side Extension To Vehicle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT pull the service rail side extension off of the dash after adhesion. To align the parts, slide the service rail side extension against the front of the dash.**

13. Position the service rail side extension to the vehicle using 3-dimensional measuring equipment.
14. Clamp the service rail side extension in place.

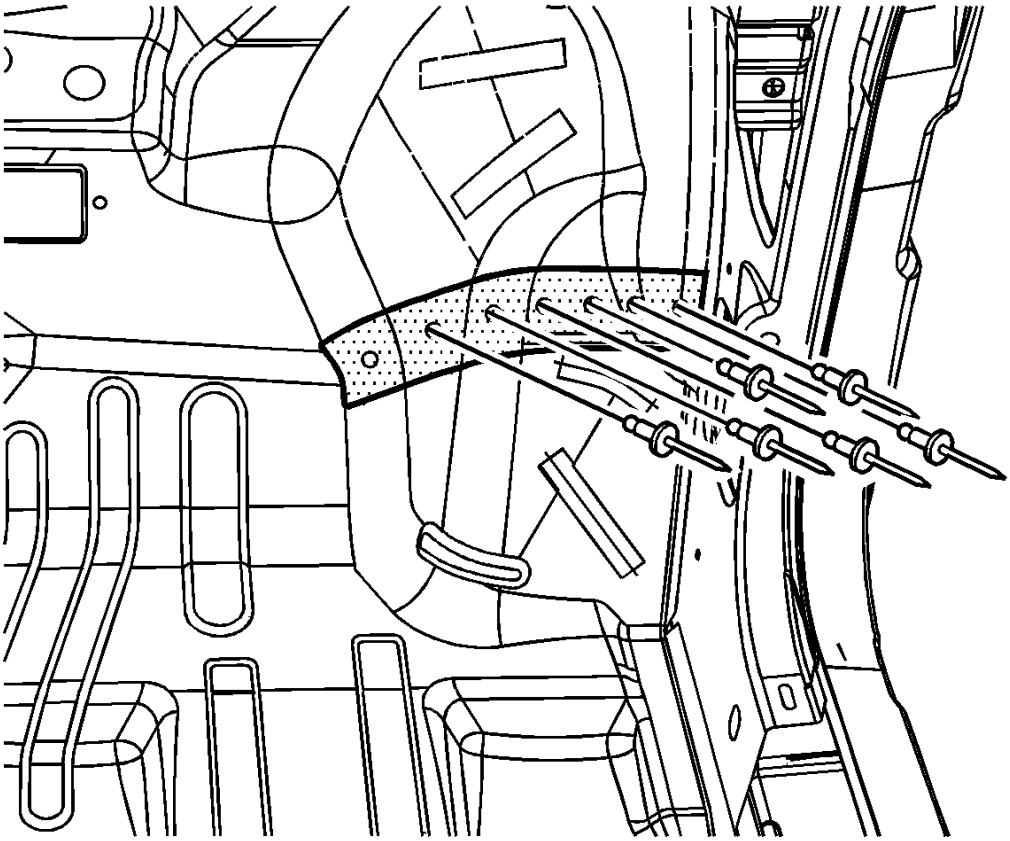

Fig. 34: 9 mm Rivets
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify proper positioning of the service rail side extension prior to riveting and welding.**

15. Install the 9-mm (11/32-in) long rivets so that the rivet head contacts the passenger compartment side of the dash.

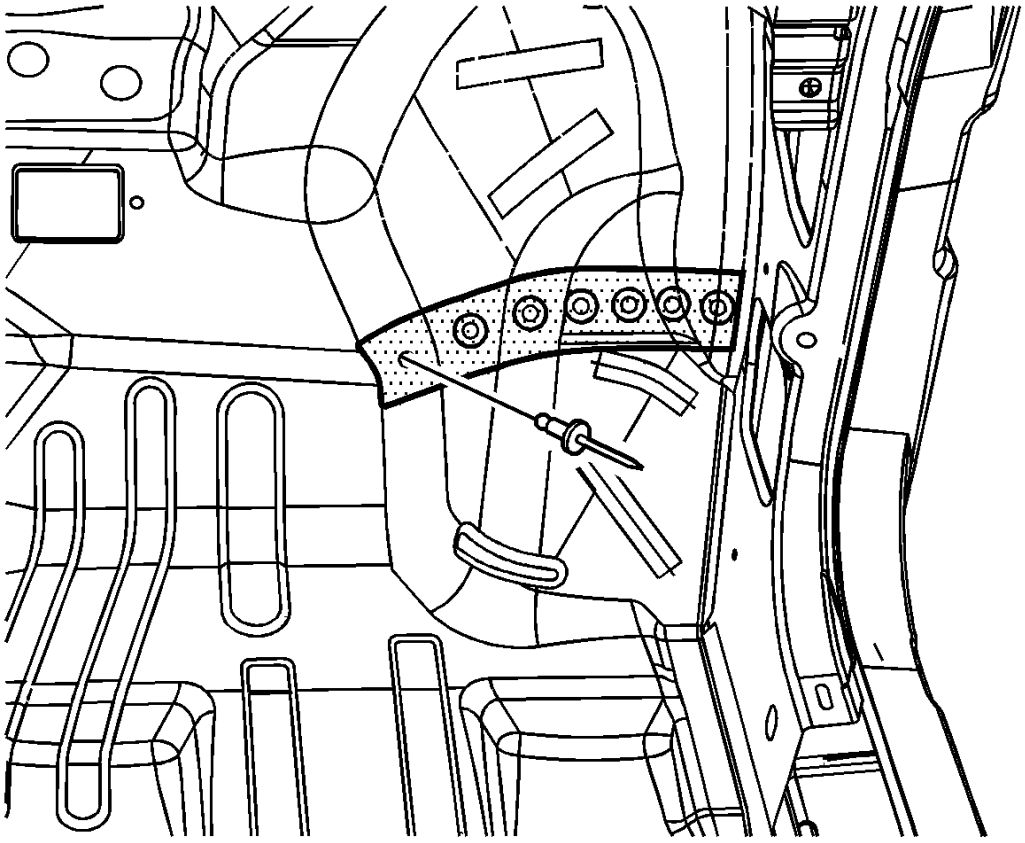

Fig. 35: Identifying 14-mm (17/32-in) Long Rivet
Courtesy of GENERAL MOTORS COMPANY

16. Install the 14-mm (17/32-in) long rivets so that the rivet head contacts the passenger compartment side of the dash.
17. Remove the excess adhesive from the service rail side extension area.

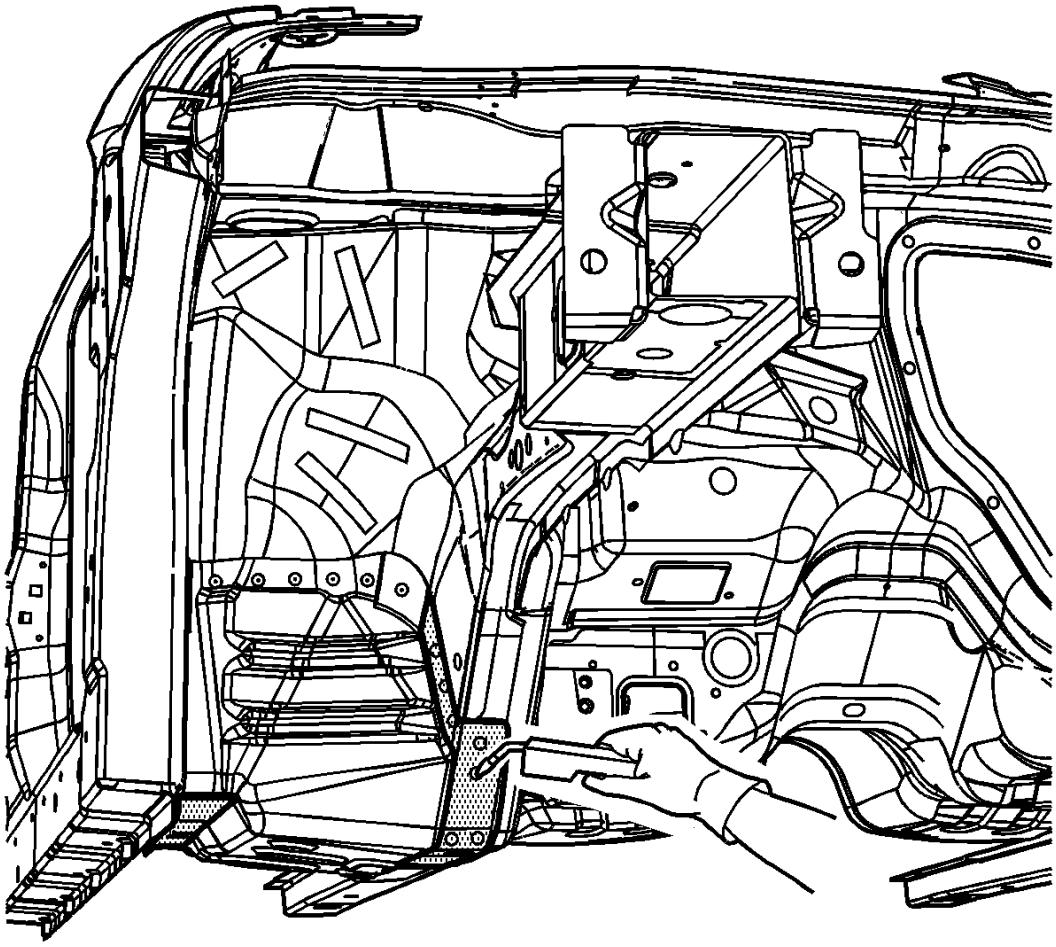

Fig. 36: Plug Welding Remaining Holes
Courtesy of GENERAL MOTORS COMPANY

18. Plug weld the remaining holes accordingly.
19. Clean and prepare all of the welded surfaces.
20. Apply the sealers and anti-corrosion materials to the repaired area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
21. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
22. Install all of the related panels and components.
23. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
24. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

REAR WHEELHOUSE OUTER PANEL REPLACEMENT

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

NOTE: **Although full replacement of the rear outer wheelhouse can be performed,**

sectioning procedures have been developed for use when damage permits.

1. Remove all of the related panels and components including the quarter panel.
2. Visually inspect and restore as much of the damage as possible.
3. Remove the following materials as necessary:
    - The sealers
    - The sound deadeners
    - The anti-corrosion materials
4. After removing the quarter panel, locate, mark and drill out the welds attaching the reinforcement panel (1) to the outer wheelhouse and the quarter panel.

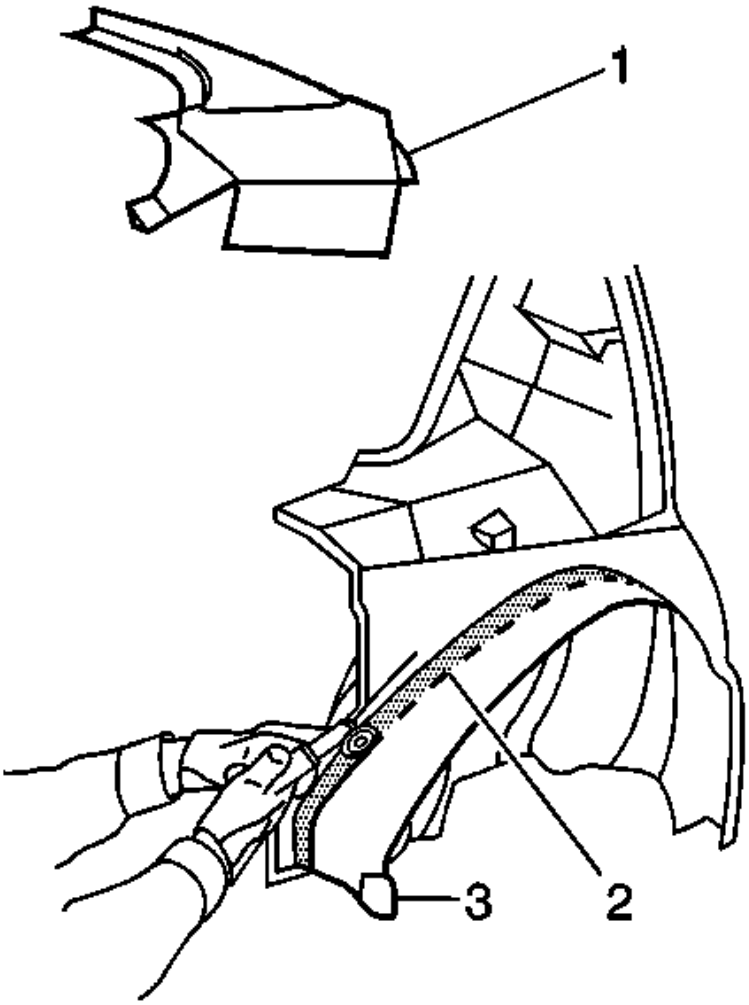

Fig. 37: Rear Outer Wheelhouse Components
Courtesy of GENERAL MOTORS COMPANY

5. Apply a strip of 25 mm (1 in) masking tape along the horizontal surface of the bend in the wheelhouse (2).
6. Cut along the outboard side of the masking tape to create a 25 mm (1 in) flange (2).

7. Remove the damaged section of the wheelhouse (3).

Installation Procedure

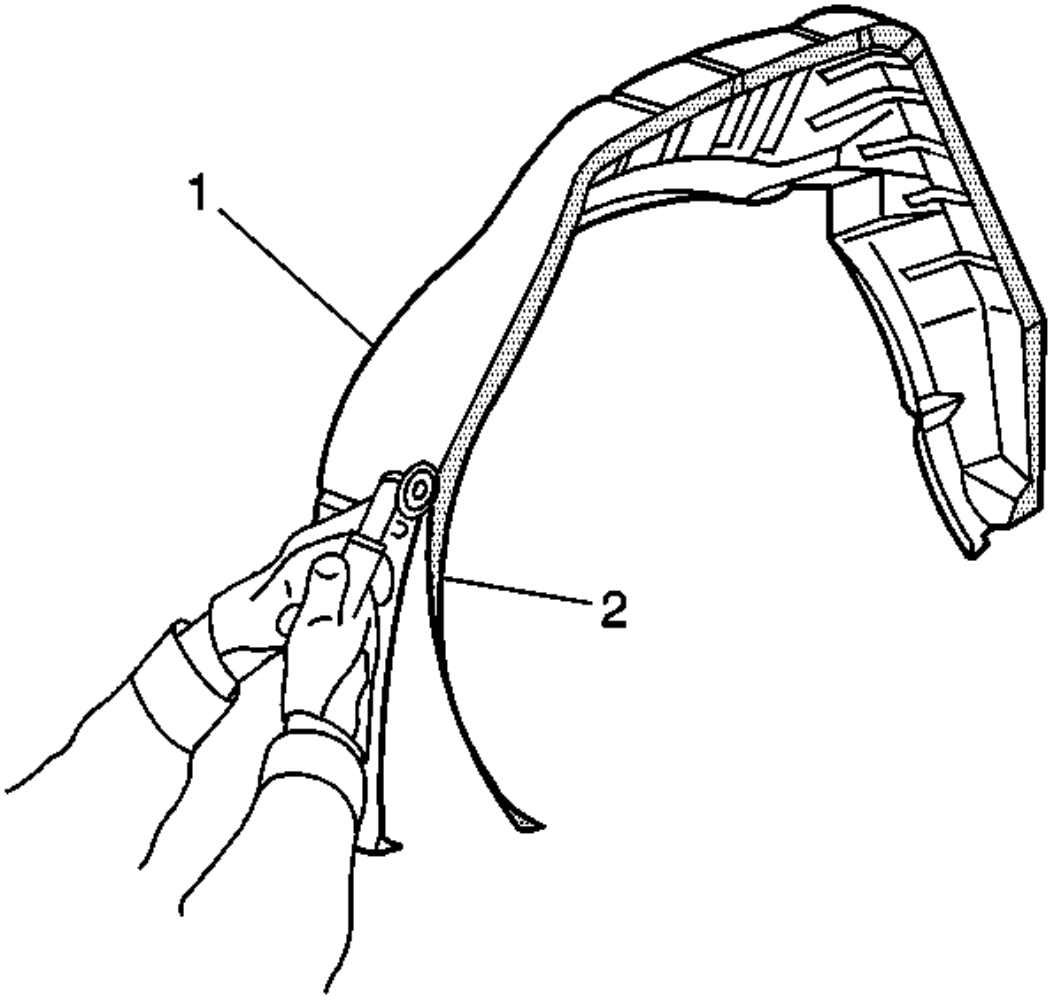

Fig. 38: Preparing Mating Surfaces For Adhesives
Courtesy of GENERAL MOTORS COMPANY

1. Cut the wheelhouse service part (1) along the corner of the bend (2).
2. Remove and discard the unused section of the wheelhouse.
3. On the service part, drill 8 mm (5/16 in) plug weld holes every 40 mm (1 1/2 in) along the cut.

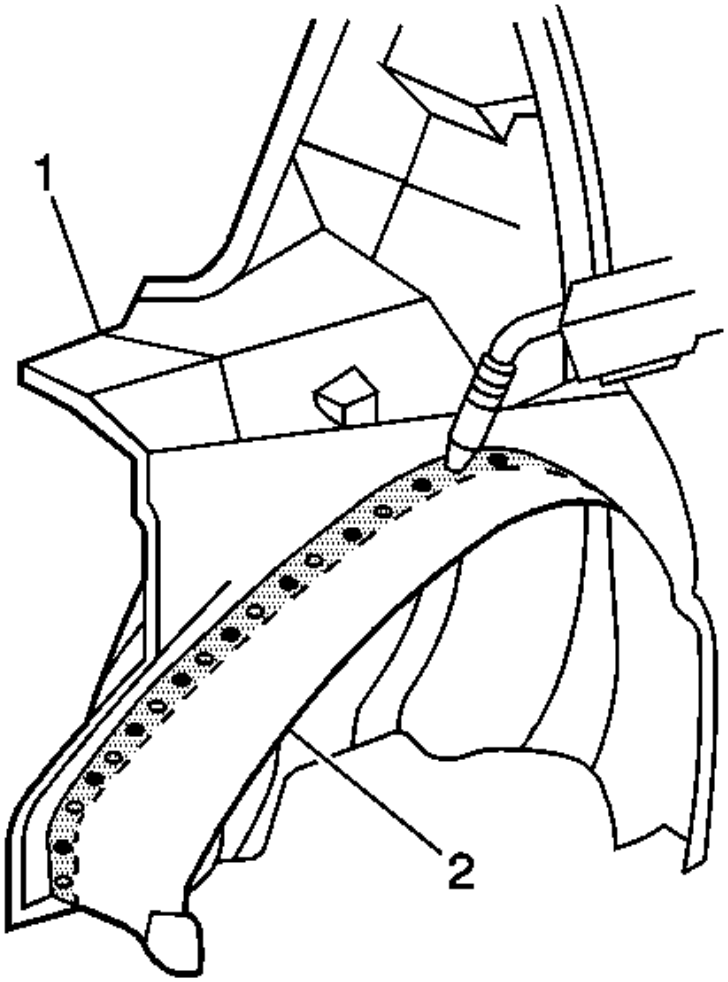

Fig. 39: Plug Welding Wheelhouse Mating Surface
Courtesy of GENERAL MOTORS COMPANY

4. Prepare the mating surfaces as necessary. Inspect for proper fit of the service part.
5. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
6. Check for proper fit and plug weld accordingly (2). Take care not to warp or distort the metal.
7. Repair or replace the outer wheelhouse reinforcement as necessary.
8. Position the reinforcement panel as noted from the original panel location.
9. Plug weld accordingly.
10. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

11. Prime with 2-part catalyzed primer.
12. Apply the sealers and the anti-corrosion materials as necessary.

13. Install all of the related panels and components.

RADIATOR SUPPORT REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

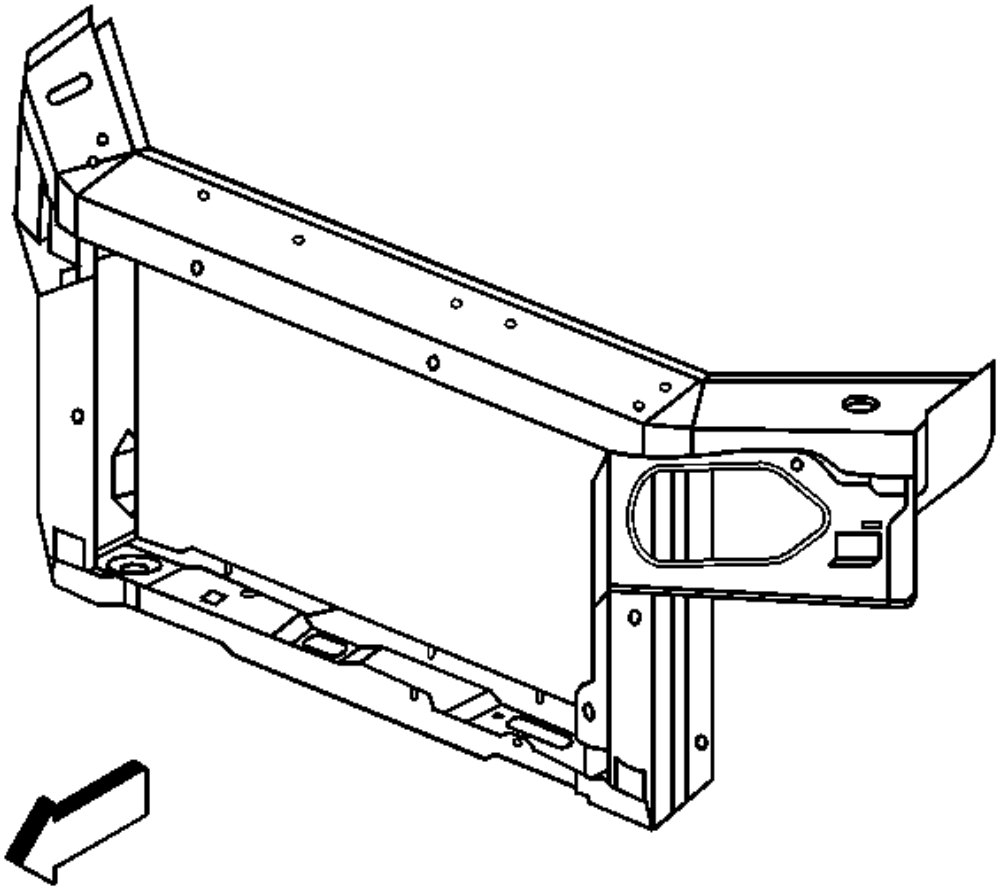

Fig. 40: Radiator Support
Courtesy of GENERAL MOTORS COMPANY

1. Remove all related panels and components.
2. Visually inspect and restore as much of the damage as possible to factory specifications.
3. Locate, mark, and drill out all factory welds. Note the number and location of welds for installation of the service assembly.
4. Remove the damaged radiator support assembly.

Installation Procedure

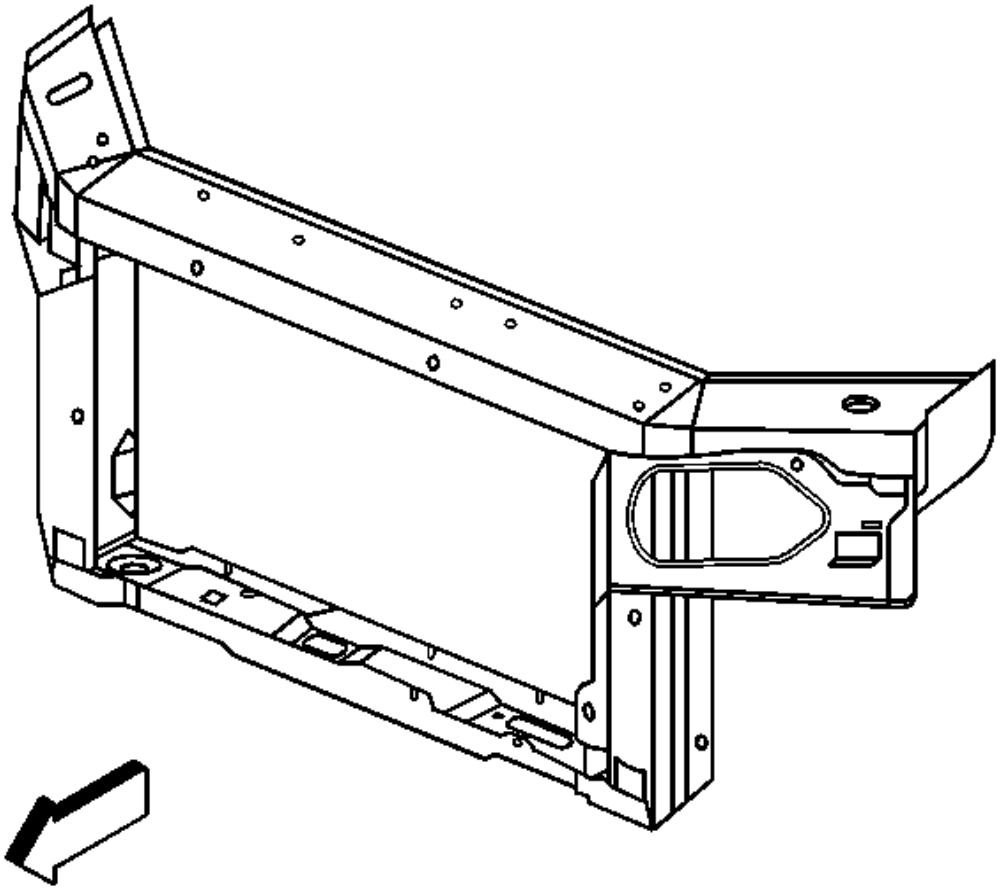

Fig. 41: Radiator Support
Courtesy of GENERAL MOTORS COMPANY

1. Prepare the mating surfaces as necessary. Inspect for proper fit of the service part.
2. Check for proper fit of the service assembly.
3. Drill 8 mm (5/16 in) plug weld holes as necessary in the locations noted from the original assembly.
4. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
5. Position the service assembly using 3-dimensional measuring equipment.
6. Plug weld accordingly with frequent measurements to ensure proper fit and alignment.
7. Clean and prepare all welded surfaces.
8. Prime with 2-part catalyzed primer.
9. Apply sealers and anti-corrosion materials as necessary.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

10. Install all related panels and components.

UPPER RAIL REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

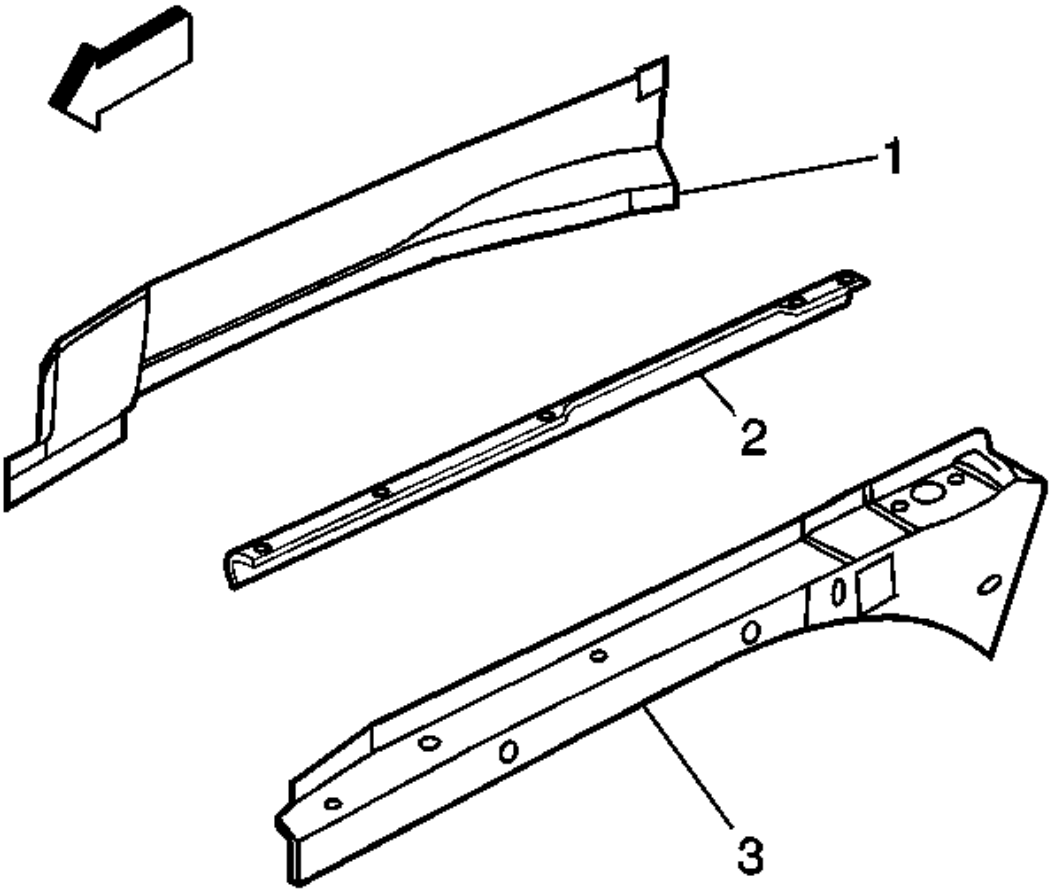

Fig. 42: Inner Reinforcement, Inner Rail & Outer Rail
Courtesy of GENERAL MOTORS COMPANY

NOTE: The front upper rail is serviced as 2 components: inner (1) and outer (3) panels. The outer panel is serviced as a sub-assembly and includes an inner reinforcement (2). After the outer rail has been removed, the inner rail is completely accessible and can be serviced at the factory seams.

NOTE: Sectioning of the front upper rails is not recommended.

1. Remove all related panels and components.

2. Remove sealers and anti-corrosion materials as necessary.
3. Locate, mark, and drill out all factory welds attaching the outer rail.
4. Remove the damaged outer rail (3).
5. Locate, mark, and drill out the welds attaching the inner rail (1).
6. Remove the damaged inner rail.

Installation Procedure

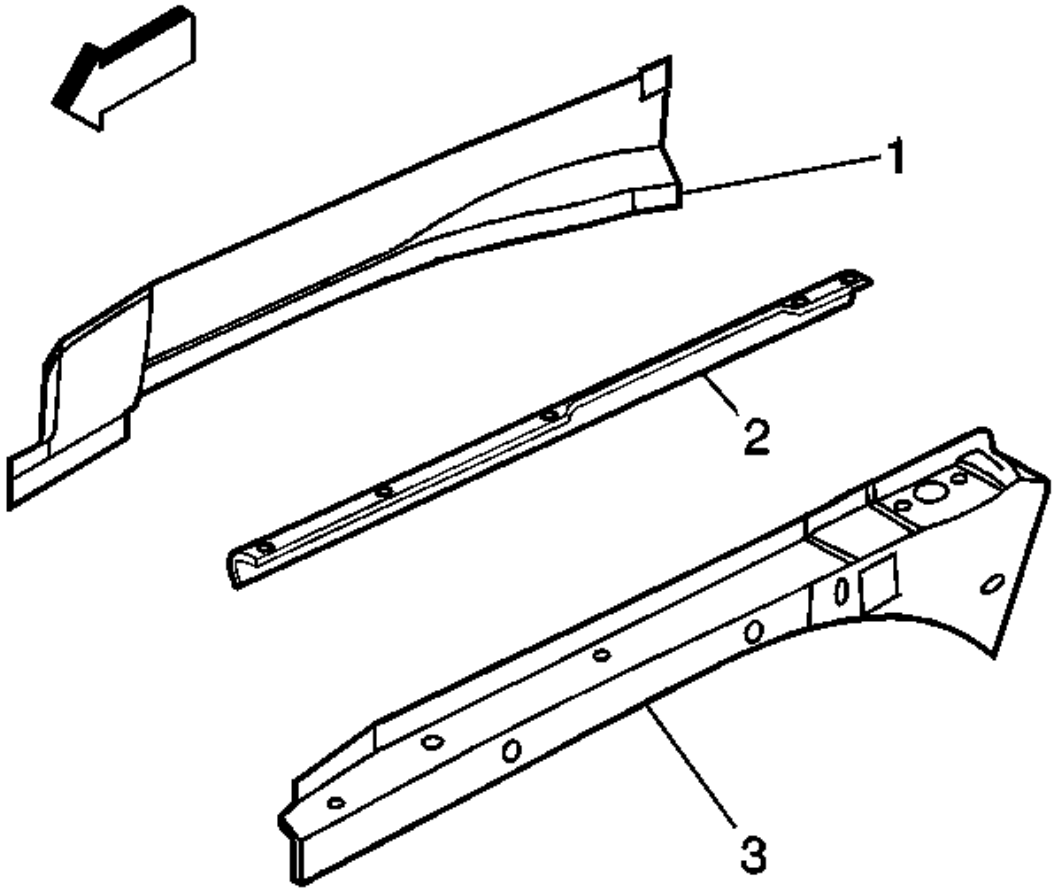

Fig. 43: Inner Reinforcement, Inner Rail & Outer Rail
Courtesy of GENERAL MOTORS COMPANY

1. Prepare the mating surfaces as necessary. Inspect for proper fit of the service part.
2. Drill 8 mm (5/16 in) plug weld holes as necessary in the locations noted from the original panels.

NOTE: **If the original plug weld locations can not be determined, locate the holes for plug welding 40 mm (1 1/2 in) apart.**

3. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.

4. Temporarily position the inner (1) and outer (3) rails on the vehicle.
5. Use 3-dimensional measuring to locate and mark front fender mounting-bolt holes in the outer rail (2).
6. Drill 5.5 mm (7/32 in) holes for self-tapping bolts as marked.

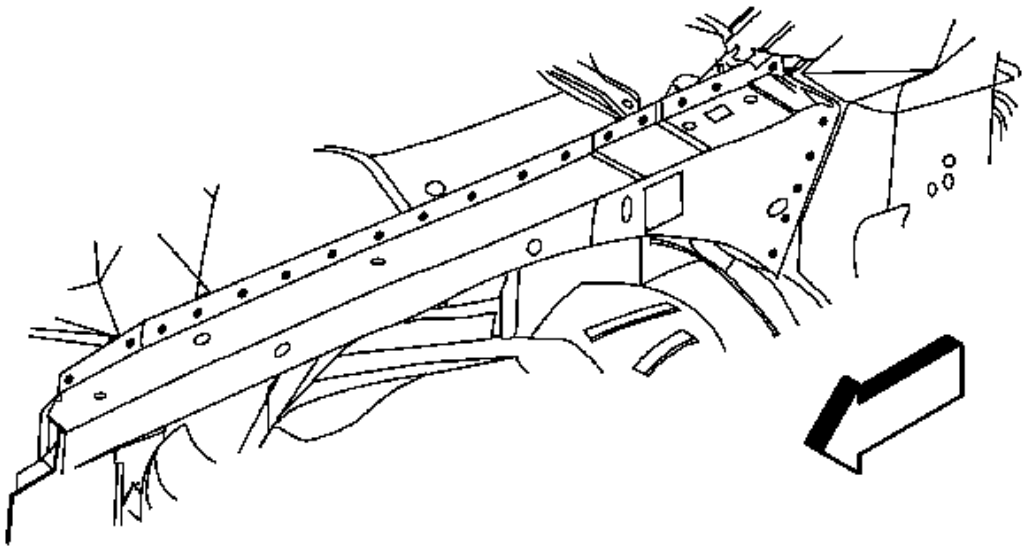

Fig. 44: Upper Rail Installed
Courtesy of GENERAL MOTORS COMPANY

7. When the service panels are correctly positioned, remove the outer panel and plug weld the inner panel as necessary.
8. Reposition the outer rail with frequent measurements to ensure proper fit and alignment.
9. Plug weld accordingly.
10. Clean and prepare all of the welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

11. Prime with 2-part catalyzed primer.

12. Apply the sealers and the anti-corrosion materials as necessary.
13. Install all of the related panels and components.

LOWER RAIL SECTIONING

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

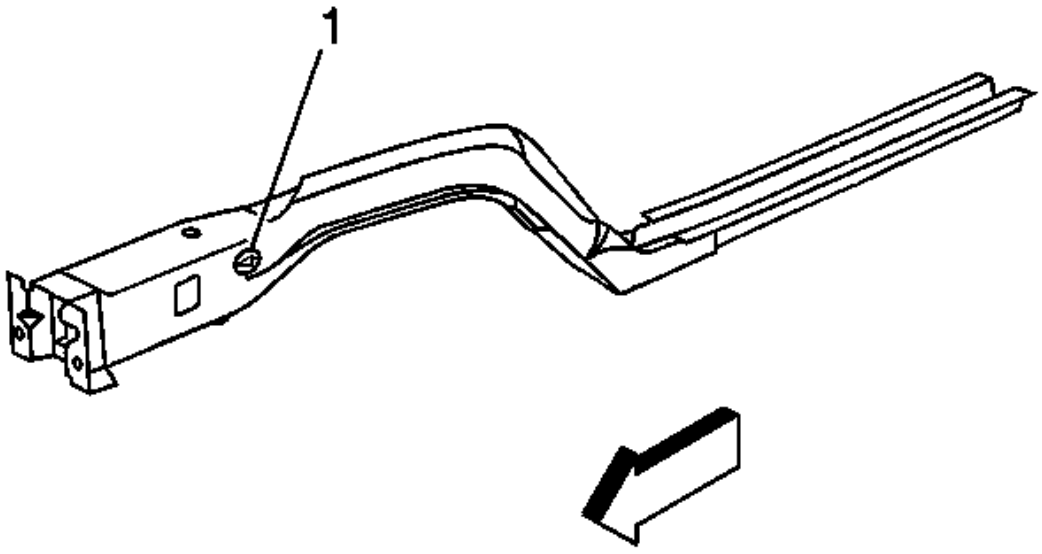

Fig. 45: Lower Rail
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Sectioning should take place only in the locations recommended in the service instructions. Failure to follow these instructions may compromise the structural integrity of the vehicle.

NOTE: Sectioning procedures have been developed to simplify repair of the lower rails, providing the majority of the damage can be returned to factory specifications. This allows the damaged front section to be replaced without performing a full

rail replacement. The rails are manufactured with diemarks (1) inboard and outboard to indicate the location for the sectioning joint.

NOTE: If the damage exceeds the recommended area for sectioning and the rail cannot be straightened, the complete rail must be replaced.

1. Support the powertrain assembly.
2. Remove 4 engine cradle bolts.
3. Position the cradle away from the rail.

NOTE: It is not necessary to completely remove the powertrain or engine cradle for rail sectioning.

4. Remove all panels and components necessary for access, including the strut and axle assemblies.
5. Remove sealers and anti-corrosion materials as necessary.
6. Locate the diemarks in the rail.

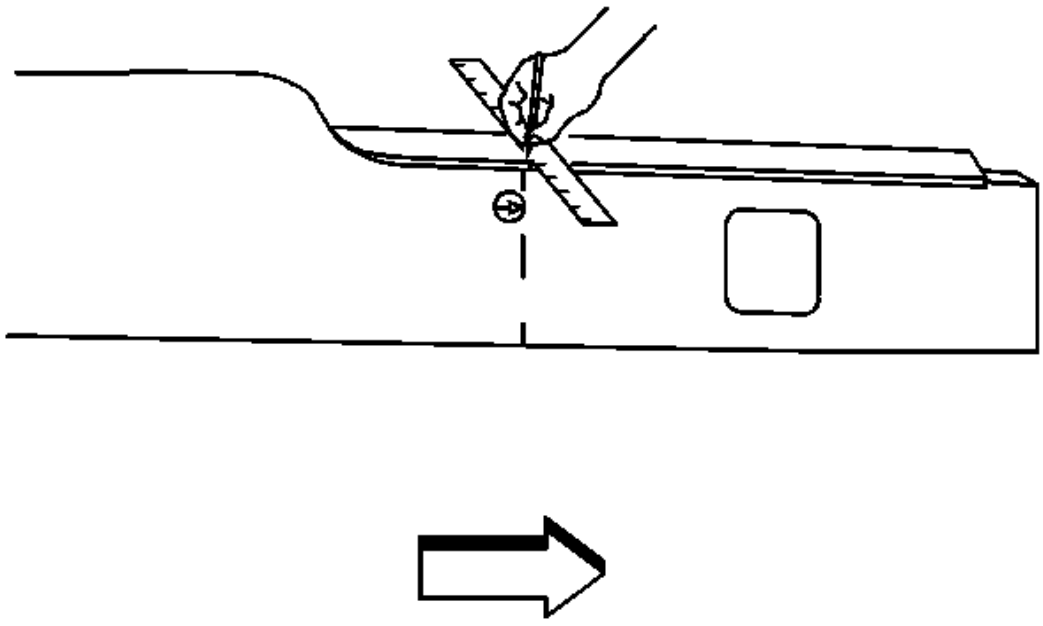

Fig. 46: Scribing Lines Around Rail

Courtesy of GENERAL MOTORS COMPANY

7. Use a straight edge to scribe lines around the rail.

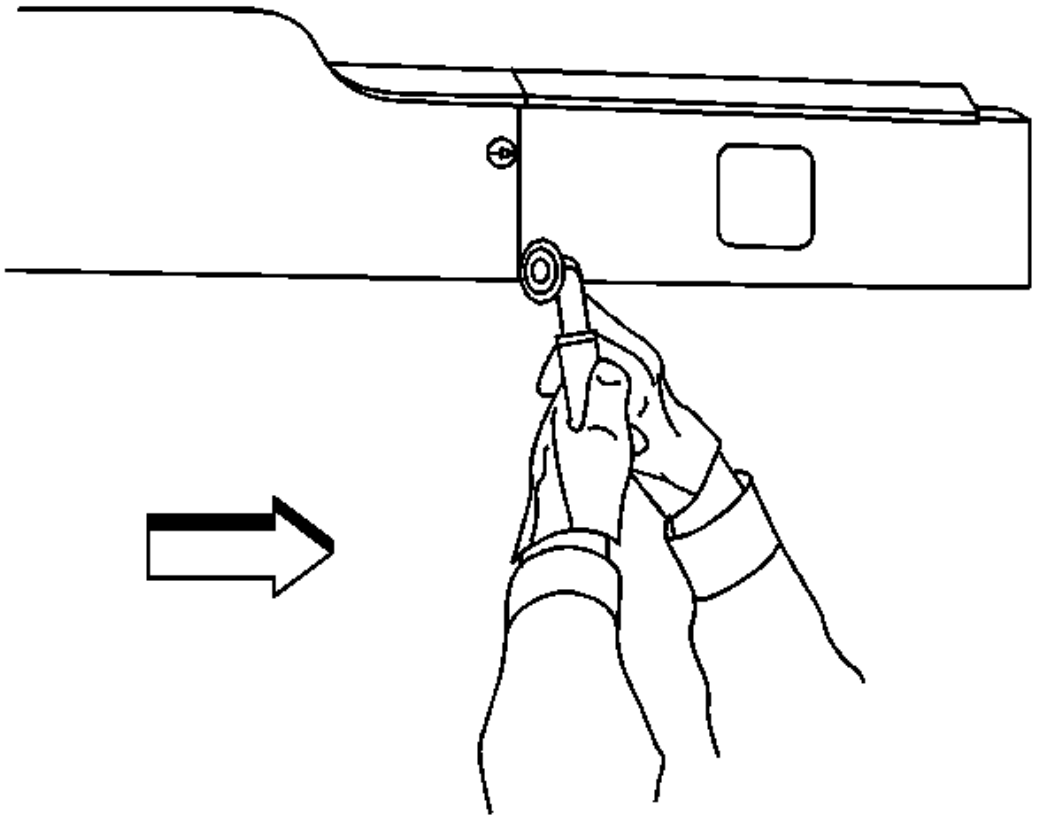

Fig. 47: Cutting Rail At Diemarks
Courtesy of GENERAL MOTORS COMPANY

8. Mark and cut the damaged rail at the diemarks.
9. Remove the damaged section of the rail.

Installation Procedure

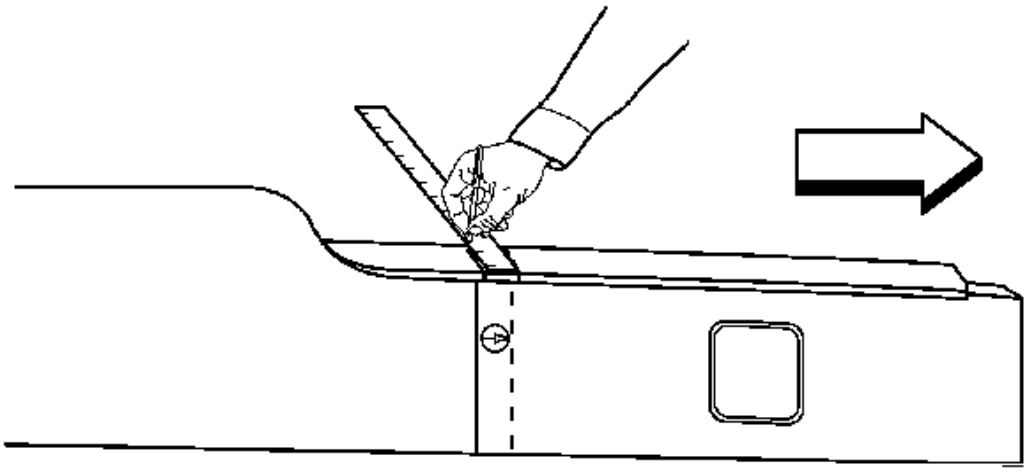

Fig. 48: Adding 20 mm (3/4 in) In Length To Service Part
Courtesy of GENERAL MOTORS COMPANY

1. Measure from the diemarks to add 20 mm (3/4 in) in length to the service part.
2. Align marks with a straight edge and scribe line for sectioning cut.
3. Cut the service part along the marked lines.
4. Leave 20 mm (3/4 in) added lengths to the service part for sectioning overlap.
5. Cut and remove approximately 20 mm (3/4 in) of the outboard and downward turned flanges of the service part.

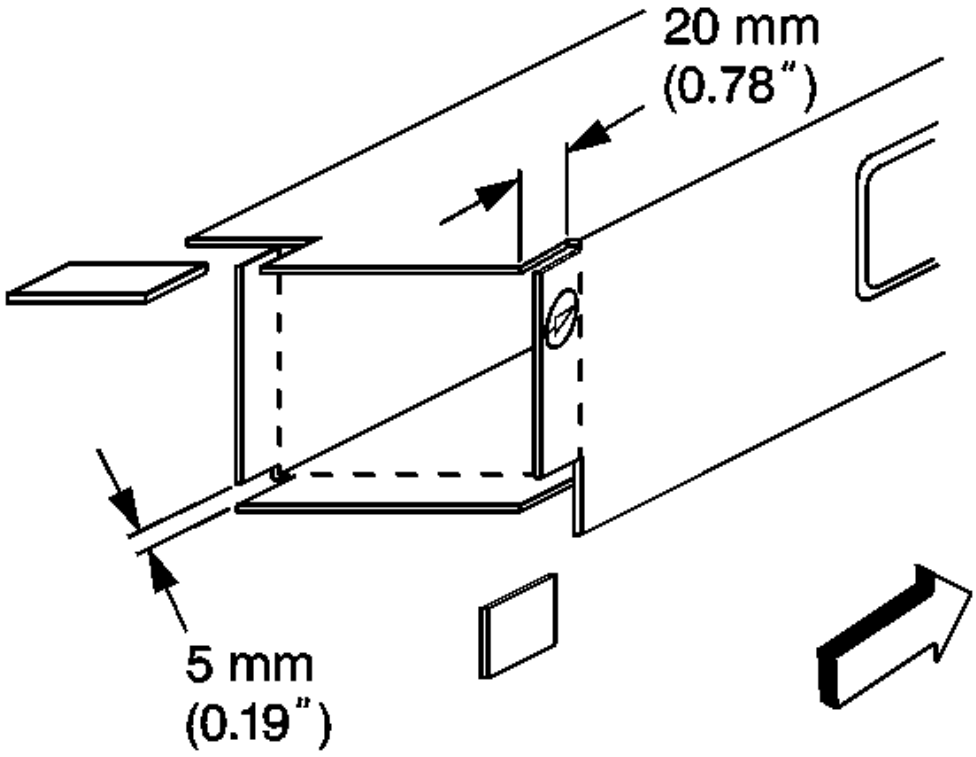

Fig. 49: Cutting Tabs Into Rail
Courtesy of GENERAL MOTORS COMPANY

6. Cut 5 mm (3/16 in) wide and 20 mm (3/4 in) long slots along the corners of the service part to create tabs on the four sides of the rail.

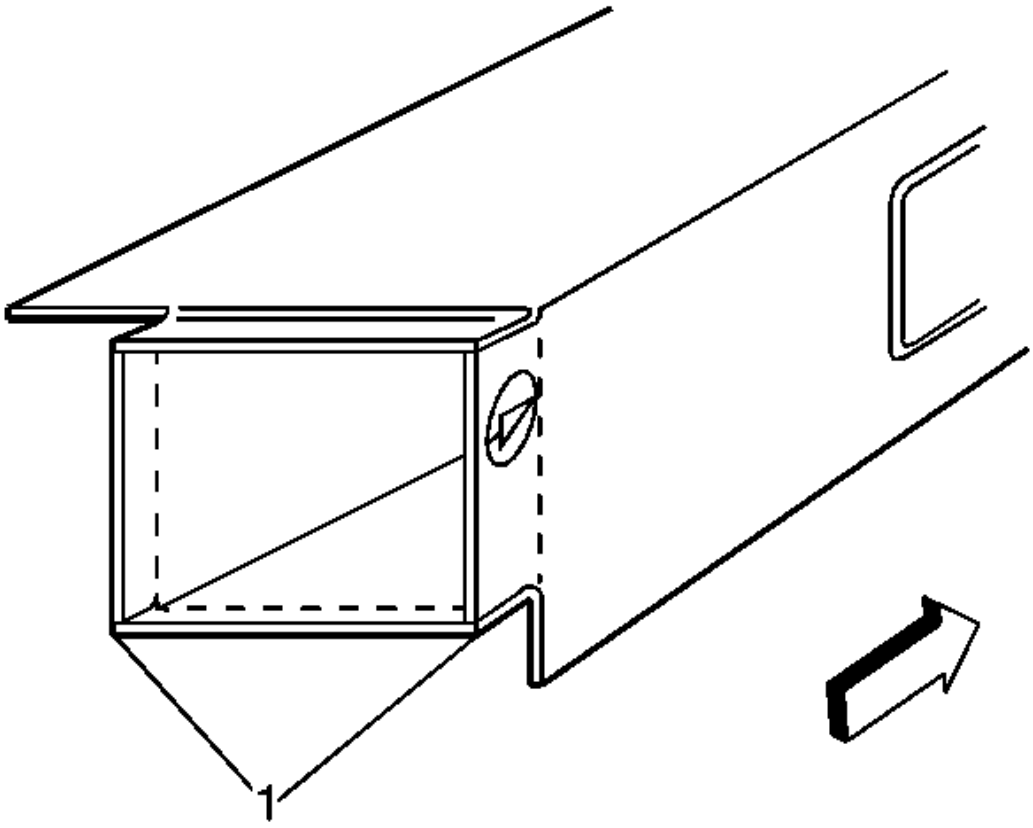

Fig. 50: Fitting Service Part Inside Original Rail
Courtesy of GENERAL MOTORS COMPANY

7. Step the top, bottom and side tabs inward to allow the service part to fit inside the original rail.
8. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
9. Welds the tabs (1) together along the corners of the service part.

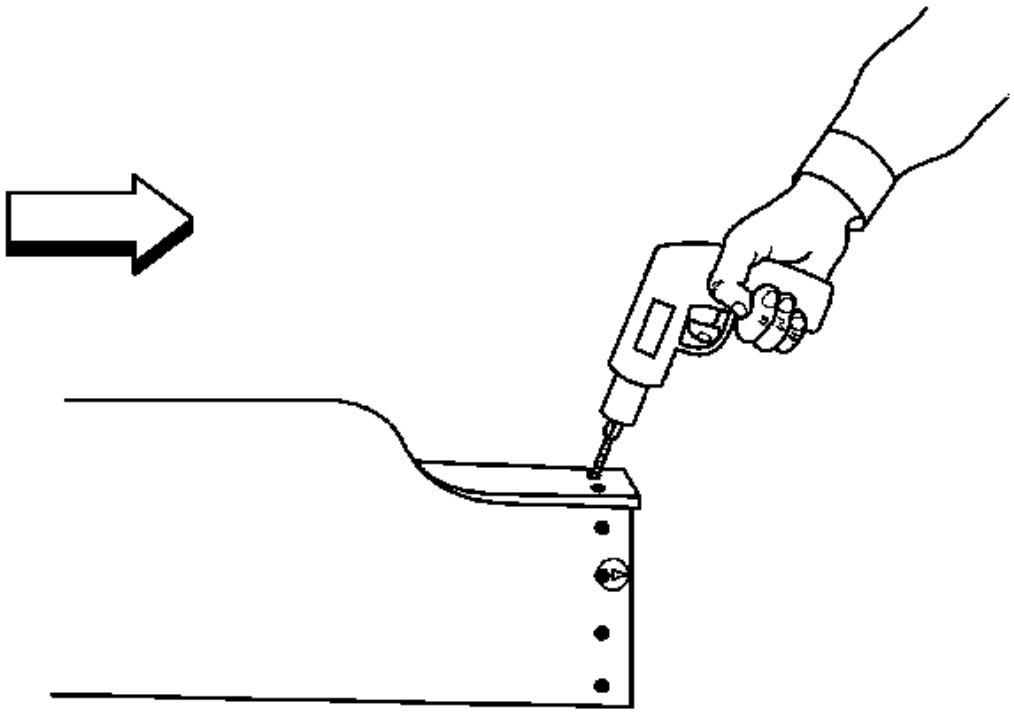

Fig. 51: Drilling Plug Weld Holes Into Rail
Courtesy of GENERAL MOTORS COMPANY

10. Drill 8 mm (5/16 in) plug weld holes in the top, bottom and sides of the original approximately 10 mm (3/8 in) from the sectioning cut.
11. Clean and prepare the mating surfaces as necessary.
12. Position the stepped tabs of the modified service part inside the original rail. Allow 20 mm (3/4 in) of overlap.
13. Align and check fit using three dimensional measuring equipment.
14. Plug weld accordingly.
15. Check measurements frequently to ensure proper fit and alignment.
16. Stitch weld along the entire sectioning joint.

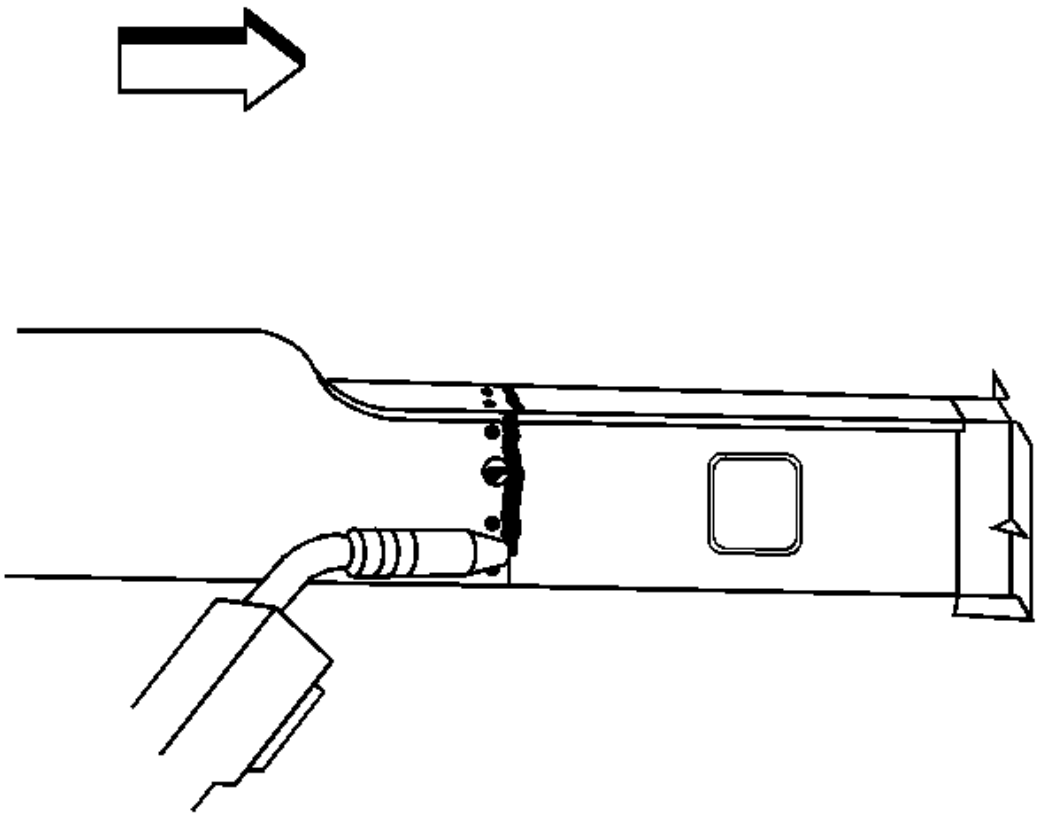

Fig. 52: Welding Rail
Courtesy of GENERAL MOTORS COMPANY

17. Make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between them.
18. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.
19. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

20. Prime with 2-part catalyzed primer.
21. Apply sealers and anti-corrosion materials as necessary.
22. Install all related panels and components.

LOWER RAIL REPLACEMENT

Removal Procedure

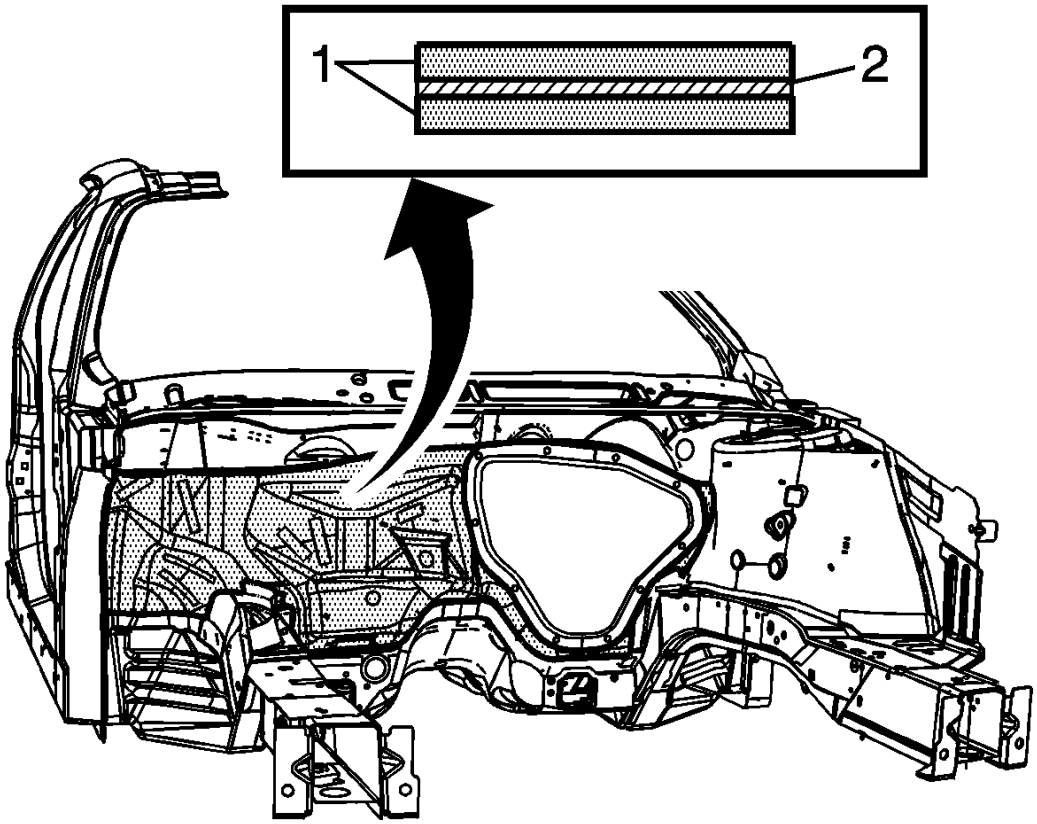

Fig. 53: View Of Laminated Steel
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

WARNING: **Refer to Foam Sound Deadeners Warning .**

NOTE:

- **Model year 2004 and prior vehicles are not manufactured with laminated steel in front of the dashes. Therefore, the front lower rail can be metal inert gas (MIG) welded instead of the rivet and bonding process, as stated in these instructions.**
- **Failure to follow this procedure will compromise the structural integrity of the vehicle.**

The front of the dash panel is formed from laminated steel. This steel is constructed by bonding 2 pieces of cold rolled steel (1) with a viscoelastic layer of adhesive (2). MIG welding laminated steel does not meet GM Corporate standards for structural integrity. As an alternative, all factory welds will be replaced by using the rivet and adhesive bond method described in the installation portion of this procedure. The rivet and

adhesive bond method must only be used in the areas as described in this procedure.

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

WARNING: Refer to Collision Sectioning Warning .

3. Remove all related panels and components.
4. Repair as much of the damage as possible.
5. Remove the sealers and the anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

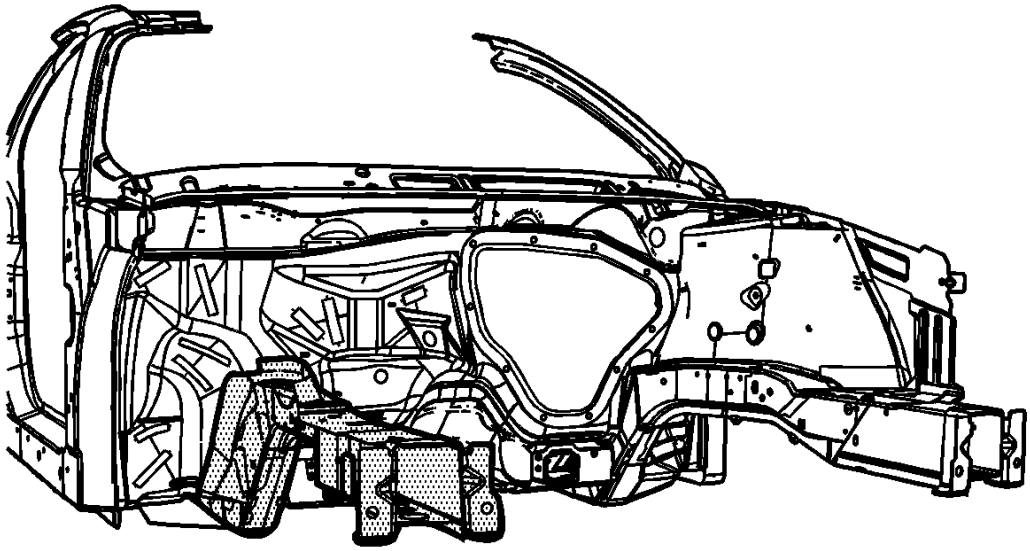

Fig. 54: View Of Front Rail Side Extension
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the number and location of the factory welds for installation of the

full rail service part.

6. Remove the front wheelhouse assembly. Refer to **Front Wheelhouse Panel Replacement**.
7. Remove the radiator support assembly. Refer to **Upper Rail Replacement**.
8. Remove the front rail side extension. Refer to **Front Compartment Side Rail Rear Extension Replacement**.

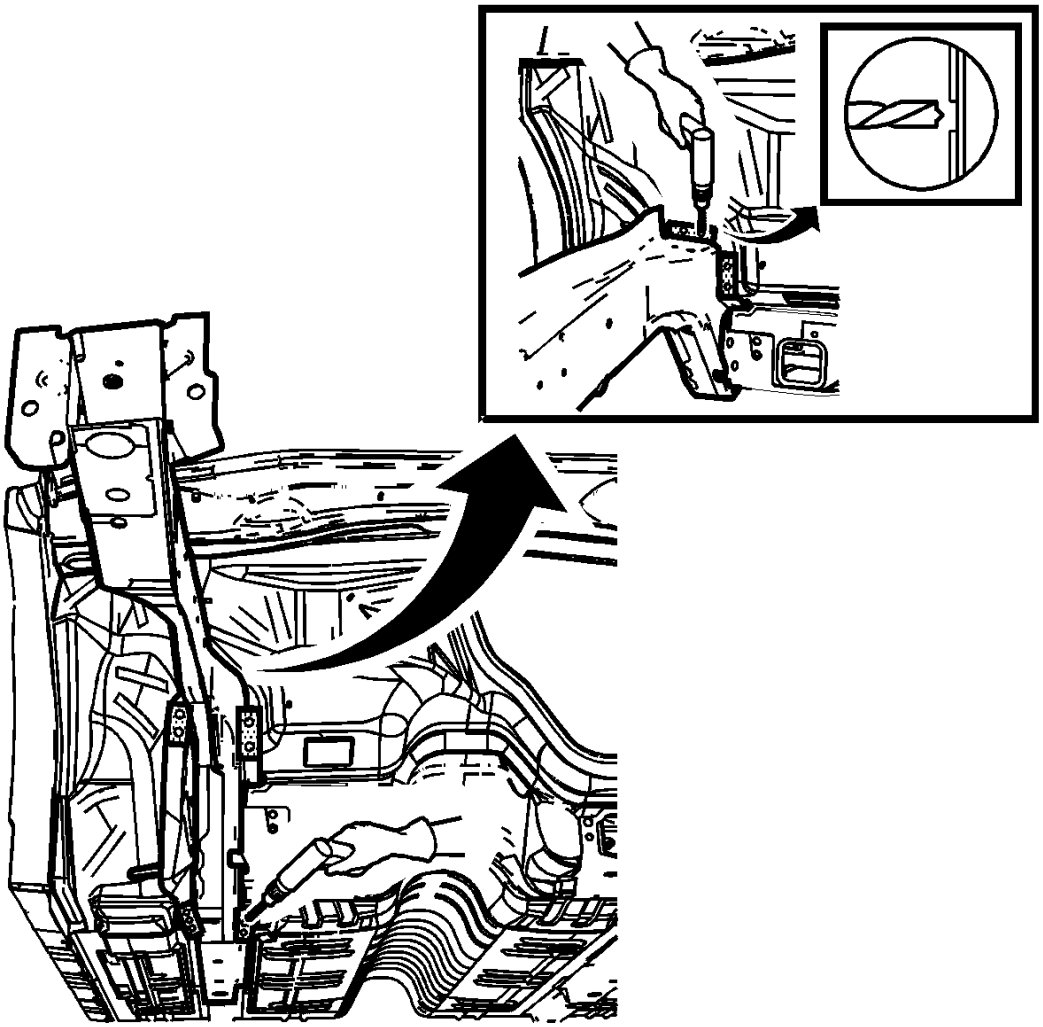

Fig. 55: Drilling Factory Welds
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Drill through the rail flange only. Do NOT drill into the dash panel or the inner reinforcements.**

9. Using an 8-mm (5/16-in) spot weld remover, locate and drill out the factory welds on the weld flange connecting the lower rail to the dash panel.

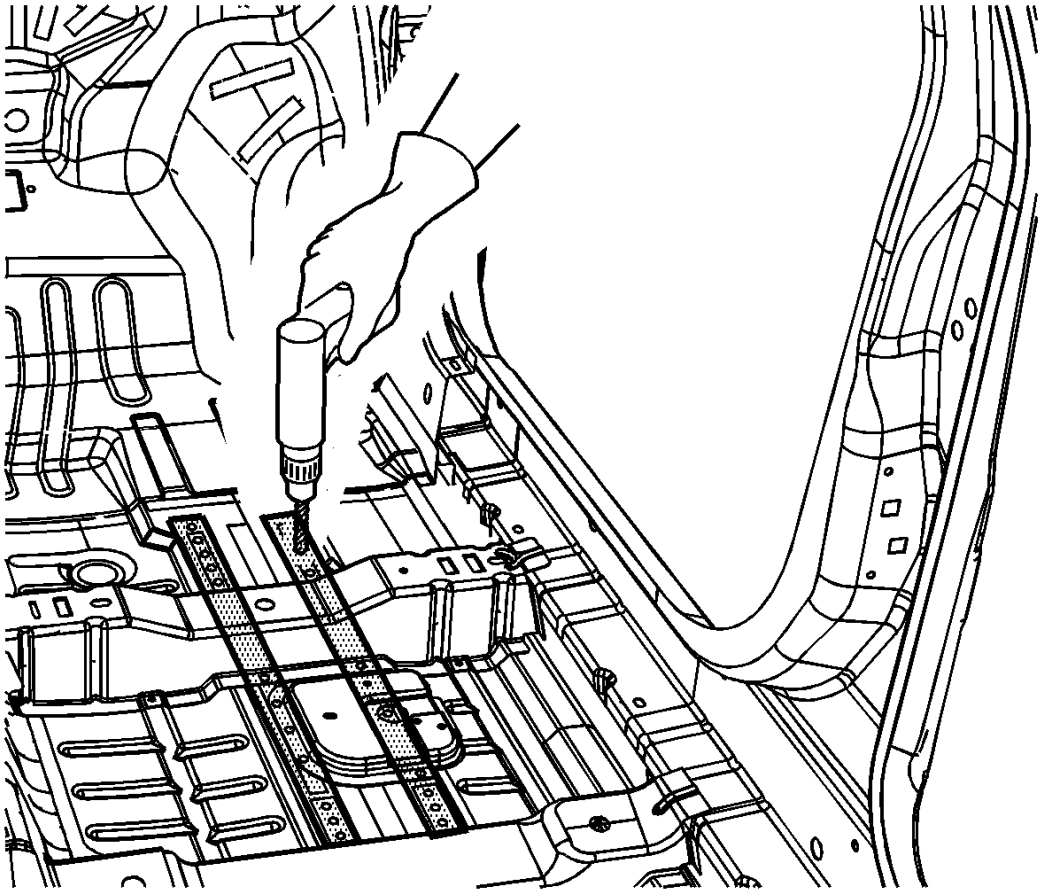

Fig. 56: Drilling Factory Welds (Passenger Compartment)
Courtesy of GENERAL MOTORS COMPANY

10. From the passenger compartment, locate and drill out the remaining factory weld.

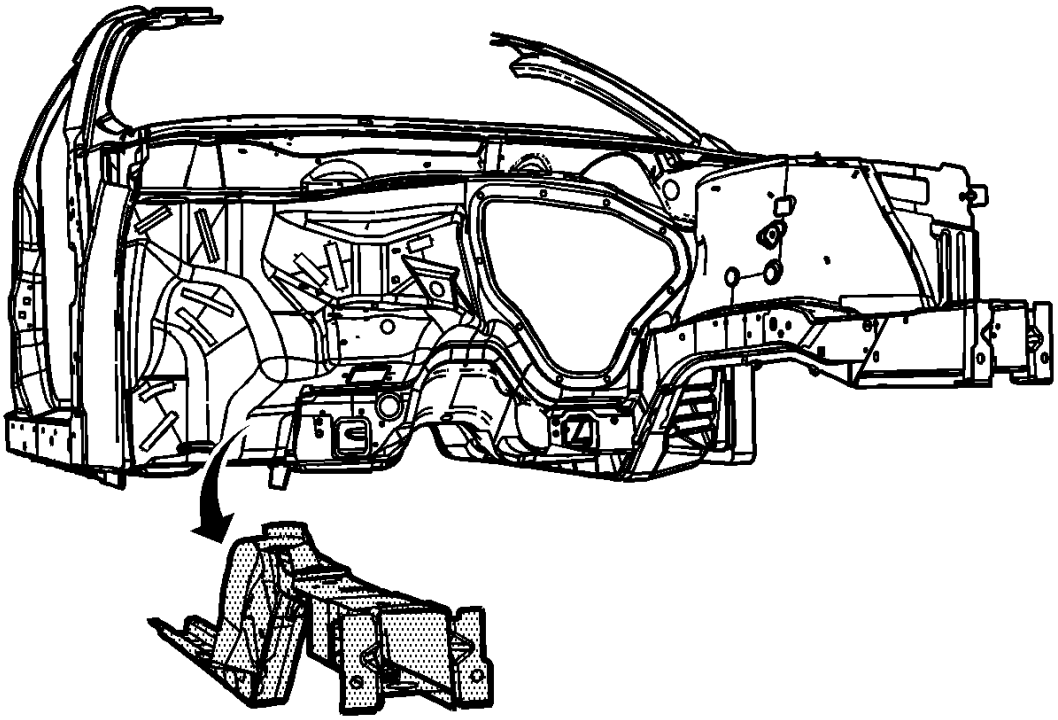

Fig. 57: View Of Service Rail
Courtesy of GENERAL MOTORS COMPANY

11. Remove the full rail.

Installation Procedure

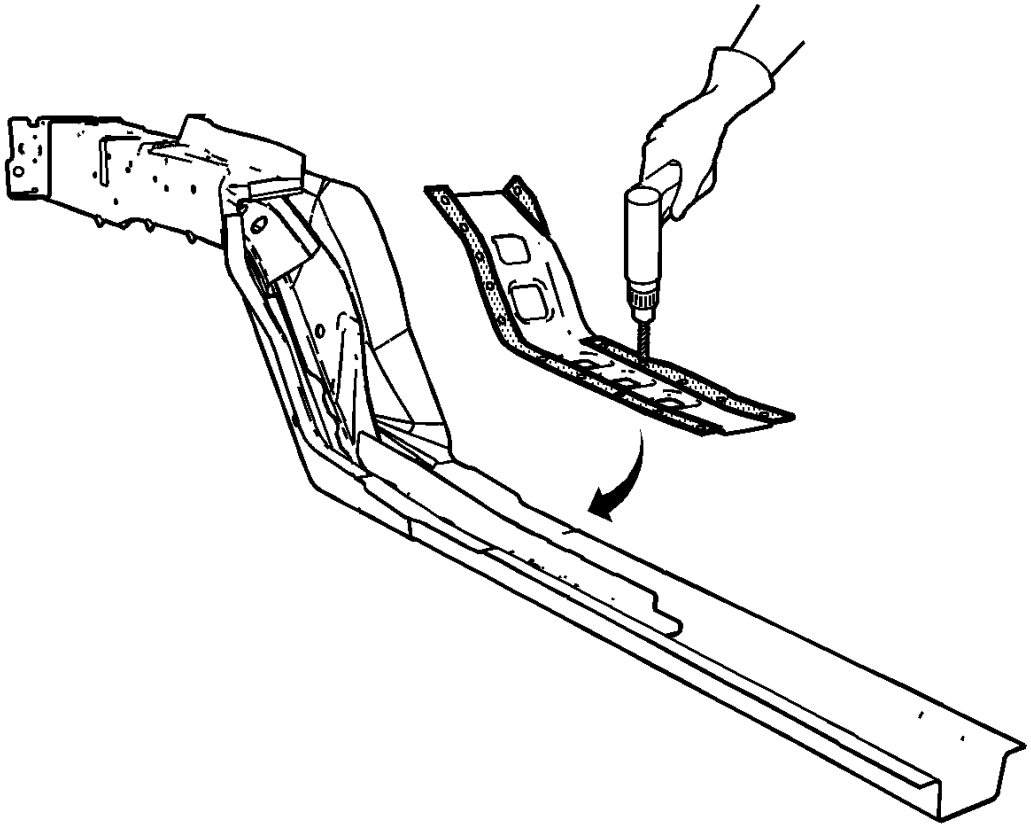

Fig. 58: Drilling Plug Weld Holes
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Failure to install the front compartment lower rail reinforcement to the front compartment lower rail will compromise the structural integrity of the vehicle.**

1. Drill 8-mm (5/16-in) plug weld holes in the service front lower rail reinforcement in the location noted from the original rail.
2. Prepare the plug weld mating surfaces, as necessary.
3. Apply 3MÂ® Weld-Thru Coating P/N 05913 or equivalent to the plug weld mating surfaces.
4. Position the front lower rail reinforcement.

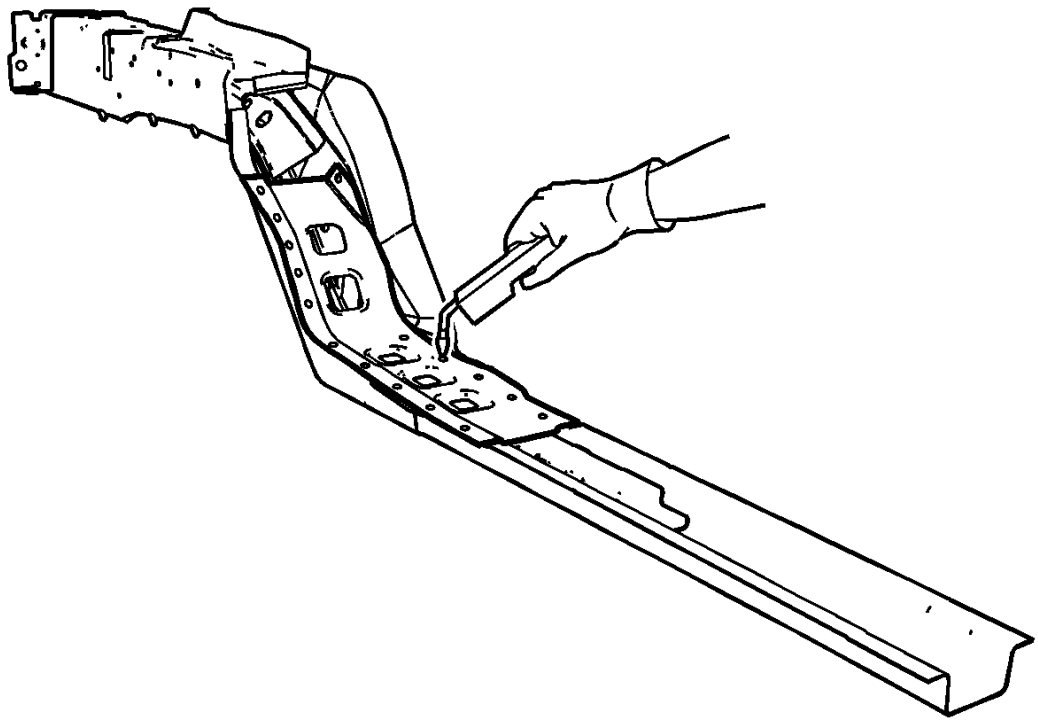

Fig. 59: Plug Welding Holes
Courtesy of GENERAL MOTORS COMPANY

5. Plug weld the holes accordingly.

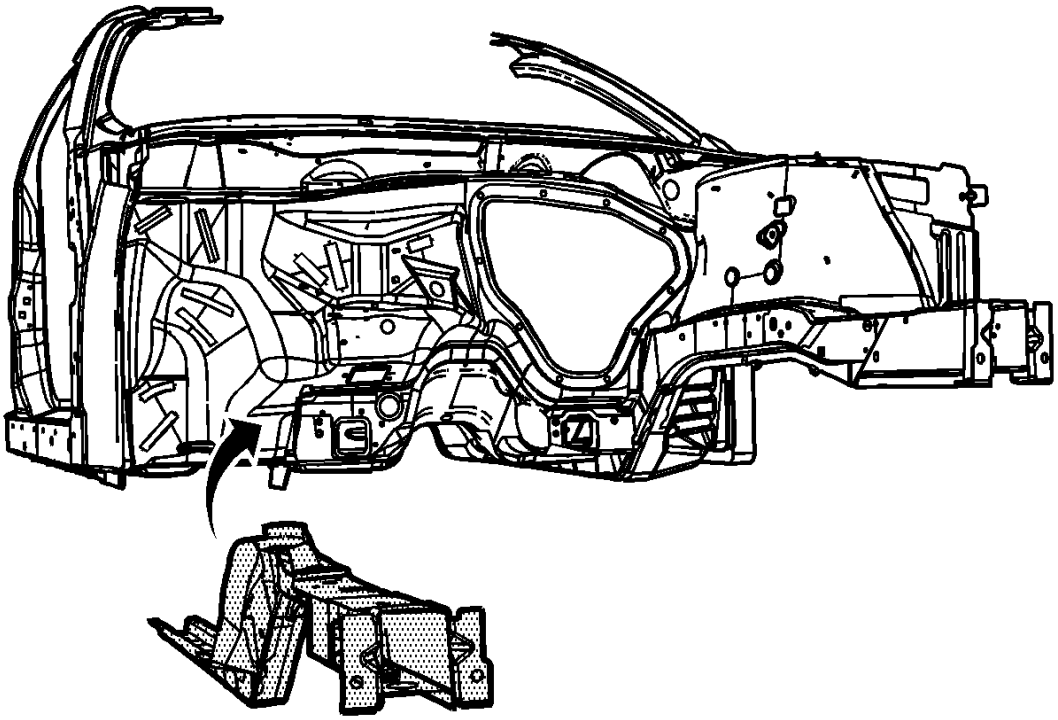

Fig. 60: Positioning Service Rail
Courtesy of GENERAL MOTORS COMPANY

6. Position the service rail to the vehicle using 3-dimensional measuring equipment.
7. Clamp the rail in place.

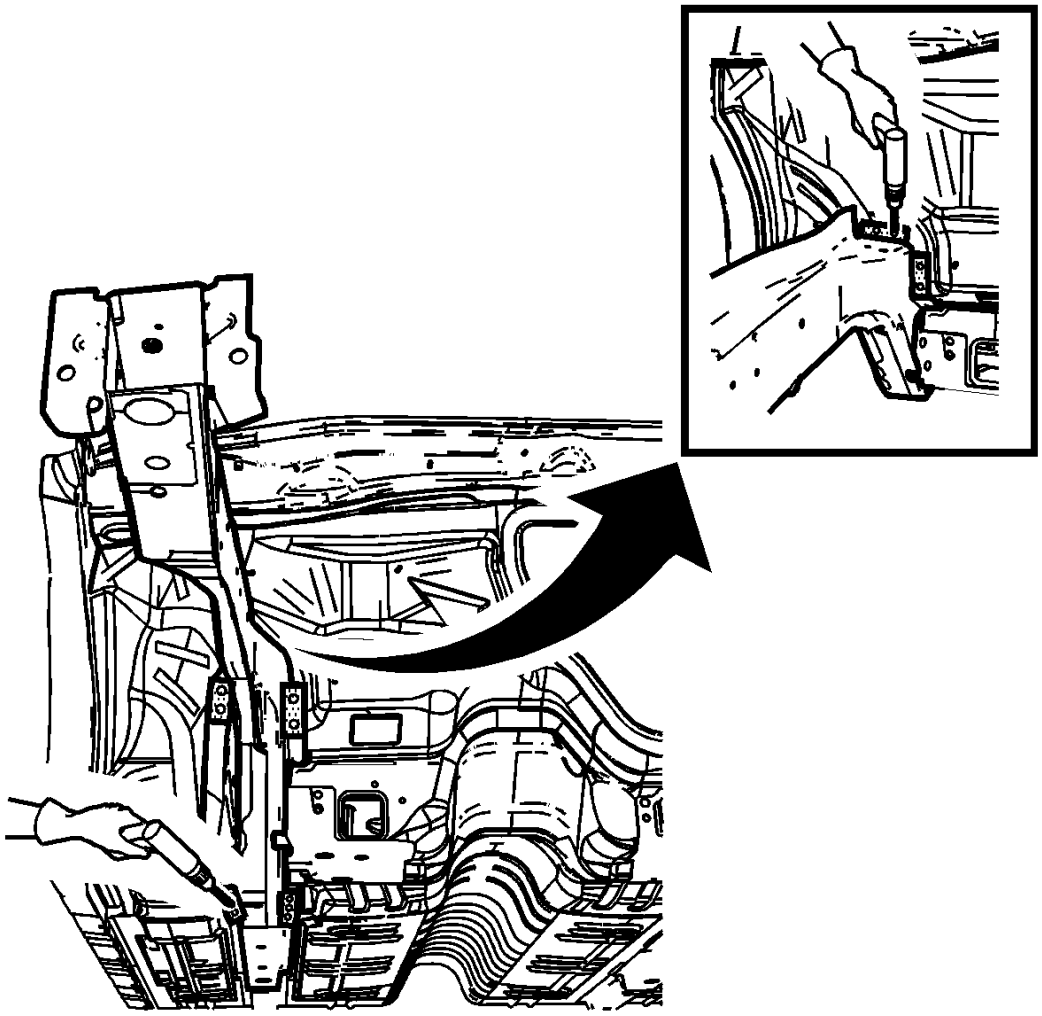

Fig. 61: Rivet Attachment Holes
Courtesy of GENERAL MOTORS COMPANY

8. Using a 7-mm (17/64-in) bit, drill the rivet attachment holes through the service rail and the dash panel in the exact locations, as noted from the factory rail.

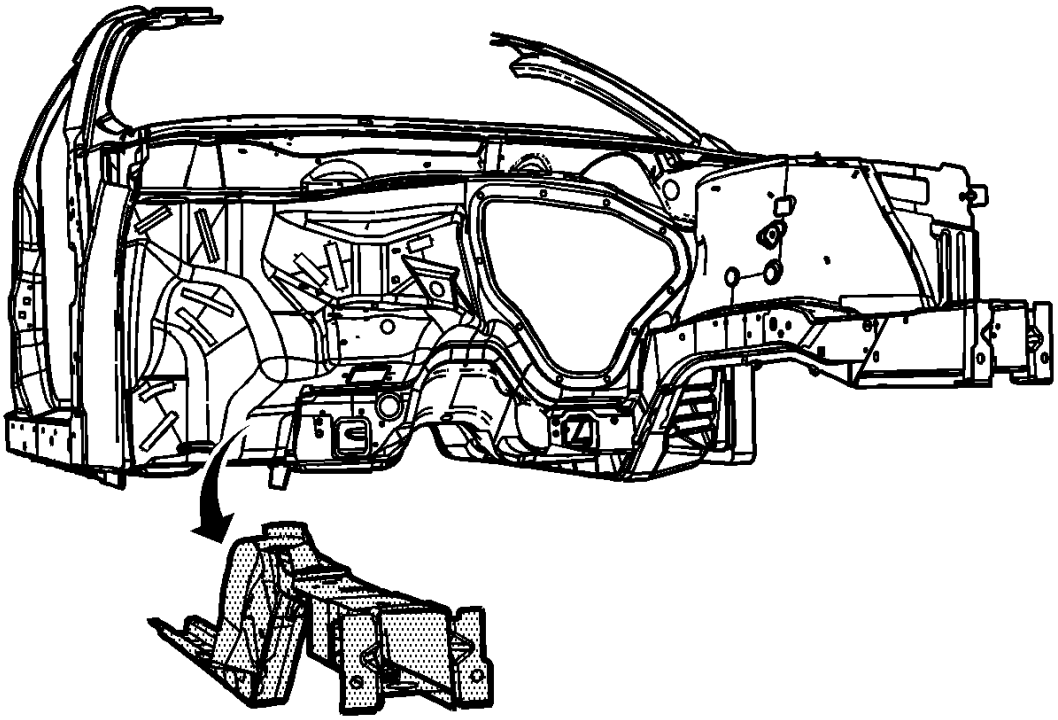

Fig. 62: View Of Service Rail
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1.5 in) apart.**

9. Remove the service rail.
10. Prepare the plug weld mating surfaces, as necessary.
11. Apply 3MÂ® Weld-Thru Coating P/N 05913 or equivalent to the plug weld mating surfaces.

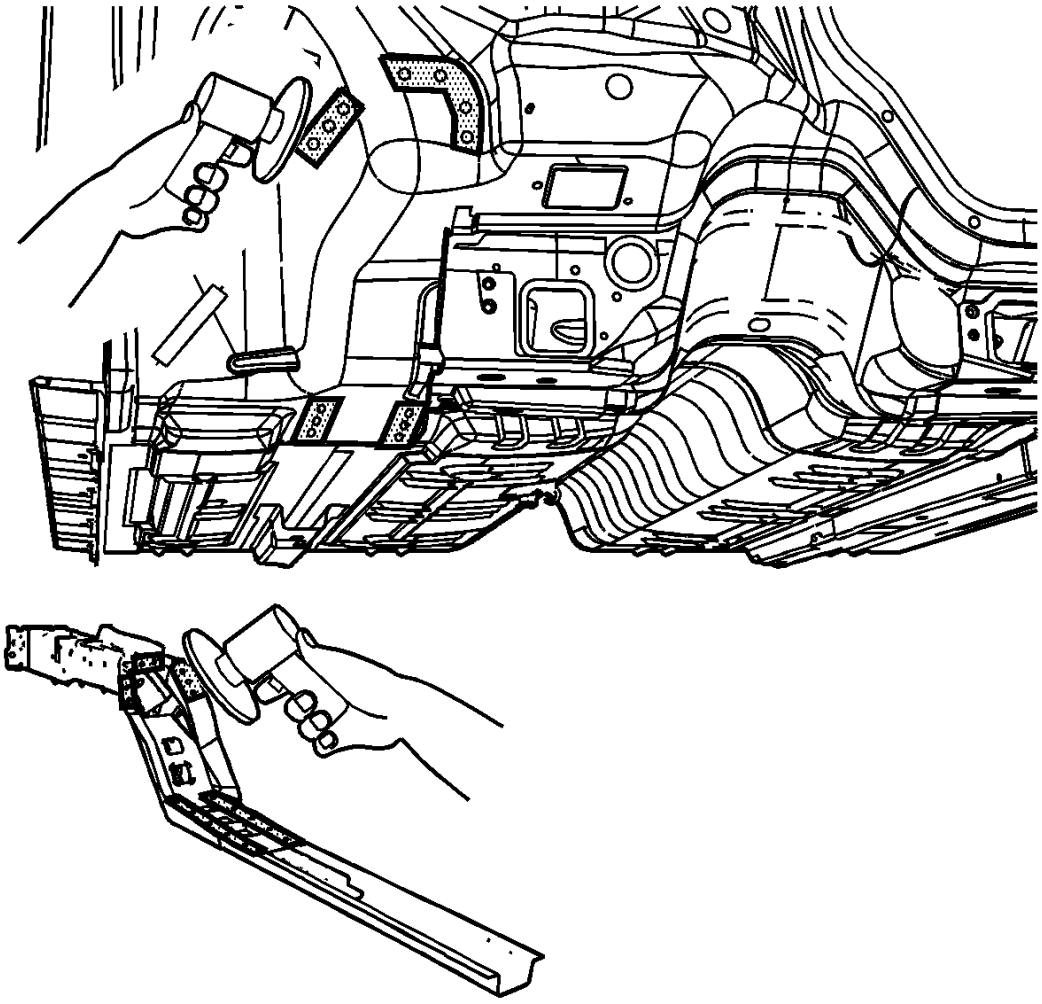

Fig. 63: Grinding Body Mating And Service Part Flanges
Courtesy of GENERAL MOTORS COMPANY

12. Prepare the bond mating areas by grinding the body mating and the service part flanges to bare steel. Do NOT damage the corners or thin the metal during the grinding process.

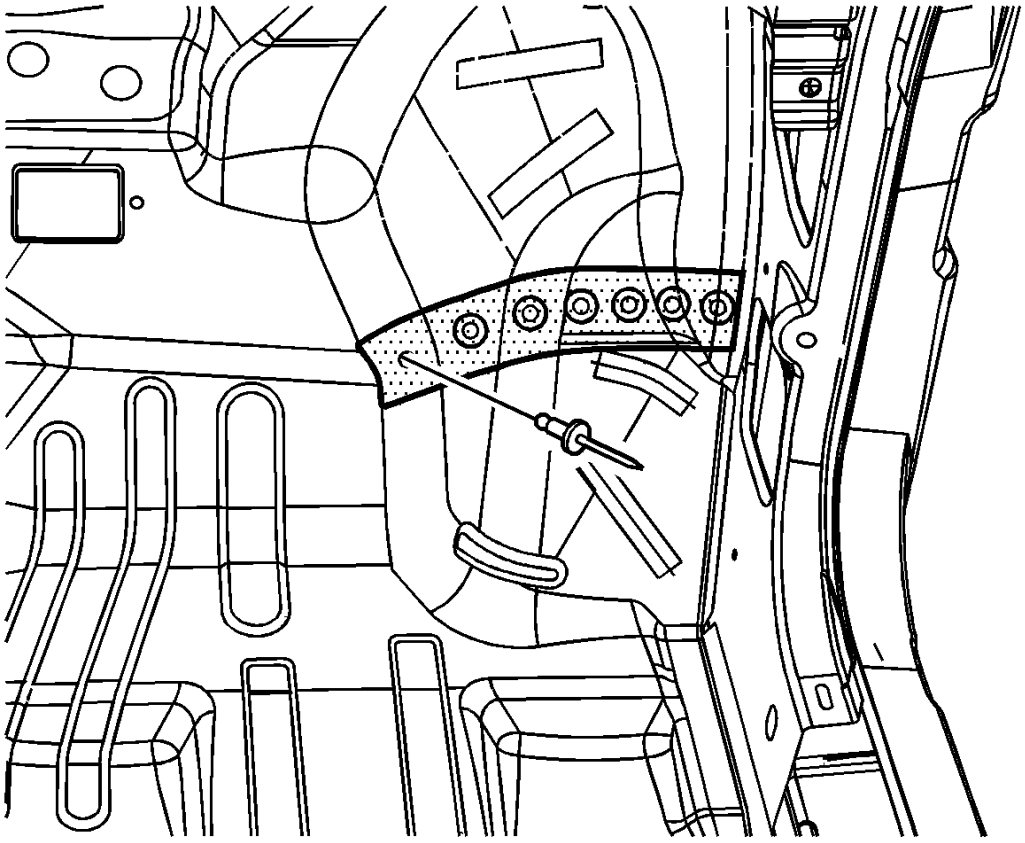

Fig. 64: Identifying 14-mm (17/32-in) Long Rivet
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Do NOT allow the adhesive to cure prior to installation of the front rail side extension. Refer to Front Compartment Side Rail Rear Extension Replacement.**
- **Note the necessary location for installation of a 14-mm (17/32-in) long rivet.**

13. Clean the mating surfaces.

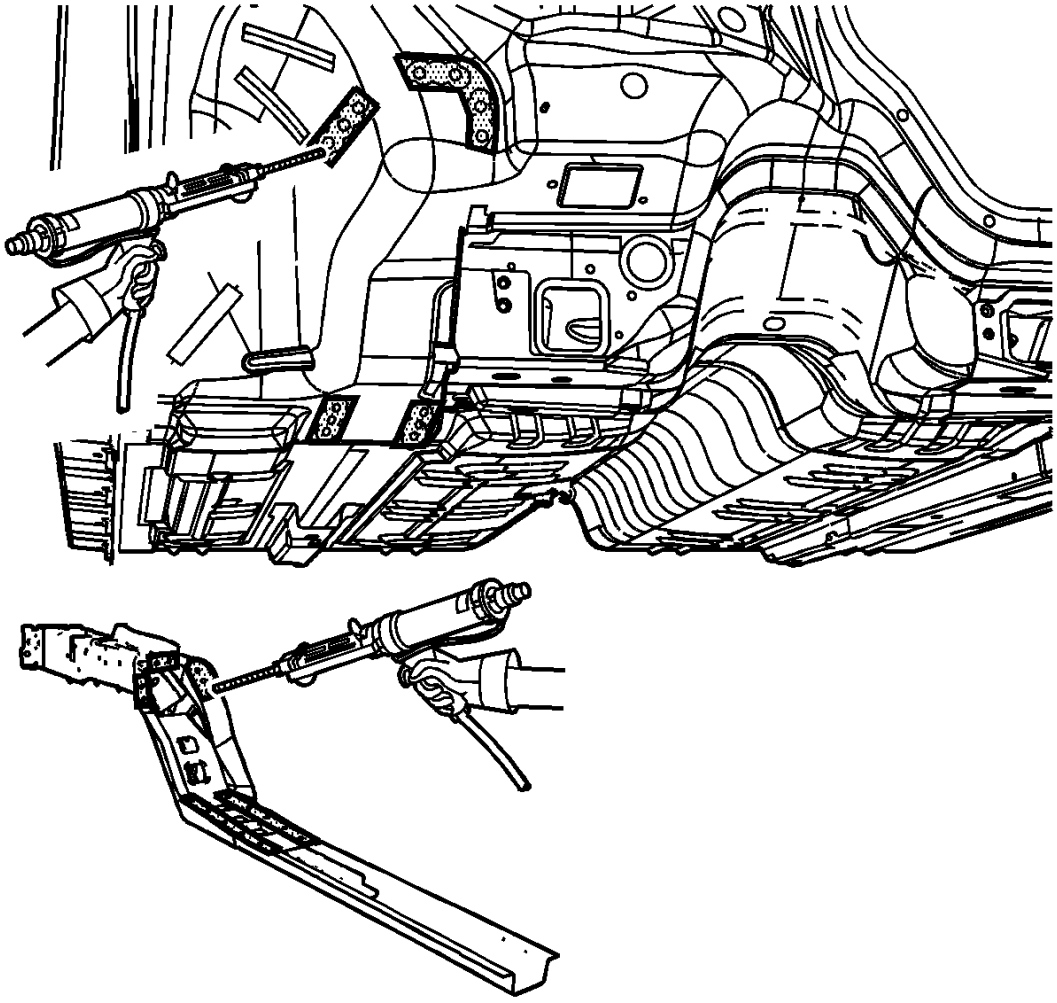

Fig. 65: Applying Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The adhesive has a 40-50 minute working time. Do NOT allow the adhesive to cure prior to installing the service rail.**

14. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to both of the mating surfaces.

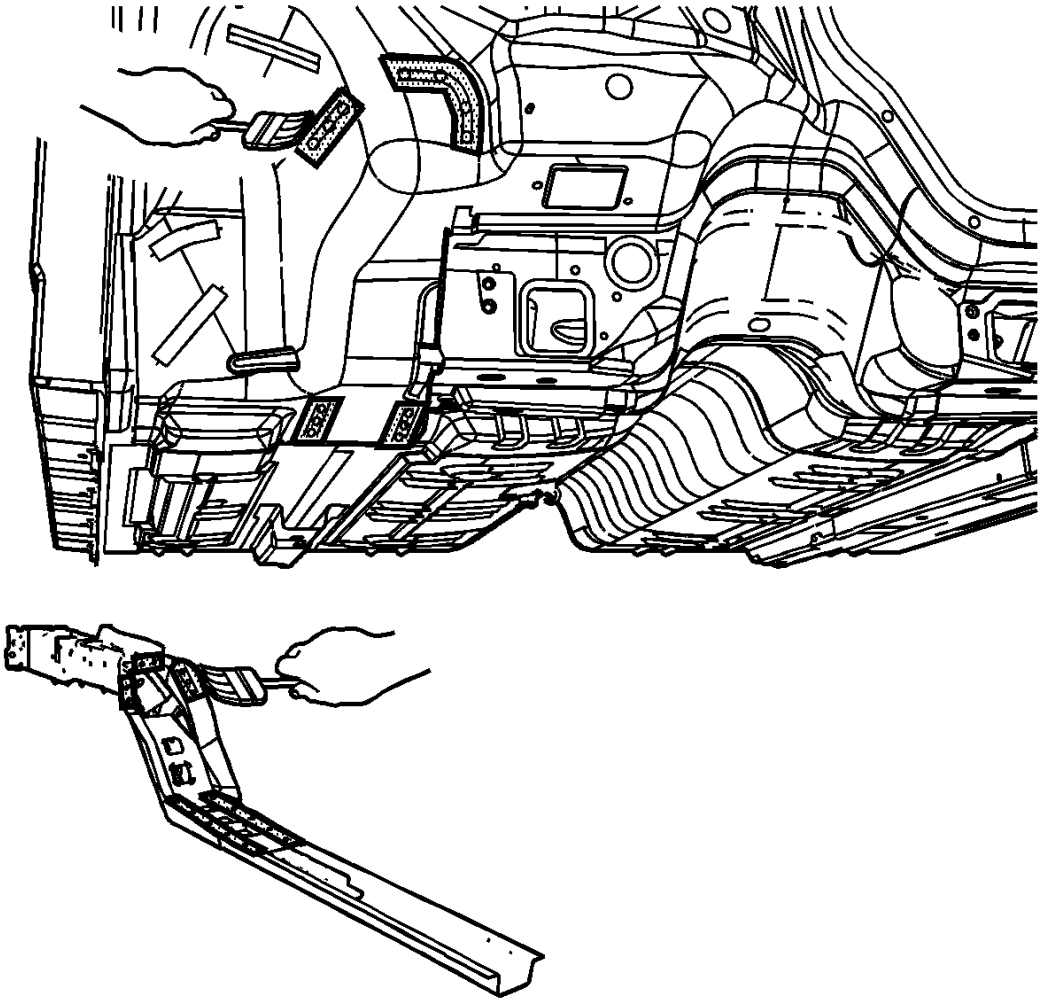

Fig. 66: Spreading Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

15. Using a small acid brush, spread a coat of adhesive to both of the mating surfaces. Cover all of the bare metal to ensure corrosion protection.

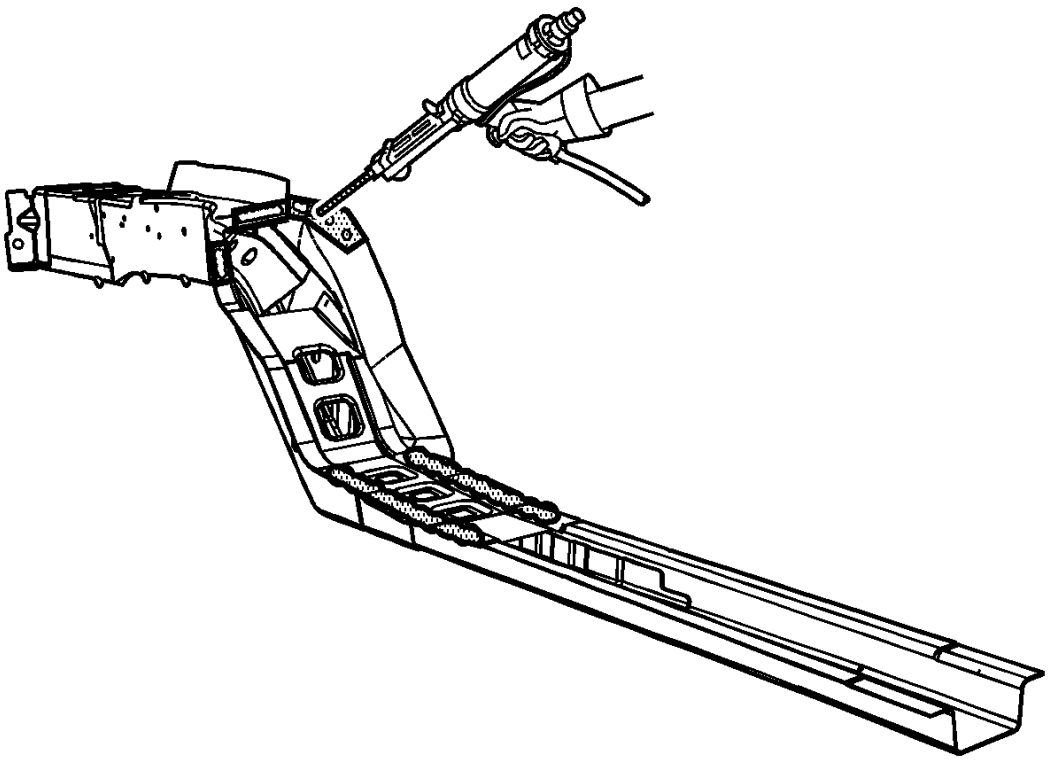

Fig. 67: Applying Bead Of Metal Panel Bonding Adhesive
Courtesy of GENERAL MOTORS COMPANY

16. Apply a 3-6 mm (1/8 to 1/4 in) bead of metal panel bonding adhesive GM P/N 12378567 (Canadian P/N 88901675) or equivalent to the mating surface of the service rail.

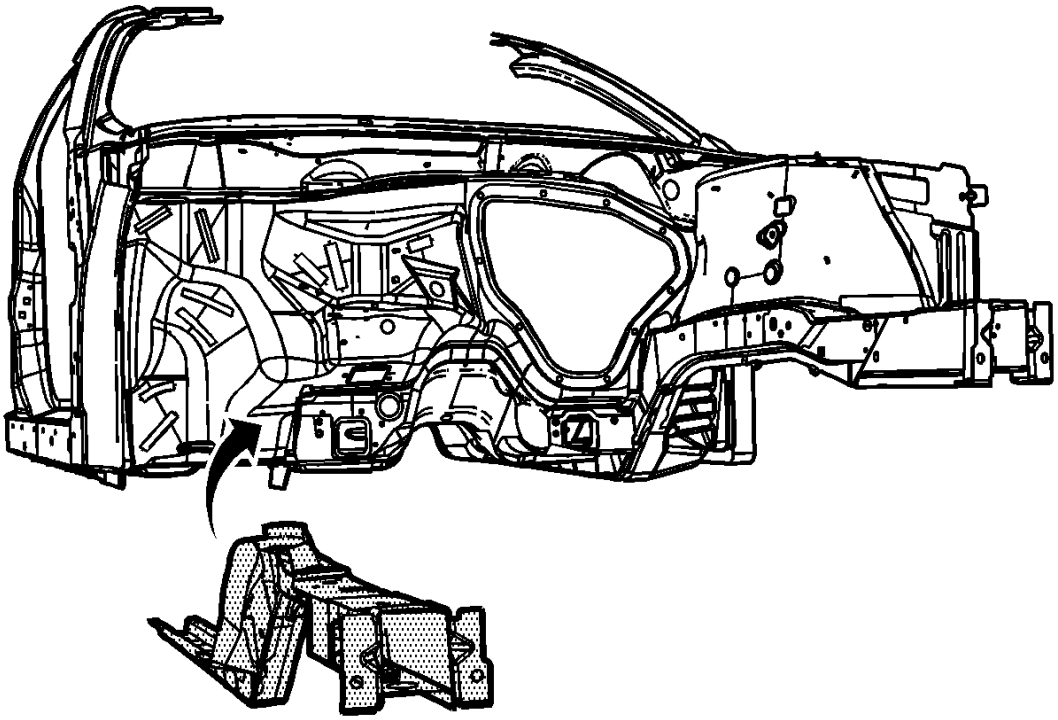

Fig. 68: Positioning Service Rail
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT pull the rail off of the dash after adhesion. To align the parts, slide the rail against the front of the dash.**

17. Position the service rail to the vehicle using 3-dimensional measuring equipment.
18. Clamp the rail in place.

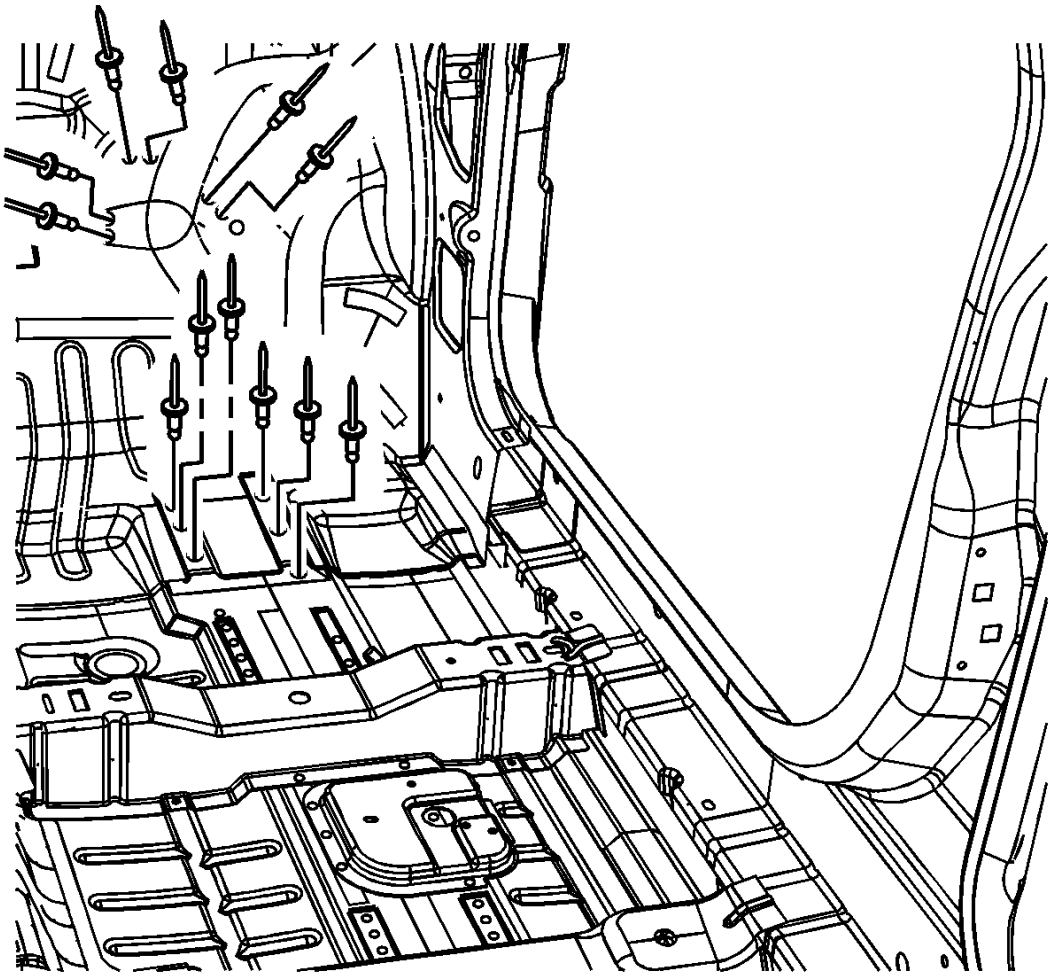

Fig. 69: Installing 9 mm (11/32 in) Long Rivets
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify proper positioning of the service rail prior to riveting and welding.**

19. Install the 9-mm (11/32-in) long rivets, so that the rivet head contacts the passenger compartment side of the dash.

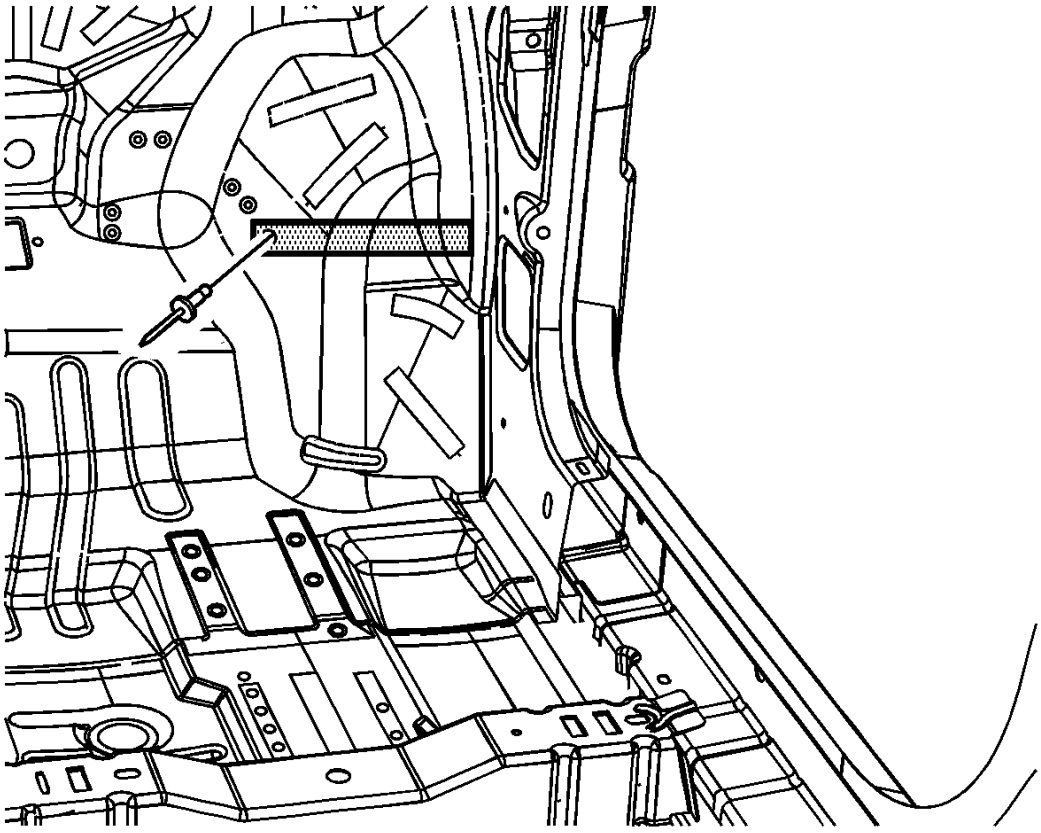

Fig. 70: Installing 14-mm (17/32-in) Long Rivet
Courtesy of GENERAL MOTORS COMPANY

20. Install the 14-mm (17/32-in) long rivet, so that the rivet head contacts the passenger compartment side of the dash, extending through the front rail and through the rail side extension.
21. Remove the excess adhesive from the rail area.

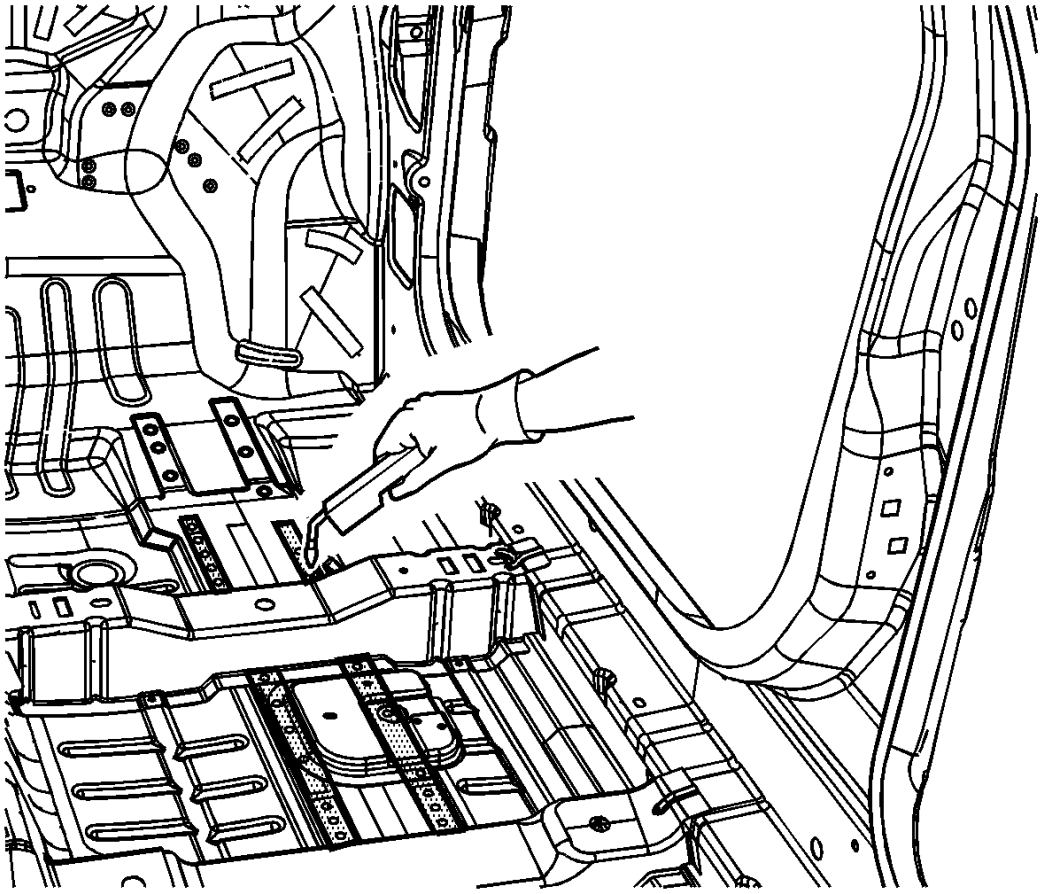

Fig. 71: Plug Welding Remaining Holes
Courtesy of GENERAL MOTORS COMPANY

22. Plug weld the remaining holes, accordingly.
23. Clean and prepare all of the welded surfaces.
24. Install the front wheelhouse assembly. Refer to **Front Wheelhouse Panel Replacement**.
25. Install the front rail side extension. Refer to **Front Compartment Side Rail Rear Extension Replacement**.
26. Install the radiator support assembly. Refer to **Upper Rail Replacement**.
27. Apply the sealers and anti-corrosion materials to the repaired area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
28. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
29. Install all of the related panels and components.
30. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
31. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT HINGE PILLAR SECTIONING

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

NOTE: **Do not cut adjacent panels.**

NOTE: **Follow general sectioning for the outer rocker panel. Sectioning should take place in shaded areas only. There are key structural areas on the outer rocker panel where sectioning should not be performed. Sectioning in these areas may compromise the structural integrity of the vehicle.**

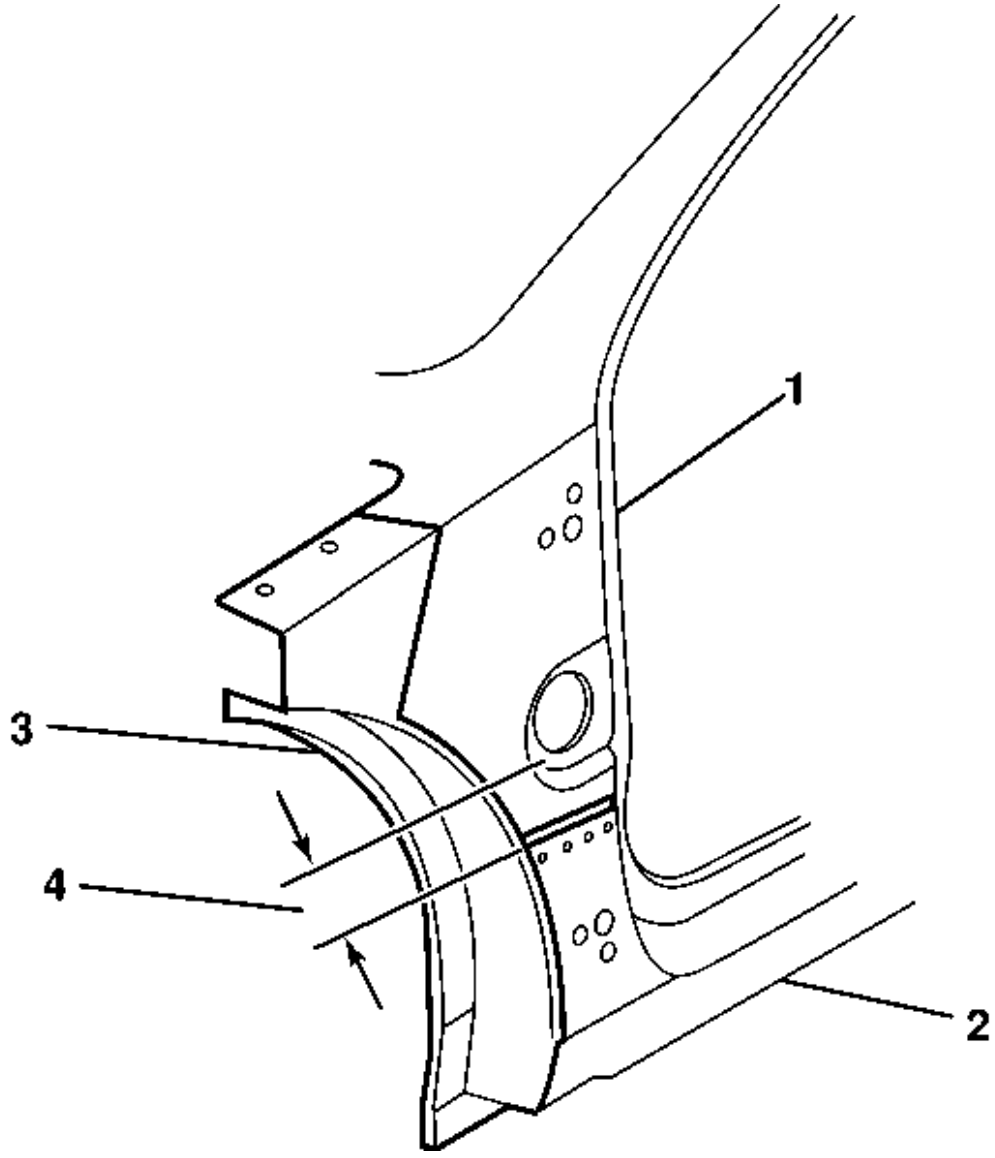

Fig. 72: Original Outer Door Frame, Inner Reinforcement & Service Panel
Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect and restore as much of the damage as possible to factory specifications.
2. Remove all related panels and components.
3. Position all wiring out of the way to prevent damage and for best access to vehicle.
4. Remove all sealers and anti-corrosion materials as necessary.

5. On the original outer door frame (1) measure down 35 mm (1 3/8 in) from the large wiring harness hole in the pillar and mark a horizontal line (4).
6. Cut the outer door frame along this line for sectioning.
7. Perform additional sectioning procedures as necessary to remove damaged areas of the door frame opening.
8. Locate and mark all factory welds. Note the number and location of welds for installation of the service part.
9. Drill out all factory welds as necessary.

NOTE: **Note the location of the sound deadening foam for installation.**

10. Remove the damaged section of the outer door frame opening (2).

Installation Procedure

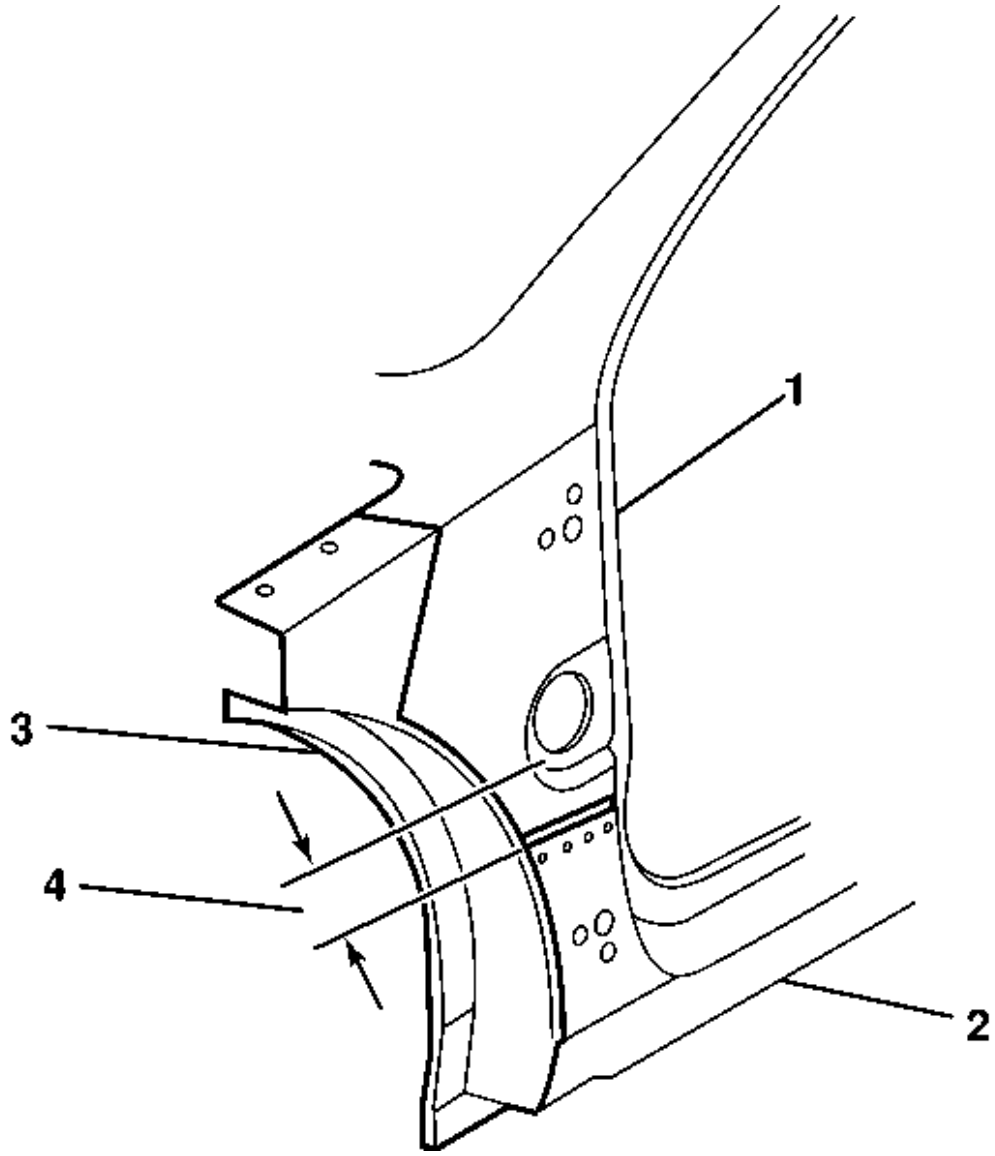

Fig. 73: Original Outer Door Frame, Inner Reinforcement & Service Panel
Courtesy of GENERAL MOTORS COMPANY

1. On the service part (2), mark a horizontal line to leave a gap of 1 1/2 times the thickness of the metal at the section joint.
2. Cut the service panel along this line.
3. Drill 8 mm (5/16 mm) holes for plug welding in the service part in the locations noted from the original panel.
4. Drill holes for plug welding along the sectioning cut on the service part. Locate these holes approximately 13 mm (1/2 in) from the edge of the sectioning cut.
5. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
6. Use the inner reinforcement (3) as a backing plate.
7. Stitch weld along the entire joint with 25 mm (1 in) welds along the seams with 25 mm (1 in) gaps between.
8. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.
9. Complete all other welds and sectioning procedures as necessary.
10. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

11. Prime with two-part catalyzed primer.

NOTE: **It is necessary to apply the sound-deadening foam in the locations as noted from removal.**

12. Apply sealers and anti-corrosion materials as necessary.
13. Install all related panels and components.

FRONT INNER HINGE PILLAR REINFORCEMENT SECTIONING

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

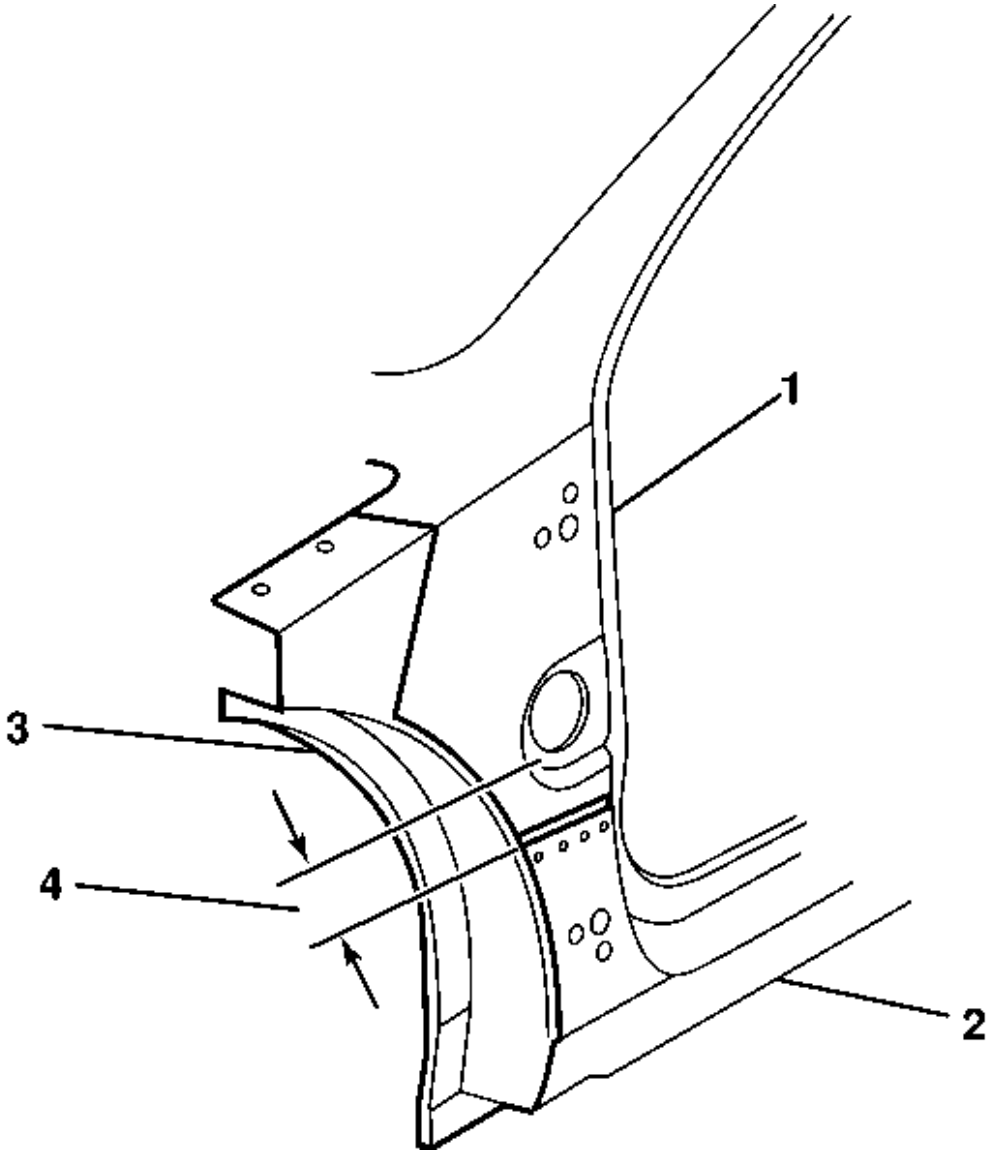

Fig. 74: Original Outer Door Frame, Inner Reinforcement & Service Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Sectioning of the inner reinforcement panel (3) can only take place with outer door frame replacement or sectioning procedures. Sectioning the outer door (1) frame at the front hinge pillar requires a 25 mm (1 in) offset from the inner reinforcement sectioning joint. The inner reinforcement can serve as a backing plate for the outer panel sectioning.**

1. Visually inspect and restore as much of the damage as possible to factory specifications.
2. Remove all related panels and components.
3. Position all wiring out of the way to prevent damage and for best access to vehicle.
4. Remove all sealers and anti-corrosion materials as necessary.

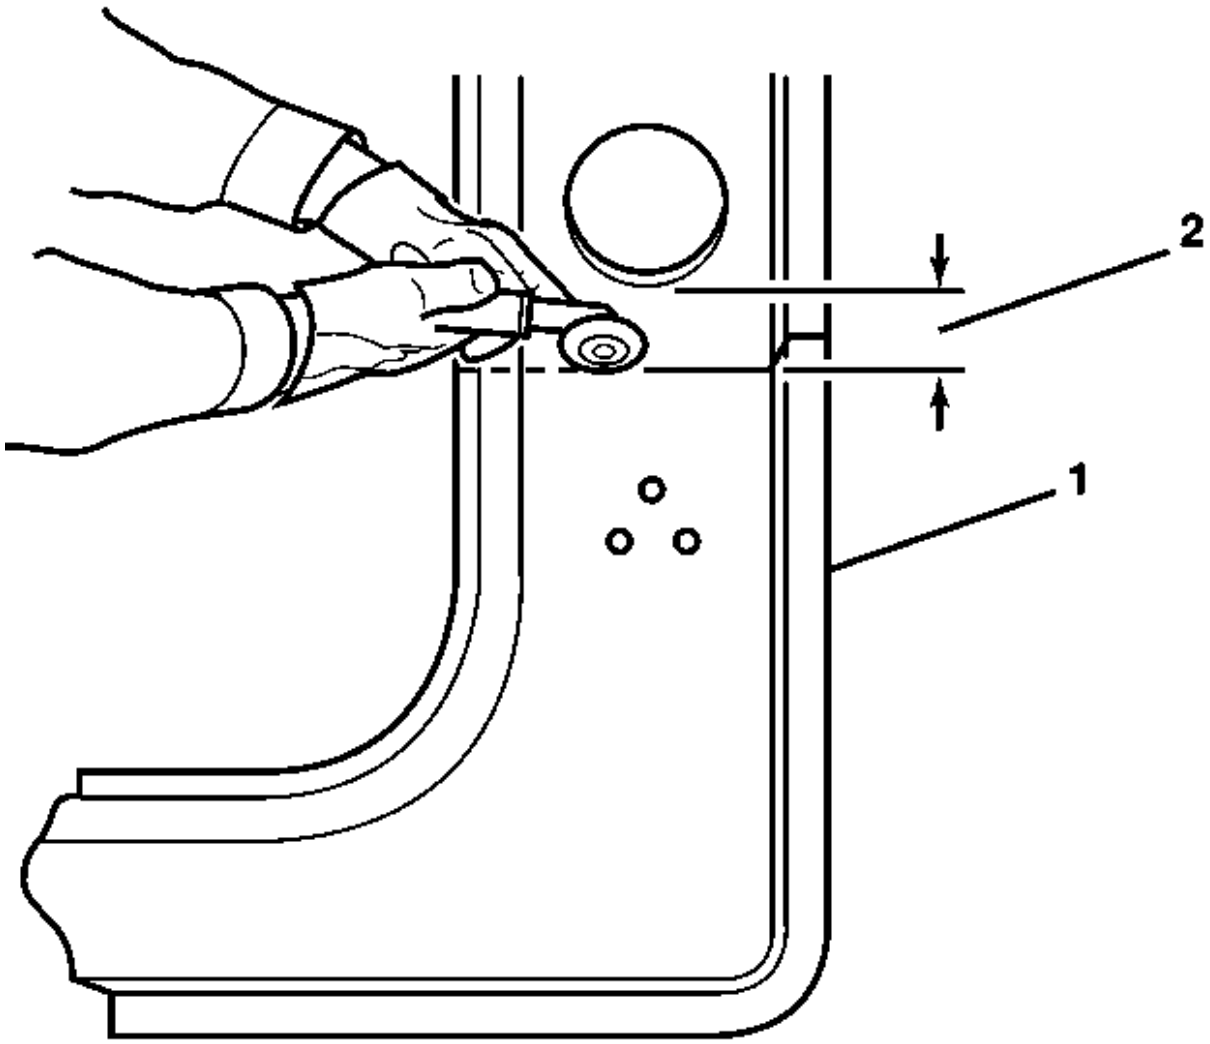

Fig. 75: Removing Damaged Inner Reinforcement (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

5. On the original reinforcement panels (1) measure down 90 mm (3 9/16 in) from the large wiring harness hole in the pillar and mark a horizontal line.
6. Cut the inner reinforcement along this line for sectioning.
7. Locate and mark all factory welds. Note the number and location of welds for installation of the service part.
8. Drill out all factory welds as necessary.

NOTE: **Note the locations of the sound-deadening foam for installation.**

9. Remove the damaged section of the inner reinforcement (2).

Installation Procedure

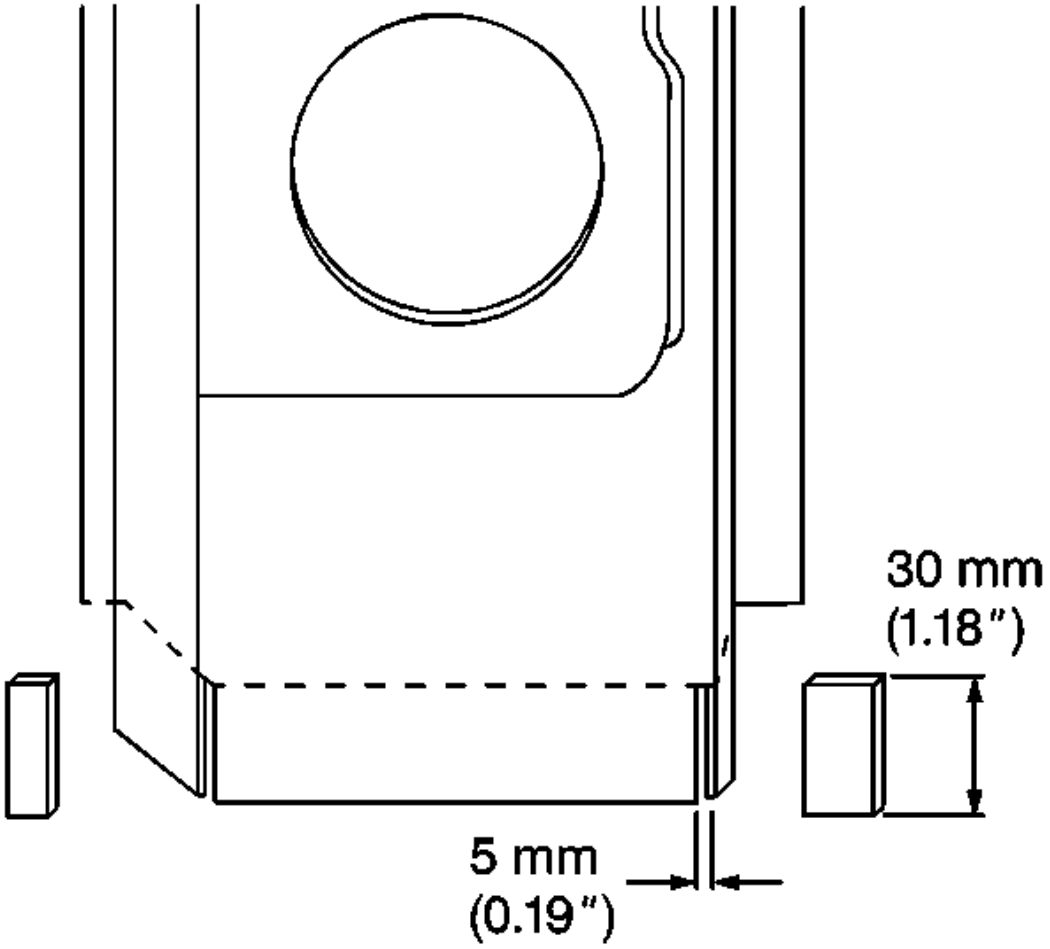

Fig. 76: Cutting Sections Of Hinge Pillar
Courtesy of GENERAL MOTORS COMPANY

1. Cut and remove 30 mm (1 3/16 in) from the flanges on either side of the remaining section of the original hinge pillar to create a 30 mm (1 3/16 in) flange.
2. Cut 5 mm (3/16 in) wide gaps in the bottom corners.
3. Step the tabs inward to allow the door frame inner reinforcement service section to fit over the original inner reinforcement.
4. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.

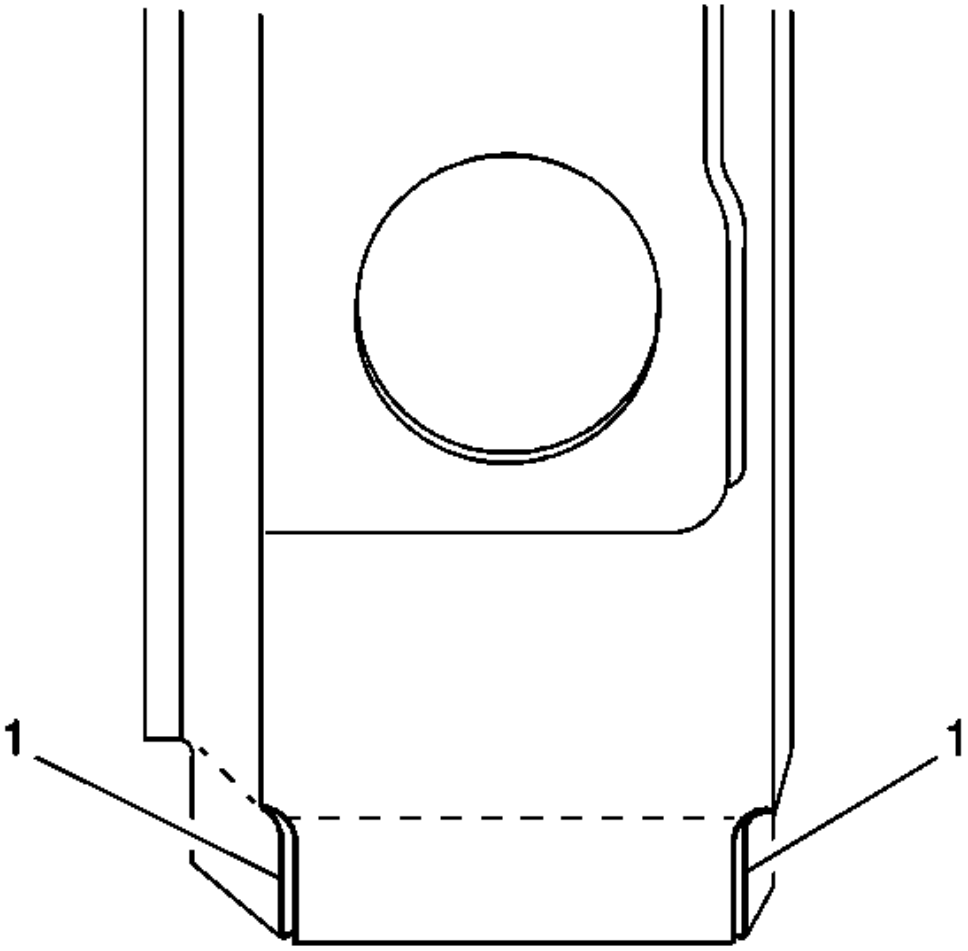

Fig. 77: Welding Tabs Together
Courtesy of GENERAL MOTORS COMPANY

5. Weld the tabs together along the edges (1).

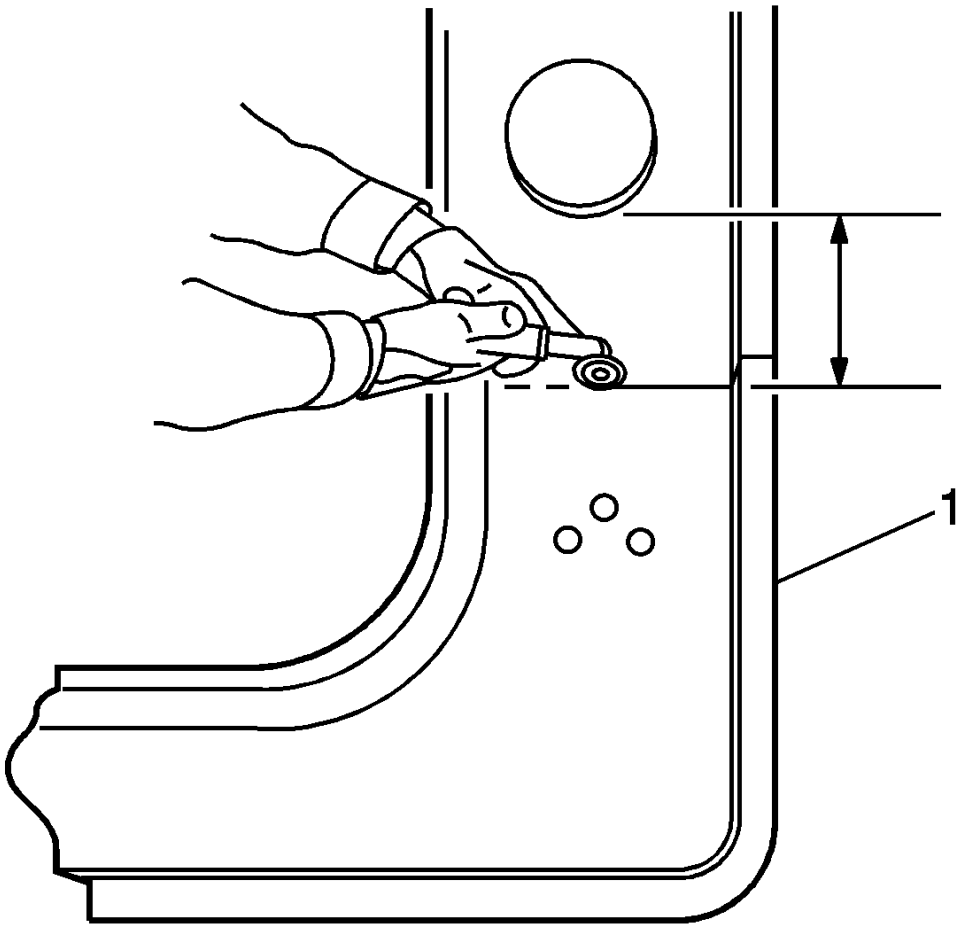

Fig. 78: Cutting Hinge Pillar (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

6. On the service part (1) measure 60 mm (2 3/8 in) down from the large wiring harness hole in the hinge pillar and mark a horizontal line.
7. Cut the hinge pillar along this line.

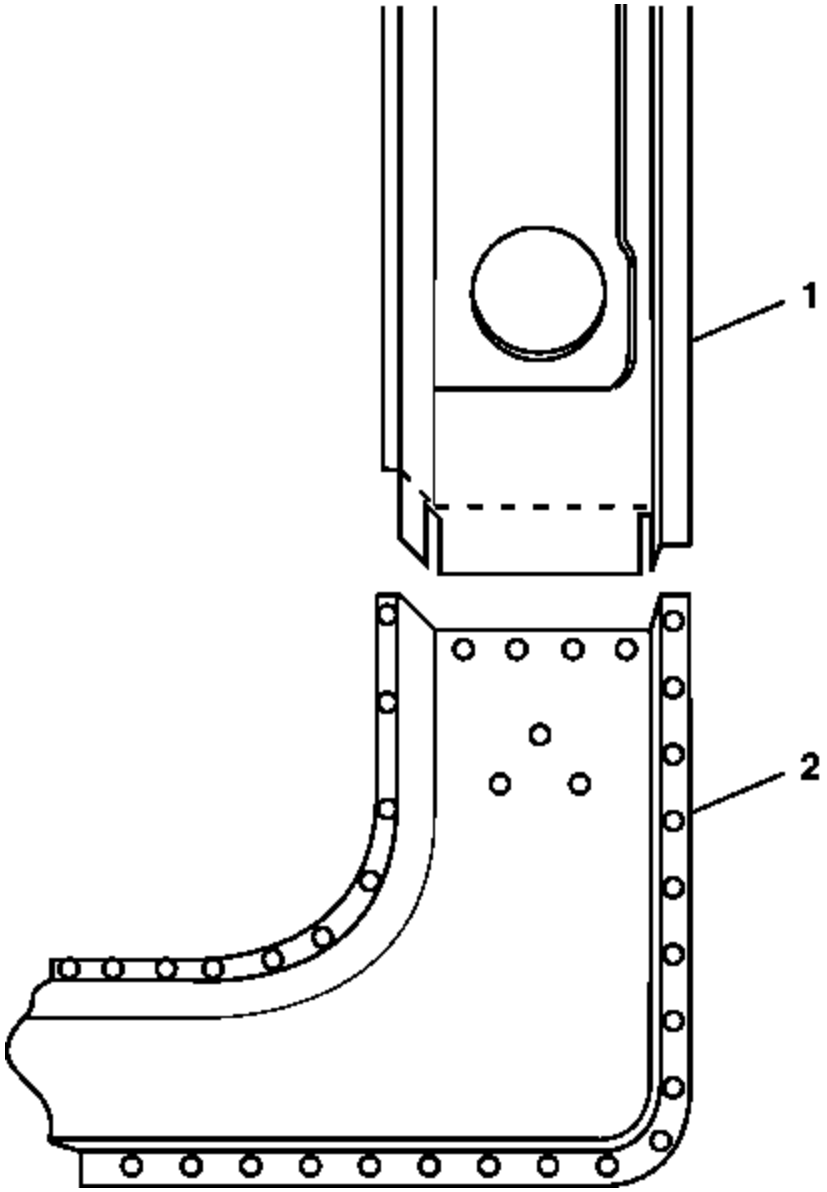

Fig. 79: Original Inner Reinforcement & Service Section
Courtesy of GENERAL MOTORS COMPANY

8. Drill 8 mm (5/16 in) plug weld holes as necessary in the locations noted from the original panel.
9. Drill plug weld holes along the sectioning cut of the service part (2).
10. Prepare the mating surfaces as necessary. Position the service section (2) over the stepped tab on the original inner reinforcement (1).
11. Check and make sure the door hinge bolt holes are properly located.

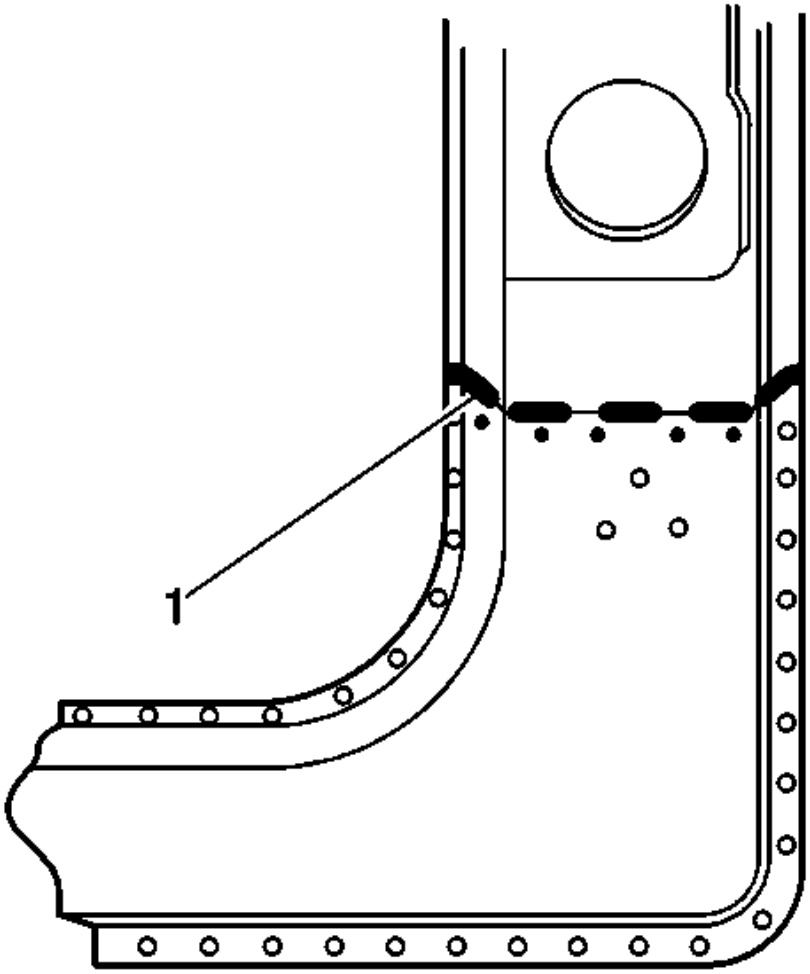

Fig. 80: Stitch Welding Joint
Courtesy of GENERAL MOTORS COMPANY

12. Plug weld accordingly.
13. Stitch weld along the entire joint (1).
14. Make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between.
15. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.
16. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

17. Prime with 2-part catalyzed primer.

NOTE: **It is important to re-apply the sound-deadening foam in the locations noted from the removal process.**

18. Apply sealers and anti-corrosion materials as necessary.

19. Install all related panels and components.

DOOR FRAME REINFORCE SECTIONING - CENTER PILLAR

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

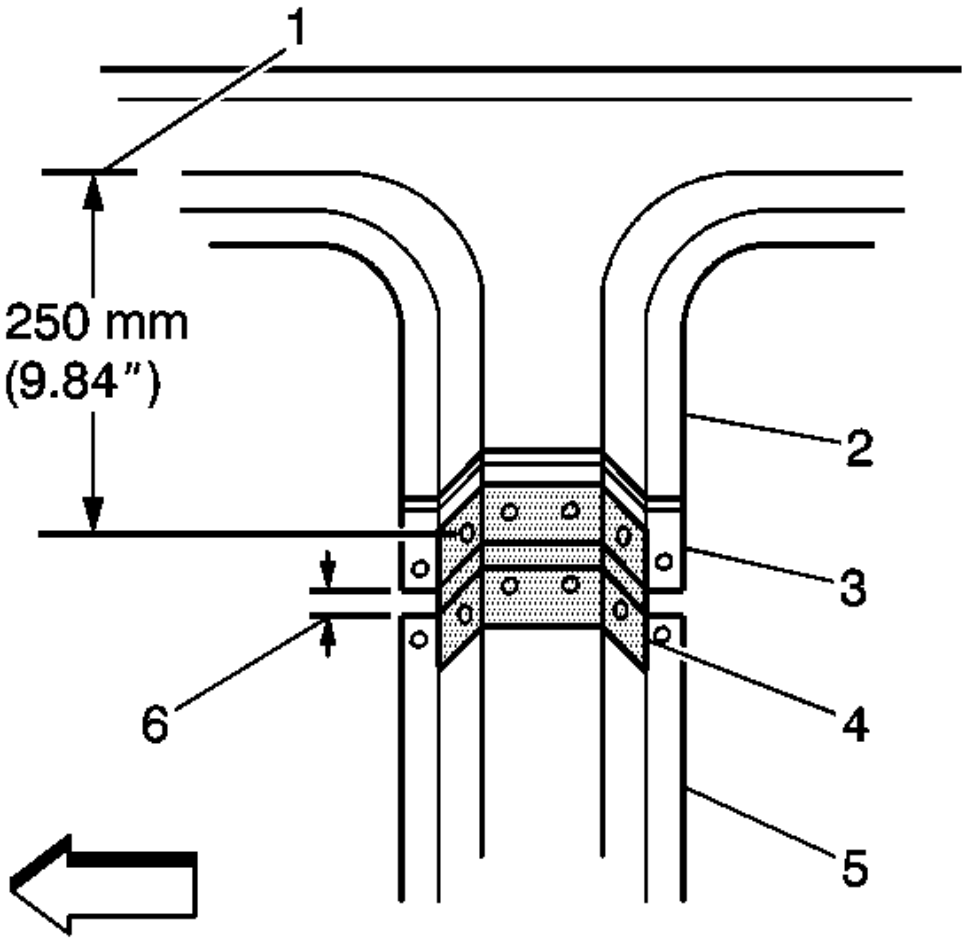

Fig. 81: Central Pillar Reinforcement
Courtesy of GENERAL MOTORS COMPANY

NOTE: The striker plate is mounted in a cage that allows some degree of adjustment independent of the outer panels position. Use body dimensions to ensure that the striker mounting location falls within the plates range of adjustment.

1. Remove all related panels and components.
2. Visually inspect and restore as much of the damage as possible.
3. Remove sealers and anti-corrosion materials as necessary.

NOTE: **When sectioning both the inner (3) and the outer panels (2) this should result in a 100 mm (4 in) offset in the sectioning joints. Use care not to cut the inner door opening frame when cutting the center pillar reinforcement.**

NOTE: **Sectioning of the center pillar reinforcement should be performed only in the specified sectioning locations.**

4. Cut the reinforcement (3) panel 250 mm (13 3/4 in) from the lower edge of the door opening (1).
5. Locate and mark all factory welds. Note the number and location of welds for installation of the service assembly.
6. Drill out all factory welds.

Installation Procedure

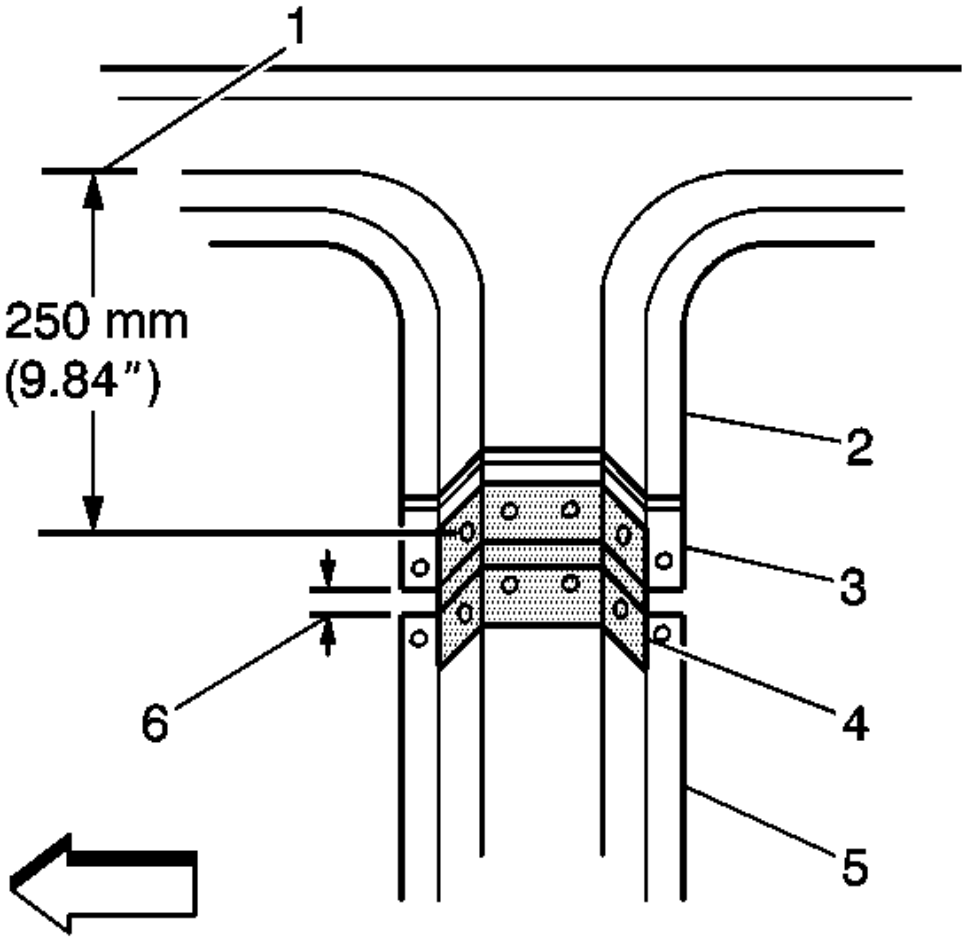

Fig. 82: Central Pillar Reinforcement
Courtesy of GENERAL MOTORS COMPANY

1. On the service part (5) mark a horizontal line to leave a gap of 1 1/2 times the thickness of the metal (6) at the sectioning joint.
2. Cut the service reinforcement panel along this line.

3. Cut a 50 mm (2 in) piece from the unused portion of the service part (5) for a backing plate.
4. Remove the flange on each side of the backing plate (4) so that it will fit behind the sectioning joint (6).
5. Drill 8 mm (5/16 in) holes for plug welding in the service part in the location noted from the original panel.
6. Drill holes for plug welding along the sectioning cuts on both the service part (5) and the original panel (3).
7. Locate these holes approximately 13 mm (1/2 in) from the edge of the sectioning cuts.
8. Prepare the mating surfaces as necessary. Position the backing plate with 25 mm (1 in) of the backing plate exposed. Position the service part (5) to overlap the exposed backing plate.
9. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
10. Make 25 mm (1 in) welds along the seams with 25 mm (1 in) gaps between.
11. Go back and complete the stitch weld. This will create solid joint with minimal heat distortion.
12. Complete all other welds as necessary.
13. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

14. Prime with 2 part catalyzed primer.
15. Apply sealers and anti-corrosion materials as necessary.

CENTER PILLAR REPLACEMENT

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

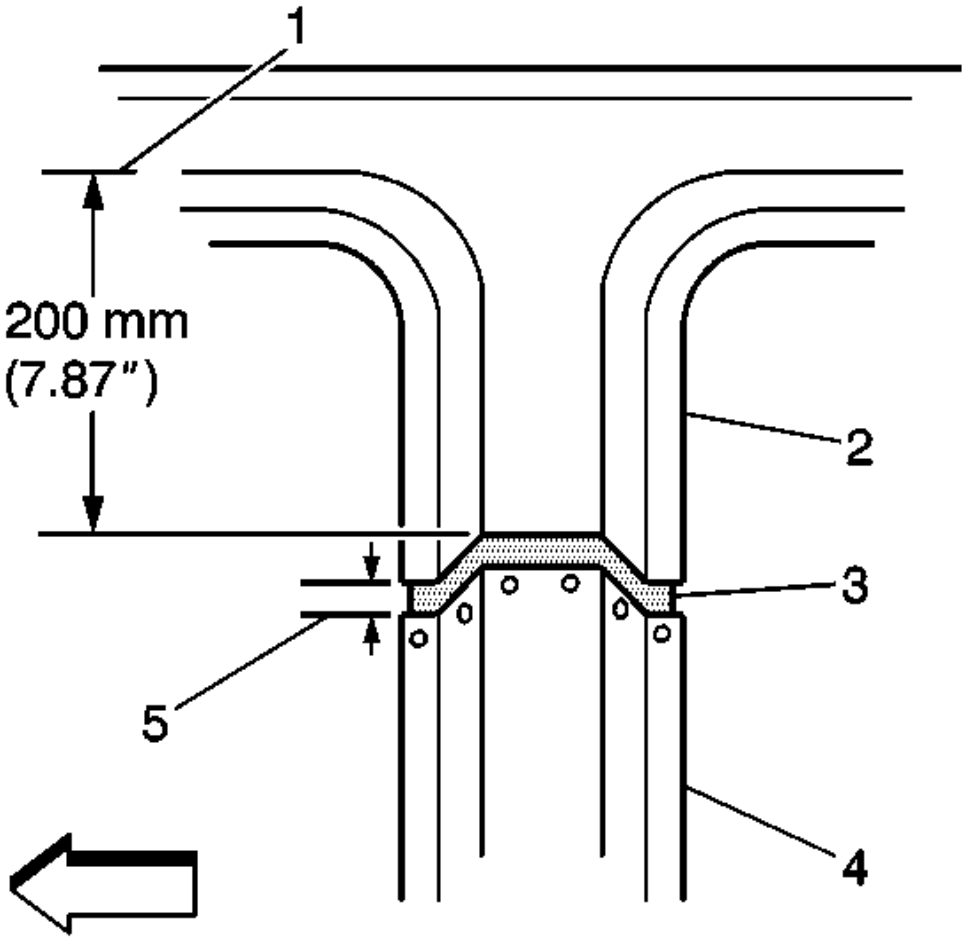

Fig. 83: Outer Door Frame Measurements
Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect and restore as much of the damage as possible to factory specifications.
2. Remove all related panels and components.
3. Position all wiring out of the way to prevent damage.
4. Remove sealers and anti-corrosion materials as necessary.
5. On the original outer door frame (2) measure down from the lower edge (1) of the door opening 200 mm (8 in) and mark a horizontal line.
6. Cut the outer door frame along this line for sectioning. Do not cut into the inner reinforcement.
7. Locate and mark all factory welds. Note the number and location of welds for installation of the service section.
8. Drill out all factory welds as necessary.
9. Perform additional sectioning procedures as necessary to remove the center lock pillar.
10. Remove the damaged section of the door frame opening (4).

Installation Procedure

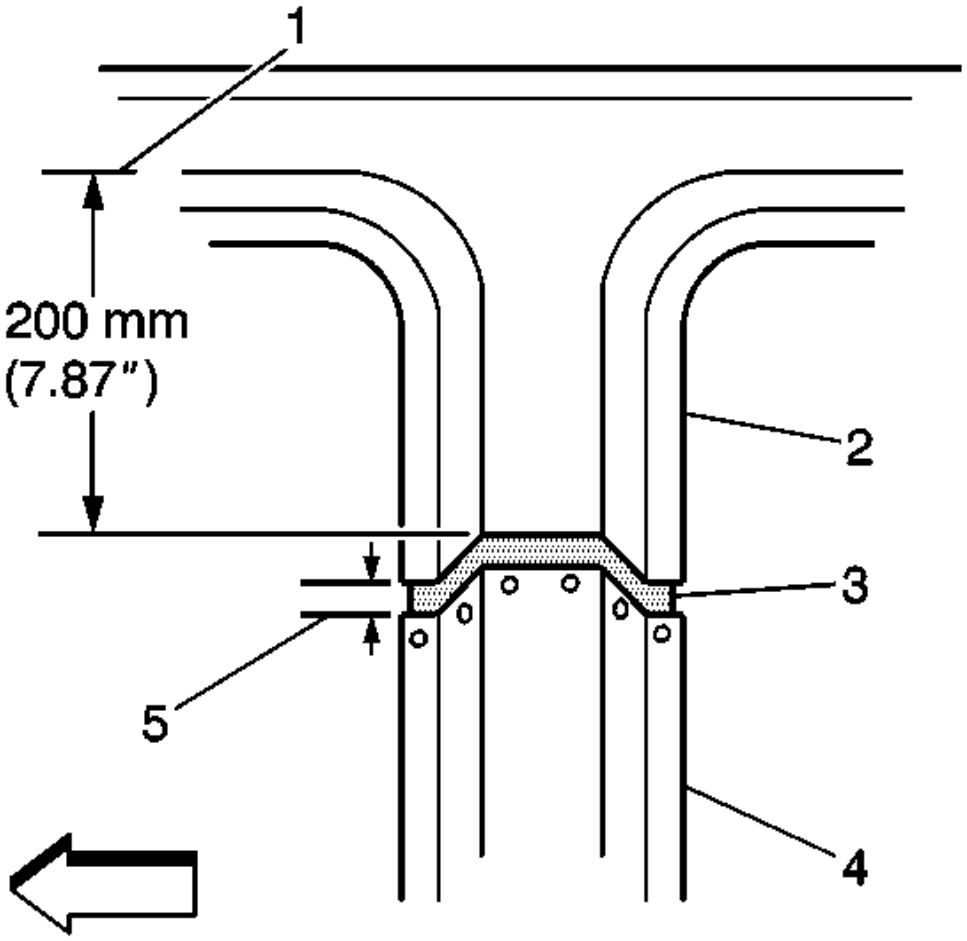

Fig. 84: Outer Door Frame Measurements
Courtesy of GENERAL MOTORS COMPANY

1. On the service part (4), mark a horizontal line to leave a gap of 1 1/2 times the thickness of the metal (5) at the sectioning joint.
2. Cut the service panel along this line.
3. Drill 8 mm (5/16 in) holes for plug welding in the service part (4) in the locations noted from the original panel.
4. Drill holes for plug welding long the sectioning cuts on the services part.
5. Locate these holes approximately 13 mm (17/32 in) from the edge of the sectioning cuts.
6. Prepare the mating surfaces as necessary. Position the service part using three-dimensional measuring equipment.
7. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
8. Plug weld accordingly.
9. Use the inner reinforcement (3) as a backing plate and stitch weld along the entire sectioning joint.
10. Make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between.
11. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.

12. Complete all other welds and sectioning procedures as necessary.
13. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

14. Prime with 2-part catalyzed primer.
15. Apply sealers and anti-corrosion materials as necessary.
16. Install all related panels and components.

GENERAL DOOR FRAME OPENING SECTIONING

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

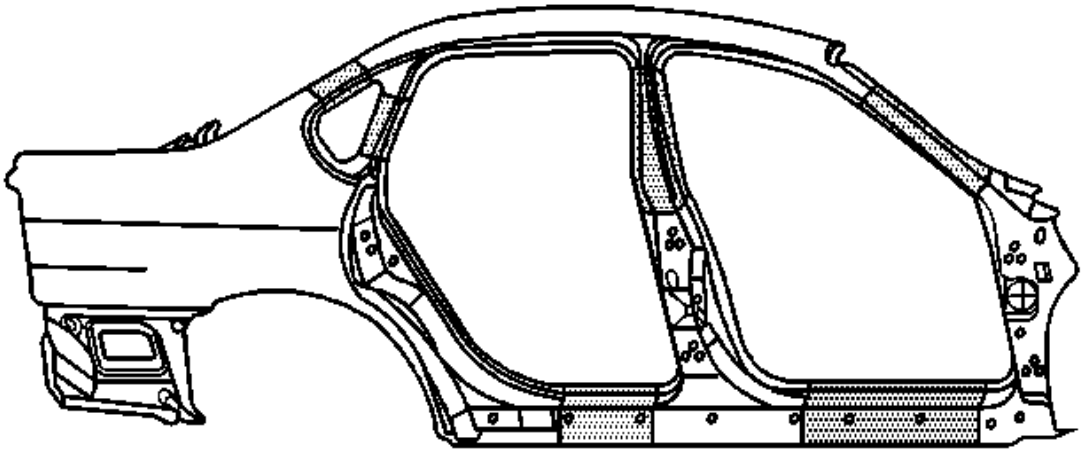

Fig. 85: Door Frame Opening (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect and restore as much of the damage as possible.
2. Remove all related panels and components.
3. Remove sealers and anti-corrosion materials as necessary.
4. Cut the panel in the areas where the sectioning is to take place. Sectioning should take place in shaded areas only.

NOTE: **Use care not to cut the inner reinforcements when cutting the outer door opening frame.**

5. Locate and mark all factory welds. Note the number and location of welds for installation of the service assembly.
6. Drill out all factory welds.

NOTE: **Note the location of the sound deadening foam for installation.**

7. Remove the damaged outer door opening frame.

Installation Procedure

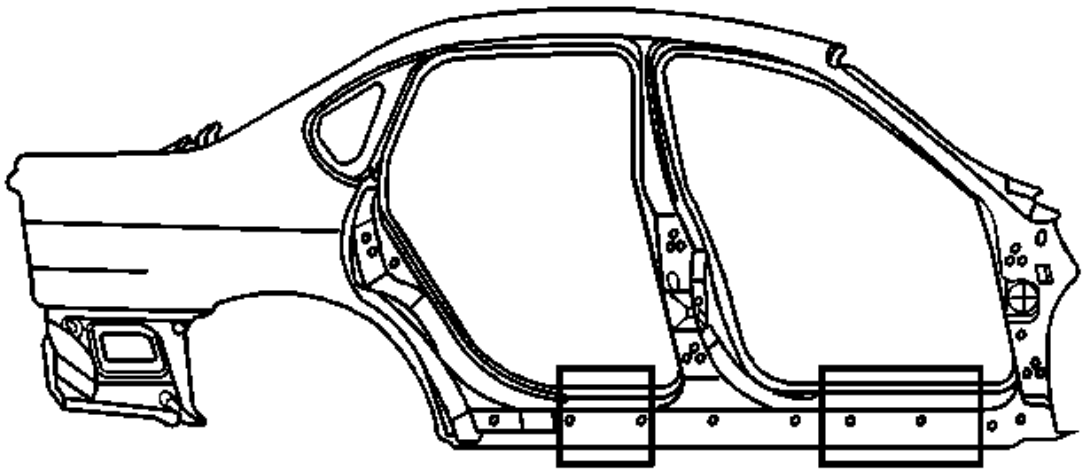

Fig. 86: Rocker Locations

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Sectioning in the rocker locations requires the use of a 100 mm (4 in) backing plate.**

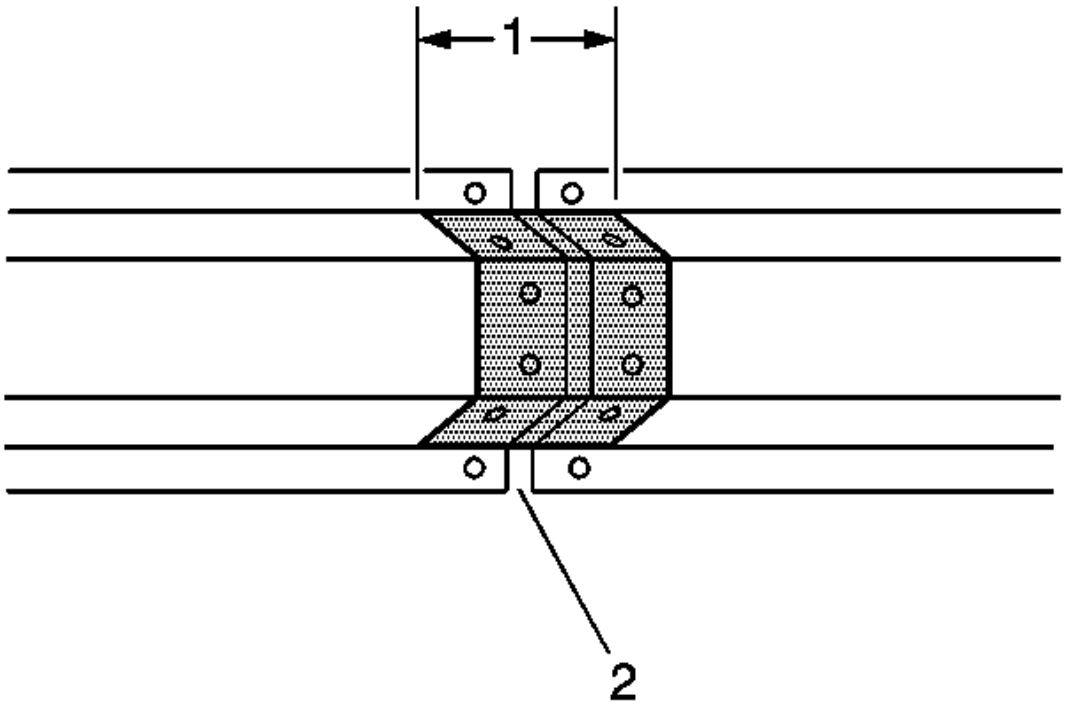

Fig. 87: Cutting Door Frame Opening Service Part (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. On the service part, mark a line to leave a gap of one and one-half times the thickness of the metal at the sectioning joint (2).
2. Cut the outer door frame opening service part along this line.
3. Cut a 100 mm (4 in) piece (1) from the unused portion of the service part for a backing plate when sectioning in the rocker areas of the door frame opening.

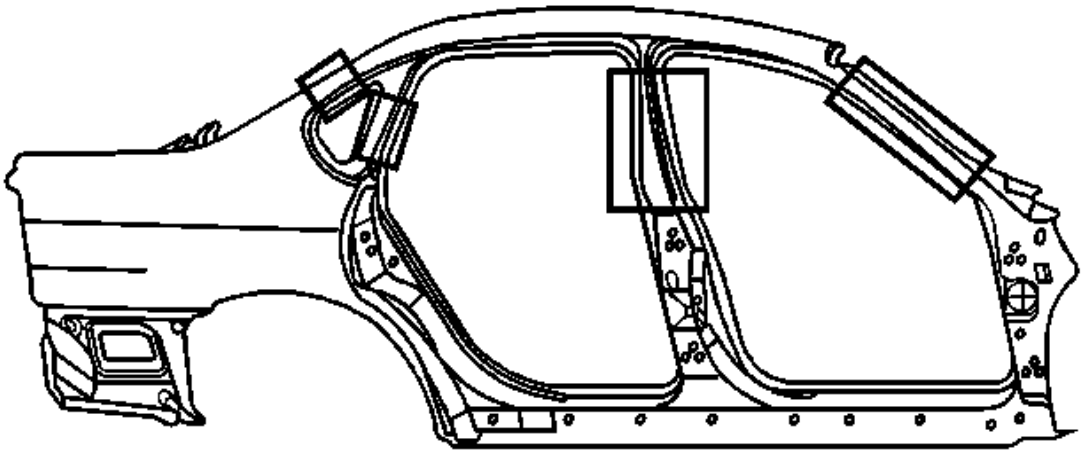

Fig. 88: Sectioning Outer Door Frame (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

4. Sectioning in the A, B, or C pillars of the outer door frame opening requires the use of a 50 mm (2 in) backing plate.

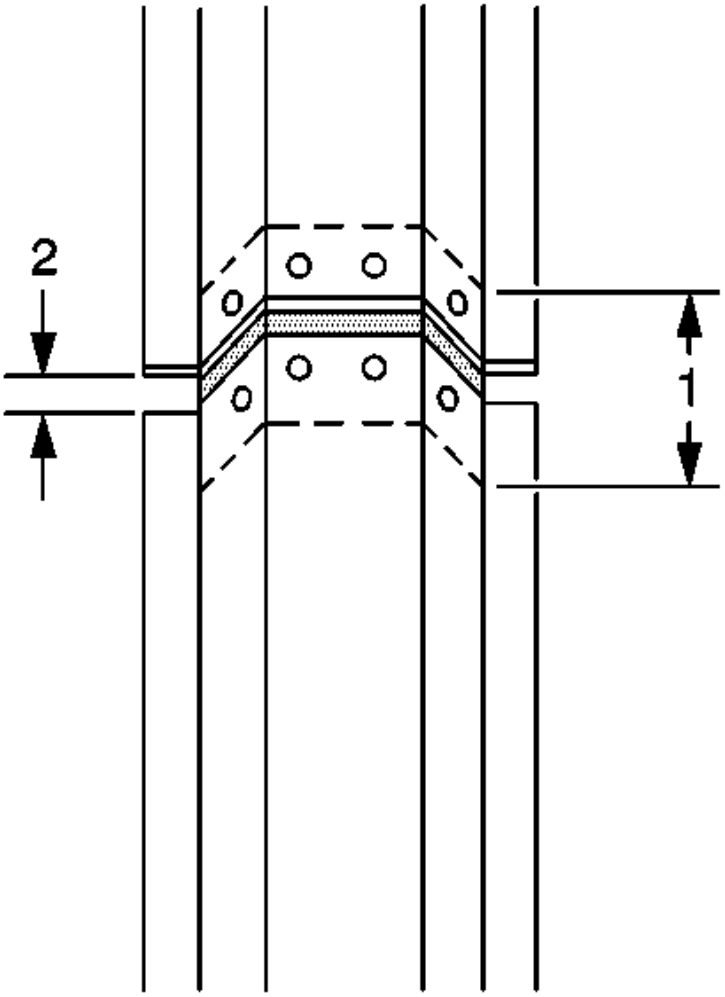

Fig. 89: Cutting Service Part For Backing Plate (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When sectioning the outer door frame at the lower front hinge pillar of at the center lock pillar, the inner reinforcement panel can be used as a backing plate.**

5. Cut a 50 mm (2 in) piece (1) from the unused portion of the service part for a backing plate, leaving a gap of 1 1/2 times the thickness of the metal (2).
6. Drill 8 mm (5/16 in) holes for plug welding in the service part in the locations noted from the original panel.
7. Drill holes for plug welding along the sectioning cuts on both the service part and the original panel.
8. Prepare the mating surfaces as necessary. Position the backing plates on the body with 50 percent of the backing plate exposed.
9. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
10. Plug weld accordingly.
11. Position the service part to overlap the exposed 50 percent of the backing plate.
12. Check the fit using 3-dimensional measuring equipment.

13. Plug weld accordingly.

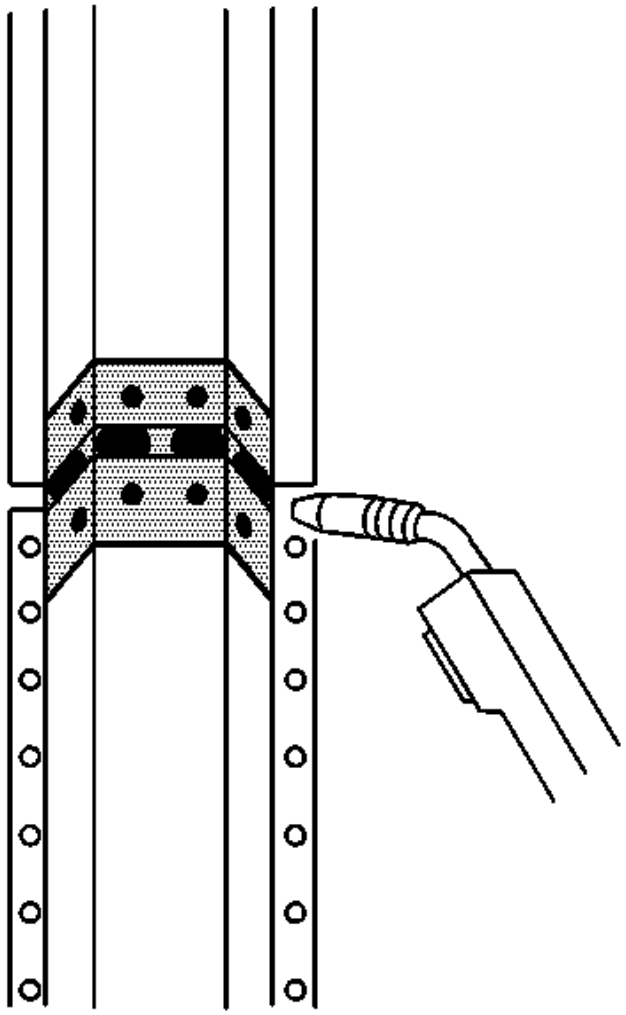

Fig. 90: Welding Sectioning Joint (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

14. Stitch weld along the entire sectioning joint.
15. Make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between.
16. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.
17. Complete all other welds and sectioning procedures as necessary.
18. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

NOTE: **Apply the sound deadening foam in the locations noted from the removal process.**

19. Prime with 2-part catalyzed primer.

20. Apply sealers and anti-corrosion materials as necessary.
21. Install all related panels and components.

ROOF PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

NOTE: The roof panel is serviced as a complete assembly, including the outer panel and the inner reinforcements. The roof panel is attached by a number of welds which must be drilled to remove the outer panel and inner reinforcements for servicing.

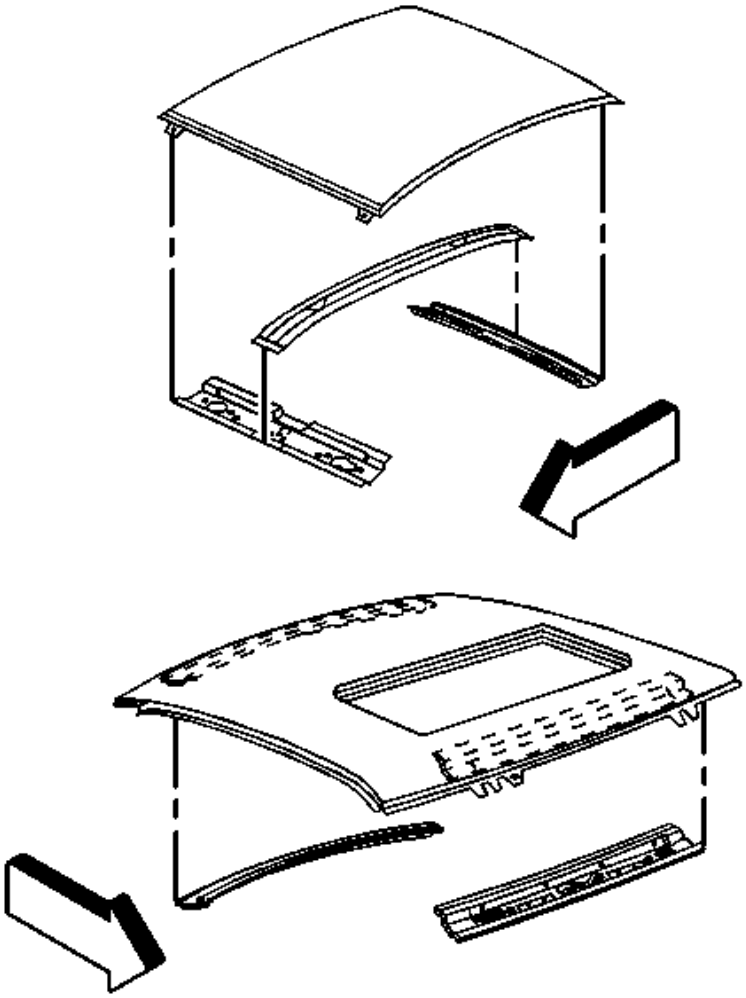

Fig. 91: Roof Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove all related panels and components necessary to access the welds attaching the roof assembly to the vehicle.
2. Visually inspect and restore as much of the damage as possible.

3. Remove sealers and anti-corrosion materials as necessary.
4. Locate, mark, and drill out all factory welds. Note the number and location of welds for installation of the service assembly.

NOTE: **A second person may be needed to safely remove the roof assembly and prevent damage to the vehicle.**

5. Remove the damaged roof panel assembly.

Installation Procedure

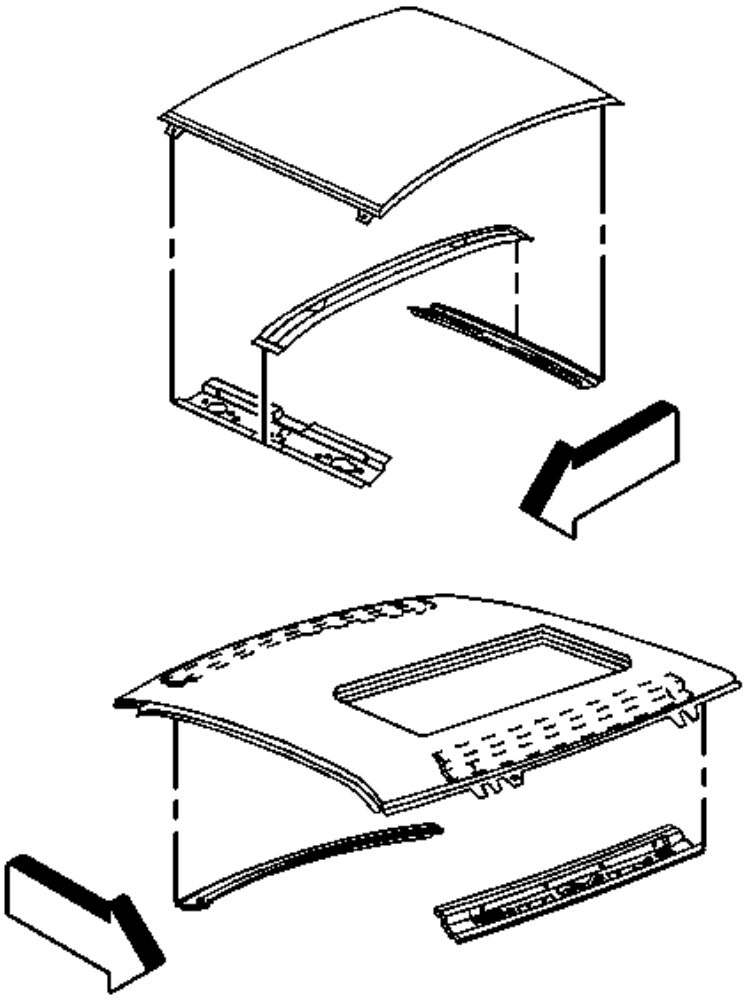

Fig. 92: Roof Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Clean and prepare the mating surfaces as necessary.
2. Position the roof panel on the vehicle.
3. Check fit and alignment.
4. Correctly position the service assembly and plug weld accordingly.
5. Clean and prepare all welded surfaces.

6. Prime with 2-part catalyzed primer.
7. Apply sealers and anti-corrosion materials as necessary.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

8. Install all related panels and components.

QUARTER PANEL REPLACEMENT

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

NOTE: **The quarter panel is serviced as a body side service assembly which includes the outer door frame opening, and the lower rear quarter close-out panel. Replacement of the quarter panel requires removal of the quarter glass and the back glass. A special sectioning procedure has been developed for improved serviceability.**

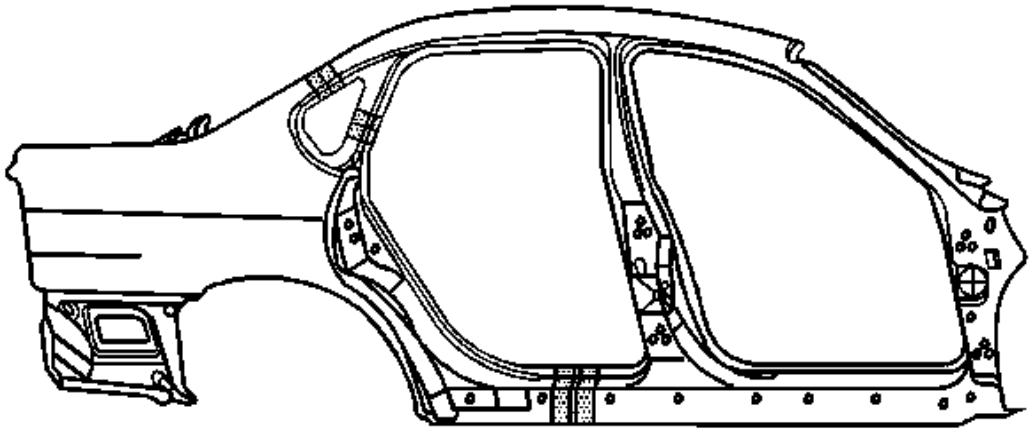

Fig. 93: Quarter Panel Location (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect and restore as much of the damage as possible to factory specifications.
2. Remove all related panels and components.
3. Remove sealers and anti-corrosion materials as necessary.
4. Scribe a cut line in upper quarter area.
5. Scribe a cut line in the rocker panel area.
6. Cut damaged section at marked locations.
7. Locate and mark all factory welds. Note the number and location of welds for installation of the service assembly.
8. Drill out all factory welds.

NOTE: **Note the location of the sound deadening foam for installation.**

9. Remove the damaged quarter panel.

Installation Procedure

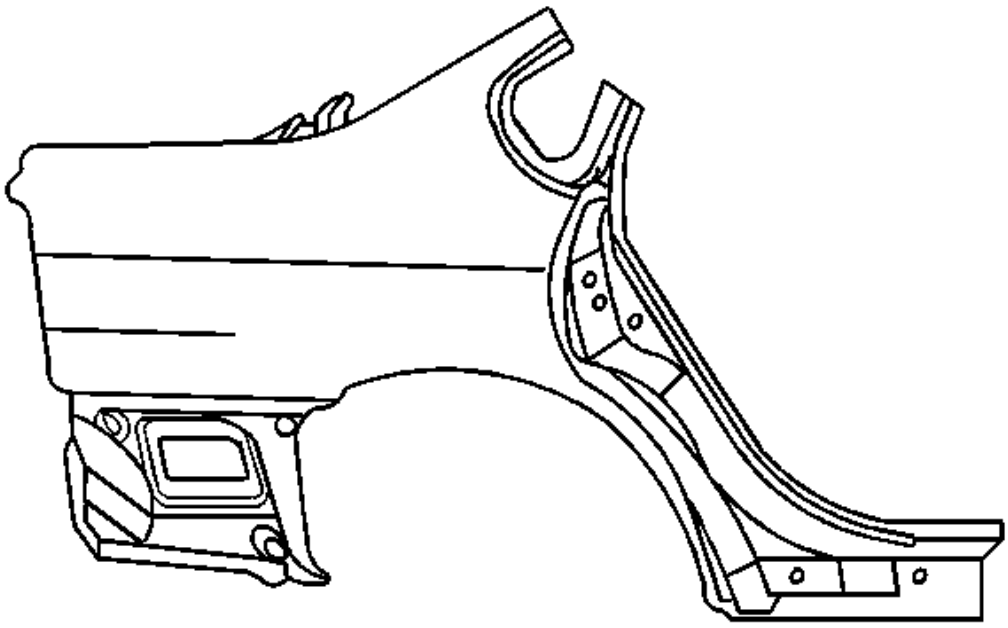

Fig. 94: Quarter Panel (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Prepare the mating surfaces as necessary.
2. On the service part, locate where to cut the upper quarter and rocker areas. Leave extra length in these areas for trimming.
3. Refer to general sectioning for appropriate usage of backing plates.
4. Trim the quarter panel to leave a gap of one and one-half times the thickness of the metal at the sectioning joints.
5. Check for proper fit and alignment.
6. Plug weld accordingly.

NOTE: **The glass bonding area should be a primer surface ONLY, and NOT an after-market top-coated (paint, or color coated) surface.**

7. Clean and prepare all welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendation.**

8. Prime with 2-part catalyzed primer.

NOTE: **It is important to apply the sound deadening foam in the locations noted from removal.**

9. Apply sealers and anti-corrosion materials as necessary.
10. Install all related panels and components.

REAR RAIL REPLACEMENT

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

NOTE: **Full rail replacement will require the removal of either the crossbar or an inner wheelhouse assembly. If sectioning is permitted, locate the diemark (3) on the lower surface of rail.**

1. Remove all related panels and components including the rear suspension and seat.
2. Visually inspect and restore as much of the damage as possible to factory specifications.
3. Remove the following as necessary:
    - Sealers
    - Sound deadeners
    - Anti-corrosion materials

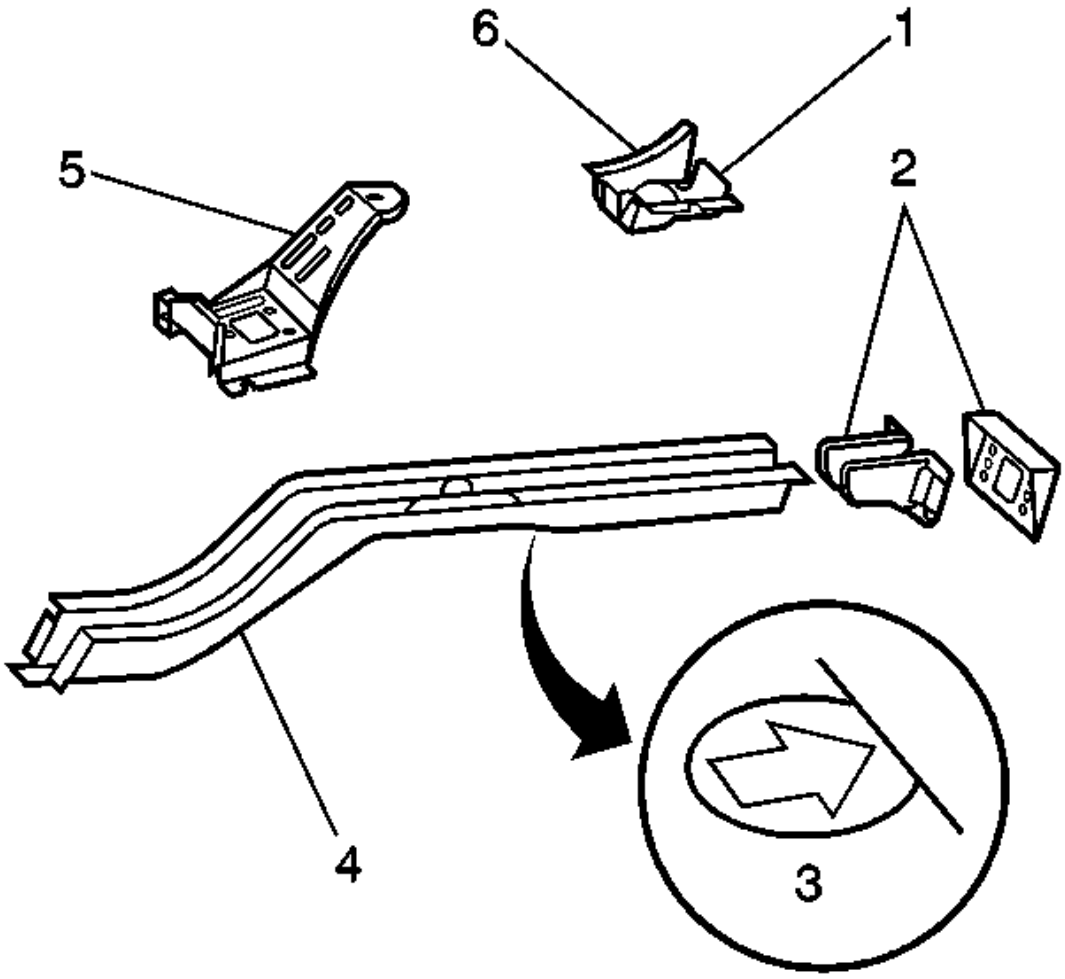

Fig. 95: Rear Rail Components
Courtesy of GENERAL MOTORS COMPANY

4. Locate, mark, and drill out all factory welds attaching the control arm mounting bracket (1) and the rear rail (4) to the vehicle.
5. The factory welds attaching the control arm mounting bracket weld flange (6) to the inner rocker panel must be drilled out from inside the vehicle.

NOTE: **The corner of the floor panel above this area will need to be positioned out of the way (6).**

6. Locate, mark and drill out all factory welds. Note the number and location of welds for installation of the service assembly.
7. Remove the damaged rear rail assembly.

Installation Procedure

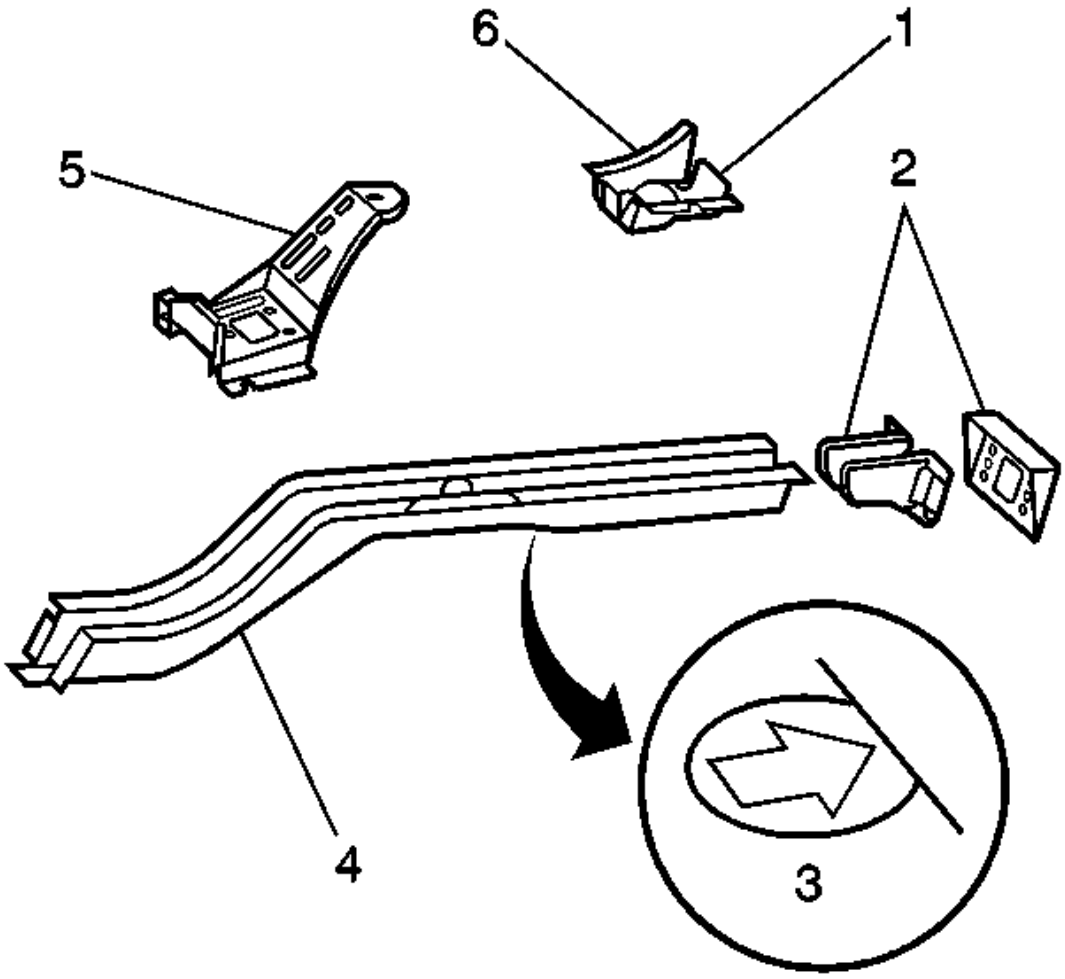

Fig. 96: Rear Rail Components
Courtesy of GENERAL MOTORS COMPANY

1. Clean and prepare the mating surfaces.
2. Check for proper fit of the rear rail service assembly.
3. Drill 8 mm (5/16 in) plug weld holes on the service assembly as necessary in the locations noted from the original assembly.
4. Position the service assembly.
5. Check fit with 3-dimensional measuring equipment.
6. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
7. Plug weld accordingly with frequent measurements to ensure proper fit.
8. Plug weld the control arm mounting bracket weld flange (6) to the inner rocker.
9. Reposition the floor panel into its original location.
10. Weld as necessary.

NOTE: **The bumper mounting bracket (2) holes must be properly located and**

drilled. Use 3-dimensional measuring equipment.

11. Clean and prepare all welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

12. Prime with 2-part catalyzed primer.
13. Apply sealers and anti-corrosion materials as necessary.
14. Apply sound deadening materials to restore sound deadening quality as manufactured.
15. Install all related panels and components.

REAR RAIL SECTIONING

Removal Procedure

WARNING: **Refer to Approved Equipment for Collision Repair Warning .**

Sectioning procedures can be used to repair the rear rail if just the portion rearward of the crossbar is damaged. Unique service parts are available for sectioning. The sub-assembly consists of the outer rail panel with the bumper mounting brackets attached.

NOTE: **If damage exceeds the recommended area for sectioning and the rail cannot be straightened, the complete rail must be replaced.**

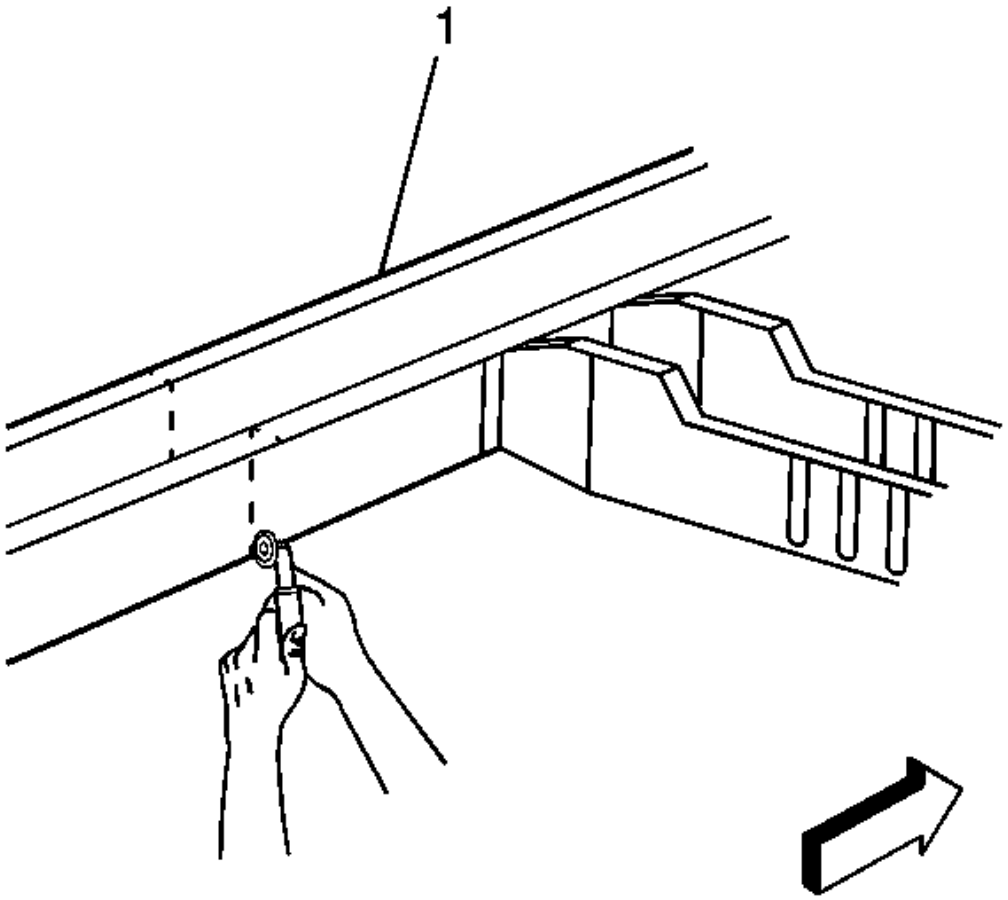

Fig. 97: Marking Damaged Rail
Courtesy of GENERAL MOTORS COMPANY

1. Remove all related panels and components.
2. Visually inspect and restore as much of the damage as possible to factory specifications.
3. Remove sealers and anti-corrosion materials as necessary.
4. Locate, mark, and drill out all factory welds. Note the number and location of welds for installation of the service assembly.
5. Use a straight edge to scribe a line around the rail.
6. Cut the damaged rail (1).
7. Remove the damaged section of the rail.

Installation Procedure

NOTE: **Note the size and the location of the precut service part.**

1. Measure 30 mm (1 3/16 in) on the service part and mark cut lines.

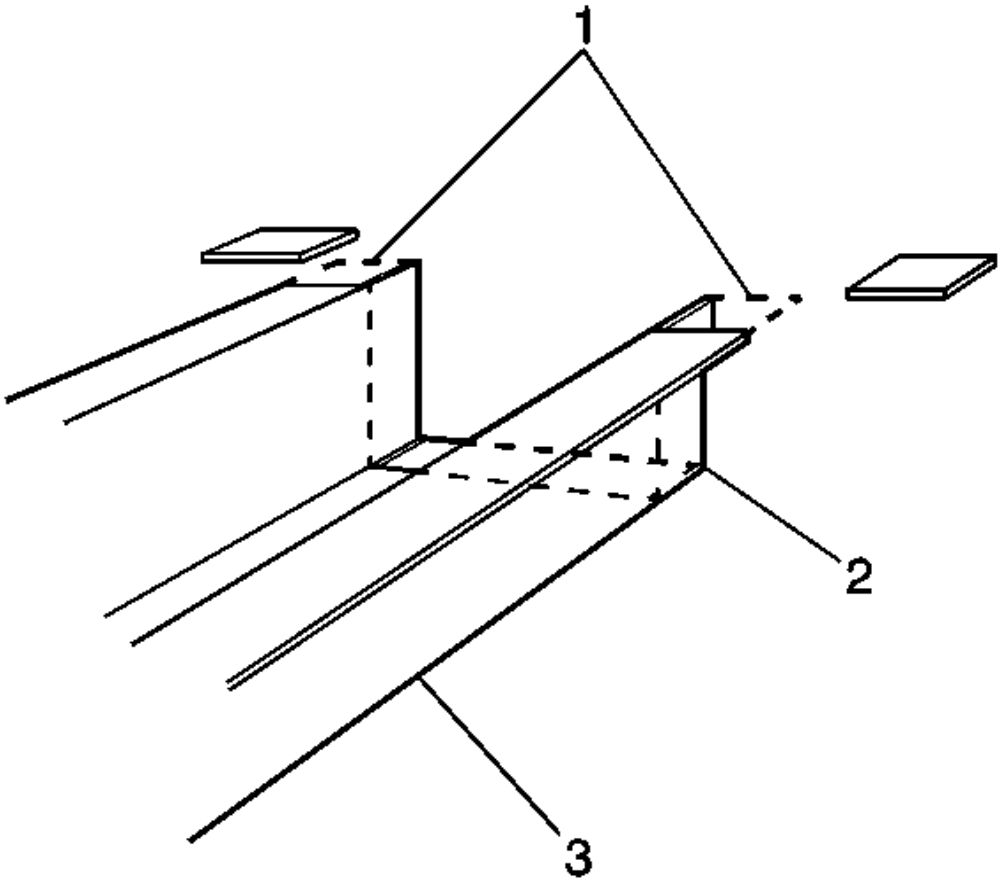

Fig. 98: Cutting Service Rail
Courtesy of GENERAL MOTORS COMPANY

2. Cut and remove 30 mm (1 3/16 in) from the flanges on either side (1) of the service rail (3) to create 30 mm (1 3/16 in) tabs.
3. Cut 5 mm (3/16 in) wide gaps in the bottom corners (2).

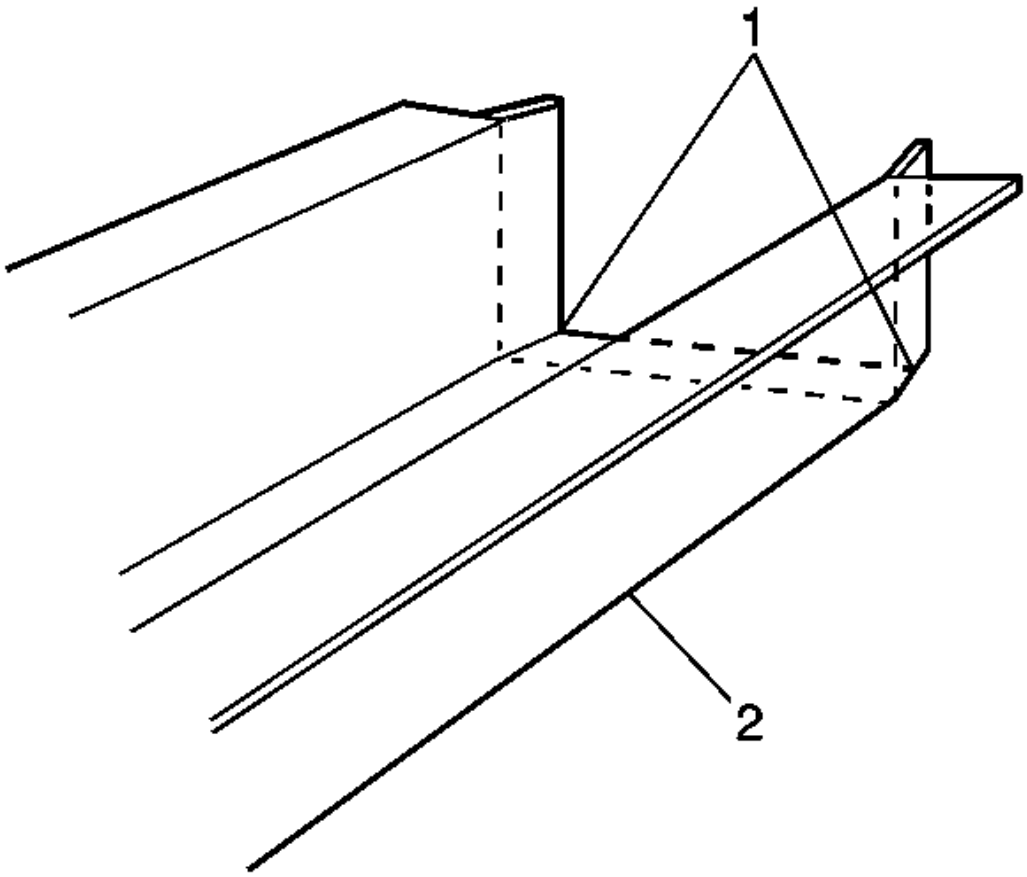

Fig. 99: Service Rail & Tabs
Courtesy of GENERAL MOTORS COMPANY

4. Step the tabs inward (1) to allow the service part (2) to fit inside of the original rail.
5. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
6. Weld the tabs together along the edges (1).
7. Clean and prepare the mating surfaces.
8. Position the service part.
9. Check fit with 3-dimensional measuring equipment.
10. Plug weld accordingly.

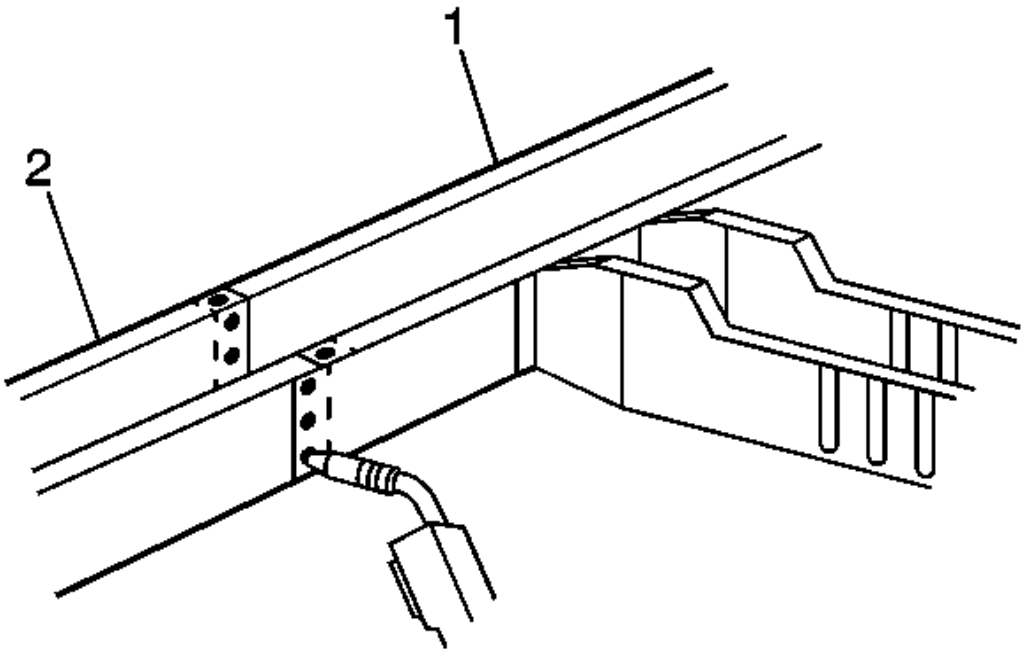

Fig. 100: Stitch Welding Service Rail Joint
Courtesy of GENERAL MOTORS COMPANY

11. Stitch weld along the entire joint (2).
12. Make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between.
13. Go back and complete the stitch weld. This will create a solid joint with minimal heat distortion.

NOTE: **The bumper mounting holes must be properly located and drilled. Use 3-dimensional measuring equipment.**

14. Clean and prepare welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

15. Prime with 2-part catalyzed primer.
16. Apply sealers and anti-corrosion materials as necessary.

17. Install all related panels and components.

FLOOR PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

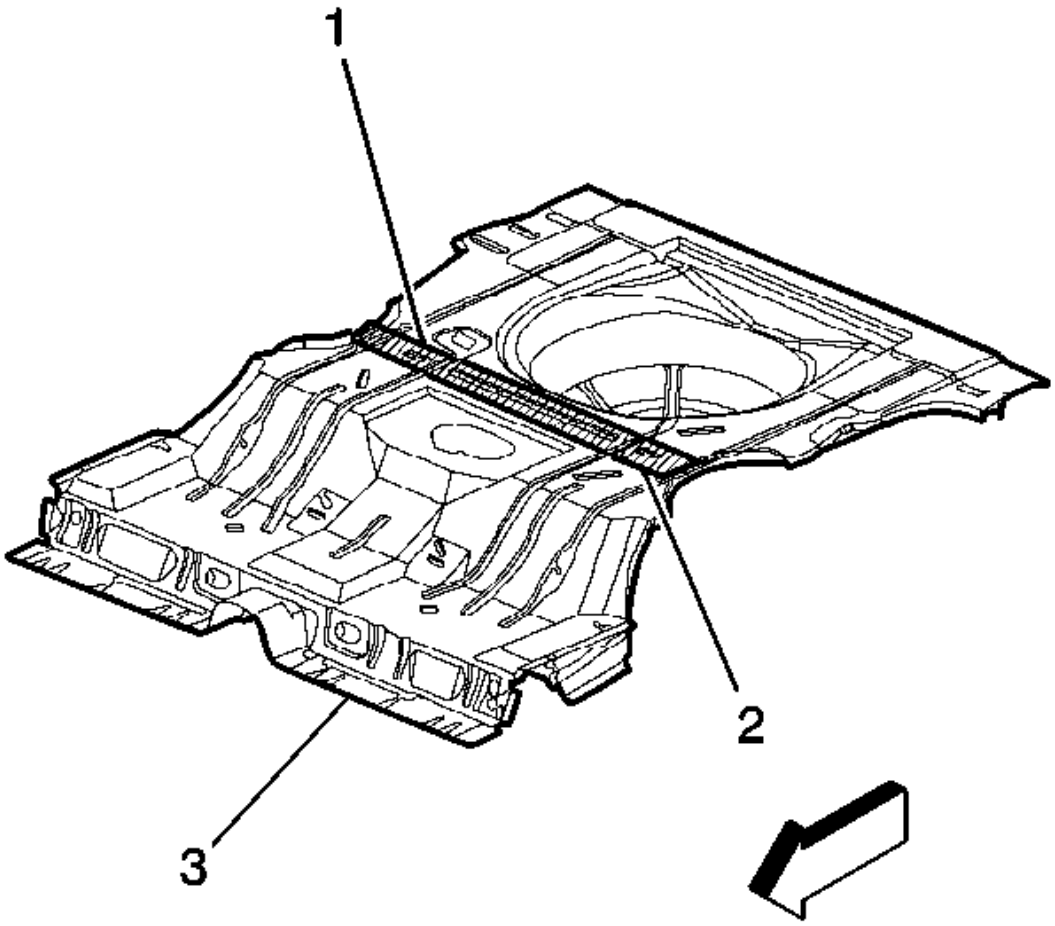

Fig. 101: Floor Panel (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

NOTE: The damaged rear floor should be cut along the rearward edge of the rear crossbar (1), and the service part should be cut so that the new floor section extends to the forward edge of the rear crossbar (2). This allows the two sections to overlap where the crossbar is attached (2). The cut to the damaged floor will be about 790 mm (31 1/8 in) from the rear edge of the floor panel.

1. Remove all related panels and components as necessary, including the following:
   - The rear end panel

- The quarter panels
- The quarter panel extensions

2. Visually inspect and restore as much of the damage as possible.
3. Remove the following as necessary:
    - The sealers
    - The sound deadeners
    - The anti-corrosion materials
4. Locate and mark all factory welds rearward of the rear crossbar including those along the lower edge of the wheelhouse.
5. Note the number and location of welds for installation of the floor service assembly.
6. Drill out all factory welds.

NOTE: **Drill out the factory welds rearward of the crossbar only. Do not drill out the welds attaching the floor to the crossbar.**

7. Cut the damaged floor along the rear edge of the crossbar.
8. Do not damage the following:
    - The rear rails
    - The crossbar
    - The wheelhouse
9. Remove the damaged floor section.

Installation Procedure

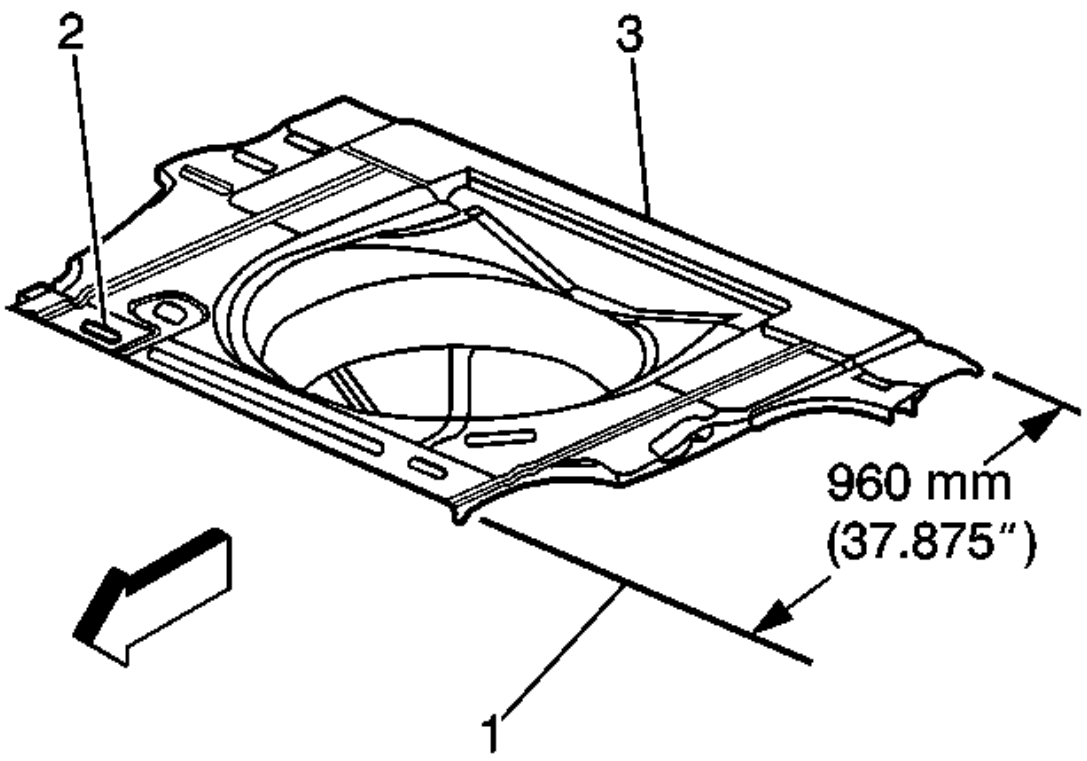

Fig. 102: Rear Floor Service Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The service part is supplied as a rear floor assembly.**

1. Measure 960 mm (37 3/4 in) forward from the rear edge of the rear floor service assembly, mark the location, and cut accordingly.
2. Prepare the mating surfaces as necessary.
3. Check for proper fit.
4. Allow the floor service assembly (3) to overlap the original floor on top of the rear crossbar (2).
5. Mark the location of the rear rail and crossbar flanges on the bottom of the floor service assembly.
6. Drill 8 mm (5/16 in) plug weld holes as necessary in the locations noted from the original floor assembly (3).
7. Drill holes approximately 40 mm (1 in) apart where the new floor section attaches to the rear rail and crossbar flanges.
8. Position the service assembly and check for proper fit.
9. Apply 3M Weld-Thru Coating P/N 05916 or equivalent to all mating surfaces.
10. Plug weld accordingly (1).

11. Clean and prepare all welded surfaces.

NOTE: **Prior to refinishing, refer to GM 4901MD-99 Refinish Manual for recommended products. Do not combine paint systems. Refer to paint manufacturer's recommendations.**

12. Apply 2-part catalyzed primer.

NOTE: **The rear crossbar areas must be properly sealed from moisture and dirt to seal both the front and rear edges of the crossbar as well as the inner seams.**

13. Apply the following materials as necessary:
    - The sealers
    - The sound deadeners
    - The anti-corrosion materials
14. Install all related panels and components.

DESCRIPTION AND OPERATION

DOOR FRAME DESCRIPTION

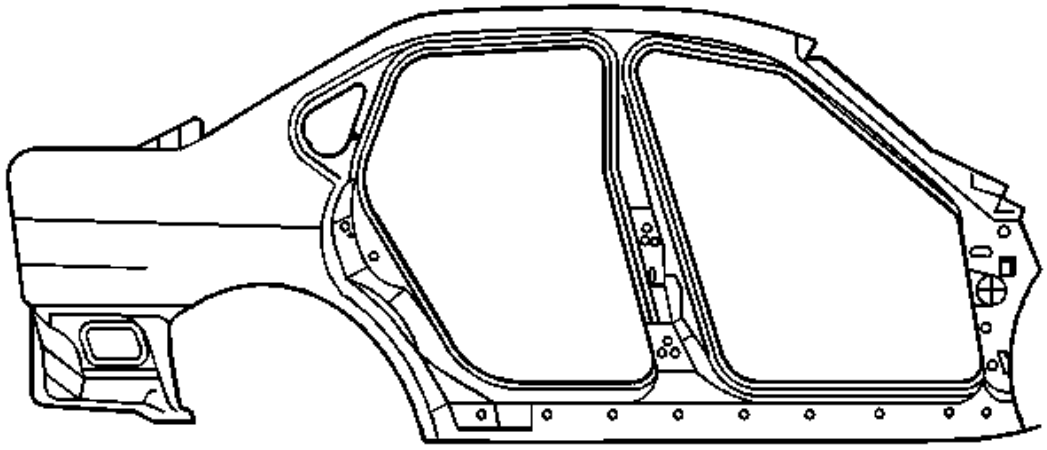

Fig. 103: Outer Door Frame
Courtesy of GENERAL MOTORS COMPANY

The outer door frame can be replaced as a complete service part or various segments can be sectioned. Complete service part replacement requires the removal of the roof panel. Sectioning the outer door frame and inner door frame reinforcement is usually much faster and more cost effective. Since the outer door frame is manufactured as a single component, service parts for sectioning must be cut from the service panel and modified as necessary. Sectioning should take place in shaded areas only.

HIGH STRENGTH LOW ALLOY STEEL

This information provides repair recommendations and general guidelines for steel classified as High Strength Low Alloy Steel, also known as HSLA. This type of steel normally has a tensile strength range from 300-700 MPa.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.

- Controlled use of heat can be used to repair damage, if the heat does not exceed 650Â°C (1200Â°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- When recommended in a specific sectioning procedure, this type of steel can be used as a weld plate for reinforcing the sectioning location.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

MILD STEEL

This information provides repair recommendations and general guidelines for steel classified as Mild Steel. This type of steel normally has a tensile strength less than 270 MPa. This includes the common steel names of:

- Mild Steel
- Bake Hardenable Steel (BH)
- Solid Solution Strengthened Steel

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs:

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650Â°C (1200Â°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- When recommended in a specific sectioning procedure, this type of steel can be used as a weld plate for reinforcing the sectioning location.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

RADIATOR SUPPORT DESCRIPTION

Radiator Support Assembly

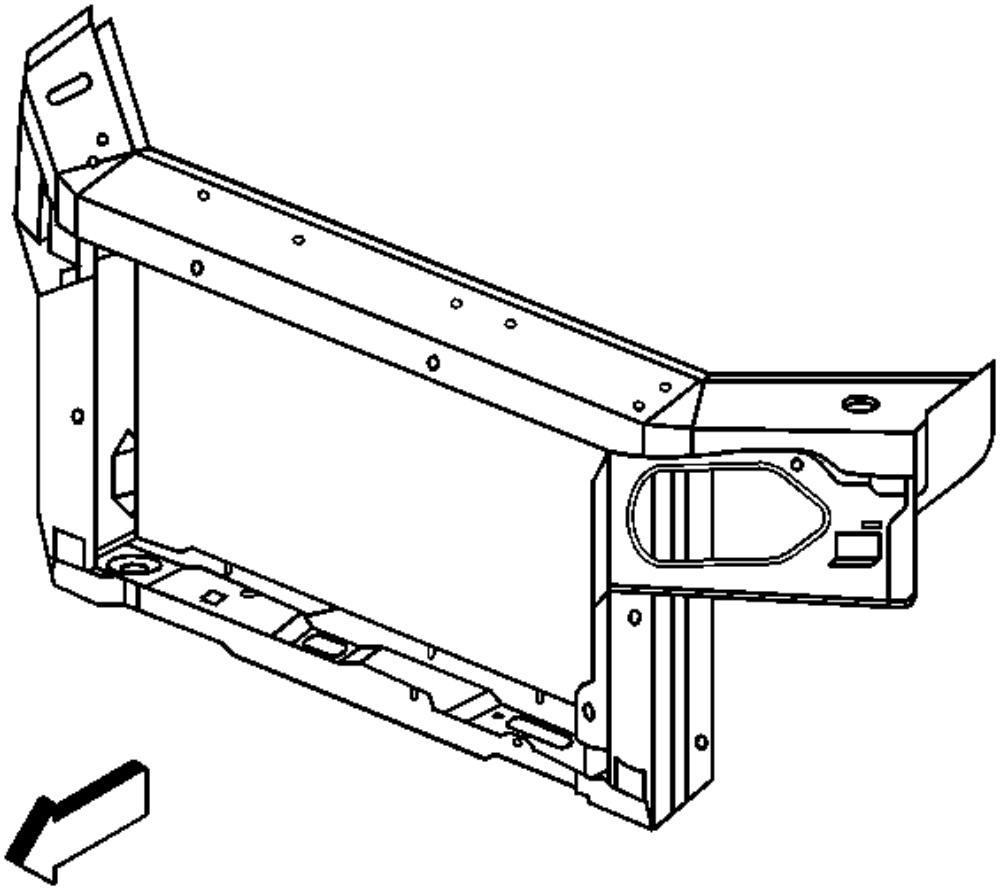

Fig. 104: Radiator Support
Courtesy of GENERAL MOTORS COMPANY

The radiator support can be serviced as a complete assembly.

The radiator is made up of 5 major components:

- Four upper
- One lower

Upper Radiator Support

The upper radiator support is an assembly consisting of four components:

- Two-piece upper tie bar
- Left and Right engine compartment front panels

Lower Radiator Support

The lower radiator support is available as a separate replaceable component if necessary.

REPAIR INSTRUCTIONS

FRONT FENDER EMBLEM/NAMEPLATE REPLACEMENT

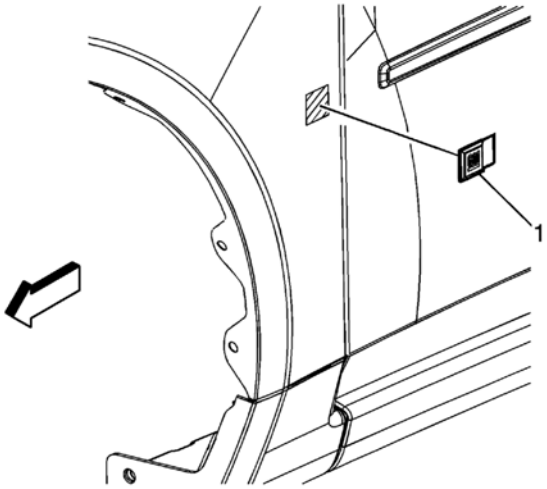

Fig. 1: Front Fender Emblem/Nameplate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Fender Nameplate • When removing protective liners from adhesive backed nameplates, be careful not to touch the tape with hands and do not allow the tape to come in contact with dirt or any foreign matter prior to adhesion. • Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old nameplate. Clean all the adhesive residue from the fender, wipe the surface dry with a clean lint-free towel prior to installing new nameplate. **Special Tools**

Callout	Component Name
	J 25070 Heat Gun 500-750Â°F

FRONT SIDE DOOR EMBLEM/NAMEPLATE REPLACEMENT

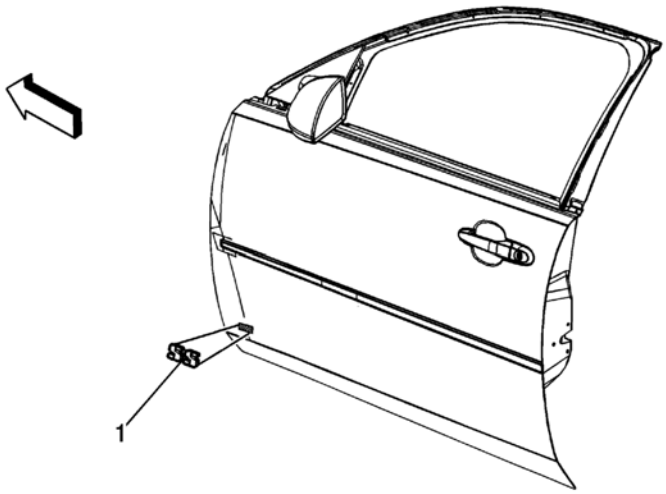

Fig. 2: Door Emblem/Nameplate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Emblem Assembly, Front Door IMPORTANT: When removing protective liners from adhesive backed emblems, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. **TIP:** Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old emblem. Clean all the adhesive residue from the door, wipe surface dry with a clean lint-free towel prior to installing new emblem.

FRONT SIDE DOOR WINDOW FRAME REAR APPLIQUE AND OUTER WEATHERSTRIP REPLACEMENT (IMPALA LIMITED)

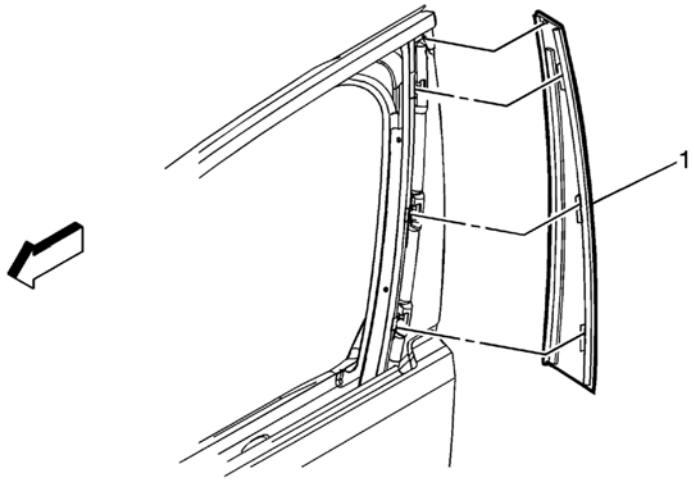

Fig. 3: Front Door Frame Applique/Runchannel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Front Side Door Window Frame Applique **TIP:** The applique is secured with 3 metal clips located in the glass run channel.

REAR COMPARTMENT LID APPLIQUE REPLACEMENT

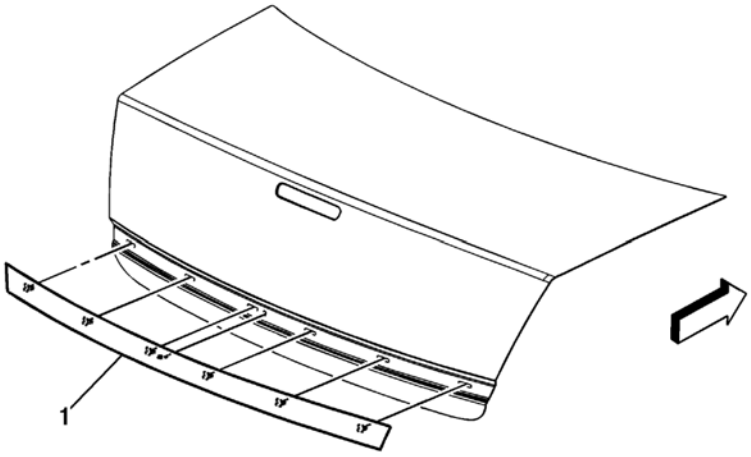

Fig. 4: Rear Compartment Lid Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Applique, Rear Compartment **TIP:** Use a flat-bladed tool and gently pry the applique from the compartment lid.

REAR SIDE DOOR WINDOW FRAME FRONT APPLIQUE AND FRONT CHANNEL REPLACEMENT

Removal Procedure

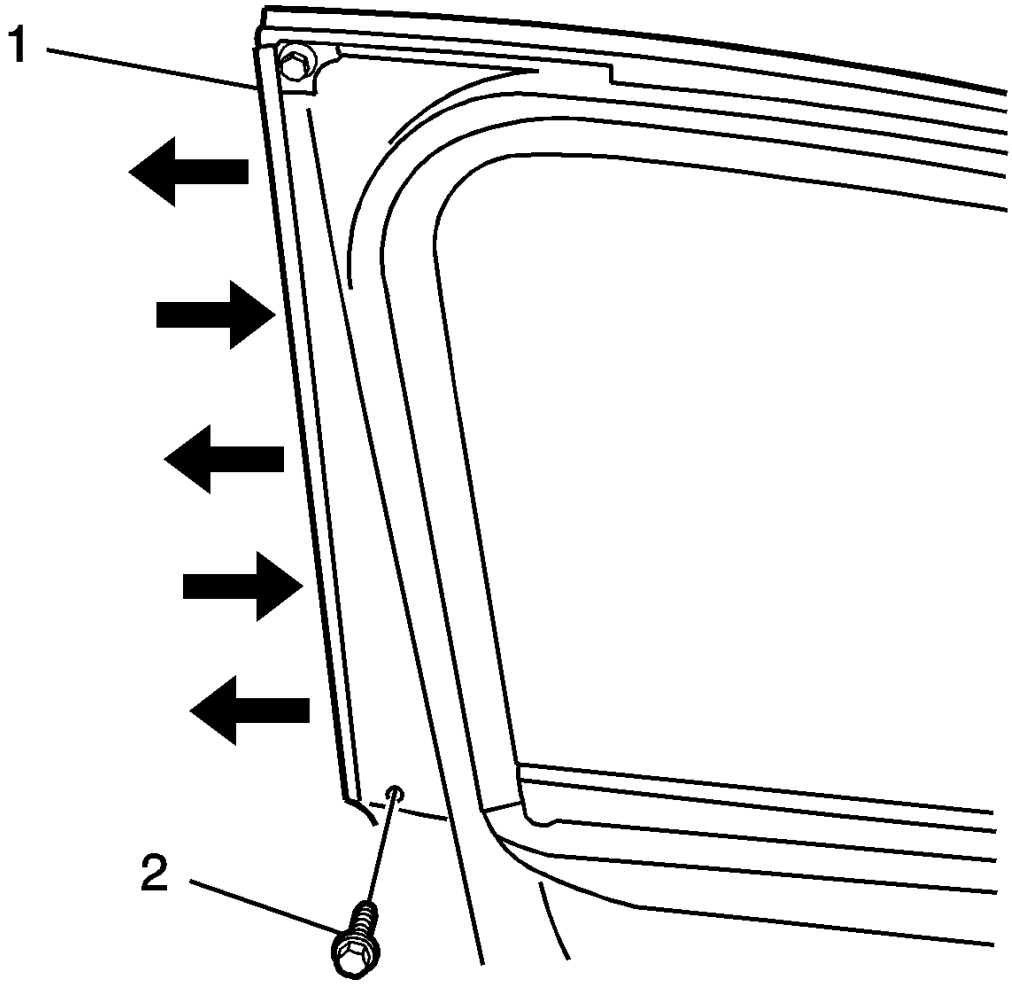

Fig. 5: Inside Door Frame Screws & Weatherstrip (Front Door)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: To avoid paint damage, protect the area surrounding the part which you are removing or installing.

1. Apply masking tape to the door frame and applique.
2. Lower the window to the full down position.
3. Remove the window channel retainer. Refer to **Rear Side Door Window Channel Retainer Replacement** .
4. Remove the screws (1, 2) from the upper and lower corners of the inside door frame.
5. Pull the window run channel weatherstrip out of the retainer and reposition it in order to access to the applique rivets.

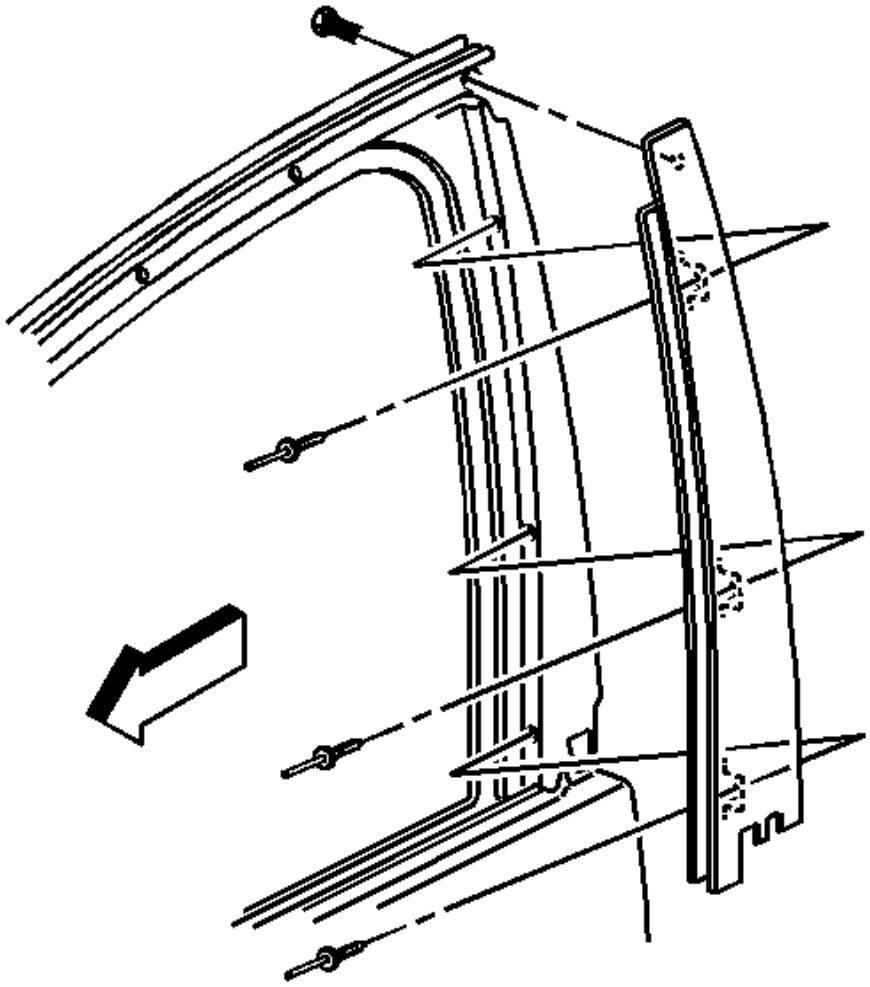

Fig. 6: Window Channel Retainer Rivets & Door Frame Applique/Run Channel (Front Door)
Courtesy of GENERAL MOTORS COMPANY

6. Drill out the 4 mm (5/32 in) rivets along the inside edge of the window channel retainer.
7. Pull upward to release the applique from the door frame.

Installation Procedure

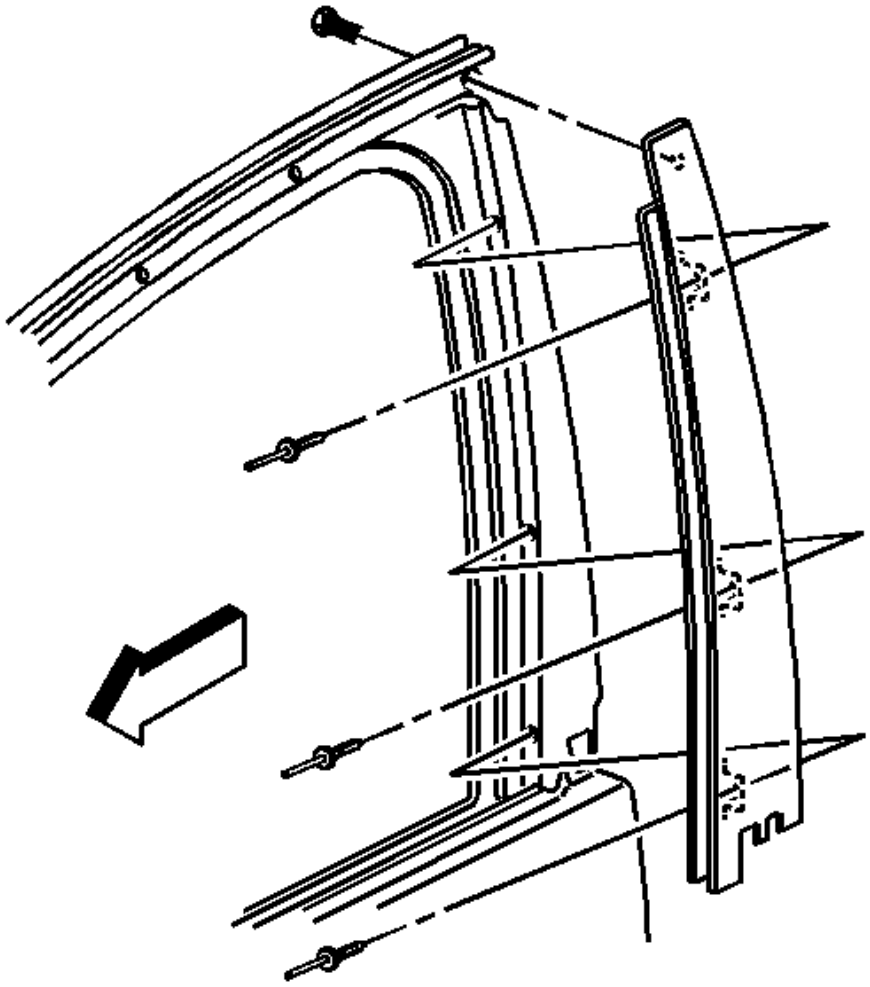

Fig. 7: Window Channel Retainer Rivets & Door Frame Applique/Run Channel (Front Door)
Courtesy of GENERAL MOTORS COMPANY

1. Install the applique to the door frame.
2. Install the new 4 mm (5/32 in) rivets along the inside edge of the window channel retainer to secure the applique to the door frame.

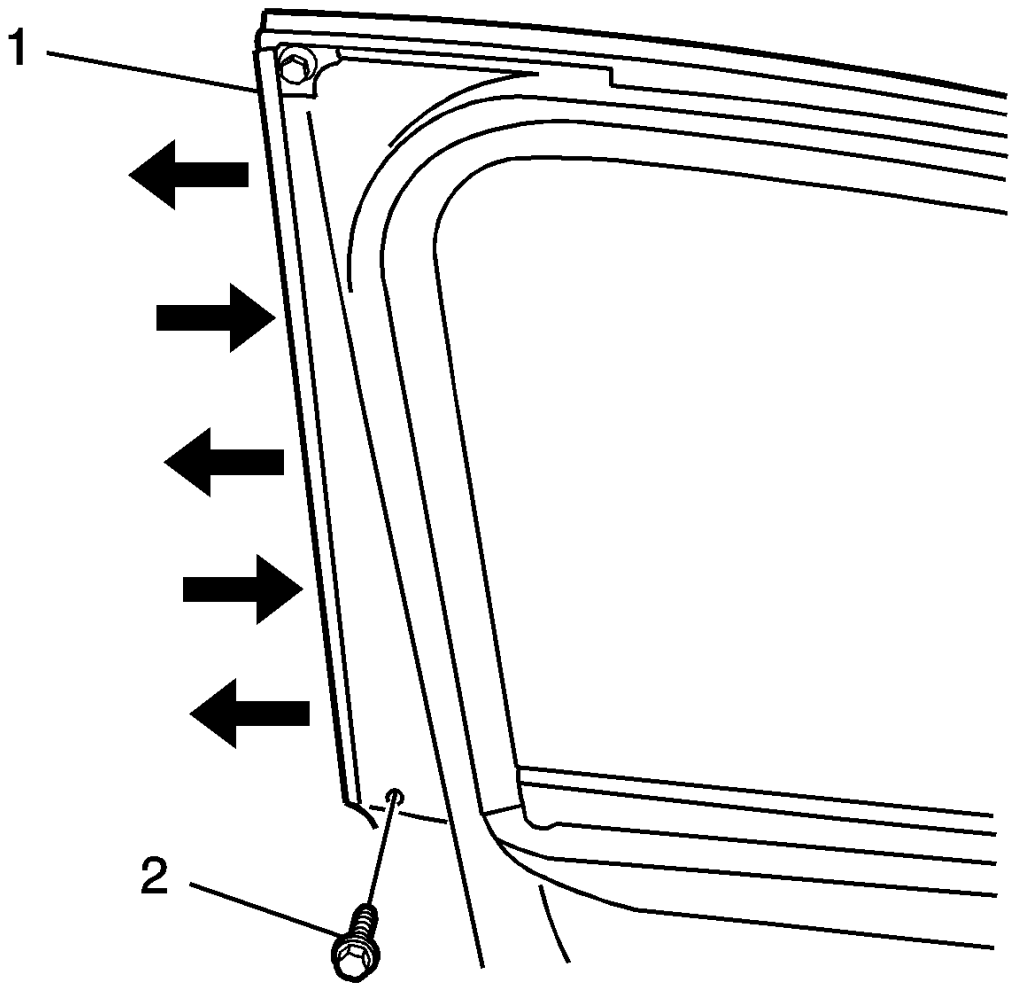

Fig. 8: Inside Door Frame Screws & Weatherstrip (Front Door)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the screws (1, 2) to the upper and lower corners of the inside door frame.

   Tighten

   Tighten the screws to 2 N.m (18 lb in).

4. Install the window channel retainer. Refer to **Rear Side Door Window Channel Retainer Replacement** .
5. Install the window weatherstrip.
6. Remove masking tape.
7. Inspect the window for proper operation.

DECAL OR STRIPE REPLACEMENT

A pressure sensitive adhesive adheres the stripes and decals to the painted surfaces.

Use a wetting solution in order to lift and position the stripe or decal during installation.

A wetting solution ensures a better bond between the stripe or decal and the panel assembly.

If the metal or underlying painted surfaces are damaged, repair and refinish the metal as needed before you install the stripes or decals.

CAUTION: **Striping material highlights vehicle surface imperfection. All dings, rough metal, paint defects and uneven two-tone paint breaklines must be eliminated before stripe/decal application. Freshly painted surfaces must be allowed to dry thoroughly before installing stripe or decal. Residual solvents in fresh painted surfaces can lead to subsequent blistering problems if stripe or decal is applied before complete release of solvents.**

Maintain body surface and decal temperature between 21-38Â°C (70 -100Â°F) during installation.

NOTE: **DO NOT apply the decals when the body surface and the decal temperatures are below 21Â°C (70Â°F).**

Use auxiliary heat sources to warm the body surface and decals if the temperature is less than 21Â°C (70Â°F).

CAUTION: **Use of harsh chemicals when cleaning can damage exterior lamps. Suggested cleaners are a mild soap and water, or Varnish Makers and Painters (VM&P) Naptha. VM&P Naptha is a specific type of naptha and should not be substituted by any other naptha.**

NOTE: **When you apply stripes or decals on flexible surfaces (fascias, etc.), use the WET method. The WET method reduces the formation of bubbles under the decal due to the outgassing potential of the flexible materials.**

You may apply stripes and decals dry. If the stripe or decal shows bubbles, use the "wet" method. Use the "wet" method for large graphics packages.

The following equipment and materials, or the equivalent, are necessary when making a quality stripe or decal installation:

- Wetting solution foaming type window cleaner that does not contain ammonia
- Silicone, wax and grease remover
- Varnish Makers and Painters (VM&P) naphtha
- Isopropyl alcohol
- Squeegee about 75-100 mm (3-4 in) wide, plastic or hard rubber. Deburr any sharp or rough edges in order to prevent scratching of the stripe or decal
- Water bucket and sponge or spray bottle
- Sandpaper 800 grit or finer, wet or dry type
- Heat gun
- Clean, lint-free wiping cloth
- Sharp knife or razor blade

- Scissors
- Fine pin or needle
- Marking pencil

Removal Procedure

1. Remove the necessary molding and trim panel.
2. Wash and clean the following items using Liquid Wash and Wax GM P/N 1052870 or the equivalent:
    - The repair surfaces
    - The adjacent panel
    - The openings
3. Remove the following components:
    - The molding attaching clips
    - The handles
    - The sidemarker reflector
    - Other stripe or decal overlapping parts

    CAUTION: To avoid damaging the paint finish, do not use pointed or sharp instruments to remove the stripe or the decal.

4. Use heat in order to remove the stripe or decal. Start at one edge and peel the stripe or decal from the panel surface.
5. Remove all traces of adhesive residue from the painted surfaces using the following items:
    - Silicone, wax and grease remover
    - Varnish makers and painters (VM&P) naphtha

Installation Procedure

1. Prepare the surface.

    CAUTION: To prevent possible vehicle, stripe or decal damage, always refer to manufacturer's packaged instructions.

    NOTE: If the area where you apply the stripe or decal has been refinished, remove any imperfections that may show through the stripe or decal.

2. Clean the painted surface with the following items:
    - Silicone
    - Wax
    - Grease remover
3. Clean the area where you apply the stripe or decal. Use a 50/50 mixture of isopropyl alcohol and water.
4. Wipe the panel surface with a clean cloth while the solvent drys.
5. Apply the wetting solution to the area where you install the stripe or decal.

NOTE: **DO NOT touch the adhesive backing of the stripes.**

6. Use the wetting solution on the adhesive side of the stripe or decal.
7. Remove the backing material of the stripe or decal as needed.
8. Install the stripe or decal to the panel.
9. Working from the center if possible, squeegee the stripe or decal into position.
10. Apply additional wetting solution in order to ease installation of the stripe or decal.

    Apply a soapy wetting solution on the top side of the stripe or decal for the following reasons:

    - In order to ease the pull of the squeegee on the stripe or decal
    - In order to eliminate the possibility of damage
11. Apply heat to the stripe or decal at recessed areas.
12. Press the stripe or decal into recess in order to obtain a firm bond.
13. Use adequate light reflection in order to detect any irregularities in the stripe or decal that may have developed during installation.

NOTE: **DO NOT use a razor blade or a knife edge.**

14. Use one of the following items in order to remove all bubbles by piercing:
    - A safety pin
    - A needle
    - A tool with the same size piercing tip
15. Pierce a bubble on the outer edge.
16. Force the air out from the opposite edge with the blade of the squeegee.
17. Install all previously removed components. Clean the components as needed.

FRONT BUMPER FASCIA EMBLEM/NAMEPLATE REPLACEMENT (BASE)

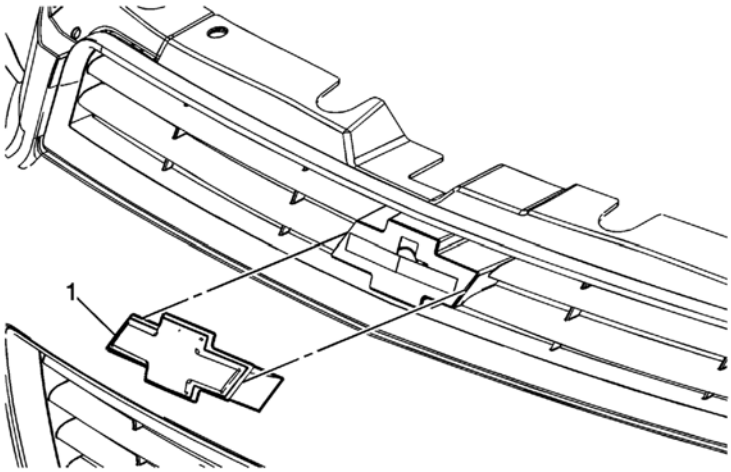

Fig. 9: Front Bumper Fascia Emblem/Nameplate (Base)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Plate Assembly, Front Bumper Fascia Name IMPORTANT: When removing protective liners from adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. **TIP:** Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old nameplate. Clean all adhesive from front bumper fascia, wipe surface dry with a clean lint-free towel prior to installing new nameplate.

QUARTER WINDOW REAR APPLIQUE EMBLEM REPLACEMENT (BASE)

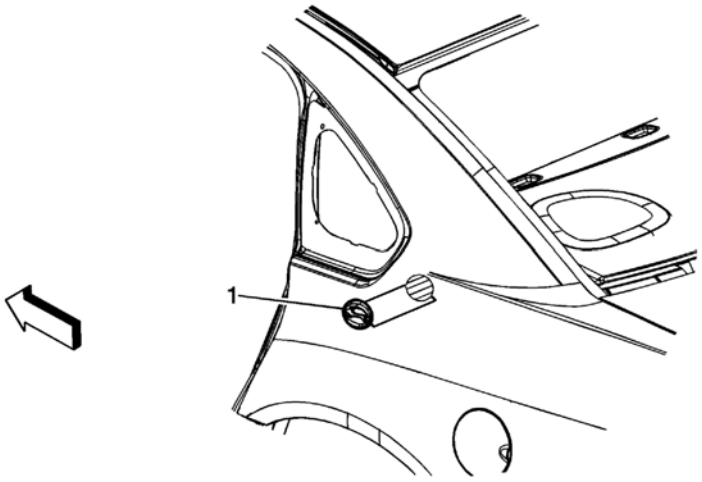

Fig. 10: Quarter Window Rear Applique Emblem (Base)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Quarter Window Rear Applique **Procedure** 1. Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old quarter window rear applique. Clean all adhesive from the quarter panel, wipe the surface dry with a clean lint-free towel prior to installing the new quarter window rear applique. 2. Apply the new quarter window rear applique in the same location as shown. 3. Apply pressure to the new quarter window rear applique to ensure full adhesion is made to the quarter panel. **TIP:** When removing protective liners from adhesive tape backed nameplates, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign

Callout	Component Name
	matter prior to adhesion. **Special Tools** **J 25070** Heat Gun 500-750Â°F

QUARTER WINDOW REAR APPLIQUE EMBLEM REPLACEMENT (50TH ANNIVERSARY EDITION)

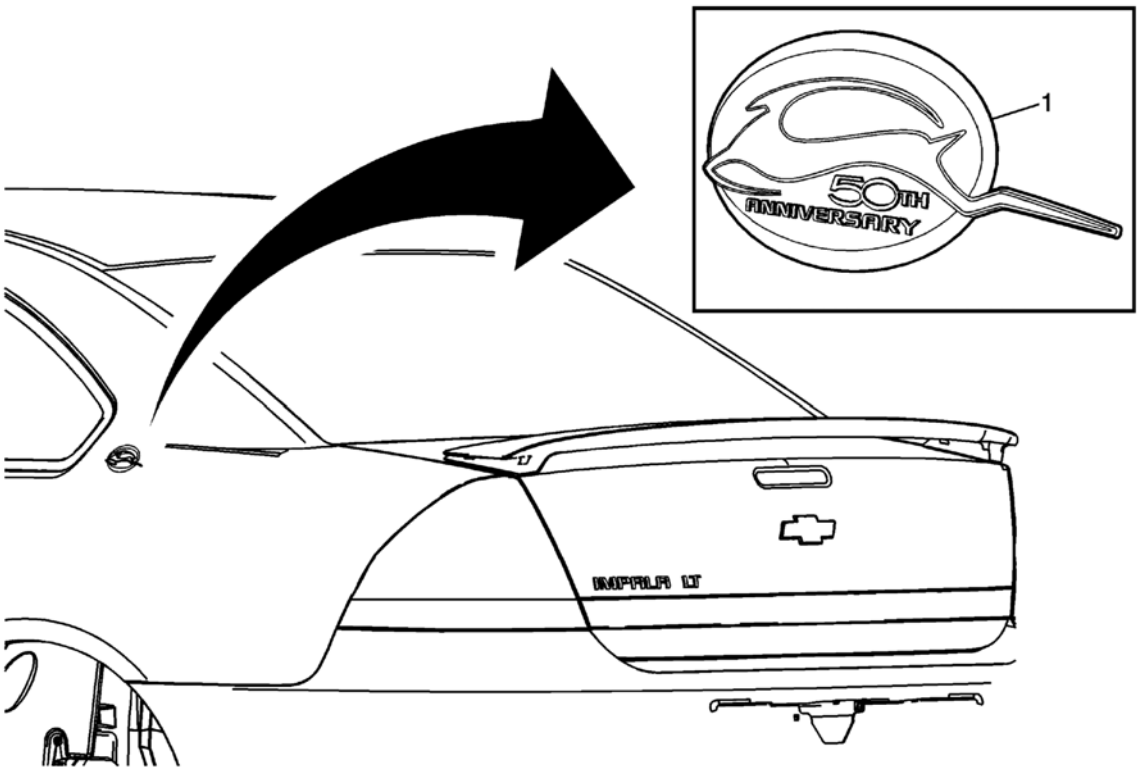

Fig. 11: Quarter Window Rear Applique Emblem (50th Anniversary Edition)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Quarter Window Rear Applique **Procedure** 1. Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old quarter window rear applique. Clean all adhesive from the quarter panel, wipe the surface dry with a clean lint-free towel prior to installing the new quarter window rear applique. 2. Apply the new quarter window rear applique in the same location as shown. 3. Apply pressure to the quarter window rear applique to ensure full adhesion is made to the quarter panel. **TIP:** When removing protective liners from adhesive tape backed nameplates, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign

Callout	Component Name
	matter prior to adhesion. **Special Tools** **J 25070** Heat Gun 500-750Â°F

REAR COMPARTMENT LID EMBLEM/NAMEPLATE REPLACEMENT (FFU)

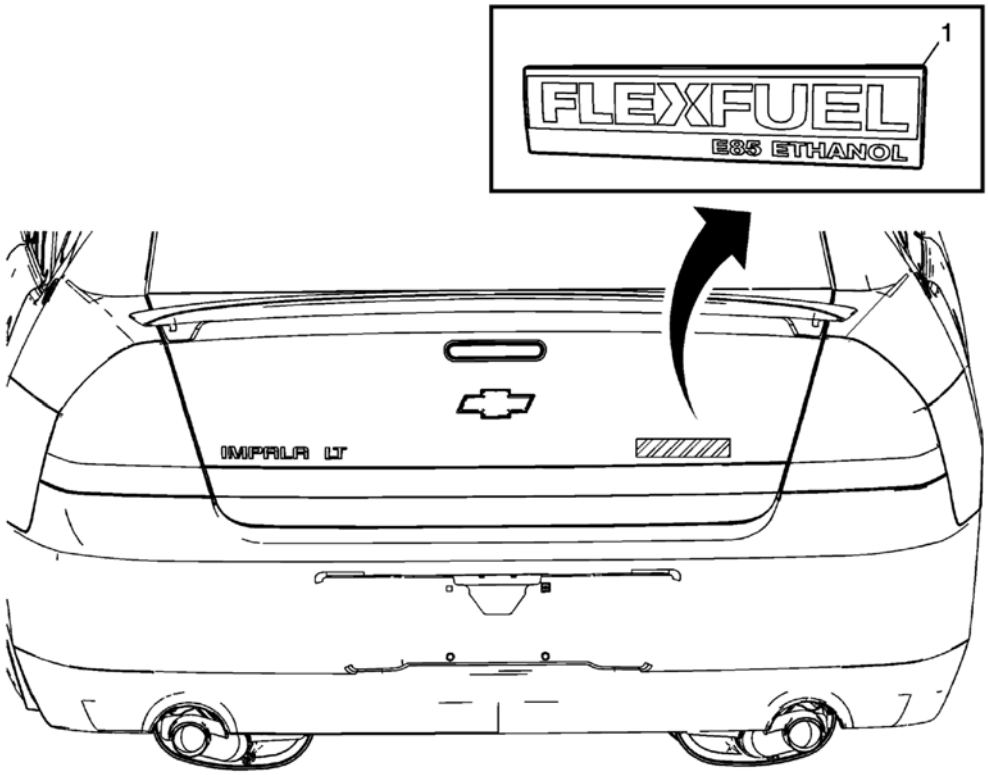

Fig. 12: Rear Compartment Lid Emblem/Nameplate (FFU)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Flex Fuel Badge **CAUTION:** **Refer to** **Exterior Trim Emblem Removal Caution .** **Procedure** 1. The part and surface should be 21Â°C (70Â°F) prior to installation. The vehicle should remain 21Â°C (70Â°F) for one hour after assembly to allow adhesive to develop sufficient bond strength. 2. Use a **J 25070** heat gun 500-750Â°F or equivalent to remove the old nameplate.

Callout	Component Name
	3. Clean all adhesive from rear compartment lid panel and wipe the surface dry with a clean lint-free towel prior to installing the new name plate. 4. When removing protective liners from the adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. 5. Close the rear compartment lid prior to installing the nameplate. 6. Using the palm of the hand, wet out the name plate to the rear compartment lid panel and ensure full adhesion of the name plate is made. **Special Tools** **J 25070** Heat Gun 500-750Â°F

REAR COMPARTMENT LID EMBLEM/NAMEPLATE REPLACEMENT (GRAPHITE)

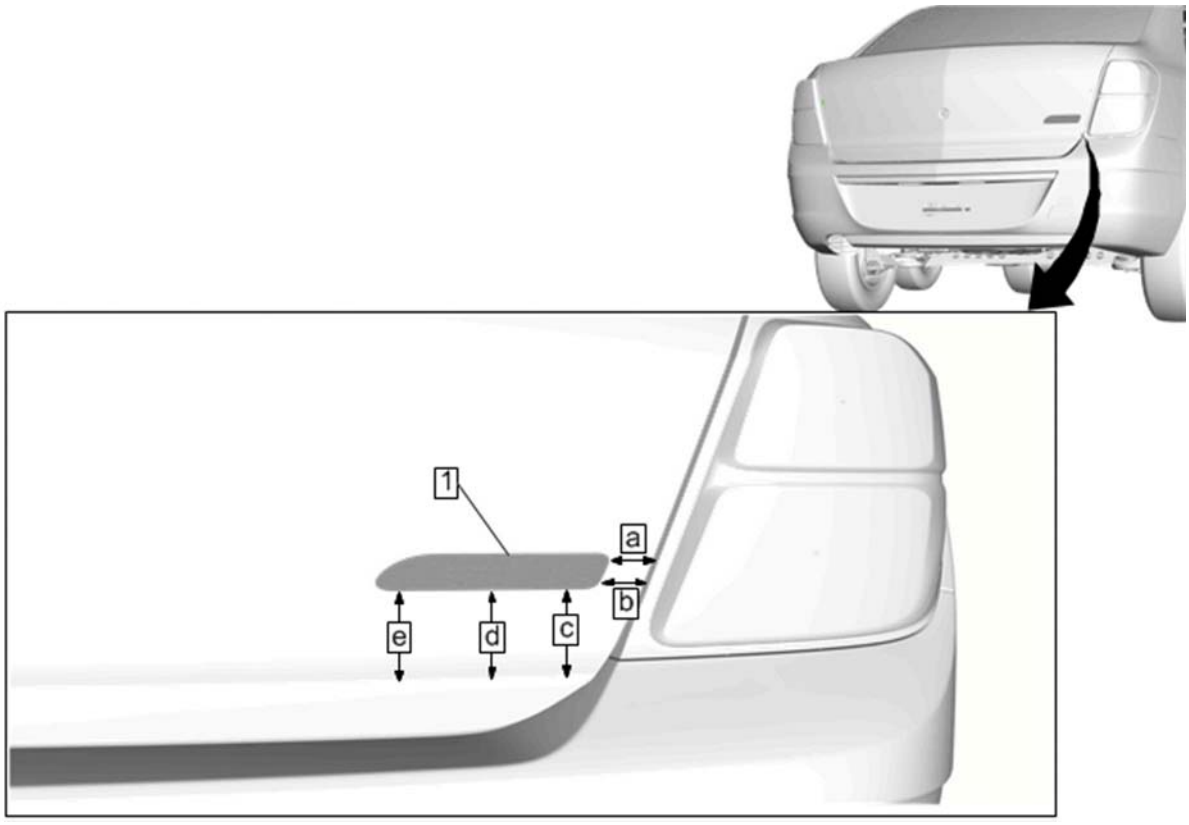

Fig. 13: Rear Compartment Lid Emblem/Nameplate (Graphite)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Liftgate Emblem/Nameplate **CAUTION:** **Refer to** **Exterior Trim**

Callout	Component Name
	Emblem Removal Caution . **Procedure** 1. Using a heat gun in a circular motion, warm the emblem/nameplate in order to help to remove the adhesive tape backing from the liftgate. 2. Clean any left over tape residue with a 50/50 mixture by volume of isopropyl alcohol and clean drinkable water. 3. Partially peel the adhesive tape liner from the backside of the emblem/nameplate before applying to the liftgate. 4. Using a clean cotton towel and hand pressure, wet out the emblem/nameplate to the liftgate. **Measurement** 1. A equals the measurement from the edge of the rear compartment lid to the upper side point of the graphite emblem. (26.3 mm) 2. B equals the measurement from the edge of the rear compartment lid to the lower side point of the graphite emblem. (27.3 mm) 3. C equals the measurement from the bottom edge of the graphite emblem to the center of the rear compartment cavity edge line. (77.8 mm) 4. D equals the measurement from the bottom edge of the graphite emblem to the center of the rear compartment cavity edge line. (79.5 mm) 5. E equals the measurement from the bottom edge of the graphite emblem to the center of the rear compartment cavity edge line. (80.2 mm)

FASCIA GRILLE REPLACEMENT (IMPALA LIMITED)

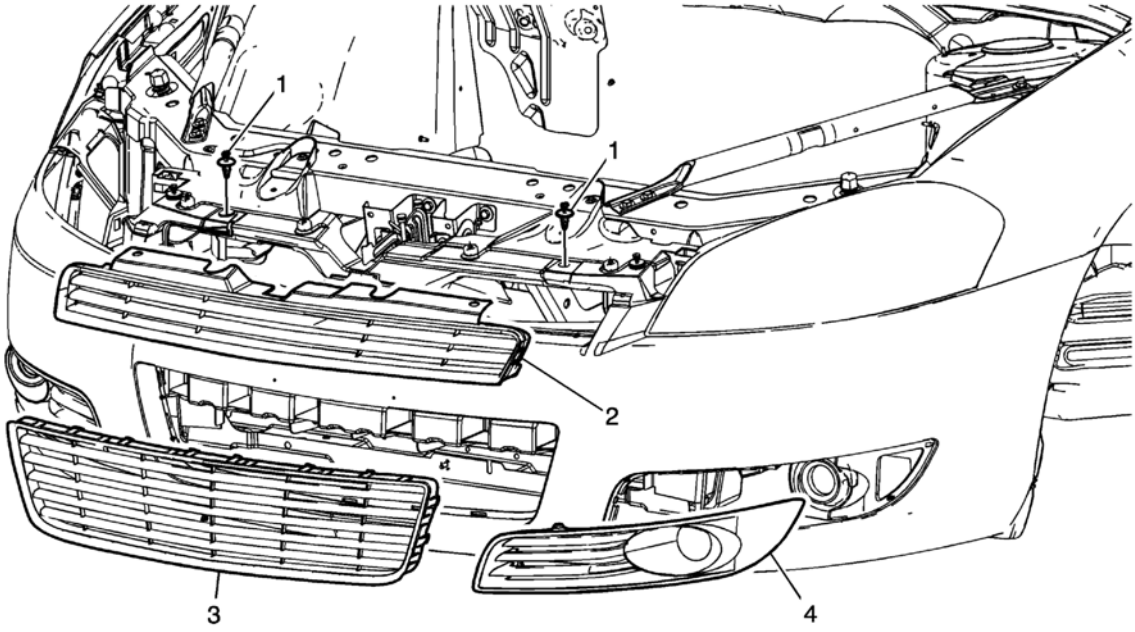

Fig. 14: Fascia Grille
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Retainer, Front Fascia Grille (Qty: 2)
2	Grille, Upper Fascia
3	Grille, Center
4	Grille, Side

FRONT SIDE DOOR MOLDING REPLACEMENT (IMPALA LIMITED)

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Using a **J 25070** heat gun 500-750Â°F in a circular motion, warm the door bodyside molding prior to removal. Carefully clean the body panel thoroughly prior to bonding the new front bodyside molding to the door.	
1	Molding Asm, Bodyside Door **Tip** 1. Upon installation of the new front door bodyside molding, position the pin on the backside of the molding to the round hole at the front edge of the door first then to the oval holes. 2. Remove the protective liner from the backside of the molding adhesive tape.

Callout	Component Name
	3. Ensure full adhesion of the molding to the door using the palm of the hand with a dry towel working from the front edge of the door to the rear, down the entire molding.

REAR SIDE DOOR MOLDING REPLACEMENT (IMPALA LIMITED)

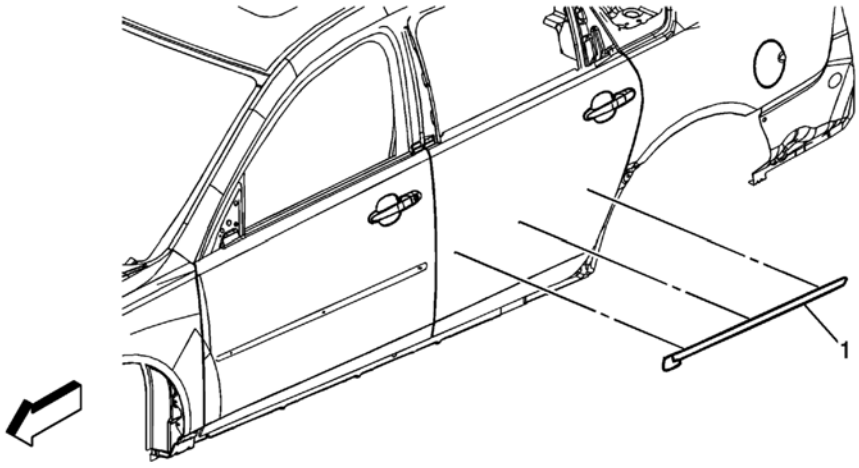

Fig. 15: Rear Door Body Side Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Use a **J 25070** heat gun 500-750Â°F in a circular motion to warm the door bodyside molding prior to removal. Carefully clean the body panel thoroughly prior to bonding the new bodyside molding to the door.	
1	Molding Asm, Bodyside Door **Tip:** 1. Upon installation of the new rear door molding, position the pin on the frontside of the molding to the round hole first at the front edge of the door then to the oval holes. 2. Remove the protective liner from the backside of the molding adhesive tape. 3. Ensure full adhesion of the molding to the door using the palm of the hand with a dry towel working from the rear edge of the door forward down the entire molding.

ROCKER PANEL MOLDING REPLACEMENT (BASE)

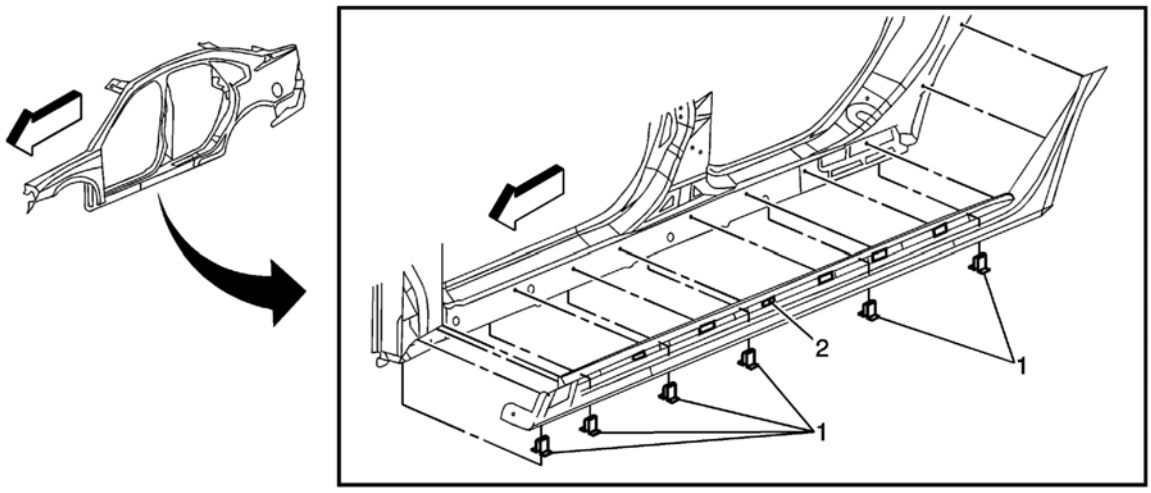

Fig. 16: Rocker Panel Molding (Base)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Open both doors on the side that the lower rocker panel molding is being removed from.	
1	Clips, Rocker Panel Integral (Qty: 6) Release the lower integral clips by pulling downward at each location prior to releasing the upper retainers from the lower rocker.
2	Retainers, Rocker Panel (Qty: 12) **TIP:** Release the lower 12 retainers from the rocker by pulling panel outward and removing the lower rocker panel.

ROOF WELD JOINT REVEAL MOLDING REPLACEMENT

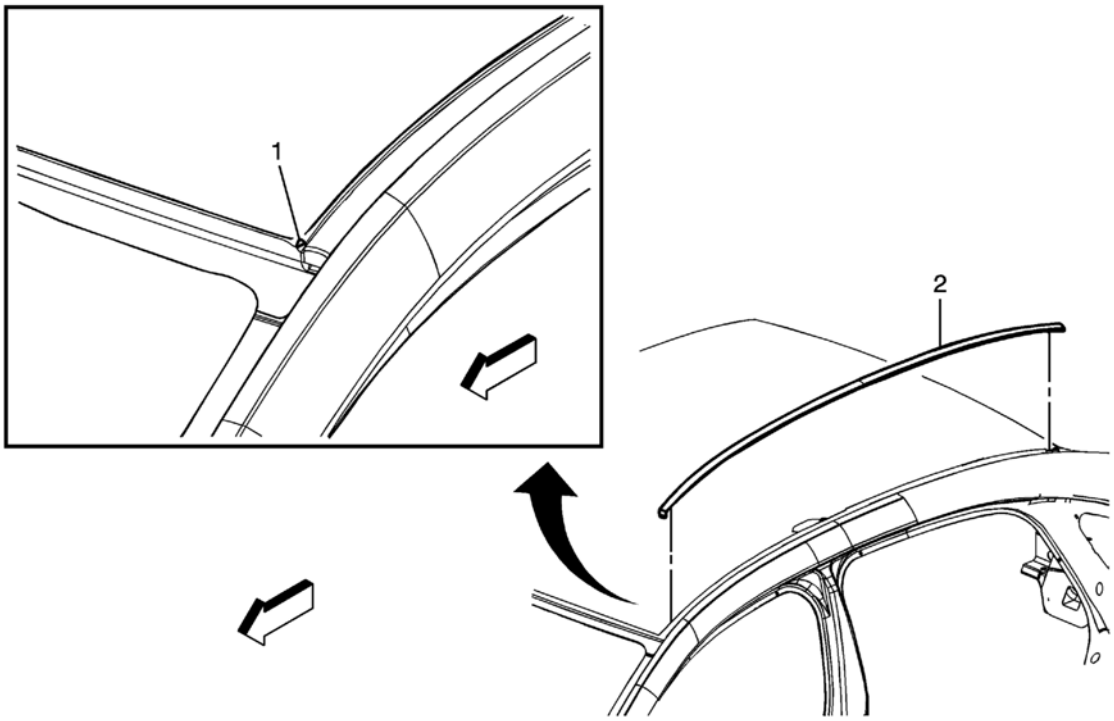

Fig. 17: Roof Weld Joint Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Use a **J 25070** heat gun 500-750Â°F in a circular motion to warm the roof ditch molding prior to removal. Carefully clean the roof panel ditch thoroughly prior to bonding the new ditch molding to the roof panel.	
1	Molding Assembly, Roof Ditch **Tip** 1. Upon installation of the new ditch molding, engage the front edge of the molding into the clip at the front roof header. 2. Remove the protective liner from the backside of the molding adhesive tape surface. 3. Ensure full adhesion of the ditch molding to the roof using the palm of the hand with a dry towel or a roller type tool working from the front of the vehicle to the rear. 4. Engage the rear end of the molding to the retainer clip in the roof ditch.
2	Molding Assembly, Roof Ditch

REAR SPOILER REPLACEMENT (T43)

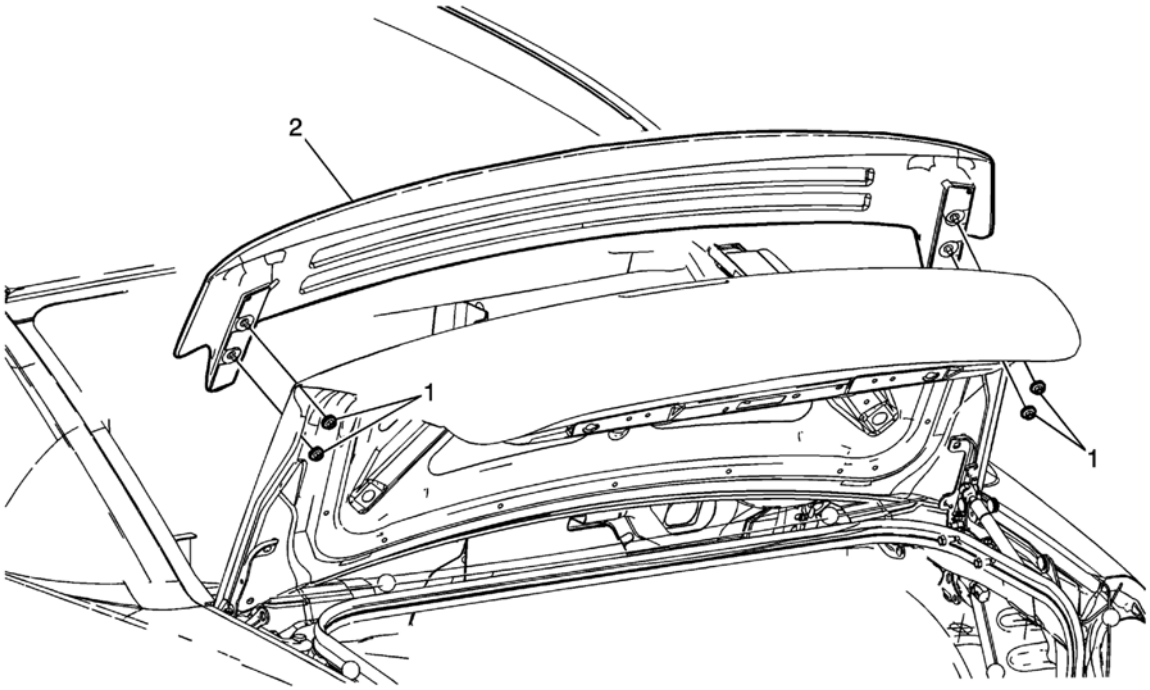

Fig. 18: Rear Spoiler (T43)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Spoiler Nuts (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Rear Spoiler

Article GUID: A00737235

REPAIR INSTRUCTIONS

ELIMINATING UNWANTED ODORS IN VEHICLES

GM Vehicle Care Odor Eliminator, GM P/N 88861431 (Canadian P/N 88861436), may control or eliminate odors in the interior and luggage compartment areas of GM vehicles. This non-toxic, biodegradable, odorless product has been shown to greatly reduce or remove the following types of odor:

- Objectionable smells of mold and mildew resulting from vehicle water leaks
- Customer created odors, such as smoke

You may safely use GM Vehicle Care Odor Eliminator on fabrics, vinyl, leather, carpet, and sound deadening materials. You may also induce this product into HVAC modules and instrument panel ducts for the control of non-bacterial related odors.

IMPORTANT: This product leaves no residual scent and should not be used as an air freshener.

This product may result in the permanent elimination of an odor and may be preferable to customers whose allergies make them sensitive to perfumes. This product may effectively remove odors when directly contacting the odor source. In cases such as water leaks, use this product with diagnostic procedures to first eliminate the primary cause of the odor. Then use further applications on the residual odor to permanently correct the vehicle condition.

How to Use this Product

- Spray GM Vehicle Care Odor Eliminator directly or as an additive with carpet shampoo in steam cleaners.
- Do not use on any interior surface that plain water would deteriorate, because this product will have the same effect. Also avoid letting this product come into contact with vinegar or any acidic substance. Acid-based products will hamper the effectiveness of GM Vehicle Care Odor Eliminator.
- Complete eight page treatment sheets are enclosed within each case of GM Vehicle Care Odor Eliminator. These treatment instructions range from simple vehicle odor elimination to full step by step procedures for odor removal from water leaks. If lost, contact 800-977-4145 to get a replacement set faxed or e-mailed to your dealership.
- Instructions and cautions are printed on the bottle, but additional help is available. If you encounter a persistent or recurring odor, you may call to obtain additional information and usage suggestions.
    - In the USA, call 1-800-955-8591.
    - In Canada, call 1-800-977-4145.

FLOOR CARPET DRYING

If the carpet or the pad or insulator is wet, use the following criteria for drying or for replacing the components:

- For a 1-piece carpet assembly bonded to a cotton or a fiber padding, replace the entire assembly.
- For a 2-piece carpet assembly with a cotton or a fiber padding, replace the padding only. While the carpet is out of the vehicle, dry the carpet using the method described below.
- For a 1-piece carpet assembly bonded to a foam padding or attached to a synthetic padding, dry the carpet using the method described below.
- For a 2-piece carpet assembly with a synthetic padding, dry the assembly using the method described below.
- For a 1-piece carpet assembly with a separate cotton or a fiber padding, replace the cotton or fiber padding. While the carpet is out of the vehicle, dry the carpet using the method described below.

Drying Method

1. If you observe puddles of liquid on the carpet face, use a wet vacuum to remove the excess moisture.
2. Blot the face of the carpet with a towel in order to absorb as much moisture as possible.
3. Point a fan at the affected area and air dry the carpet.

FLOOR PANEL CARPET REPLACEMENT (IMPALA LIMITED)

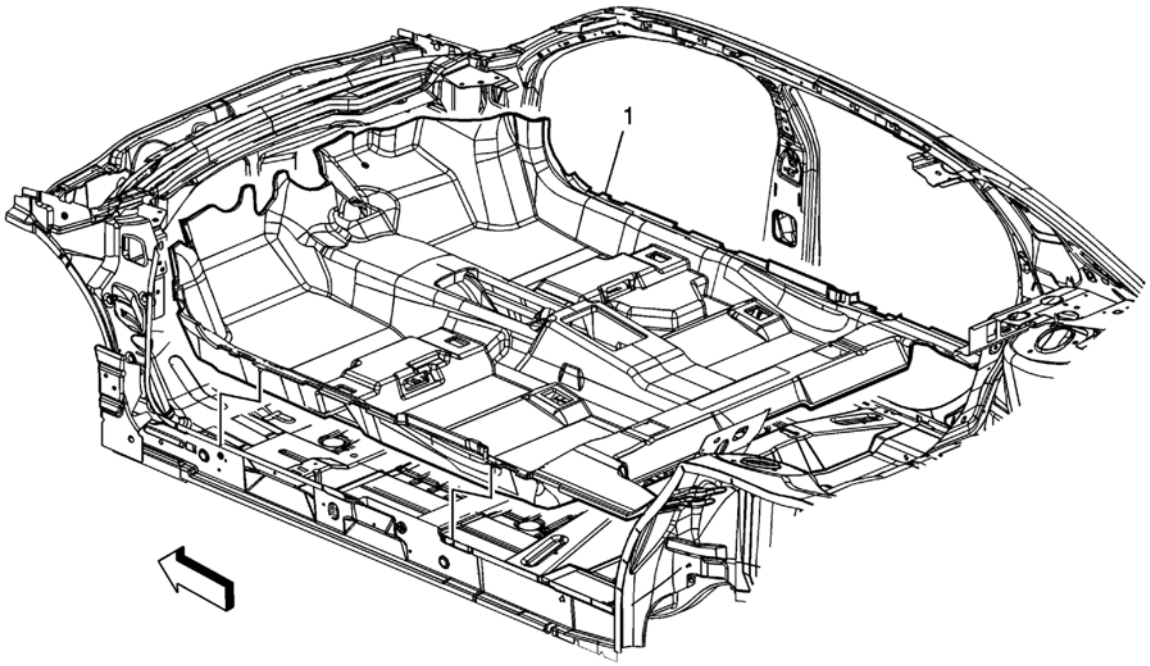

Fig. 1: Floor Panel Carpet
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures	
1. Remove the front seats. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)** .	

Callout	Component Name
2. Remove the rear seat. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)** . 3. Remove the floor console. Refer to **Front Floor Console Replacement** . 4. Remove the carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)**. 5. Loosen the center lower pillar garnish moldings. Refer to **Center Pillar Lower Trim Panel Replacement** . 6. Loosen the lower lock pillar garnish moldings. Refer to **Quarter Lower Rear Trim Panel Replacement (Impala Limited)** 7. Remove the lower front seat belt bolt.

WARNING: **Do not attempt to repair or alter the head impact energy-absorbing material glued to the**	

Callout	Component Name
headliner or to the garnish trims. If the material is damaged, replace the headliner and/or the garnish trim. Failure to do so could result in personal injury. **CAUTION:** **Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced.** **CAUTION:** **If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and**	

Callout	Component Name
tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced. **Preliminary Procedures** 1. Disable the SIR. Refer to **SIR Disabling and Enabling** . 2. Remove the rear quarter upper trim panel. Refer to **Quarter Upper Trim Panel Replacement** . 3. Remove the upper center pillar trim. Refer to **Center Pillar Upper Trim Panel Replacement** . 4. Remove the windshield pillar trim. Refer to **Windshield Pillar Garnish Molding Replacement** . 5. Remove the sunshades. Refer to **Sunshade Replacement** . 6. Remove the sunshade anchors. Refer to **Sunshade Anchor Replacement** . 7. Remove the assist handles. Refer to **Assist Handle Replacement** .	
1	Headlining Trim Screw **TIP:** The screws come off with the sunshade and sunshade anchors.
2	Headlining Trim Retainer (Qty: 2)
3	Headlining Trim **Procedure** 1. Disconnect the electrical connectors. 2. Fully recline the front seat backs. 3. Tilt the steering wheel fully upward. 4. Set the parking brake and put shifter in low gear. 5. Cover the instrument panel (I/P) to protect from damage. 6. Remove through the front passenger door opening. **TIP:** When installing a new headliner, tape any unused connector to the headliner with a high adhesive tape.

REPAIR INSTRUCTIONS

FRAME REPLACEMENT

Special Tools

J 39580 Universal Engine Support Table

Removal Procedure

1. Install the engine support fixture to support the engine/transaxle assembly. Refer to **Engine Support Fixture** .
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the front tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
4. Remove the lower radiator air deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
5. Remove the positive battery cable retainers. Position the positive battery cable aside. Refer to **Battery Positive and Negative Cable Replacement** .
6. Disconnect the power steering cooler pipe from the frame. Refer to **Power Steering Fluid Cooling Pipe Replacement** .
7. Secure the power steering cooler to the exhaust pipe.
8. Remove the stabilizer shaft links. Rotate the stabilizer shaft up to gain access to the mounting bolts for the power steering gear. Refer to **Stabilizer Shaft Link Replacement** .
9. Remove the mounting fasteners for the power steering gear. Refer to **Steering Gear Replacement** .

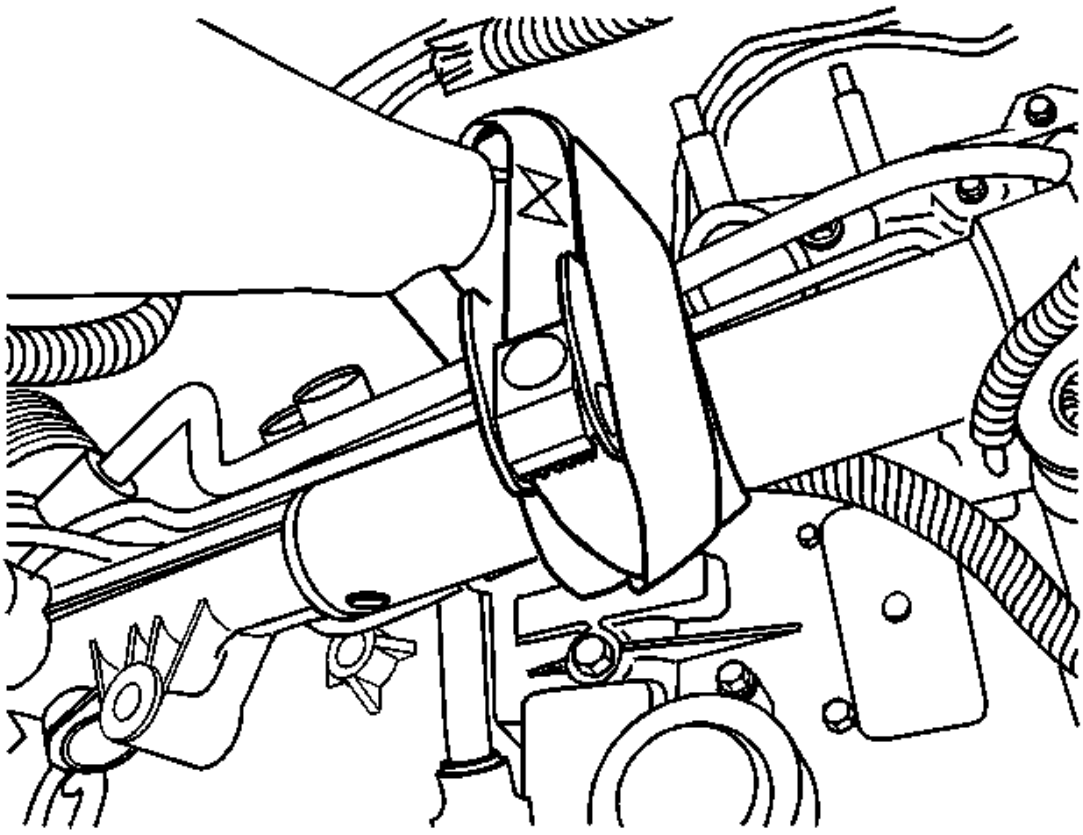

Fig. 1: Securing Power Steering Gear To Exhaust Manifold
Courtesy of GENERAL MOTORS COMPANY

10. Secure the power steering gear to the exhaust front pipe using mechanics wire.

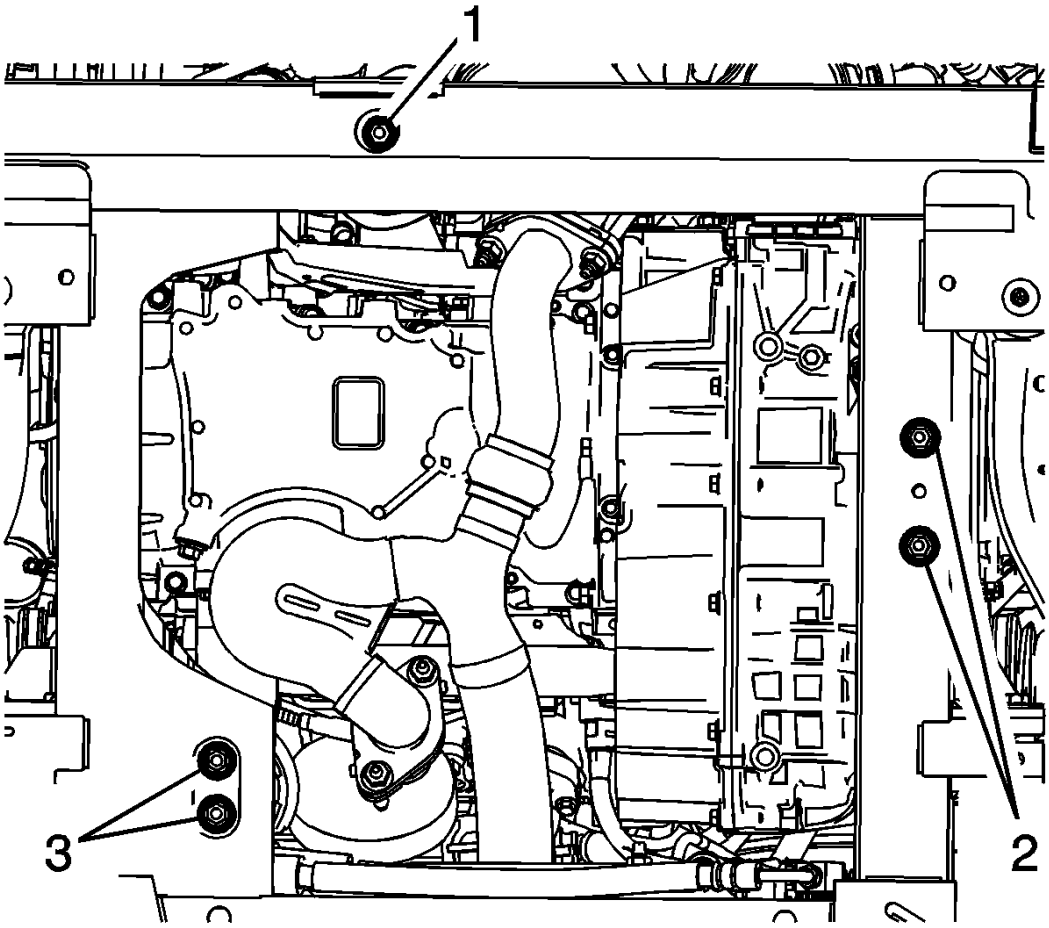

Fig. 2: Engine Mount Fasteners
Courtesy of GENERAL MOTORS COMPANY

11. Remove the front engine mount to frame fastener (1).
12. Remove the rear engine mount to frame fasteners (3).
13. Loosen the transmission mount fasteners (2).

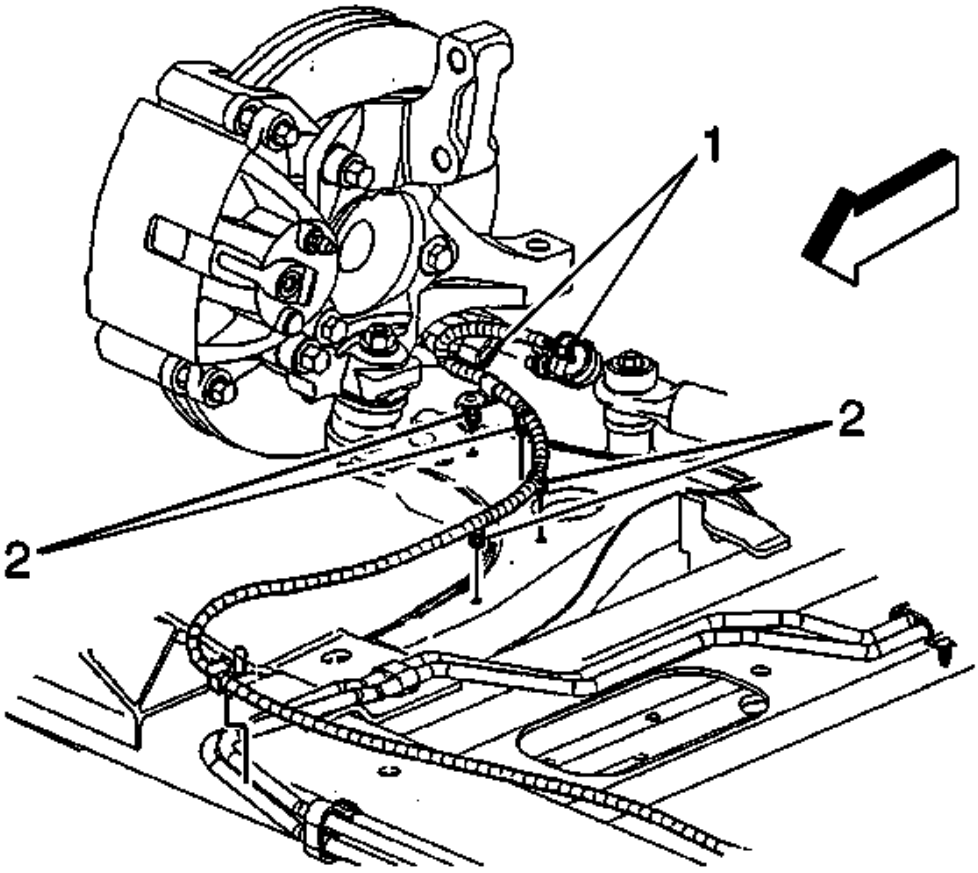

Fig. 3: Front Wheel Speed Sensor Connectors & Harness Retainers
Courtesy of GENERAL MOTORS COMPANY

14. Disconnect both front wheel speed sensor connectors (1), if equipped.
15. Remove both front wheel speed harness retainers (2) from the frame and the lower control arms, if equipped.
16. Separate both of the lower ball joints from the steering knuckle. Refer to **Lower Control Arm Ball Joint Replacement** .

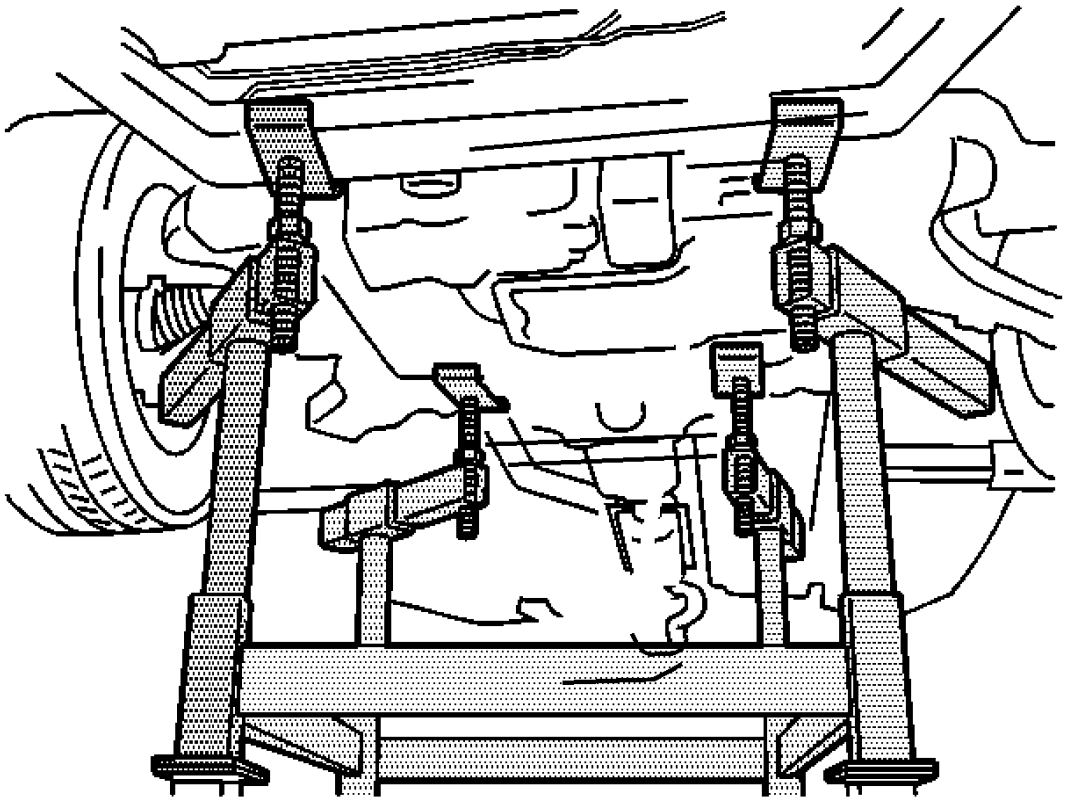

Fig. 4: Identifying Utility Stand
Courtesy of GENERAL MOTORS COMPANY

17. Lower the vehicle until the frame contacts **J 39580** table.

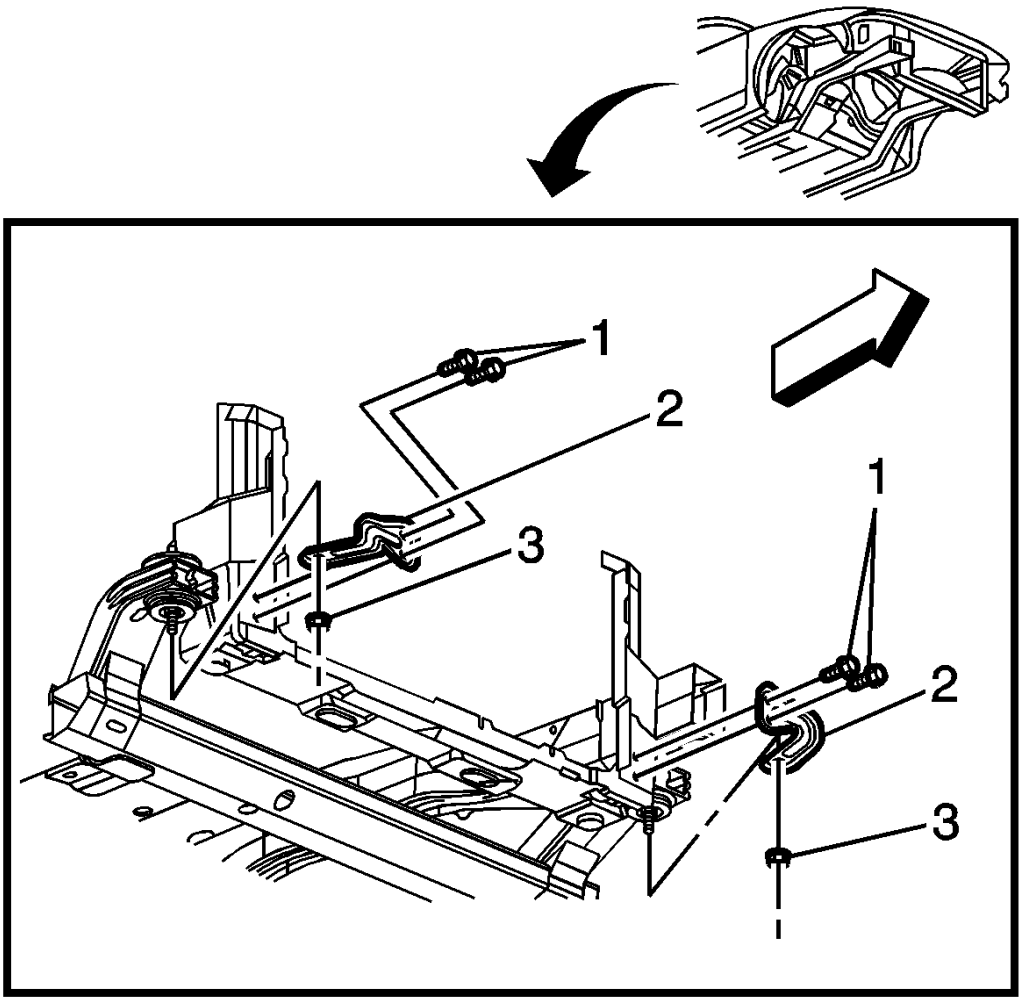

Fig. 5: Frame Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

18. Remove the frame reinforcement nuts (3).
19. Remove the frame reinforcement bolts (1).
20. Remove the frame reinforcements (2).

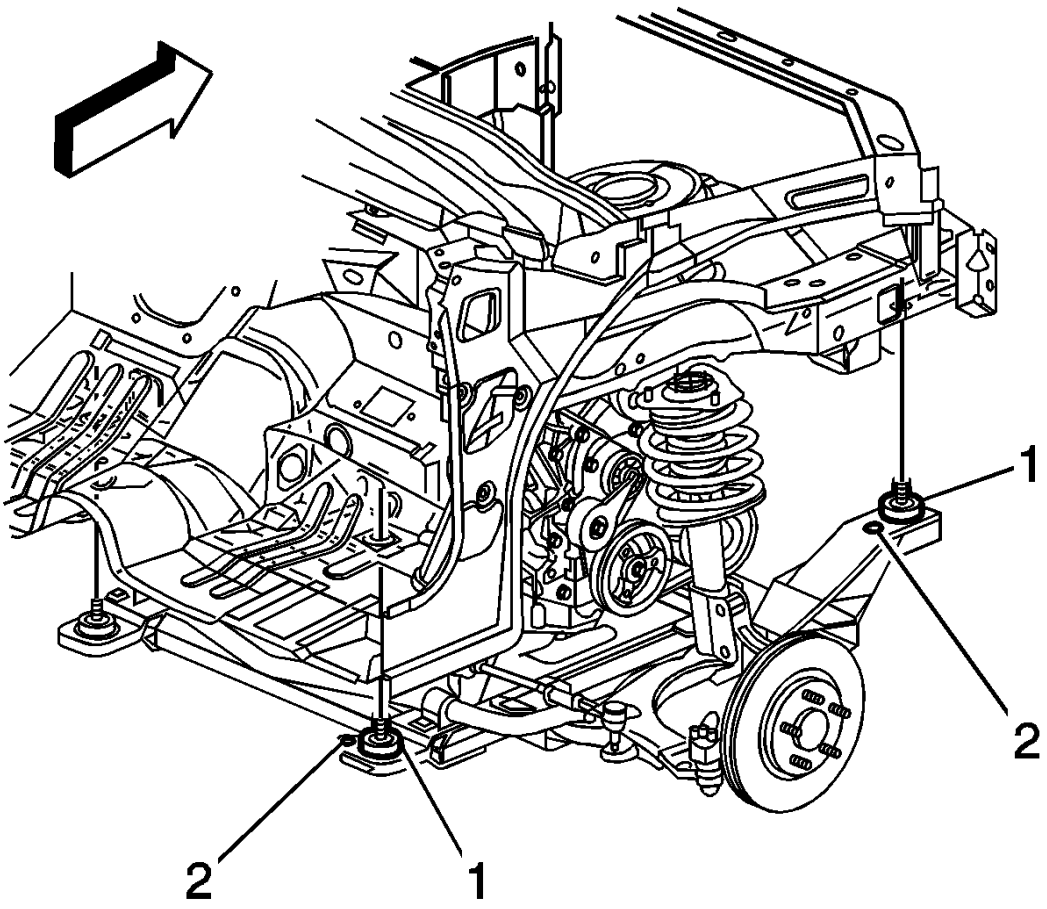

Fig. 6: Frame Securing Bolts
Courtesy of GENERAL MOTORS COMPANY

21. Remove the bolts (1) which secure the frame to the body.
22. Raise the vehicle in order to separate the frame from the body.
23. If replacement of the frame is necessary, remove the following components:
    - Both of the lower control arms-Refer to **Lower Control Arm Replacement** .
    - The stabilizer shaft-Refer to **Stabilizer Shaft Replacement** .
    - The spacers, the upper insulator, the lower insulator, and the retainers-Refer to **Drivetrain and Front Suspension Frame Front Insulator Replacement**, and to **Drivetrain and Front Suspension Frame Rear Insulator Replacement**.

Installation Procedure

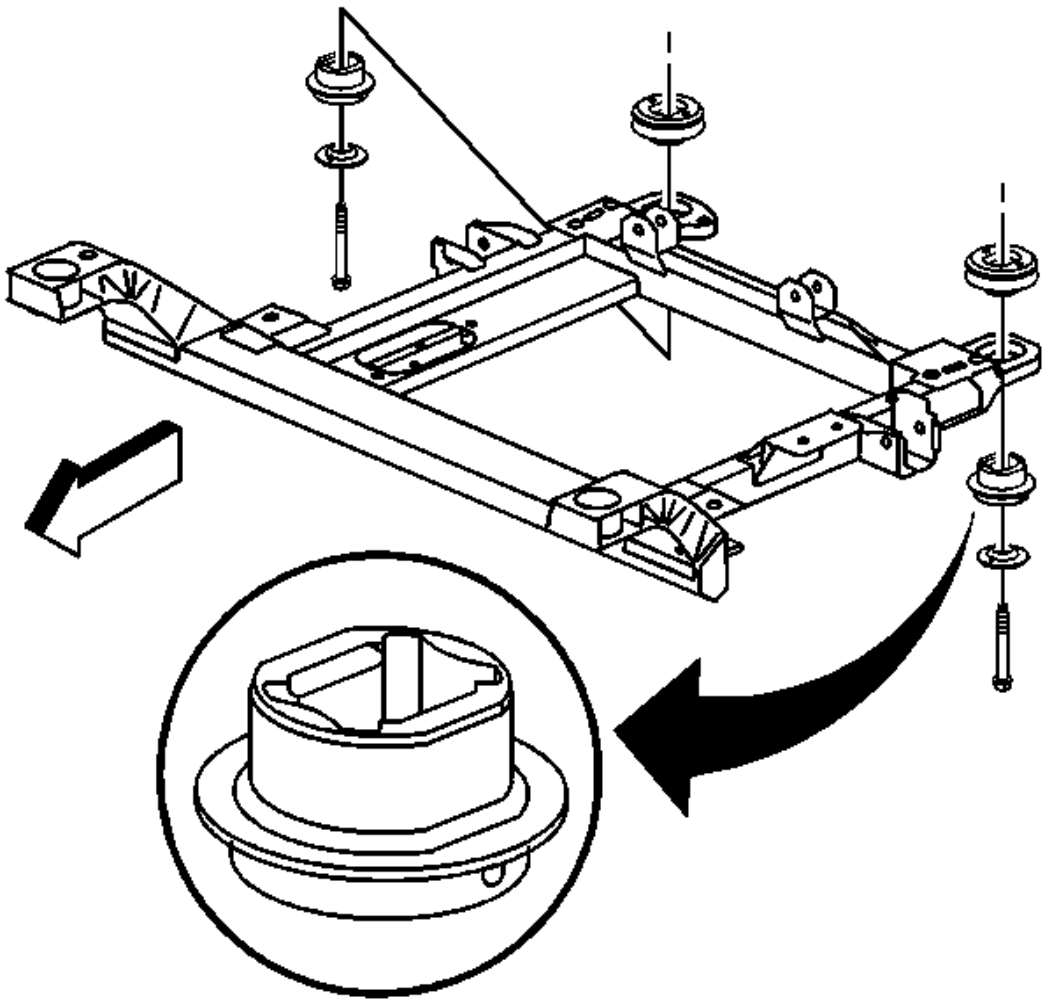

Fig. 7: Rear Frame To Body Bolts
Courtesy of GENERAL MOTORS COMPANY

1. If a new frame is being installed, install the following components:
    - Both of the lower control arms-Refer to **Lower Control Arm Replacement** .
    - The stabilizer shaft-Refer to **Stabilizer Shaft Replacement** .
    - The spacers, the upper insulator, the lower insulator, and the retainers-Refer to **Drivetrain and Front Suspension Frame Front Insulator Replacement**, and to **Drivetrain and Front Suspension Frame Rear Insulator Replacement**.

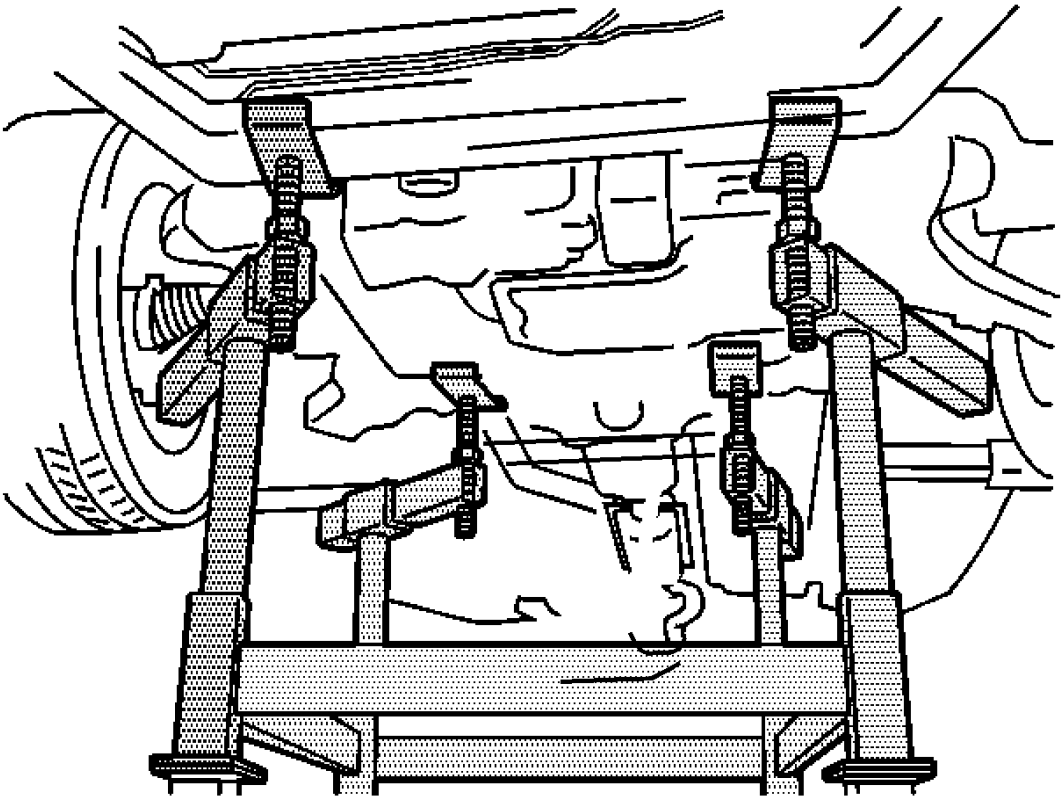

Fig. 8: Identifying Utility Stand
Courtesy of GENERAL MOTORS COMPANY

2. Position the engine support table with the frame under the vehicle.
3. Lower the vehicle to the frame.

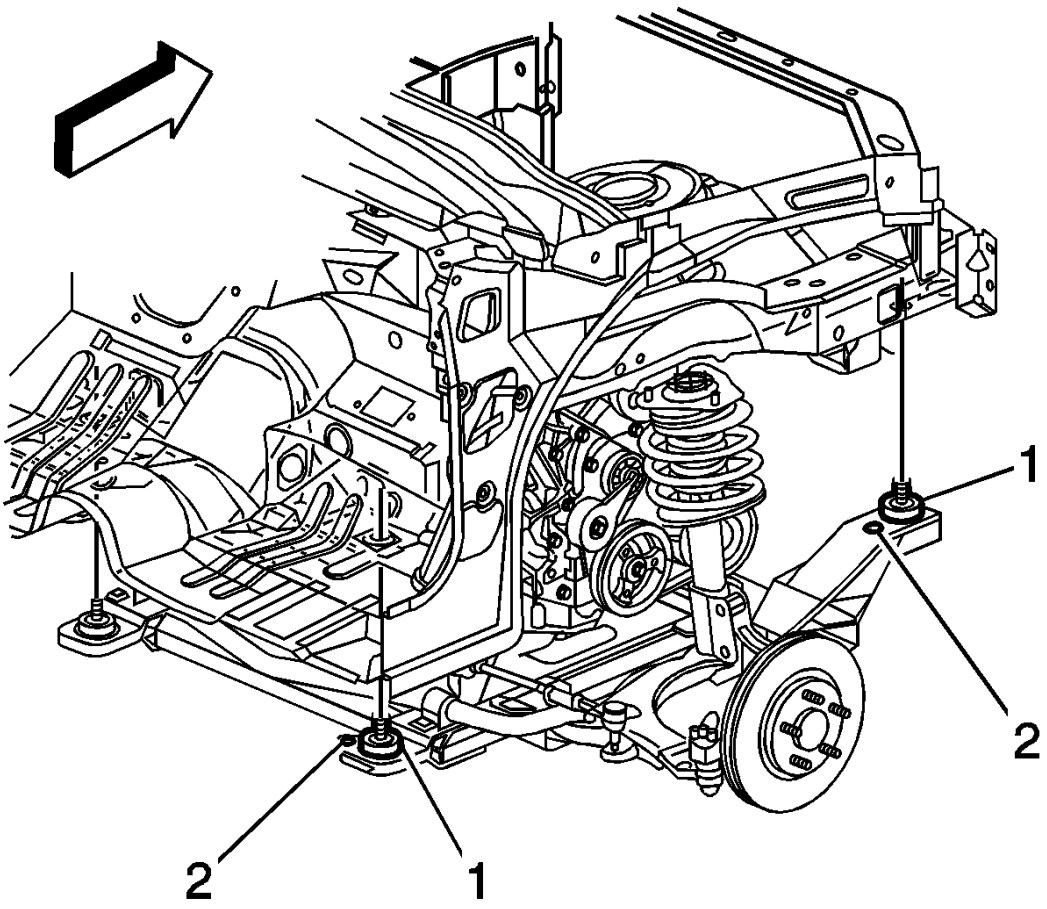

Fig. 9: Frame Securing Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Loosely install the bolts (1) to secure the frame to the body.

CAUTION: Refer to Fastener Caution .

5. Align the frame to the body by inserting two 19X203 mm (0.74X8.0 in) pins in the alignment holes (2) on the right side of the frame.

Tighten

- Tighten the front frame bolts to 145 N.m (107 lb ft).
- Tighten the rear frame bolts to 160 N.m (118 lb ft).

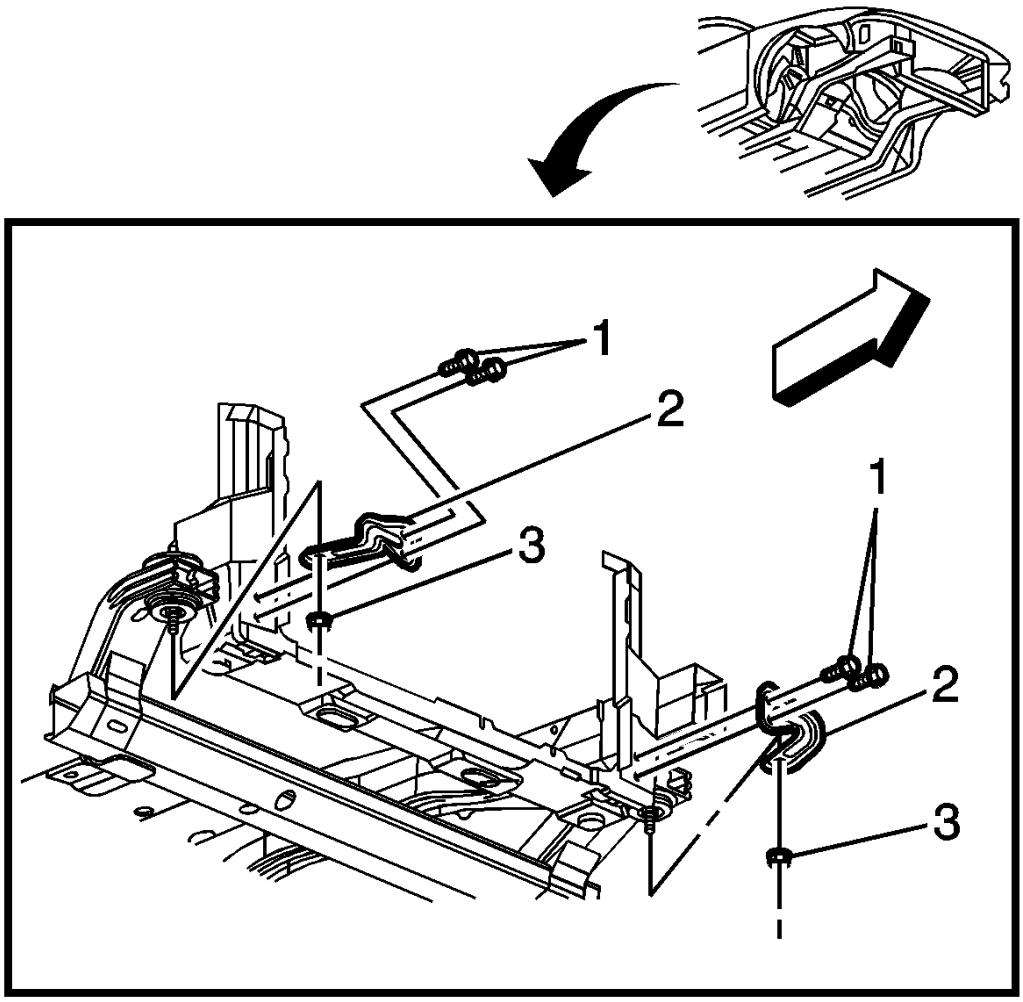

Fig. 10: Frame Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the frame reinforcements (2).
7. Install the frame reinforcement bolts (1).

   Tighten

   Tighten the bolts to 20 N.m (15 lb ft).

8. Install the frame reinforcement nuts (3).

   Tighten

   Tighten the nuts to 20 N.m (15 lb ft).

9. Connect both the lower ball joints to the steering knuckle. Refer to **Lower Control Arm Ball Joint Replacement** .

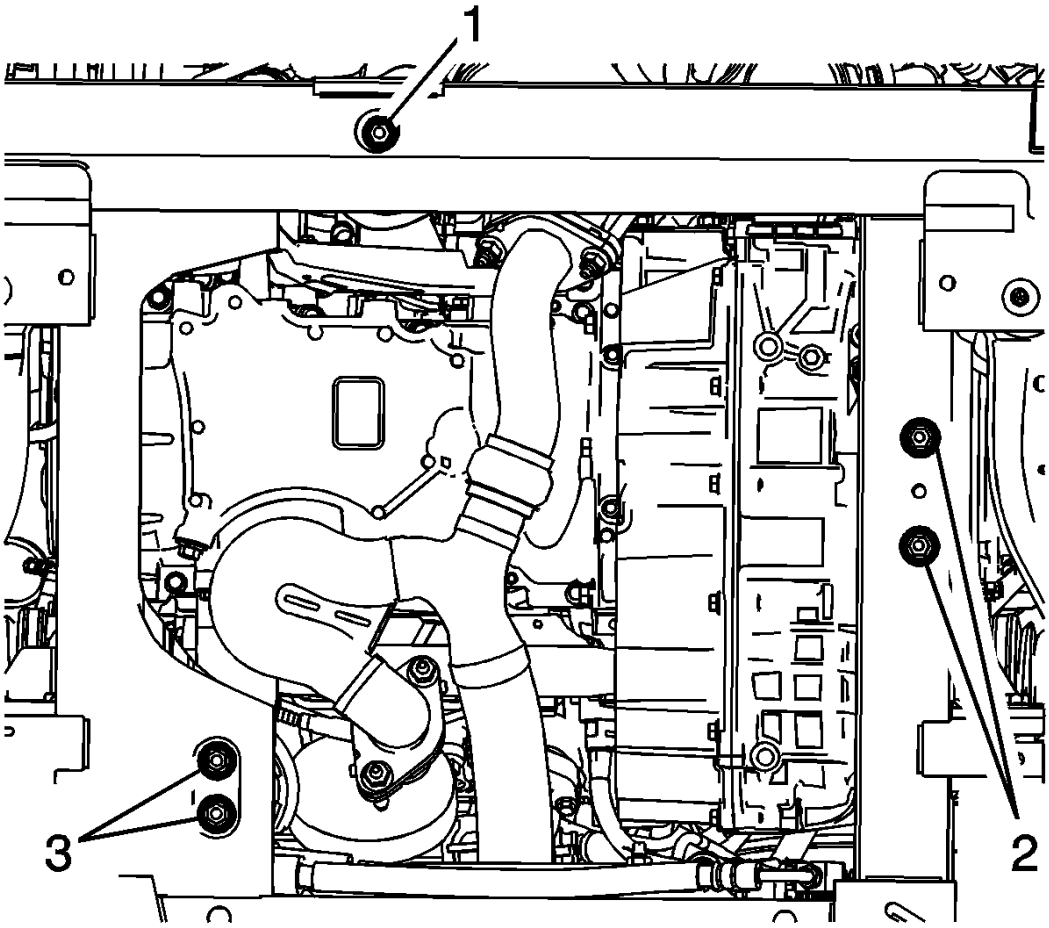

Fig. 11: Engine Mount Fasteners
Courtesy of GENERAL MOTORS COMPANY

10. Install the front engine mount to frame fastener (1) and tighten to 80 N.m (59 lb ft).
11. Remove the rear engine mount to frame fasteners (3) to 52 N.m (38 lb ft).
12. Loosen the transmission mount fasteners (2) to 52 N.m (38 lb ft).
13. Remove the power steering gear from the exhaust pipe. Position to the frame.
14. Install the steering gear mounting fasteners. Refer to **Steering Gear Replacement** .
15. Install the stabilizer shaft links. Refer to **Stabilizer Shaft Link Replacement** .

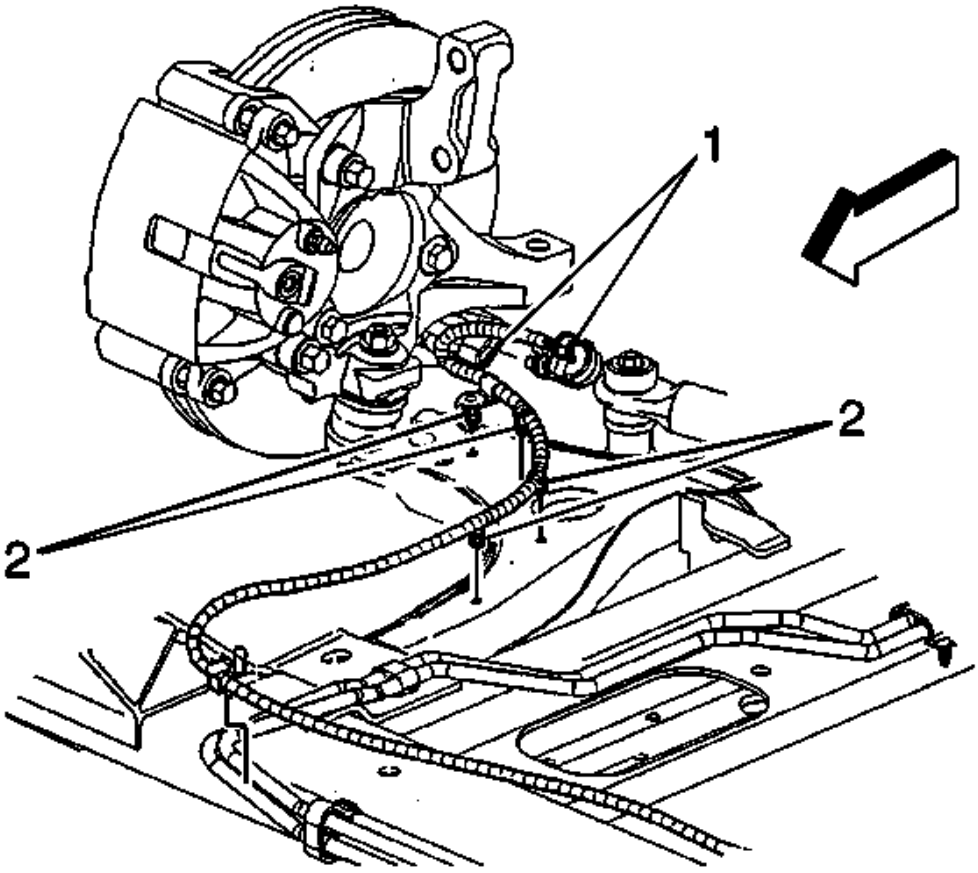

Fig. 12: Front Wheel Speed Sensor Connectors & Harness Retainers
Courtesy of GENERAL MOTORS COMPANY

16. Connect both front wheel speed sensor connectors (1), if equipped.
17. Install both front wheel speed harness retainers (2) to the frame and to the lower control arm, if equipped.
18. Install the positive battery cable. Refer to **Battery Positive and Negative Cable Replacement** .
19. Install the power steering cooler pipe. Refer to **Power Steering Fluid Cooling Pipe Replacement** .
20. Install the radiator lower air deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
21. Install the front tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
22. Lower the vehicle.
23. Remove the engine support fixture.
24. Inspect the front wheel alignment. Refer to **Wheel Alignment Measurement** .

DRIVETRAIN AND FRONT SUSPENSION FRAME FRONT INSULATOR REPLACEMENT

Removal Procedure

NOTE: **In order to remove any frame insulator, loosen the adjacent frame insulators to**

permit the frame to separate from the body. Do not break the fan shroud or damage the frame attachments, such as steering hoses and brake pipes during the replacement of body mounts.

When installing a body mount, ensure the lower insulator is seated into the frame. The lower insulator should not be loose. The spacer and the corresponding upper insulator is pressed into the lower insulator thus squeezing the frame. The bolt is then inserted through the mount, capturing the lower retainer. The body mount components prevent contact of the frame to the body.

Do not over tighten the body mount. Over tightening may collapse a spacer or strip a bolt. When the frame insulator bolts are removed, always discard the bolts and replace with new bolts.

When clamping by the mount, ensure the surfaces are clean and dry. If the frame insulator bolt does not screw in smoothly, run a tap through the frame crossmember nut in the body in order to remove foreign material. Ensure the tap does not punch through the underbody.

Whenever the body is moved in relation to the frame, disconnect the intermediate shaft from the rack and pinion steering gear and stub shaft.

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

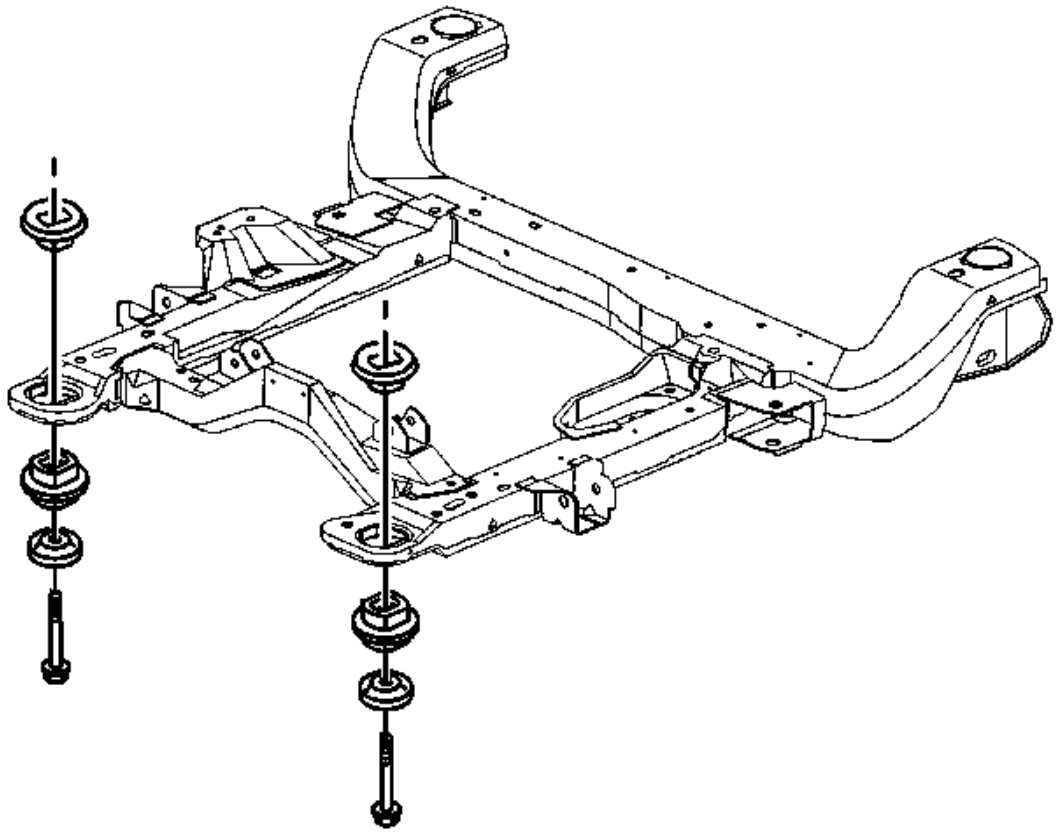

Fig. 13: View Of Rear Frame
Courtesy of GENERAL MOTORS COMPANY

2. Remove the intermediate shaft from the steering gear stub shaft. Refer to **Intermediate Steering Shaft Replacement** .
3. Install a utility stand to the rear of the frame.
4. Remove the rear frame bolts.
5. Lower the rear of the frame.
6. Remove the upper and lower insulators from the rear of the frame as a set.

Installation Procedure

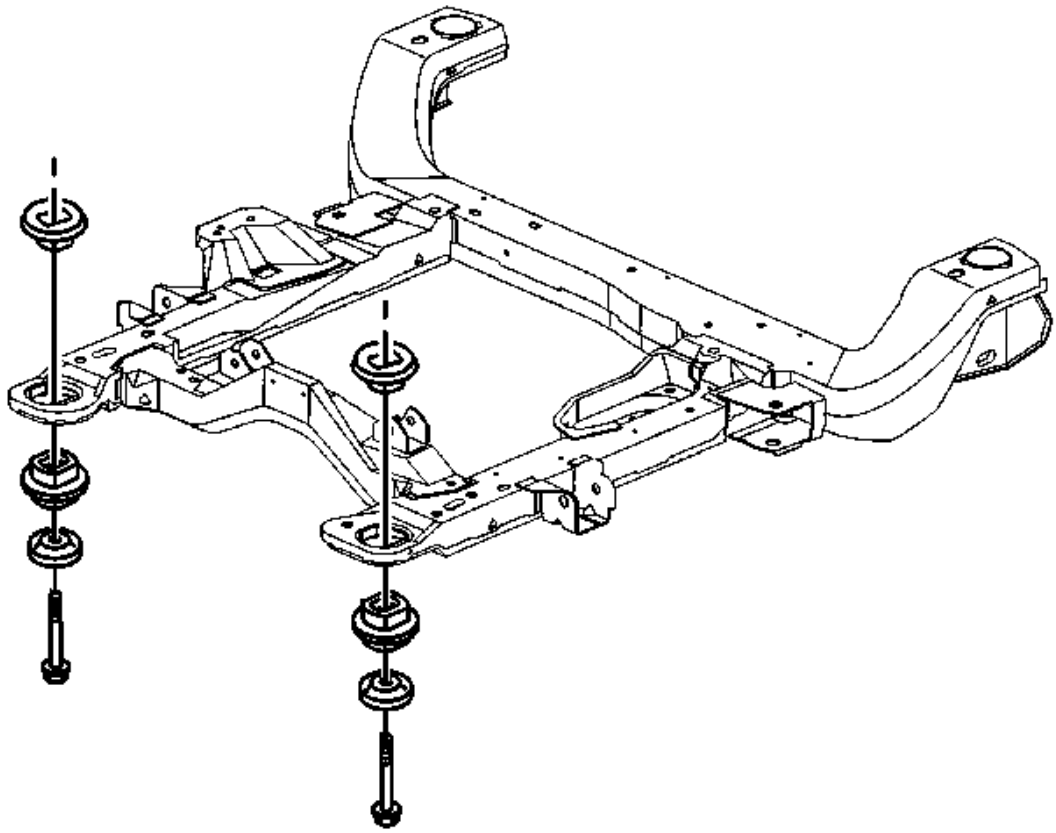

Fig. 14: View Of Rear Frame
Courtesy of GENERAL MOTORS COMPANY

1. Apply lube to inside surface of lower insulator and to top surface of upper insulator.
2. Install the upper and lower insulators to the rear of the frame as a set.
3. Raise the rear of the frame.

CAUTION: Refer to Fastener Caution .

4. Install the rear frame bolts.

Tighten

Tighten the rear frame bolts to 160 N.m (118 lb ft).

5. Remove the utility stand.
6. Install the intermediate shaft to the steering gear stub shaft. Refer to **Intermediate Steering Shaft Replacement** .
7. Lower the vehicle.

DRIVETRAIN AND FRONT SUSPENSION FRAME REAR INSULATOR REPLACEMENT

Special Tools

J 45296 Frame Insulator Remover/Installer

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Disconnect the steering intermediate shaft. Refer to **Intermediate Steering Shaft Replacement** .
3. Disconnect the fog lamp electrical connectors from the fog lamps.

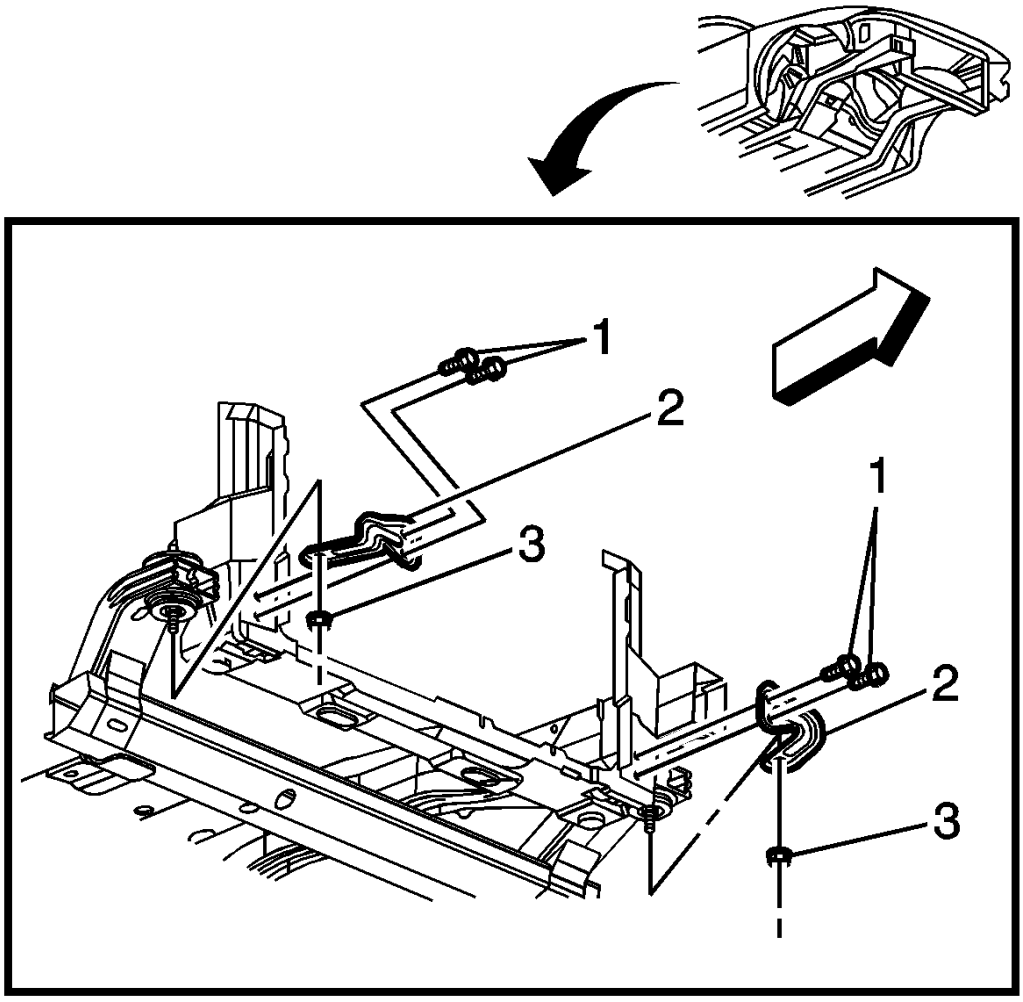

Fig. 15: Frame Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the frame reinforcement nuts (3).
5. Remove the frame reinforcement bolts (1).
6. Remove the frame reinforcements (2).
7. Install a jackstand under the center of the frame, between the front frame insulators.

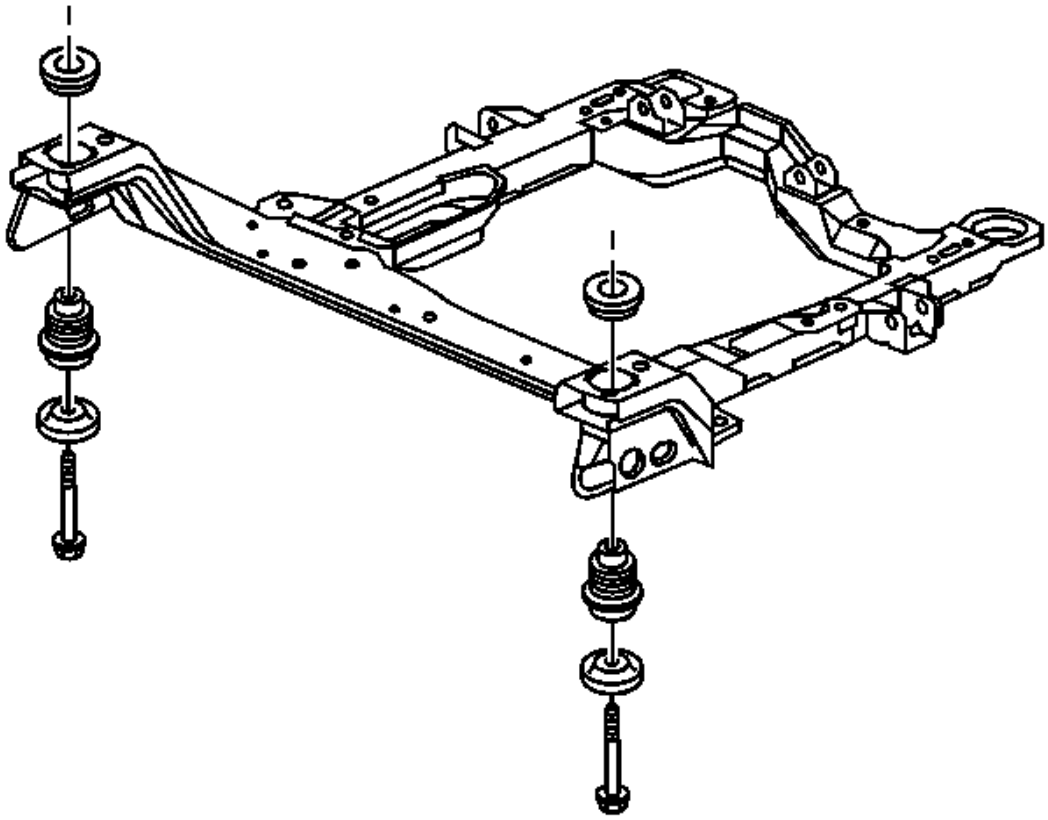

Fig. 16: View Of Front Frame Bolts And Retainers
Courtesy of GENERAL MOTORS COMPANY

8. Remove the front frame bolts and retainers.
9. Lower the front of the frame.
10. Remove the frame front upper insulators.

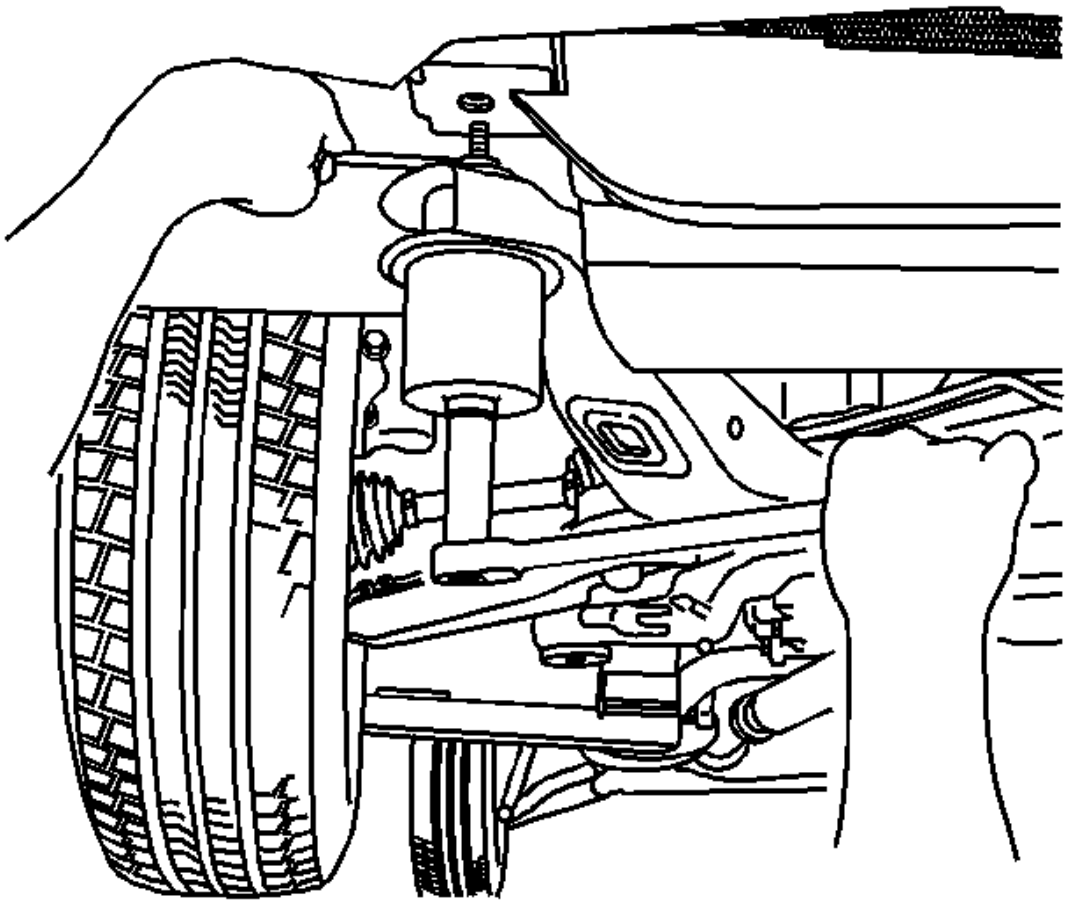

Fig. 17: View Of Frame Front Upper Insulators
Courtesy of GENERAL MOTORS COMPANY

11. Install the **J 45296** remover/installer , or equivalent to the front frame insulator you are removing.
12. Using the **J 45296** remover/installer , or equivalent remove the front frame insulator from the frame.

Installation Procedure

1. Clean the front frame insulator opening.
2. Apply a thin coat of rubber lubricant GM P/N 01051717 (Canadian P/N 12345884) or equivalent to the inside of the front frame insulator opening.
3. Apply a thin coat of rubber lubricant GM P/N 01051717 (Canadian P/N 12345884) or equivalent to the front frame insulator.

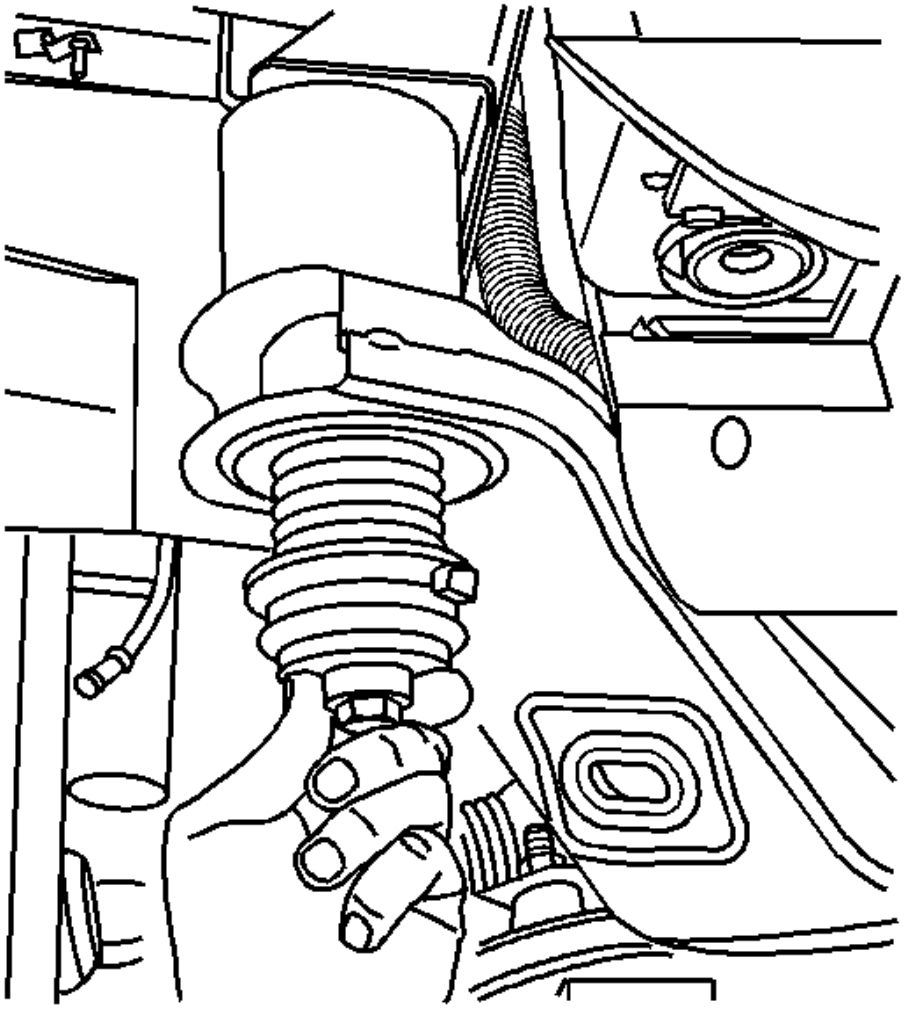

Fig. 18: Aligning Front Frame Insulator
Courtesy of GENERAL MOTORS COMPANY

4. Align the front frame insulator to the front frame opening with the front frame alignment tabs facing to the front.
5. Using the **J 45296** remover/installer , or equivalent install the front frame insulator to the front frame.

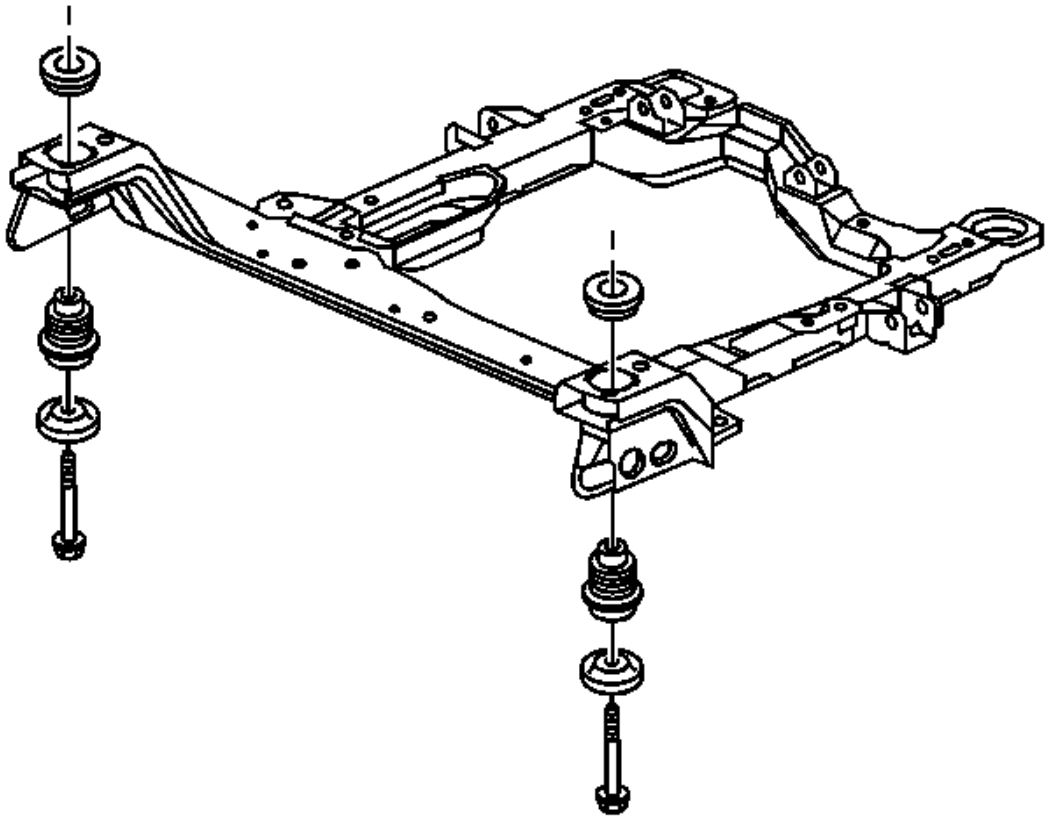

Fig. 19: View Of Front Frame Bolts And Retainers
Courtesy of GENERAL MOTORS COMPANY

6. Install the frame front upper insulators.
7. Raise the front of the frame.

CAUTION: Refer to Fastener Caution .

8. Install the front frame bolts and retainers.

Tighten

Tighten the front frame bolts to 145 N.m (107 lb ft).

9. Remove the jackstand.

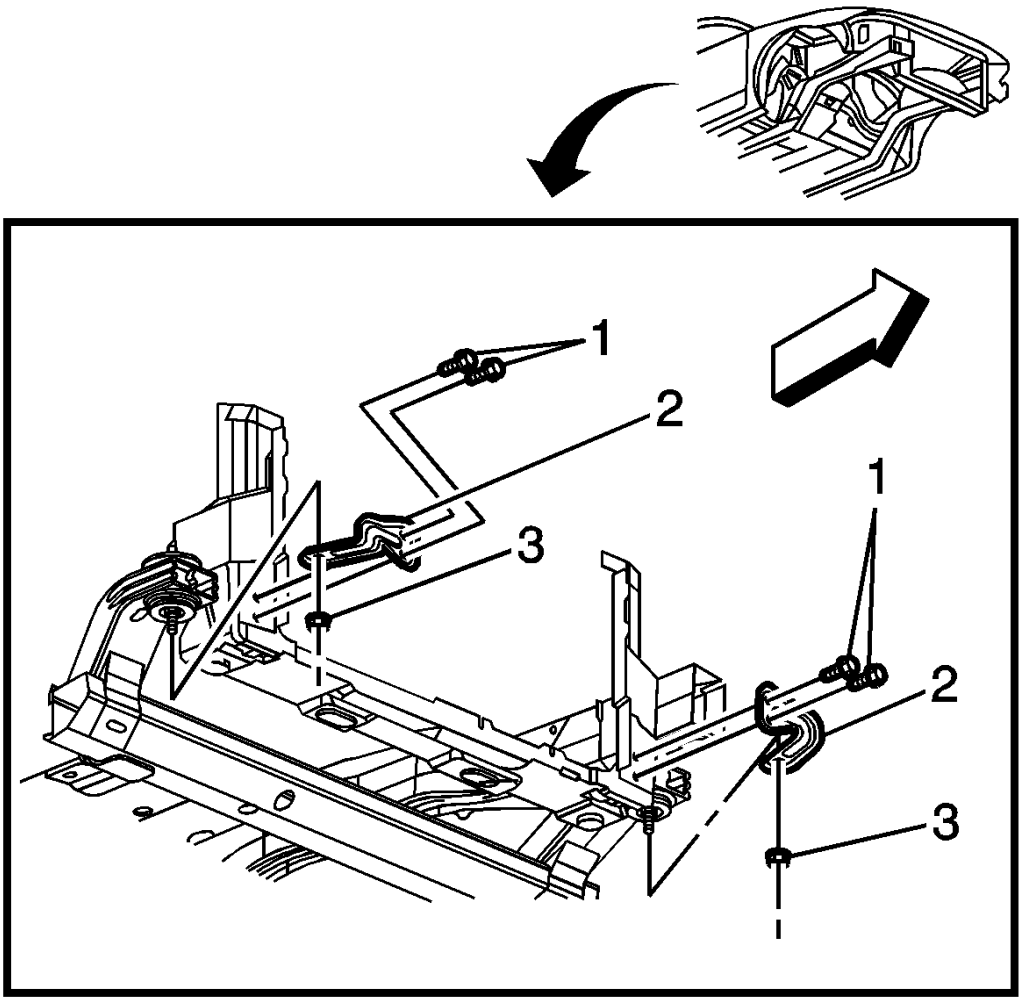

Fig. 20: Frame Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Install the frame reinforcements (2).
11. Install the frame reinforcement bolts (1).

    Tighten

    Tighten the bolts to 20 N.m (15 lb ft).

12. Install the frame reinforcement nuts (3).

    Tighten

    Tighten the nuts to 20 N.m (15 lb ft).

13. Connect the fog lamp electrical connectors to the fog lamps.
14. Connect the steering intermediate shaft. Refer to **Intermediate Steering Shaft Replacement** .
15. Lower the vehicle.

FRONT FENDER LINER REPLACEMENT

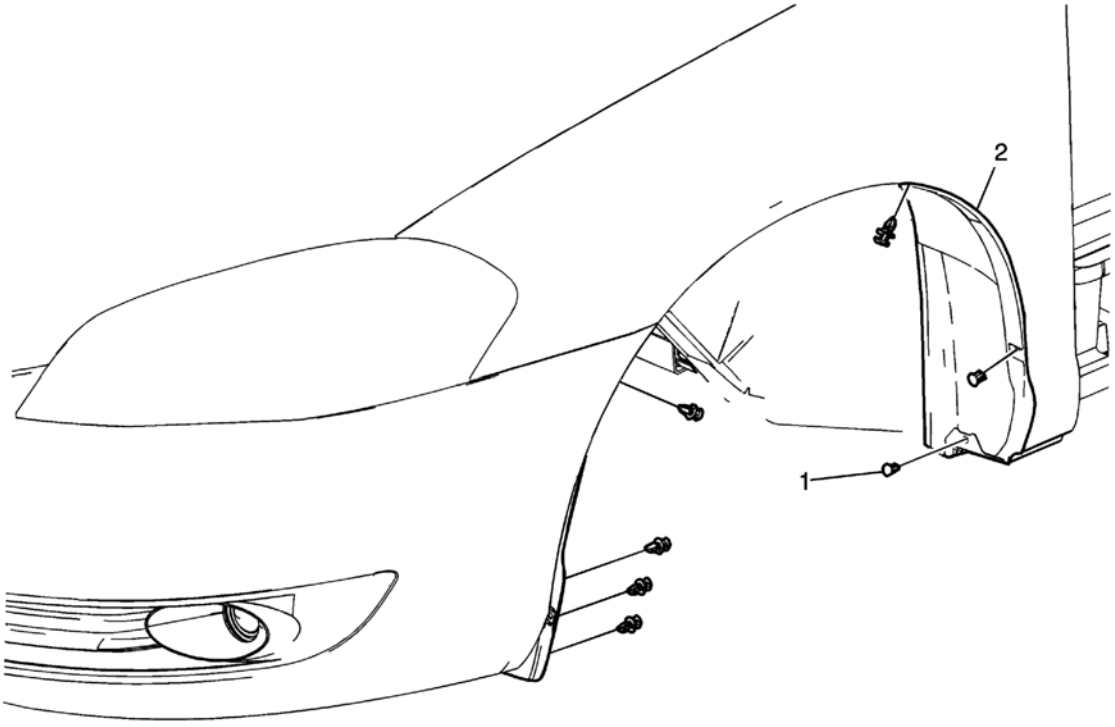

Fig. 21: Front Fender Liner
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Lift and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the front wheel. Refer to **Tire and Wheel Removal and Installation** .	
1	Front Fender Liner Retainer (Qty: 7)
2	Front Fender Liner

REAR WHEELHOUSE LINER REPLACEMENT

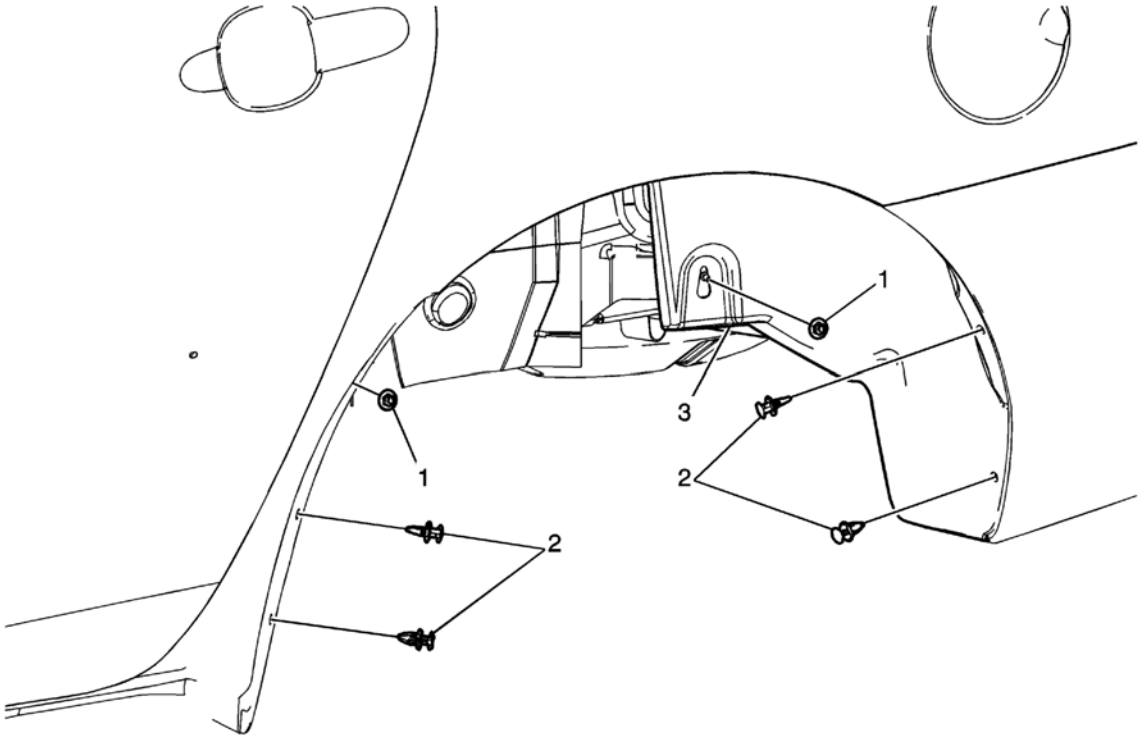

Fig. 22: Rear Wheelhouse Liner Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Lift and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the rear wheel. Refer to **Tire and Wheel Removal and Installation** .	
1	Rear Wheelhouse Liner Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Rear Wheelhouse Liner Retainer (Qty: 4)
3	Rear Wheelhouse Liner

ENGINE SPLASH SHIELD REPLACEMENT (RIGHT)

Tools Required

J 38778 Door Trim Pad and Garnish Clip Remover

Removal Procedure

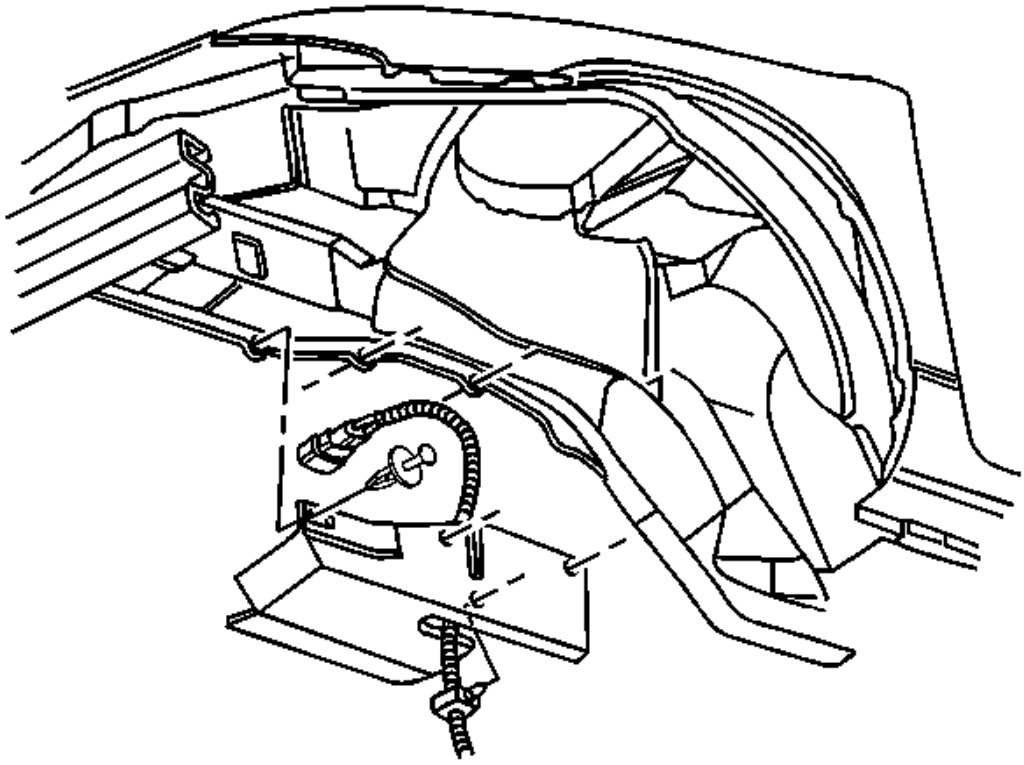

Fig. 23: Engine Splash Shield & Retainers
Courtesy of GENERAL MOTORS COMPANY

1. Remove the push-in retainers that hold the ABS lead to the engine splash shield.

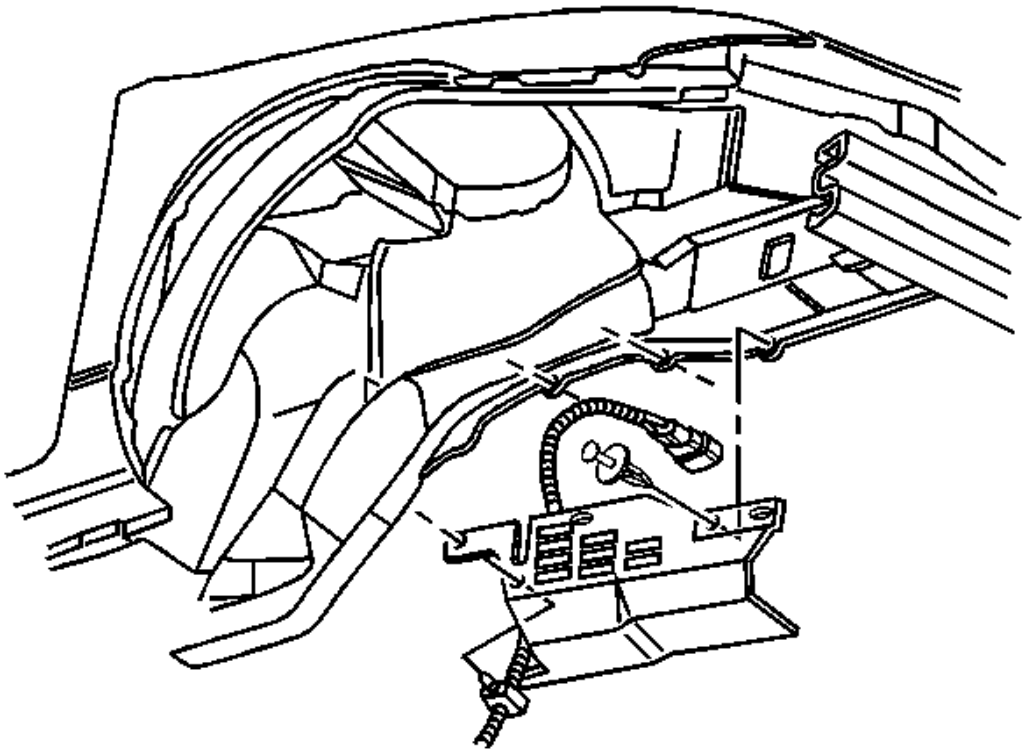

Fig. 24: Right Engine Splash Shield & Retainers
Courtesy of GENERAL MOTORS COMPANY

2. Remove the engine splash shield from the lower flange of the engine compartment side rail.

Installation Procedure

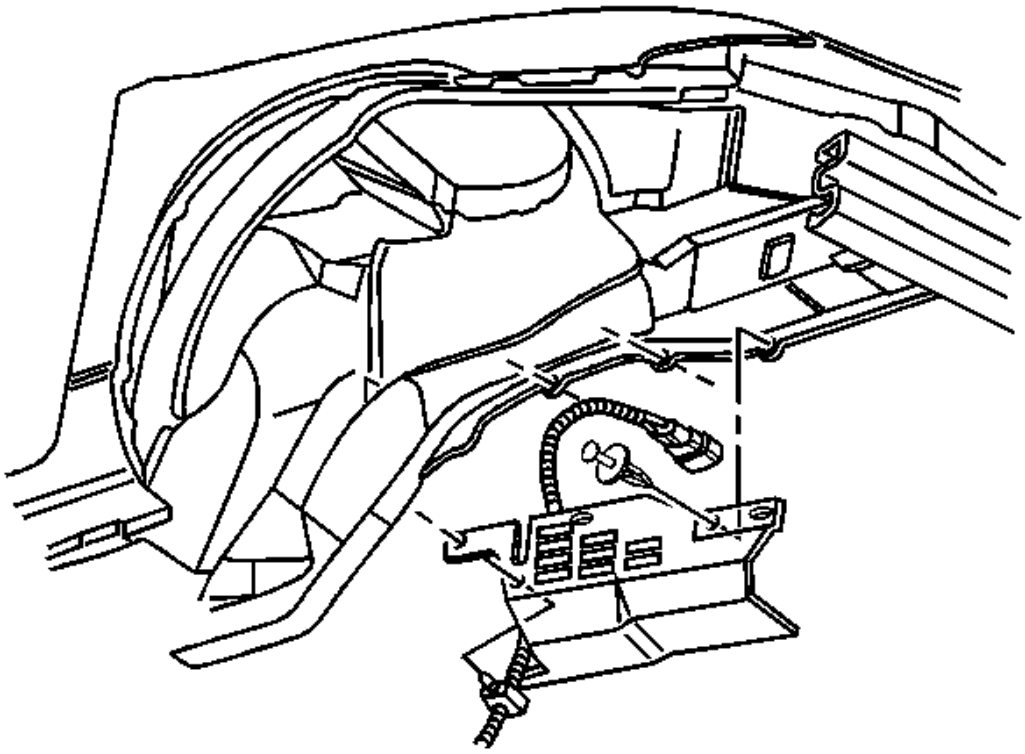

Fig. 25: Right Engine Splash Shield & Retainers
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine splash shield to the lower flange of the engine compartment side rail.
2. Route the ABS lead through the slot in the engine splash shield.

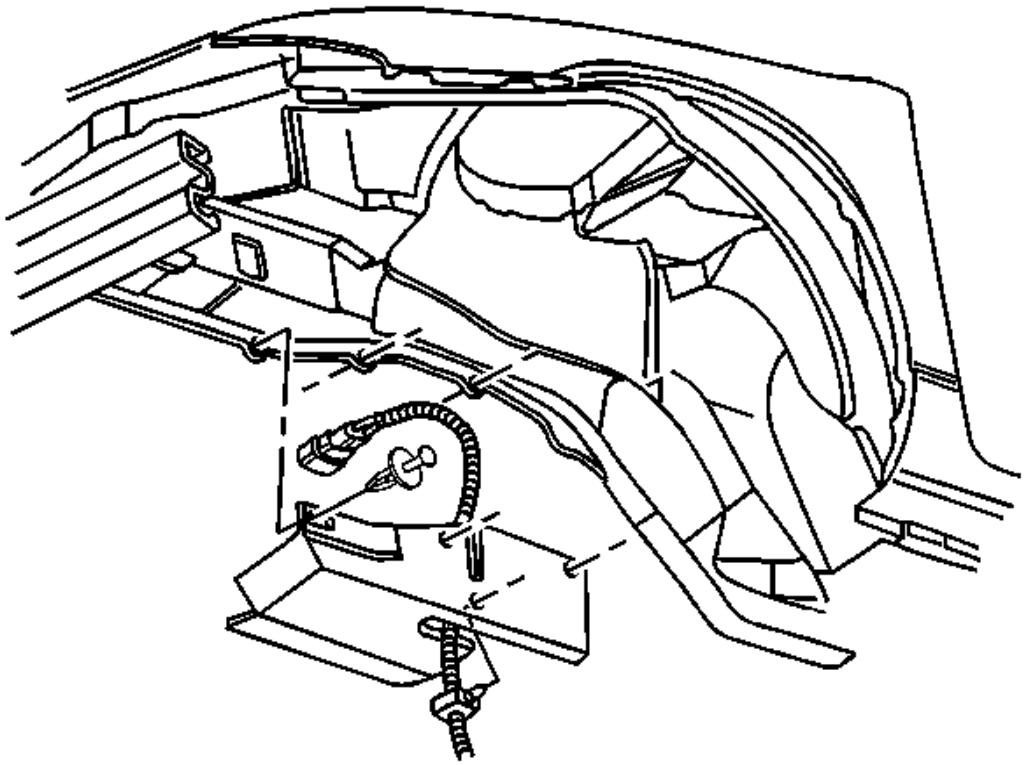

Fig. 26: Engine Splash Shield & Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Align the holes in the engine splash shield to holes in the outboard side engine compartment side rail.
4. Install the push-in retainers to the engine splash shield.

ENGINE SPLASH SHIELD REPLACEMENT (LEFT)

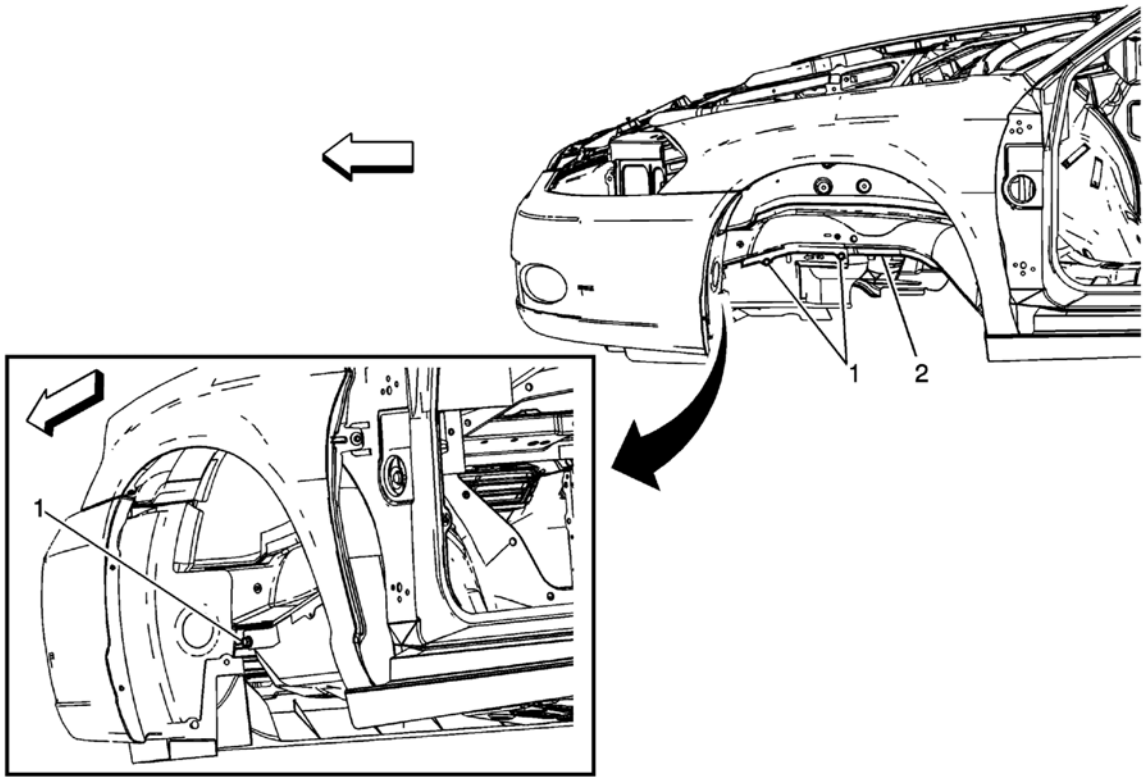

Fig. 27: Engine Splash Shield - Engine (Left)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the left tire/wheel assembly. Refer to **Tire and Wheel Removal and Installation** .	
1	Engine Splash Shield (Left) Plastic Retainer (Qty: 3)
2	Engine Splash Shield (Left)

REPAIR INSTRUCTIONS

INSTRUMENT PANEL INSULATOR PANEL REPLACEMENT - RIGHT SIDE

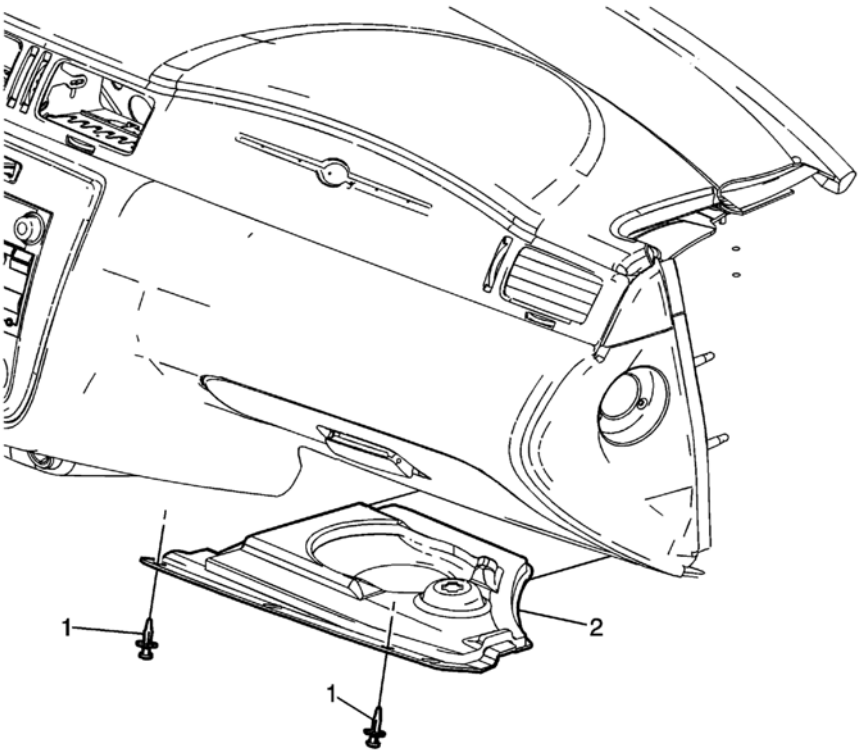

Fig. 1: Right Closeout/Insulator Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Push Pin Retainer (Qty: 2)
2	Instrument Panel Closeout/Insulator Panel **TIP:** Remove the courtesy lamp, if equipped.

INSTRUMENT PANEL INSULATOR PANEL REPLACEMENT - LEFT SIDE

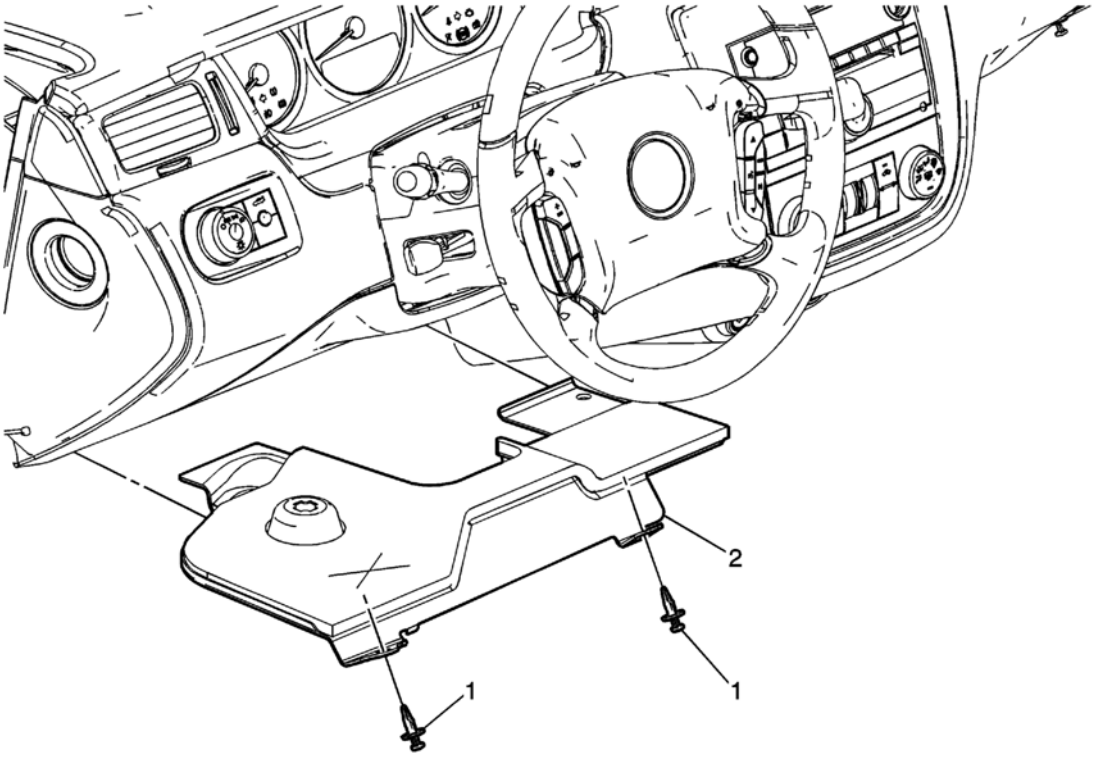

Fig. 2: Left Closeout/Insulator Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Push Pin Retainer (Qty: 2)
2	Instrument Panel Closeout/Insulator Panel **TIP:** Remove the courtesy lamp, if equipped.

STEERING COLUMN OPENING FILLER REPLACEMENT

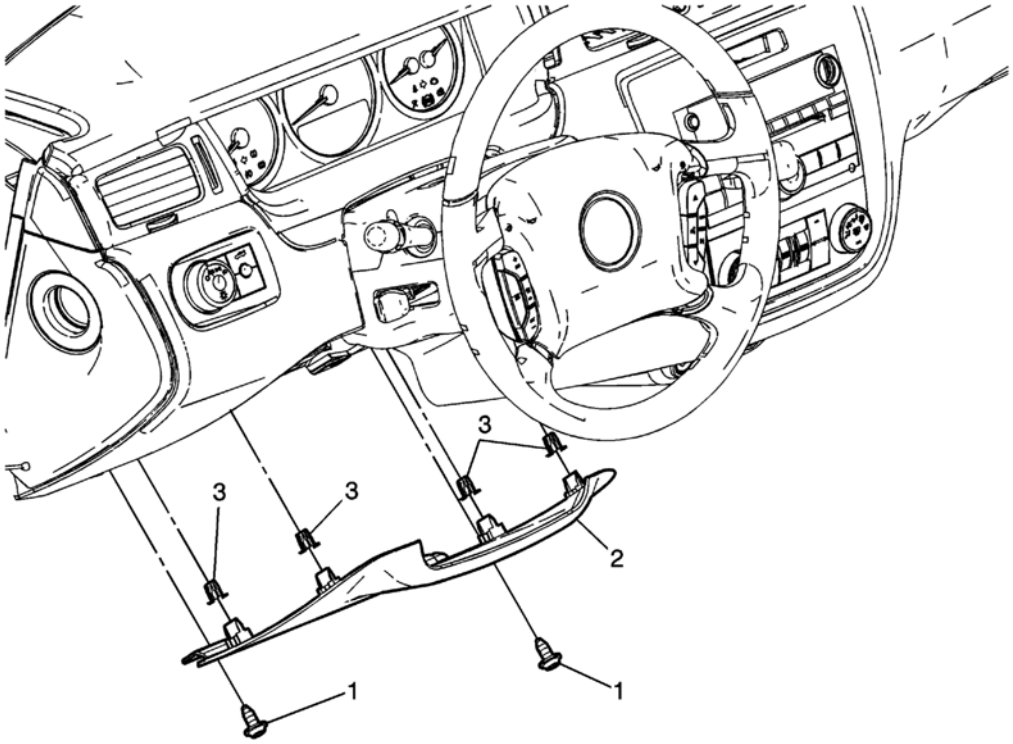

Fig. 3: Steering Column Filler
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Steering Column Filler Panel Screw (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Steering Column Filler Panel Assembly
3	Retainer Clip (Qty: 4)

INSTRUMENT PANEL LOWER CENTER TRIM REPLACEMENT

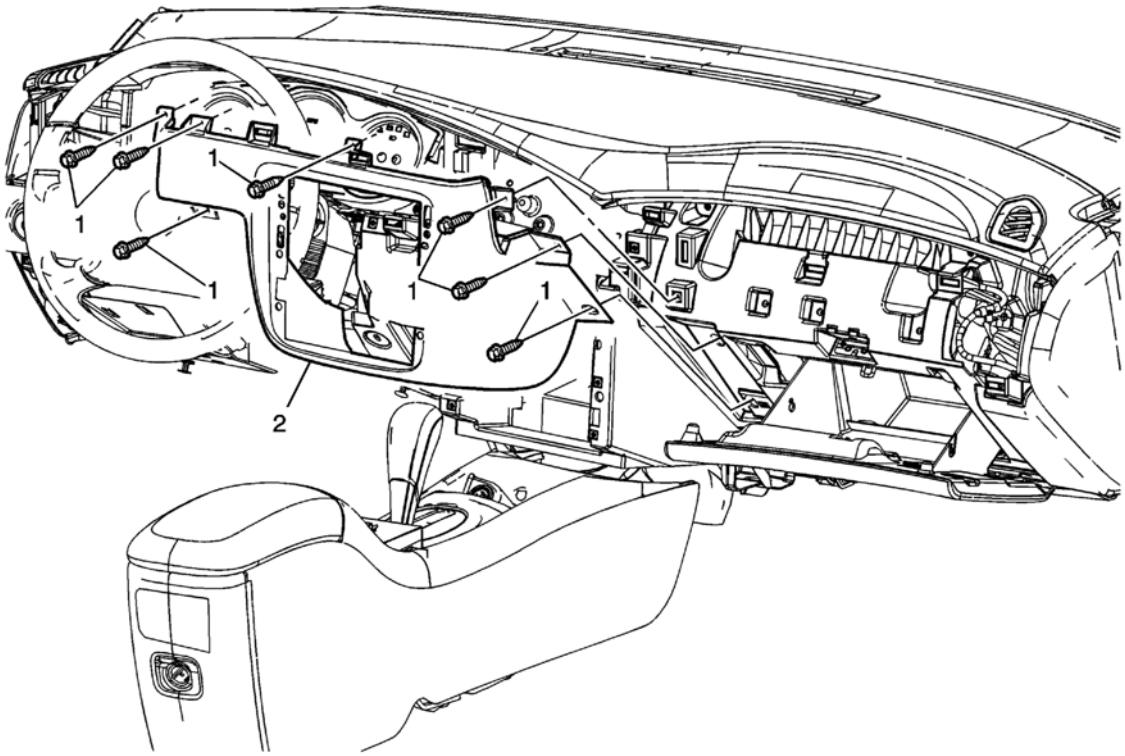

Fig. 4: Instrument Panel (I/P) Lower Center Trim
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the instrument panel trim plate. Refer to **Instrument Panel Trim Plate Replacement**. 2. Remove the radio. Refer to **Radio Replacement** . 3. Remove the HVAC control module. Refer to **Heater and Air Conditioning Control Replacement** .	
1	Instrument Panel Center Lower Trim Panel Screw (Qty: 7) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Center Lower Trim Panel

INSTRUMENT PANEL EXTENSION TRIM PLATE REPLACEMENT

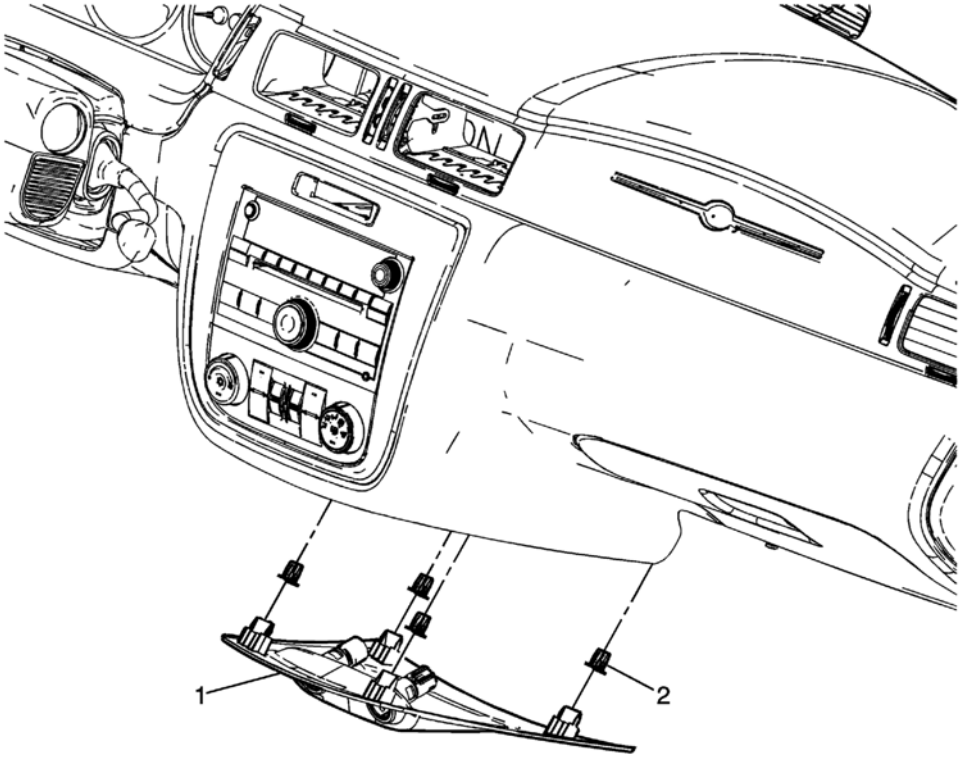

Fig. 5: Instrument Panel (I/P) Extension Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Extension Panel Assembly 1. Disconnect electrical connectors. 2. Remove the 12-volt accessory power receptacles. Refer to **Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement** .
2	Retainer Clips (Qty 4)

PASSENGER KNEE BOLSTER BRACKET REPLACEMENT

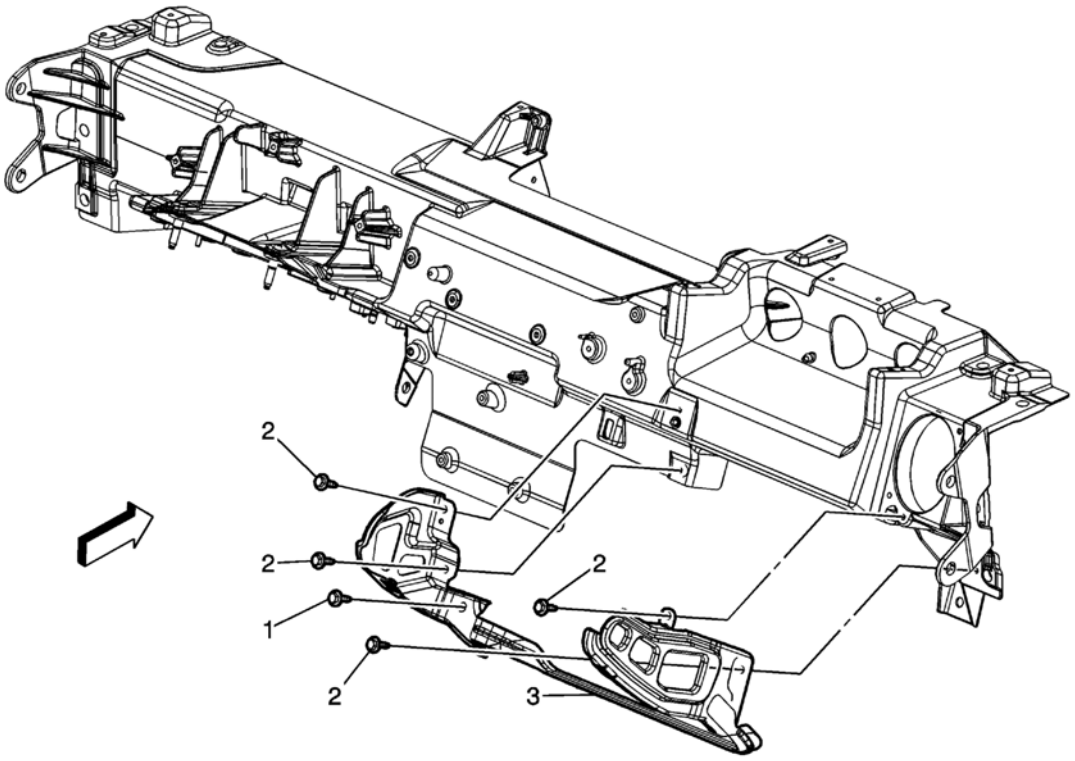

Fig. 6: Right Knee Bolster Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement**.	
1	Passenger Knee Bolster Bracket to HVAC Module Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 4 N.m (35 lb in)
2	Passenger Knee Bolster Bracket Bolt (Qty: 4) **Tighten** 10 N.m (89 lb in)
3	Passenger Knee Bolster Bracket Assembly

DRIVER KNEE BOLSTER BRACKET REPLACEMENT

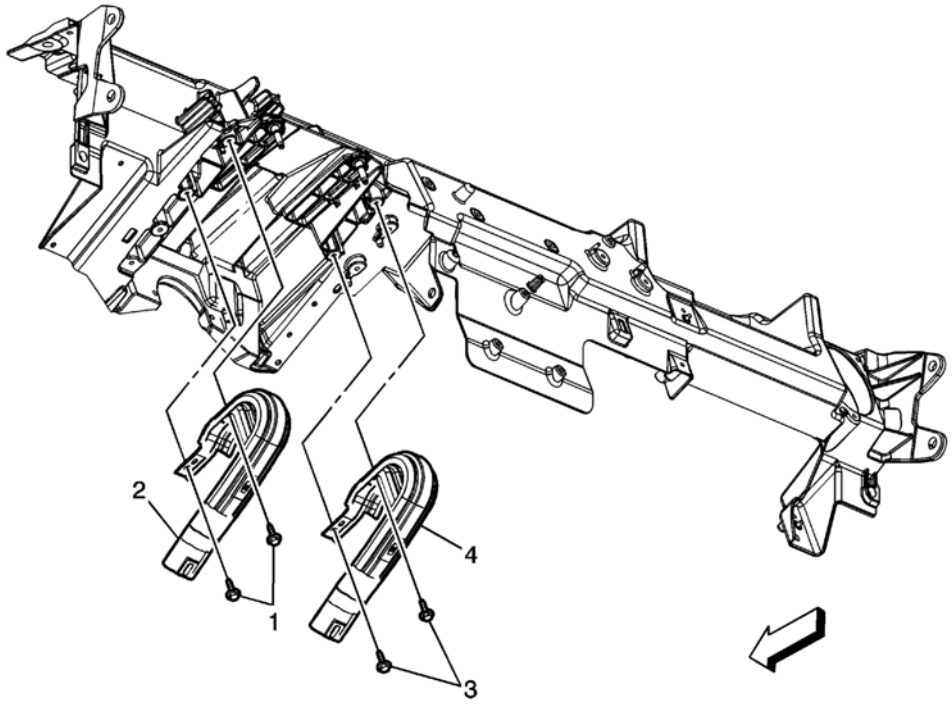

Fig. 7: Left Knee Bolster Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement**.	
1	Driver Knee Bolster Bracket Bolt (Qty 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Driver Knee Bolster - Left Bracket Assembly
3	Driver Knee Bolster Bracket Bolt (Qty 2) **Tighten** 10 N.m (89 lb in)
4	Driver Knee Bolster - Right Bracket Assembly

DRIVER KNEE BOLSTER REINFORCEMENT REPLACEMENT

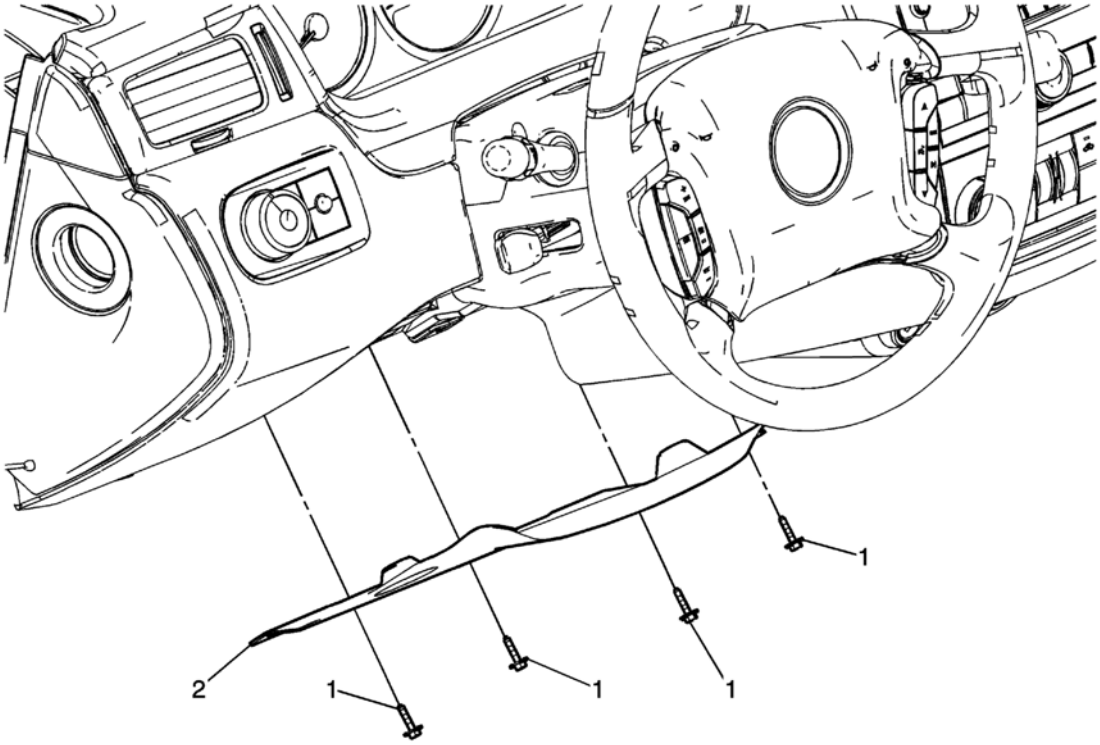

Fig. 8: Knee Bolster Reinforcement
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the steering column filler panel. Refer to **Steering Column Opening Filler Replacement**.	
1	Knee Bolster Reinforcement Bolt (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Drivers Knee Bolster Reinforcement

INSTRUMENT PANEL TRIM PLATE REPLACEMENT

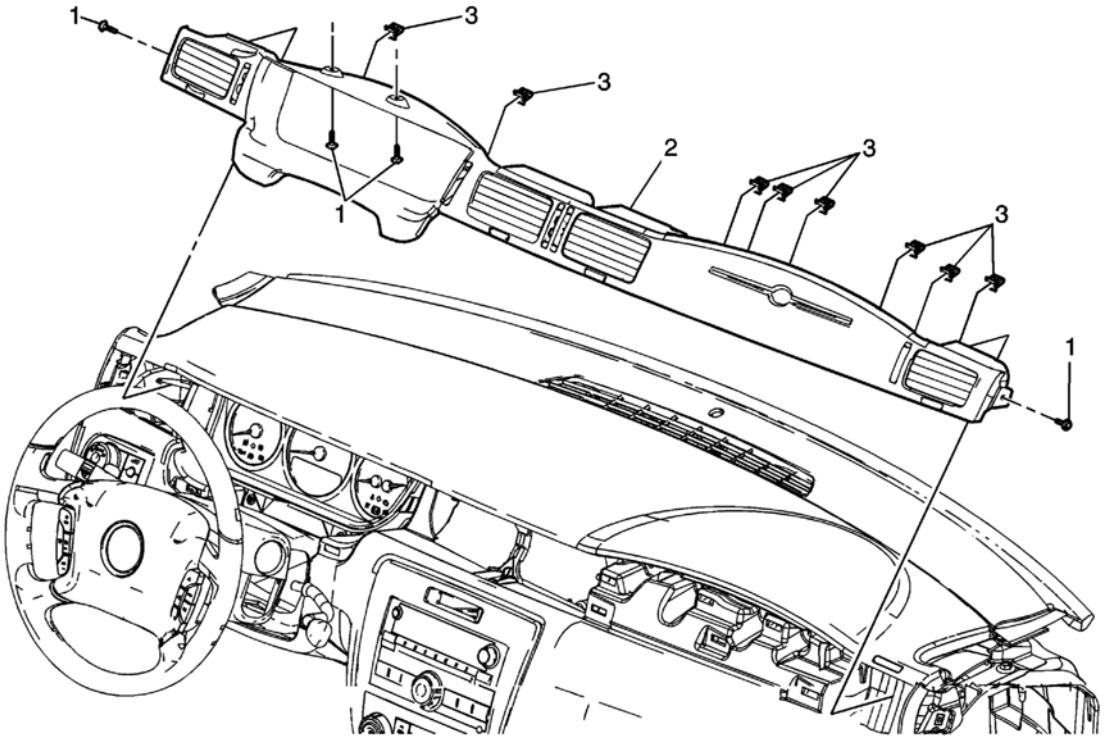

Fig. 9: Instrument Panel (I/P) Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel (I/P) outer trim covers. Refer to **Instrument Panel Outer Trim Cover Replacement - Left Side**, and **Instrument Panel Outer Trim Cover Replacement - Right Side**.	
1	Instrument Panel Trim Plate Screw (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Trim Plate Assembly **Procedure** 1. Disconnect the electrical connector. 2. Tilt the steering column to the lowest position. 3. Remove the driver information center switch. Refer to **Driver Information Display Switch Replacement** .
3	Retainer Clip (Qty: 8)

INSTRUMENT PANEL LOWER TRIM PLATE REPLACEMENT

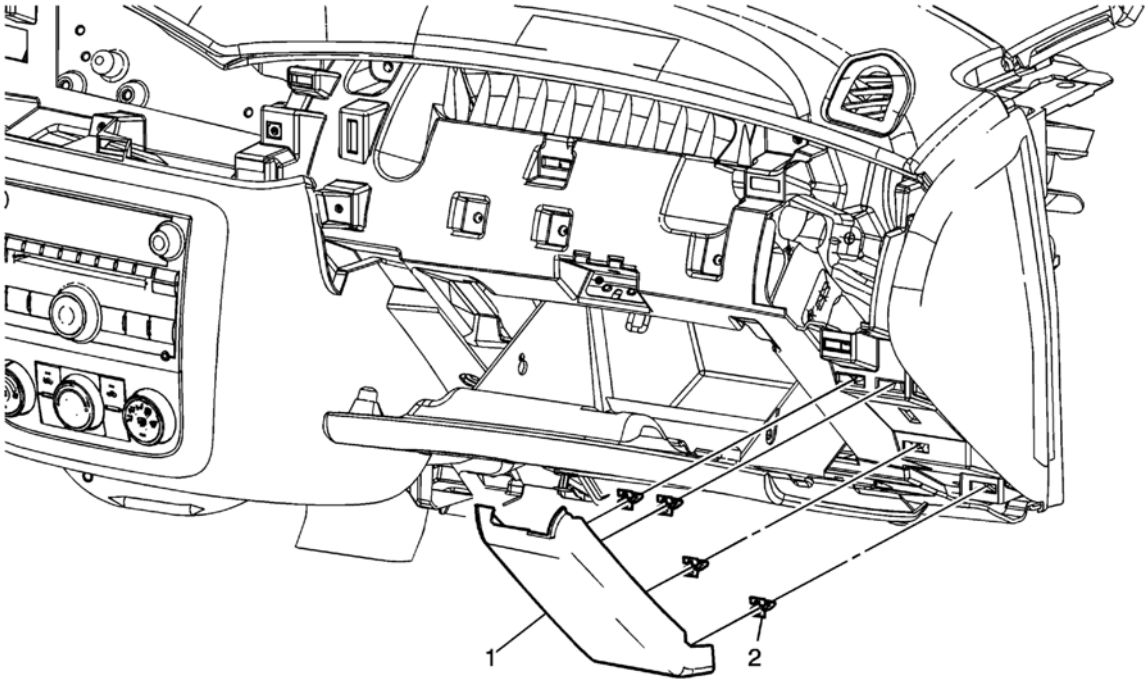

Fig. 10: Instrument Panel (I/P) Lower Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Remove the instrument panel trim plate. Refer to **Instrument Panel Trim Plate Replacement**.	
1	Instrument Panel Lower Trim Plate
2	Retainer Clips (Qty: 4)

INSTRUMENT PANEL ACCESSORY TRIM PLATE REPLACEMENT

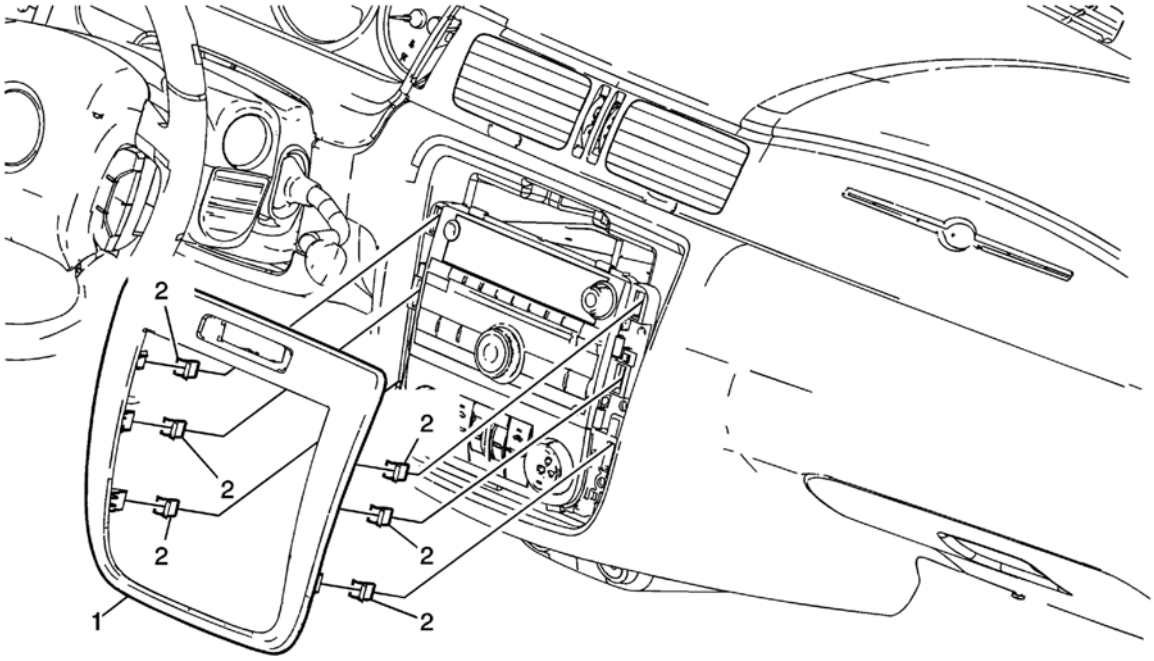

Fig. 11: Instrument Panel (I/P) Accessory Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Accessory Plate Assembly **Procedure** 1. Disconnect electrical connectors. 2. Remove the inflatable restraint iIndicator. Refer to **Instrument Panel Airbag Arming Status Display Replacement** .
2	Retainer Clip (Qty 6)

INSTRUMENT PANEL UPPER TRIM PANEL REPLACEMENT

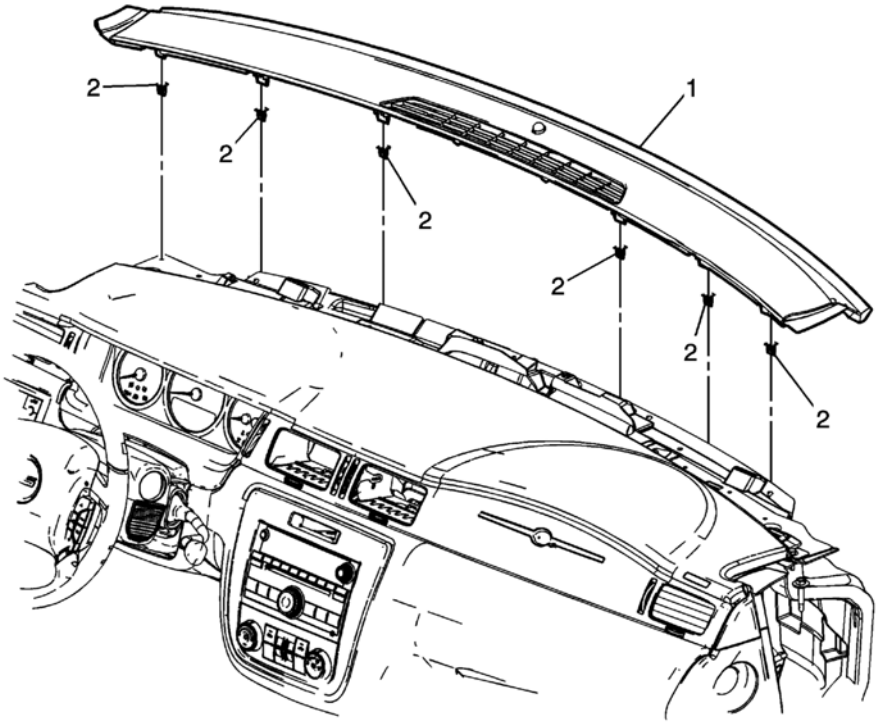

Fig. 12: Instrument Panel (I/P) Upper Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the windshield garnish moldings. Refer to **Windshield Pillar Garnish Molding Replacement** .	
1	Instrument Panel Upper Trim Panel Assembly **Procedure** 1. Disconnect electrical connectors. 2. Remove the ambient light sensor.
2	Retainer Clip (Qty: 6)

INSTRUMENT PANEL OUTER TRIM COVER REPLACEMENT - RIGHT SIDE

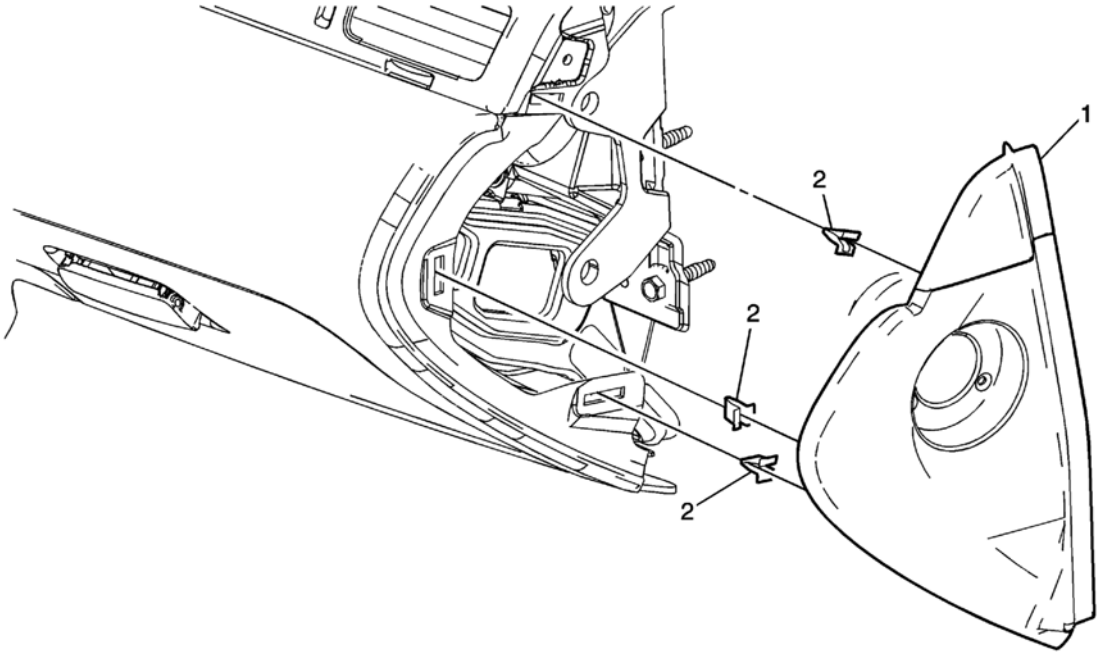

Fig. 13: Right Instrument Panel (I/P) Outer Trim Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Outer Trim Cover
2	Retainer Clip (Qty: 3)

INSTRUMENT PANEL OUTER TRIM COVER REPLACEMENT - LEFT SIDE

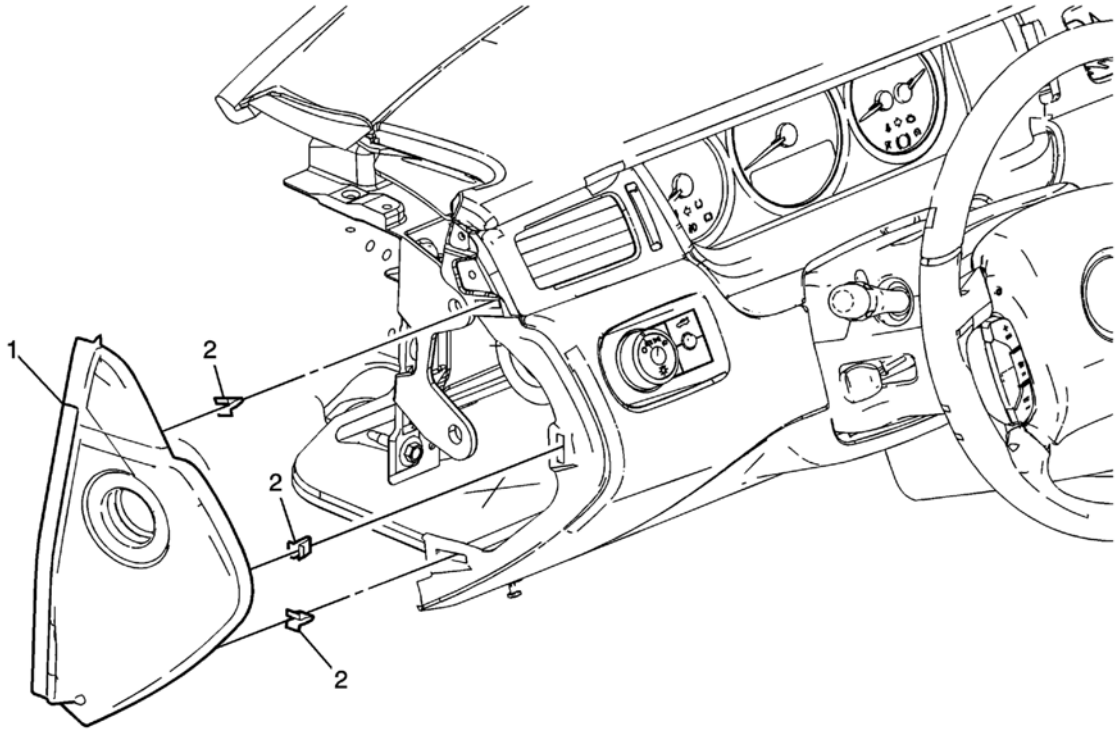

Fig. 14: Left Instrument Panel (I/P) Outer Trim Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Outer Trim Cover
2	Retainer Clip (Qty: 3)

INSTRUMENT PANEL LOWER TRIM PANEL REPLACEMENT

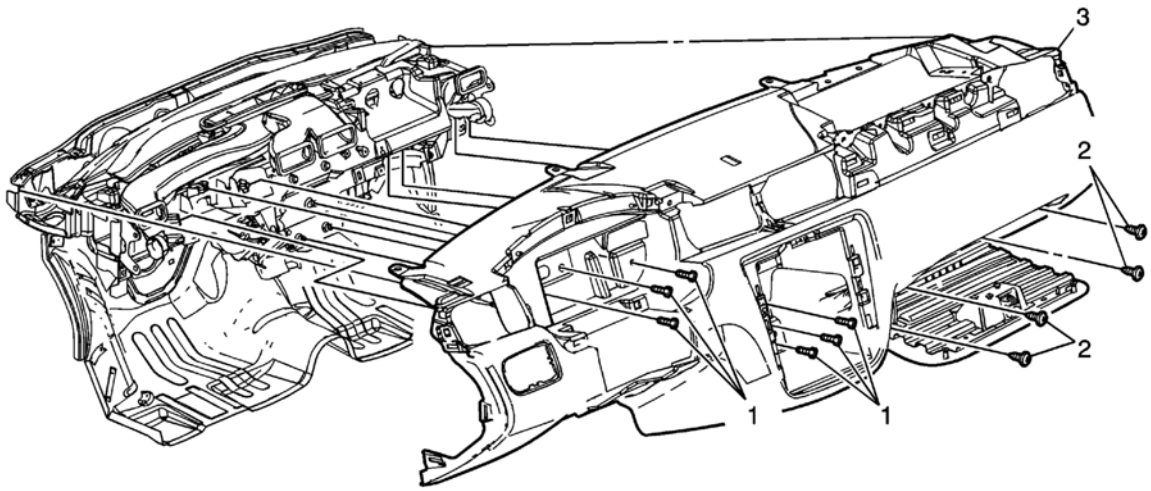

Fig. 15: Lower Instrument Panel (I/P) Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel (I/P) upper trim pad. Refer to **Instrument Panel Upper Trim Pad Replacement**. 2. Remove the I/P cluster assembly. Refer to **Instrument Cluster Replacement** . 3. Remove the headlamp switch assembly. Refer to **Headlamp Switch Replacement (Impala)** . 4. Remove the right and left insulator panels. Refer to **Instrument Panel Insulator Panel Replacement - Right Side**, and **Instrument Panel Insulator Panel Replacement - Left Side**. 5. Remove the I/P inflatable restraint. Refer to **Airbag Instrument Panel Module Replacement (Impala)** . 6. Remove the drivers knee bolster reinforcement. Refer to **Driver Knee Bolster Reinforcement Replacement**. 7. Remove the steering column. Refer to **Steering Column Replacement** . 8. Remove the radio. Refer to **Radio Replacement** . 9. Remove the HVAC control module. Refer to **Heater and Air Conditioning Control Replacement** .	
1	Instrument Panel Lower Trim Panel Bolt (Qty 6) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 10 N.m (88 lb in)
2	Instrument Panel Lower Trim Panel Screw (Qty 4) **Tighten** 2 N.m (18 lb in)
3	Instrument Panel Lower Trim Panel Assembly **Procedure** 1. Note routing of the wiring harness prior to removal to aid in the reinstallation. 2. Disconnect all electrical connections to the trim panel.

INSTRUMENT PANEL COMPARTMENT DOOR LOCK STRIKER REPLACEMENT

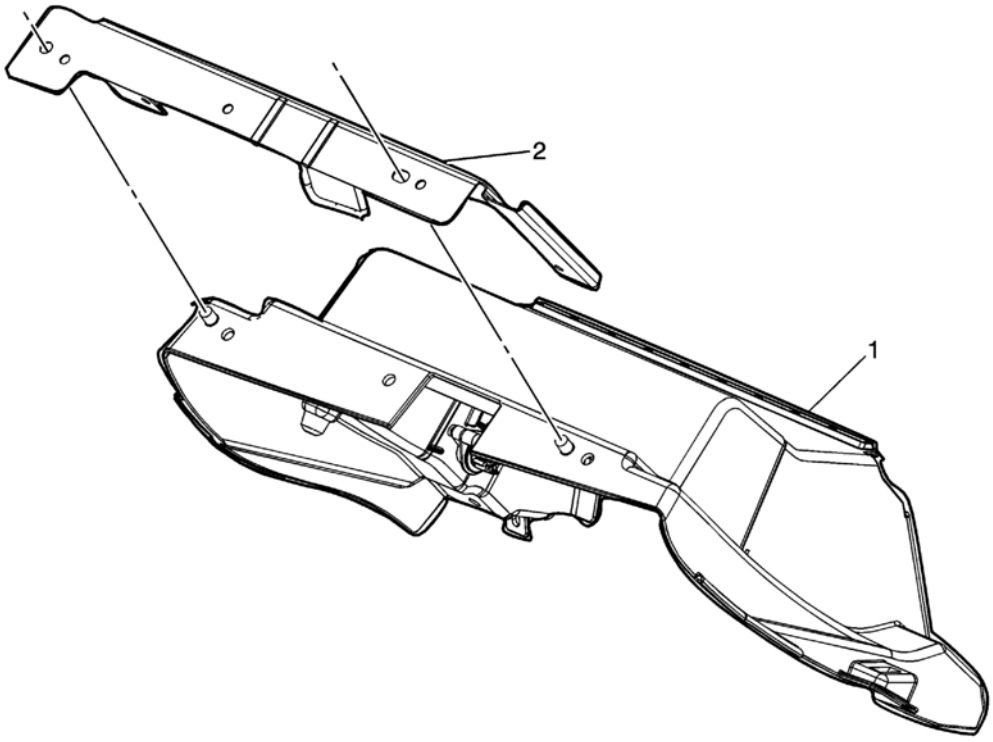

Fig. 16: Instrument Panel (I/P) Compartment Striker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Compartment Inner Panel Assembly Refer to Instrument Panel Compartment Inner Panel Replacement.

Callout	Component Name
2	Instrument Panel Compartment Striker Assembly

INSTRUMENT PANEL COMPARTMENT DOOR REPLACEMENT

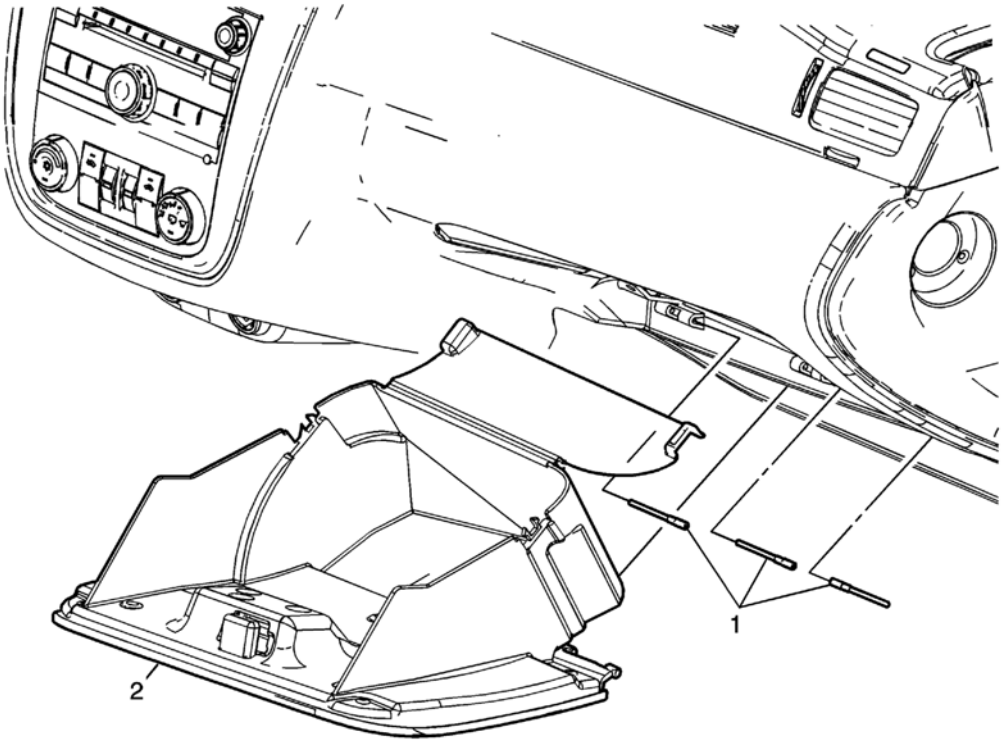

Fig. 17: Instrument Panel (I/P) Compartment Door
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Pin, Compartment Door Hinge (Qty 3) **TIP:** Use a small pointed tool in order to drive the pins out of the hinge.
2	Door Assembly, Instrument Panel Compartment 1. Squeeze the compartment bin enough to pull the door and bin assembly out the opening past the stops and the dampener. 2. Remove the compartment Latch Assembly. Refer to **Instrument Panel Compartment Door Latch Replacement**.

INSTRUMENT PANEL COMPARTMENT DOOR LATCH REPLACEMENT

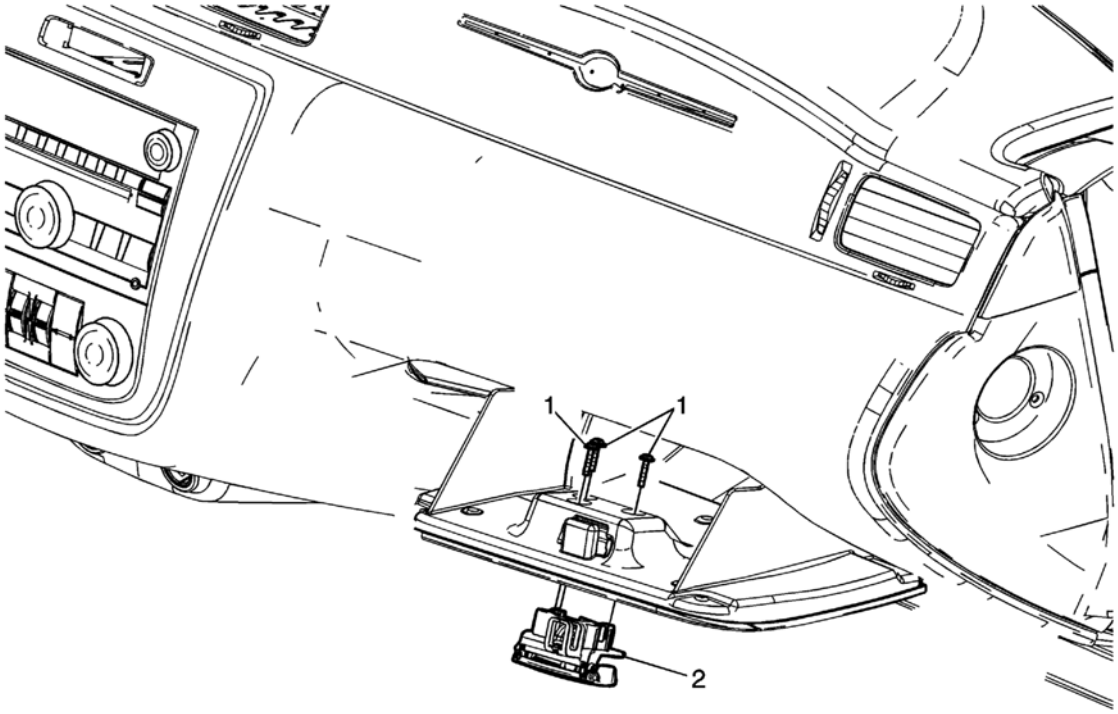

Fig. 18: Instrument Panel (I/P) Compartment Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Compartment Latch Screw (Qty 3) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Compartment Latch Assembly

INSTRUMENT PANEL COMPARTMENT DOOR DAMPENER REPLACEMENT

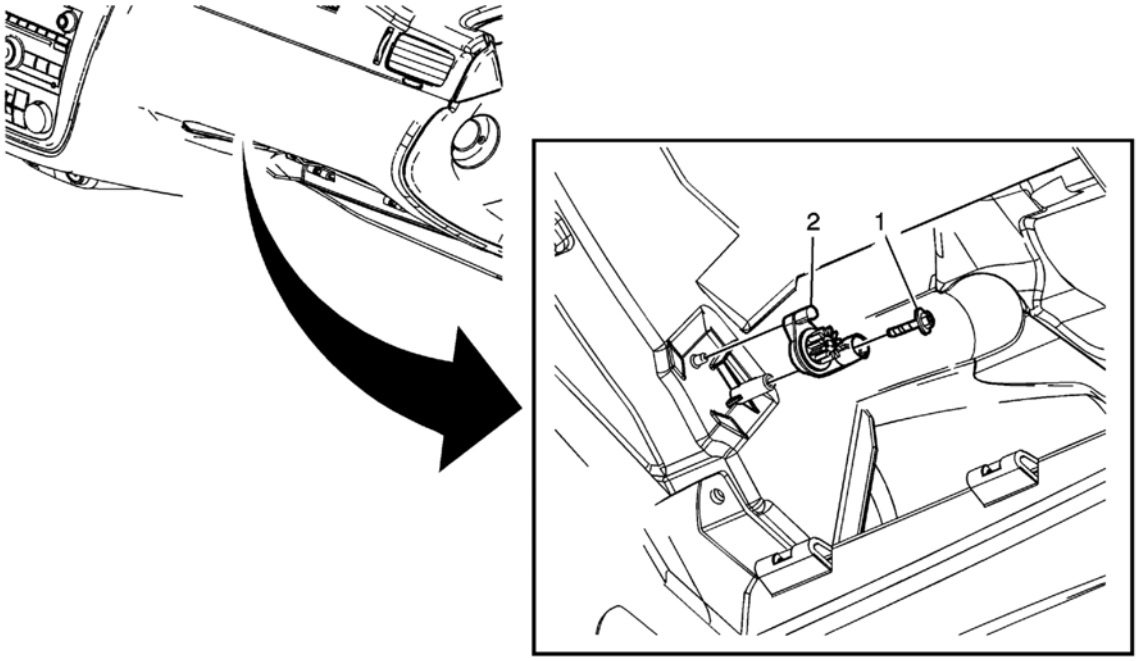

Fig. 19: I/P Compartment Dampener
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel compartment door assembly . Refer to **Instrument Panel Compartment Door Replacement**.	
1	Instrument Panel Compartment Striker Screw (Qty 1) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Instrument Panel Compartment Dampener Assembly

INSTRUMENT PANEL COMPARTMENT INNER PANEL REPLACEMENT

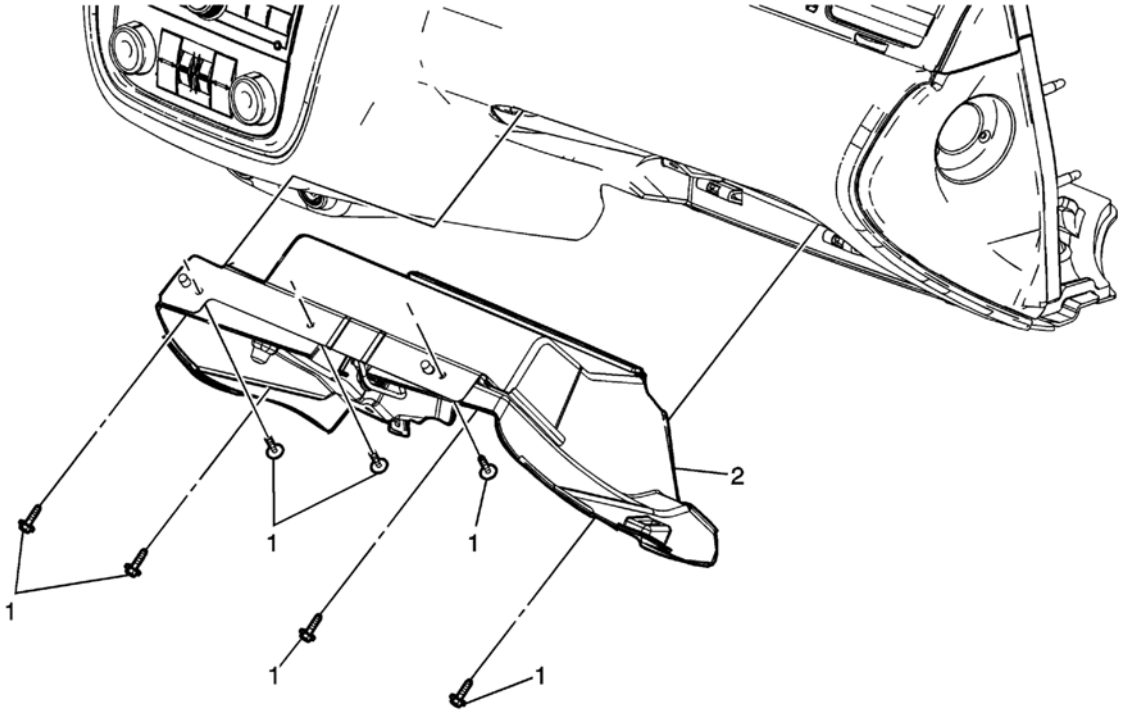

Fig. 20: Instrument Panel Compartment Inner Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the instrument panel compartment door assembly. Refer to **Instrument Panel Compartment Door Replacement**. 2. Remove the right side instrument panel closeout/insulator. Refer to **Instrument Panel Insulator Panel Replacement - Right Side**. 3. Remove the right side carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** . 4. Remove the instrument panel right hand outer trim cover. Refer to **Instrument Panel Outer Trim Cover Replacement - Right Side**. 5. Remove the instrument panel trim plate right outer screw. Refer to **Instrument Panel Trim Plate Replacement**.	
1	Instrument Panel Compartment Inner Panel Screw (Qty 7) **CAUTION:** **Refer to Fastener Caution .** **Tighten**

Callout	Component Name
	2 N.m (18 lb in)
2	Instrument Panel Compartment Inner Panel Assembly **TIP:** Flex the bottom right hand corner of the instrument panel in order to remove the instrument panel compartment inner panel assembly.

INSTRUMENT PANEL UPPER TRIM PAD REPLACEMENT

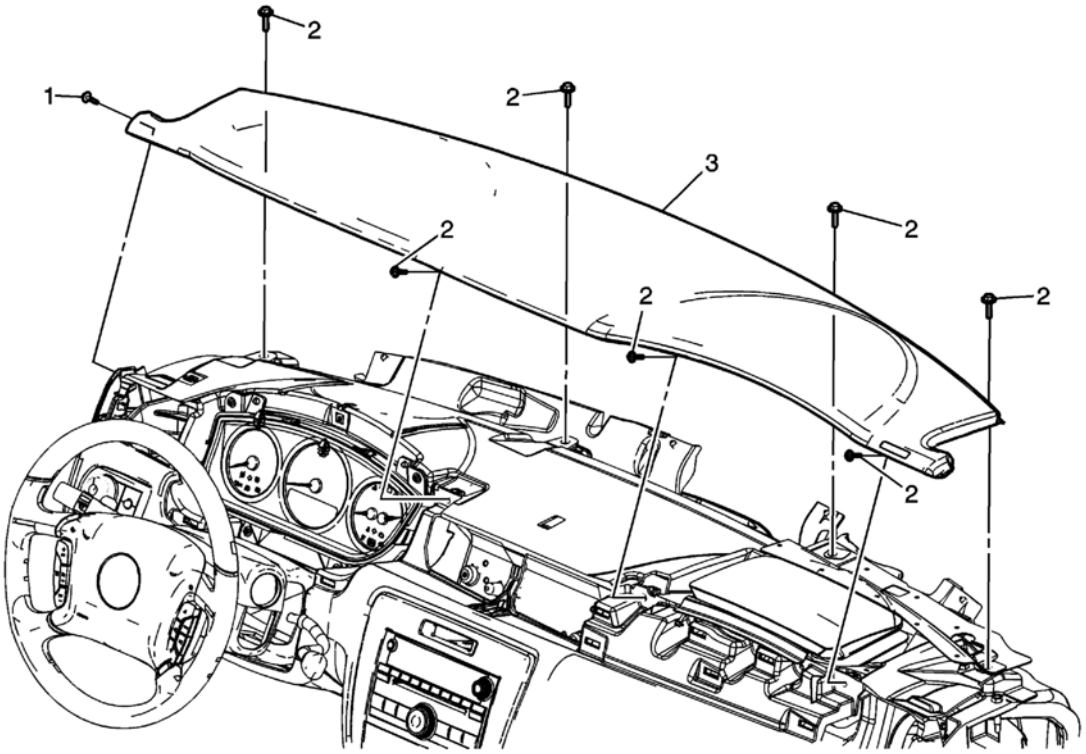

Fig. 21: Instrument Panel (I/P) Upper Trim Pad
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel (I/P) upper trim panel. Refer to **Instrument Panel Upper Trim Panel Replacement**. 2. Remove the I/P trim plate. Refer to **Instrument Panel Trim Plate Replacement**.	
1	Instrument Panel Upper Trim Pad Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten**

Callout	Component Name
	2 N.m (18 lb in)
2	Instrument Panel Upper Trim Pad Bolt (Qty: 7) **Tighten** 10 N.m (88 lb in)
3	Instrument Panel Upper Trim Pad Assembly **Procedure** Disconnect the electrical connector.

INSTRUMENT PANEL CENTER SUPPORT BRACKET REPLACEMENT

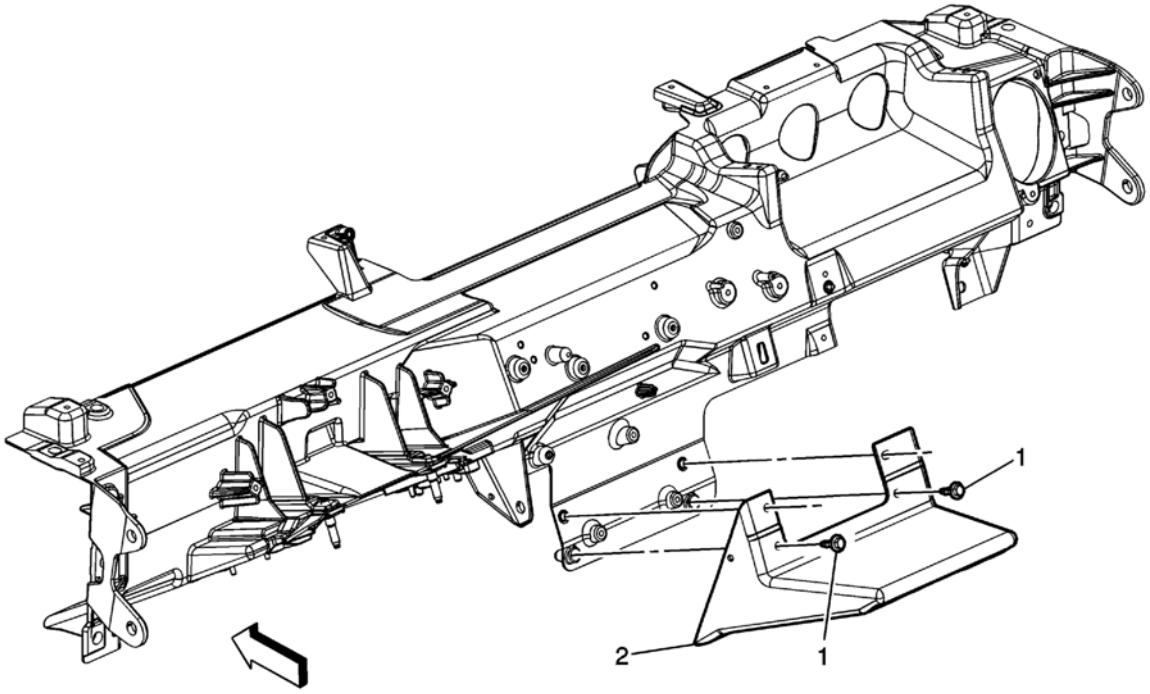

Fig. 22: Instrument Panel (I/P) Center Support Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement**.	
1	Instrument Panel Center Support Bracket Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Tighten 10 N.m (89 lb in)
2	Instrument Panel Center Support Bracket Assembly

INSTRUMENT PANEL CARRIER REPLACEMENT

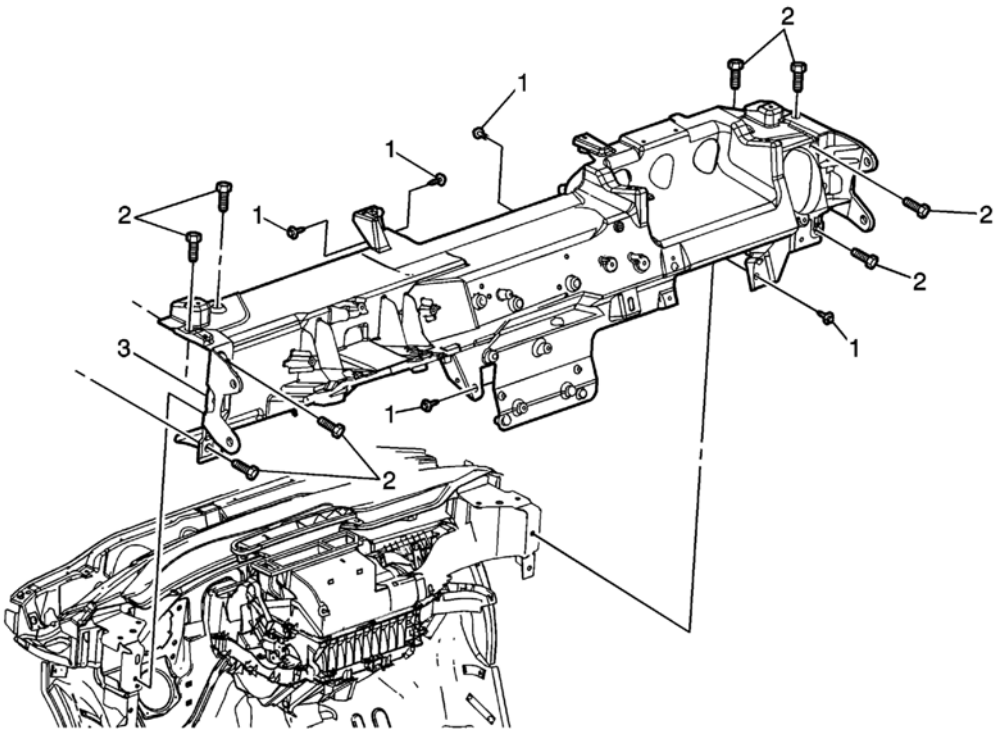

Fig. 23: Instrument Panel (I/P) Carrier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	

1. Remove the instrument panel lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement**.
2. Remove the drivers knee bolster brackets. Refer to **Driver Knee Bolster Bracket Replacement**.
3. Remove the passenger knee bolster bracket. Refer to **Passenger Knee Bolster Bracket Replacement**.
4. Remove the brake pedal nut and bolt, and pedal bracket bolts. Refer to **Brake Pedal Assembly Replacement** .
5. Remove the instrument panel center support bracket. Refer to **Instrument Panel Center Support Bracket Replacement**.
6. Remove the air distributor duct assembly. Refer to **Air Distributor Duct Replacement** .
7. Remove the right air outlet duct assembly. Refer to **Instrument Panel Outer Air Outlet Upper Duct Replacement - Right Side** .

Callout	Component Name
1	Instrument Panel Carrier to HVAC Module Bolt (Qty: 5) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 4 N.m (35 lb in)
2	Instrument Panel Carrier to Body Bolt (Qty: 8) **Tighten** 25 N.m (18 lb ft)
3	Instrument Panel Carrier Assembly **Procedure** 1. Note routing of the wiring harness to aid in the reinstallation. 2. With the aid of an assistant, remove the carrier from the vehicle. 3. Remove the defroster air outlet duct assembly. Refer to **Defroster Air Outlet Duct Replacement** .

FRONT FLOOR CONSOLE COMPARTMENT DOOR HINGE REPLACEMENT

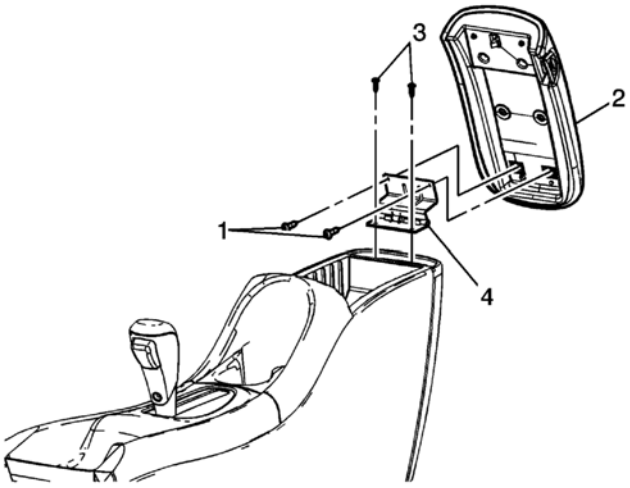

Fig. 24: Console Compartment Door Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Floor Console Door Screw (Qty: 2) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 2 N.m (18 lb in)
2	Front Floor Console Door Assembly
3	Front Floor Console Hinge Screw (Qty: 2) **Tighten** 2 N.m (18 lb in)
4	Front Floor Console Door Hinge

FRONT FLOOR CONSOLE COMPARTMENT DOOR LATCH REPLACEMENT

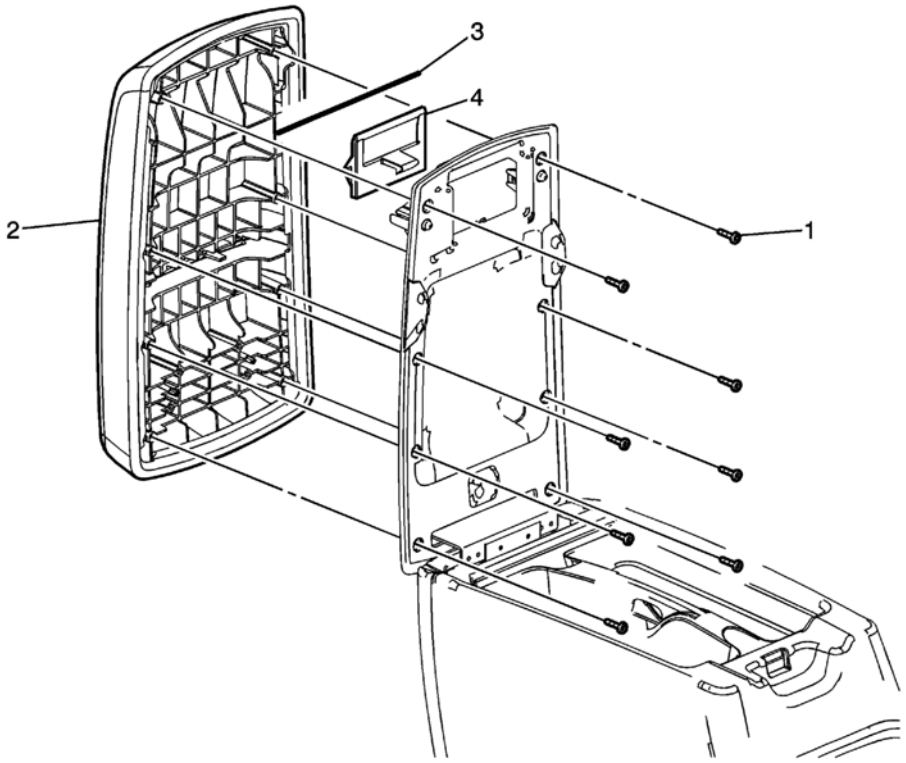

Fig. 25: Console Compartment Door Latch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **To prevent component**	

Callout	Component Name
damage, DO NOT use metal tools to remove the trim. **Preliminary Procedures** 1. Place the front floor shiftier in the Neutral position. 2. Remove the front floor console cupholder assembly. Refer to **Front Floor Console Cup Holder Replacement (Impala)** .	
1	Front Floor Console Trim Plate **Procedure** 1. For console removal and shift lock actuator access, use ONLY a plastic trim tool to lift the trim plate from the console. Do not use any tool between the trim plate and the shiftier. 2. Apply the park brake and shift lever rearward. The sound deadener must be reinstalled if the wire harness is removed or replaced.
2	Retainer Clip (Qty: 4)

CONSOLE REAR TRIM PLATE REPLACEMENT

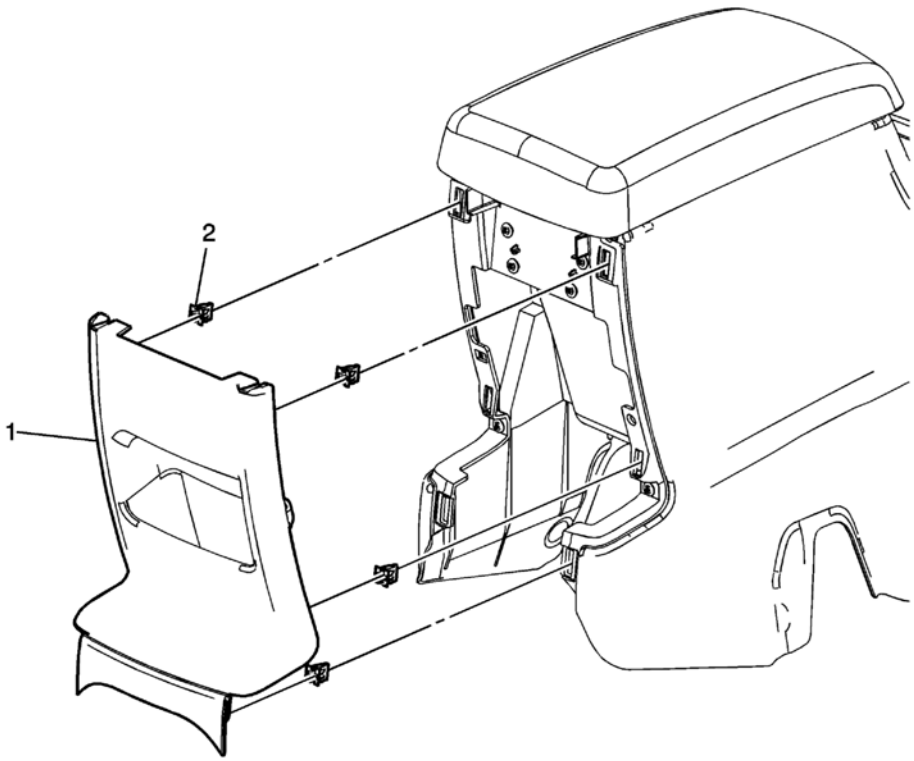

Fig. 27: Console Rear Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Floor Console Plate Assembly
2	Retainer Clip (Qty 6)

CONSOLE FRONT TRIM PLATE REPLACEMENT

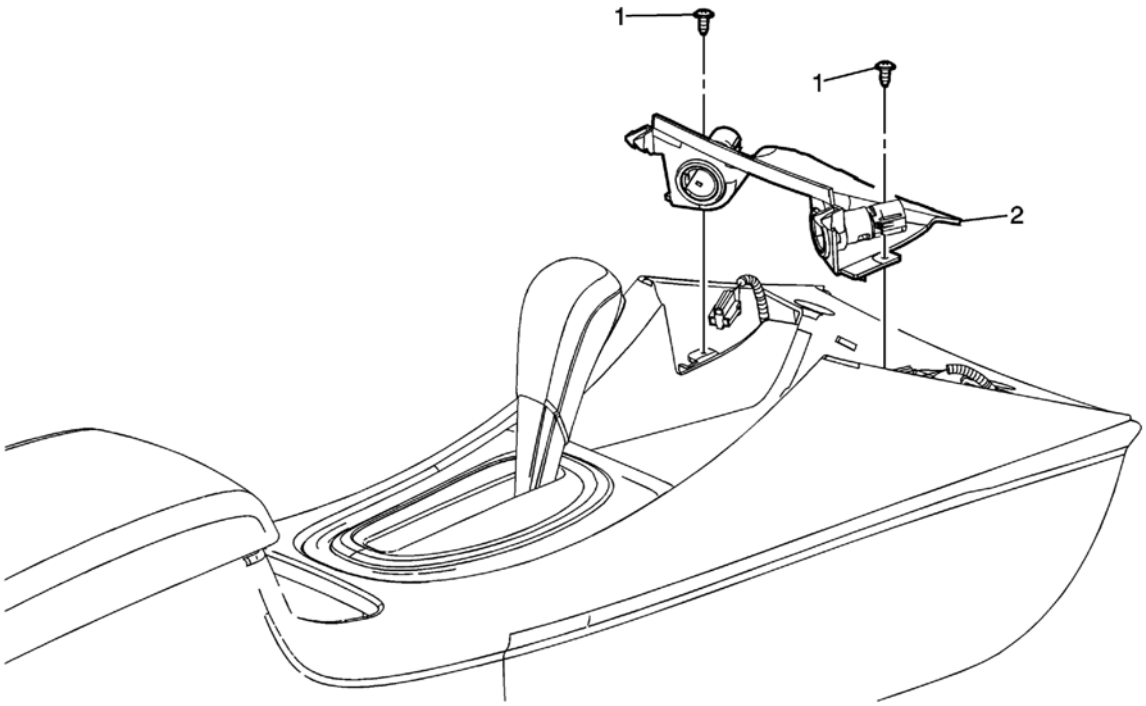

Fig. 28: Console Front Trim Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front floor console. Refer to **Front Floor Console Replacement**.	
1	Front Floor Console Trim Panel Screw (Qty 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)

Callout	Component Name
2	Front Floor Console Trim Panel Assembly **Procedure** 1. Disconnect electrical connectors. 2. Remove the 12 volt accessory power receptacles. Refer to **Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement** .

CONSOLE SHIFT LEVER BEZEL REPLACEMENT

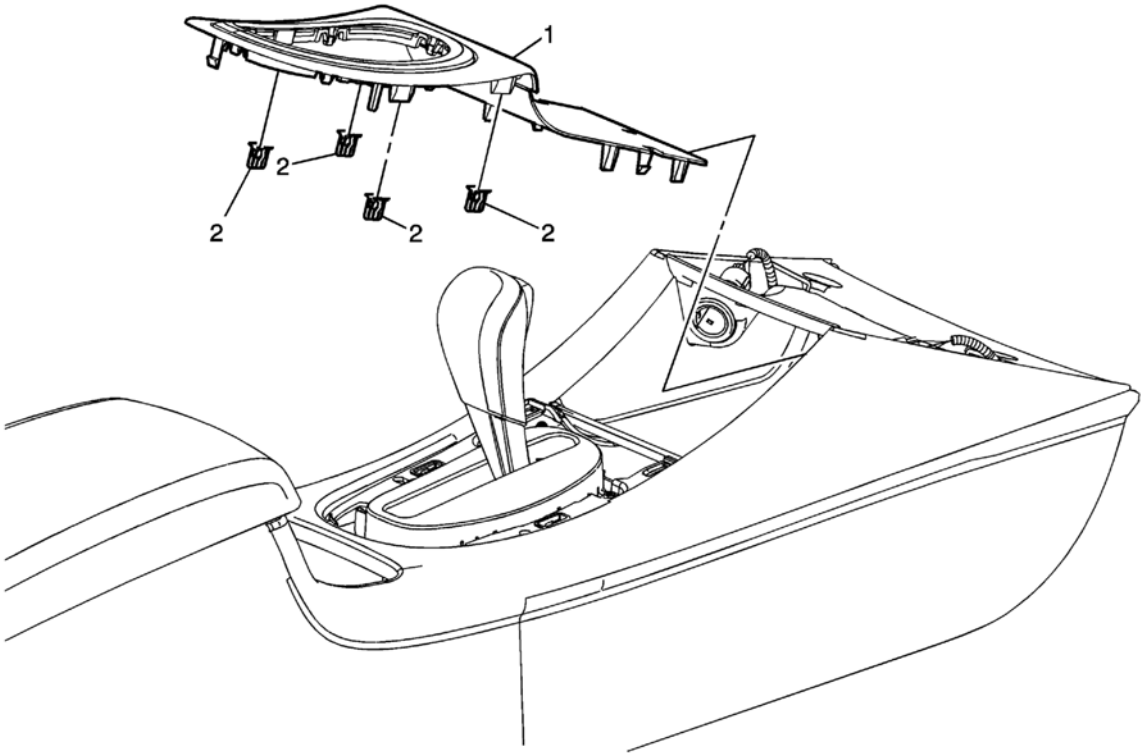

Fig. 29: Console Shift Lever Bezel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Console Shift Lever Bezel Assembly 1. Block the drive wheels. 2. Move shift lever to the neutral position. 3. Use a flat-bladed plastic trim tool to aid in the removal of the shift bezel. 4. For console removal and shift lock actuator access, use ONLY a plastic trim tool to lift the trim bezel from the console. Do not use any tool between the trim bezel and the shifter. 5. Apply the park brake and shift lever rearward. The sound deadener must be reinstalled

Callout	Component Name
	if the wire harness is removed or replaced.
2	Retainer Clips (Qty: 4)

FRONT FLOOR CONSOLE REPLACEMENT

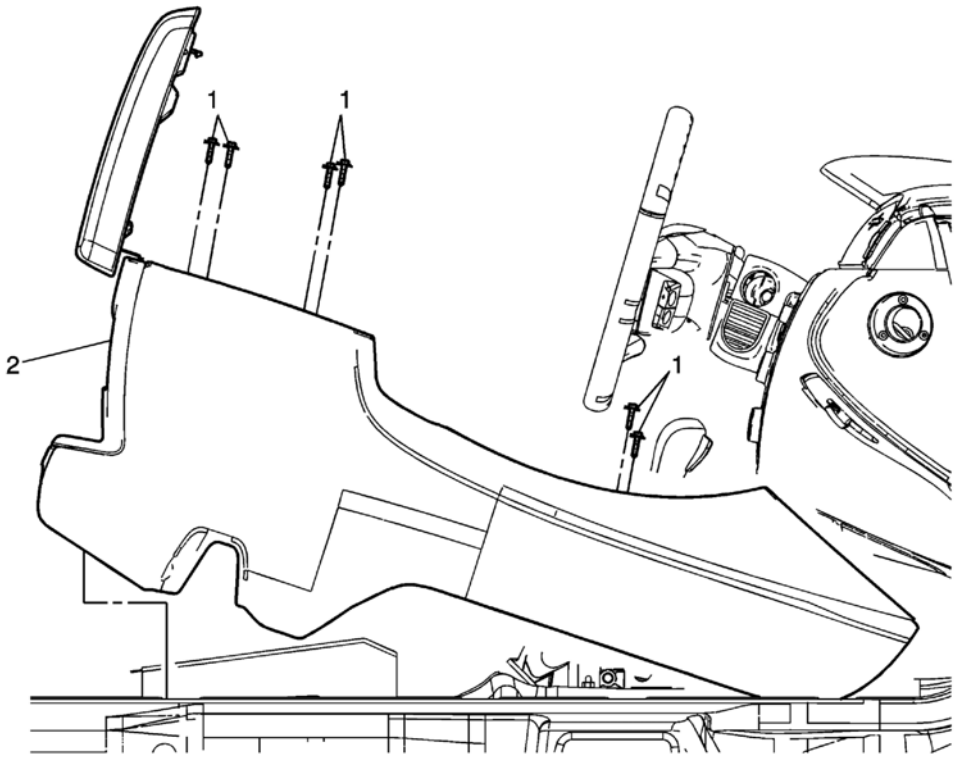

Fig. 30: Front Floor Console
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **To prevent component damage, DO NOT use metal tools to remove the trim.**	

Preliminary Procedure

1. Remove the front floor console bin liner.
2. Remove the console shift lever bezel. Refer to **Console Shift Lever Bezel Replacement**.
3. Use ONLY a plastic trim tool to lift the shift lever bezel from the console. Do not use any tool between the trim bezel and the shifter.

Callout	Component Name
4. Apply the park brake and shift lever rearward. The sound deadener must be reinstalled if the wire harness is removed or replaced.	
1	Front Floor Console Bolt (Qty: 6) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 7 N.m (62 lb in)
2	Front Floor Console Assembly **Procedure** Disconnect the electrical connector.

FLOOR CONSOLE BRACKET REPLACEMENT

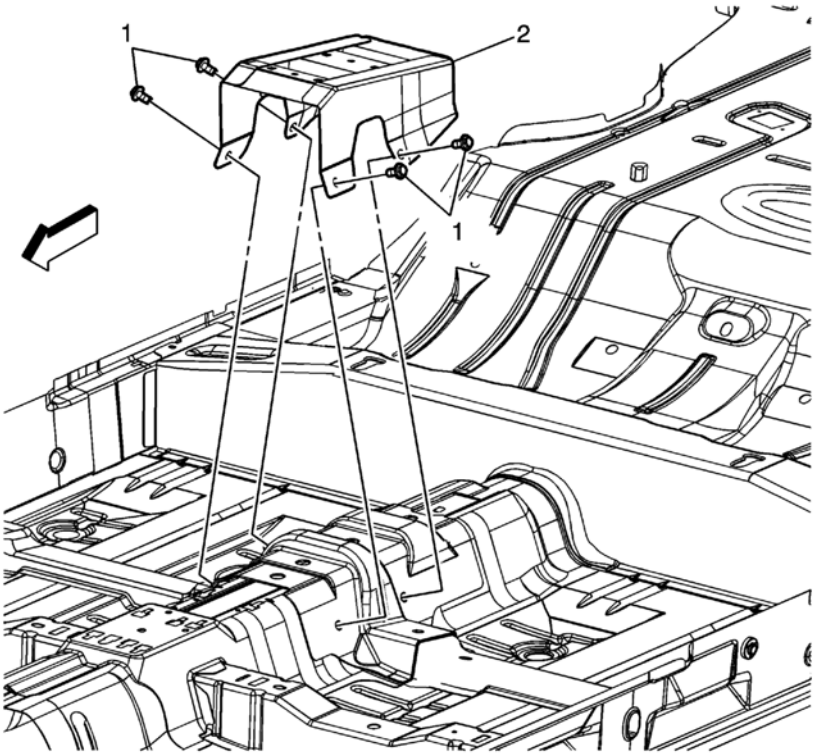

Fig. 31: Console Floor Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front floor console. Refer to **Front Floor Console Replacement**.	

Callout	Component Name
1	Front Floor Console Reinforcement Bracket Bolt (Qty 4) **CAUTION:** **Refer to** **Fastener Caution .** **TIP:** Pull the carpet back enough to access the bolts. **Tighten** 44 N.m (32 lb ft)
2	Front Floor Console Reinforcement Bracket Assembly

FRONT FLOOR CONSOLE ARMREST REPLACEMENT

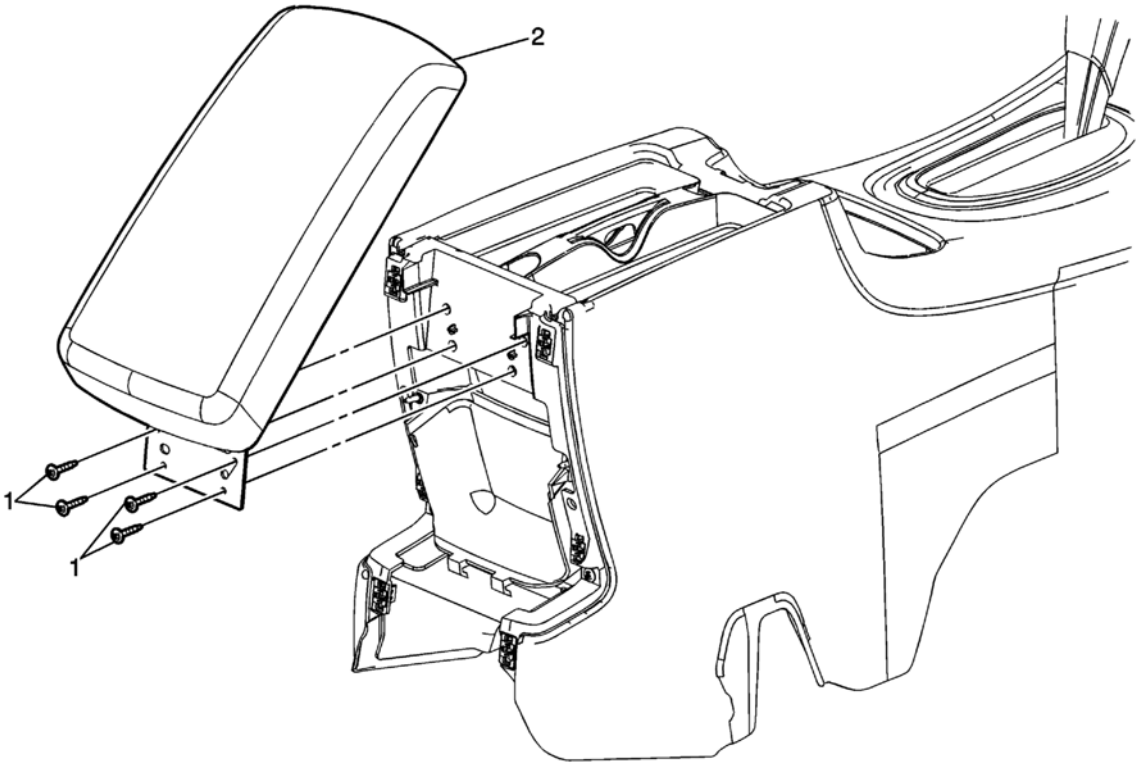

Fig. 32: Front Floor Console Armrest
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front floor console rear trim plate. Refer to **Console Rear Trim Plate Replacement**.	
1	Front Floor Console Armrest Hinge Screw (Qty 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 2 N.m (18 lb in)
2	Front Floor Console Armrest Assembly

FRONT FLOOR CONSOLE ARMREST HINGE REPLACEMENT

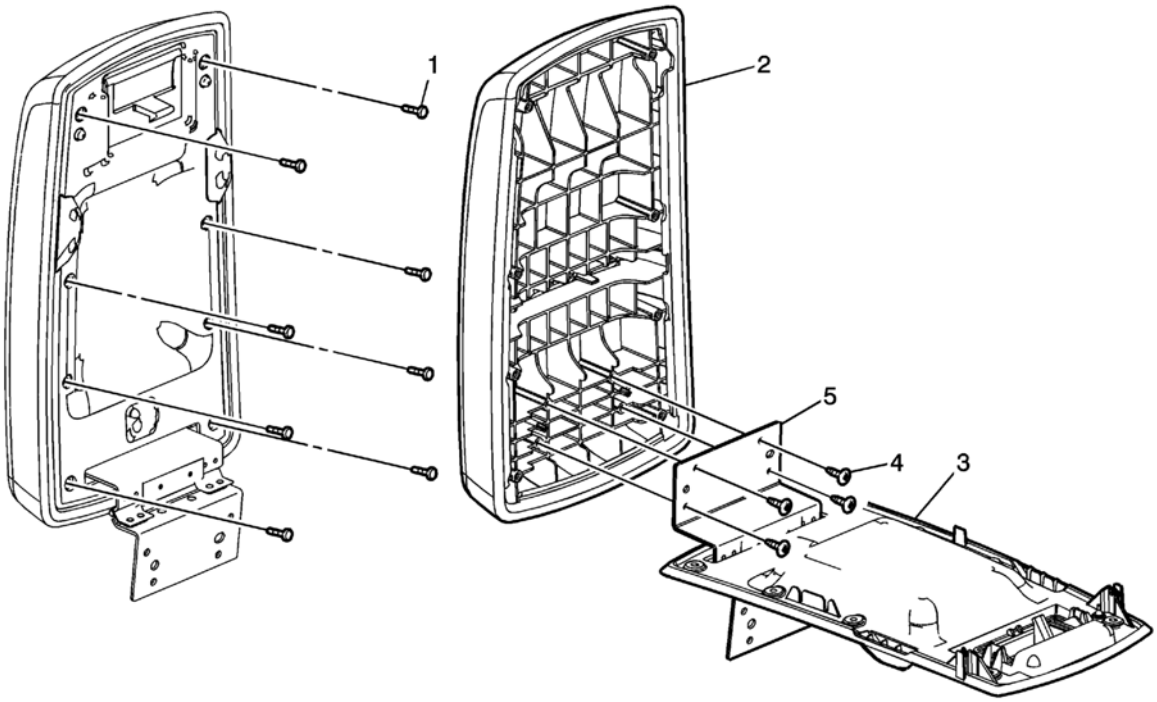

Fig. 33: Floor Console Arm Rest Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front floor console armrest assembly. Refer to **Front Floor Console Armrest Hinge Replacement**.	
1	Front Floor Console Armrest Screw (Qty 8) **CAUTION:** **Refer to** Fastener Caution .

Callout	Component Name
	Tighten 2 N.m (18 lb in)
2	Front Floor Console Armrest Armrest Assembly **TIP:** Separate the armrest cover assembly from the inner panel.
3	Front Floor Console Armrest Inner Panel **TIP:** Rotate the inner panel in order to access the hinge screws.
4	Front Floor Console Armrest Hinge Screw (Qty 4) **Tighten** 2 N.m (18 lb in)
5	Front Floor Console Armrest Hinge Assembly **TIP:** Remove the hinge from the inner panel.

ROOF CONSOLE REPLACEMENT

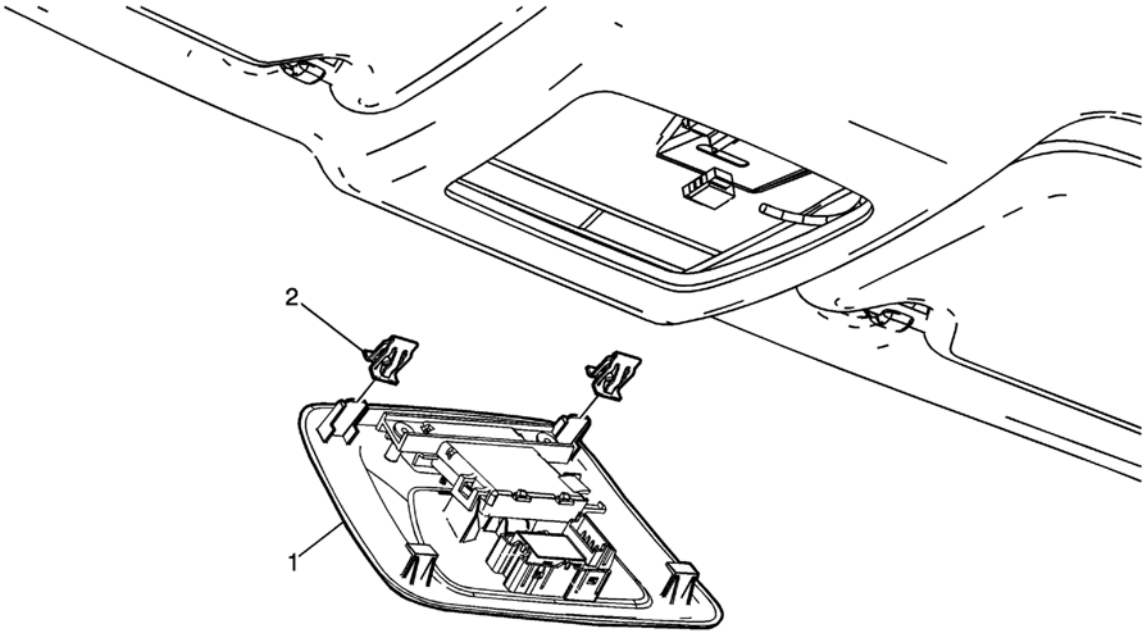

Fig. 34: Overhead Console
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Overhead Console • Lower the front of the console first. • Disconnect the electrical connectors.
2	Overhead Console Retainer Clip

Article GUID: A00737181

REPAIR INSTRUCTIONS

FRONT SIDE DOOR WINDOW SWITCH BEZEL REPLACEMENT

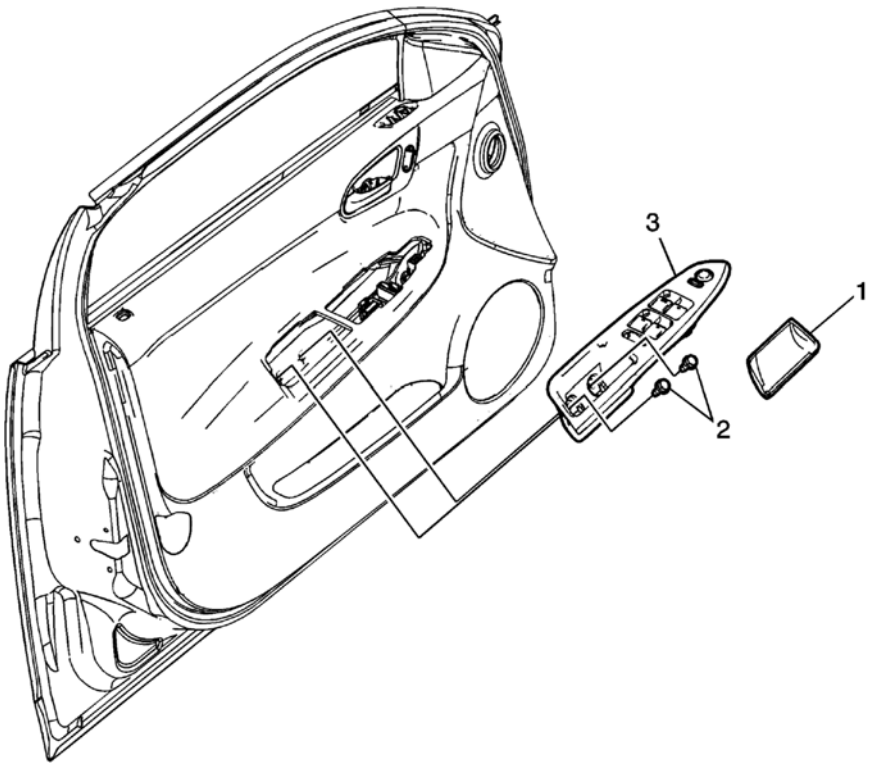

Fig. 1: View Of Front Door Switch Bezel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Armrest Opening Cover
2	Front Side Door Armrest Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
3	Side Window Switch Bezel **Procedure** 1. Lift upward at the rear edge of the bezel first and slide rearward while lifting to disengage the retaining clips. 2. Disconnect the electrical connectors from the switches. If replacing the switch bezel, transfer all necessary components.

UPPER EXTENSION TRIM PANEL REPLACEMENT

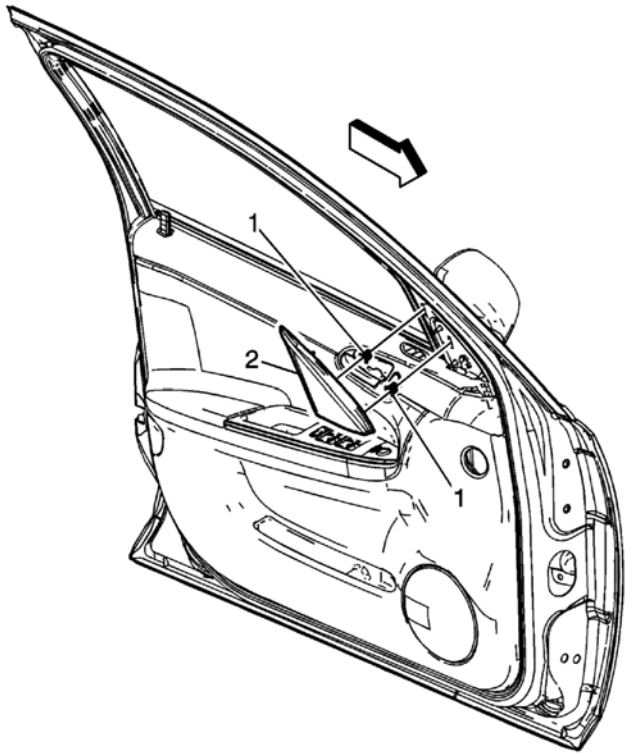

Fig. 2: Identifying Upper Extension Trim Panel Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Upper Trim Panel Clip (Qty: 2)
2	Front Side Door Upper Trim Panel Assembly 1. Pull on the top end of extension panel to disengage attaching clips. 2. Lift extension panel out from behind the door trim panel.

FRONT SIDE DOOR TRIM PANEL REPLACEMENT

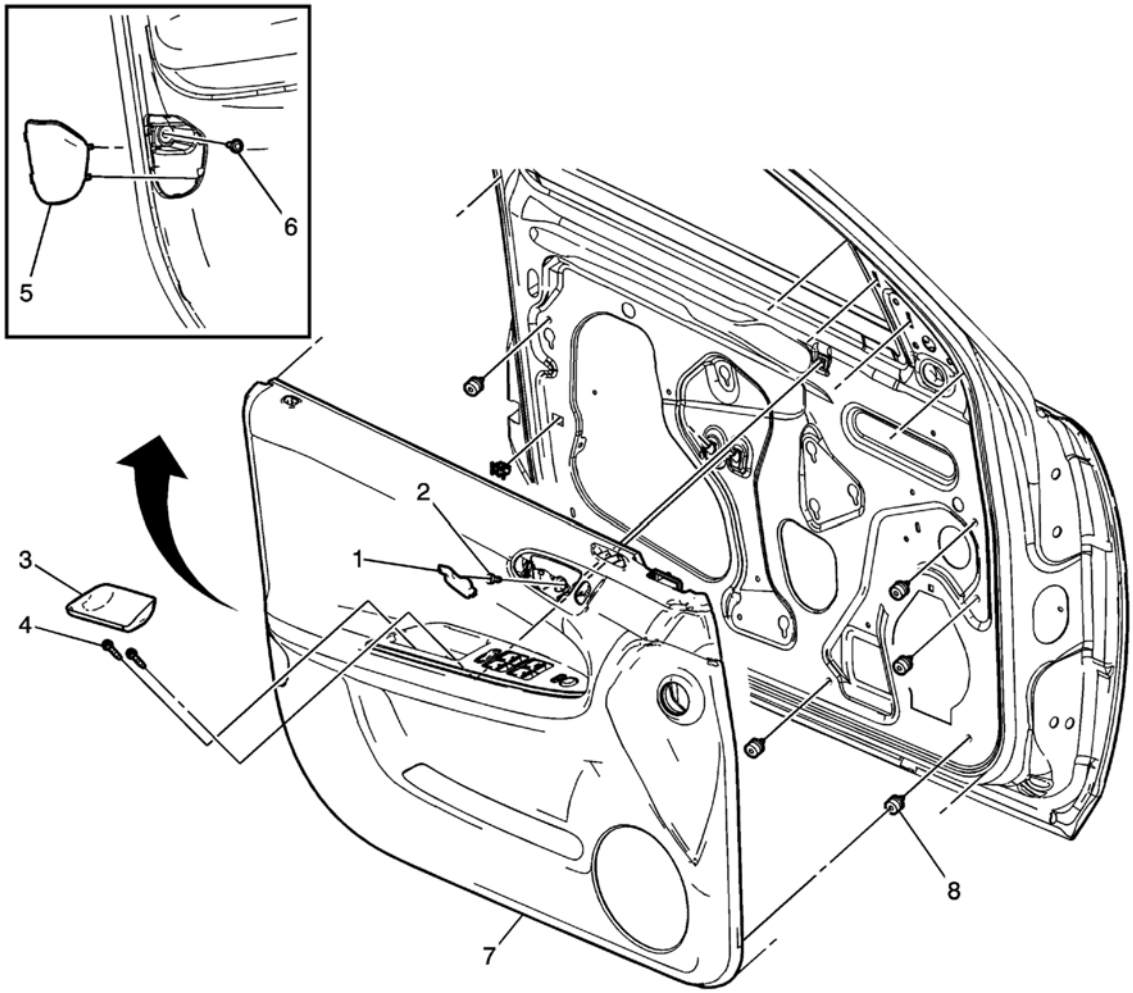

Fig. 3: Side Front Door Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front side door upper trim panel. Refer to **Upper Extension Trim Panel Replacement**.	
1	Front Side Door Inside Handle Bezel Cover
2	Front Side Door Inside Handle Bezel Screw **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 2 N.m (18 lb in)
3	Armrest Finish Cover
4	Front Side Door Pull Handle Screw **Tighten** 2 N.m (18 lb in)
5	Front Side Door Trim Panel Reflector
6	Front Side Door Trim Panel Screw **Tighten** 2 N.m (18 lb in)
7	Front Side Door Trim Assembly **Procedure** 1. Pull upwards on the door lock retainer cable to disengage. 2. Disconnect the electrical connectors.
8	Side Door Trim Retainer

REAR SIDE DOOR TRIM PANEL REPLACEMENT

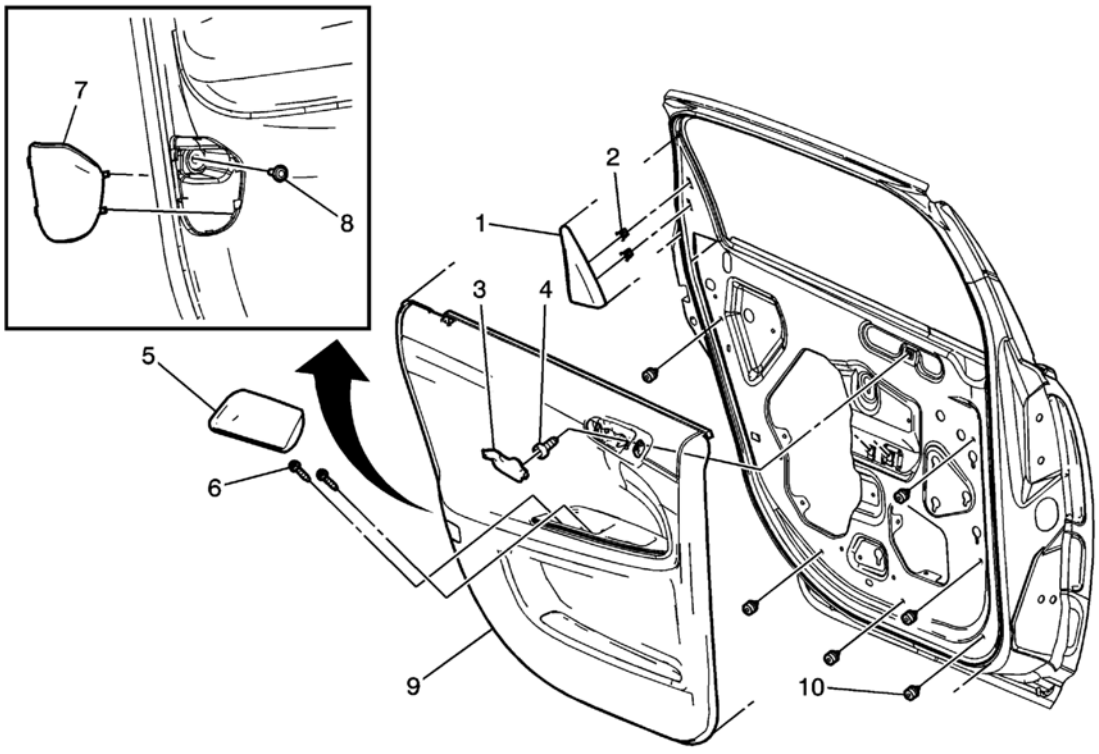

Fig. 4: Side Rear Door Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Side Door Upper Trim Panel Assembly
2	Side Door Upper Trim Clip
3	Rear Side Door Inside Handle Bezel Cover
4	Rear Side Door Inside Handle Bezel Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
5	Armrest Finish Cover
6	Rear Side Door Pull Handle Screw **Tighten** 2 N.m (18 lb in)
7	Rear Side Door Trim Panel Reflector
8	Rear Side Door Trim Panel Screw **Tighten** 2 N.m (18 lb in)
9	Rear Side Door Trim Assembly **Procedure** 1. Release the inside door handle cable. 2. Disconnect the electrical connectors.
10	Side Door Trim Retainer

REAR SIDE DOOR INNER PANEL LOWER ENERGY ABSORBER REPLACEMENT

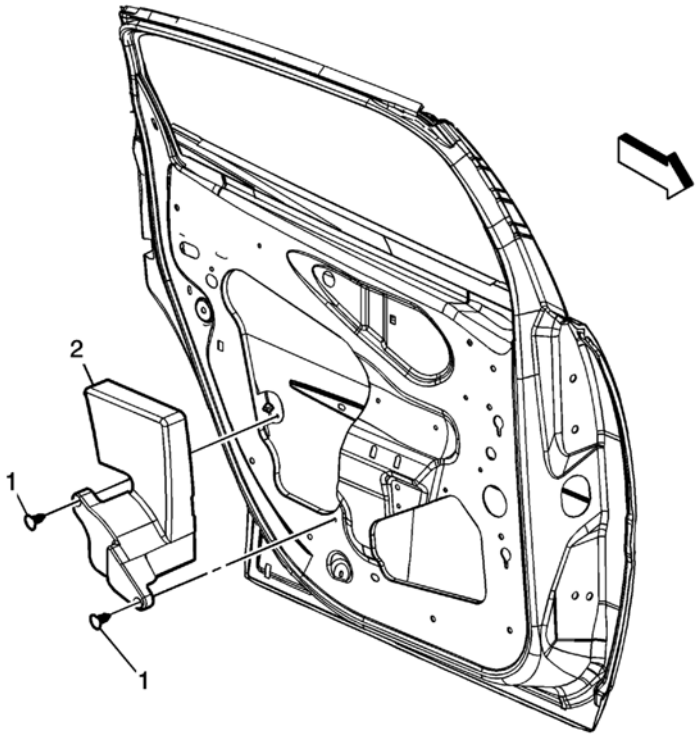

Fig. 5: Inner Rear Energy Absorber Pad
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** 1. Remove the interior trim panel. Refer to **Rear Side Door Trim Panel Replacement**. 2. Remove the water deflector. Refer to **Rear Side Door Water Deflector Replacement**.	
1	Retainer, Push Pin (Qty: 2)
2	Absorber, Rear Side Door Energy **TIP:** Pull the absorber from the door to release the retainers and adhesive.

FRONT SIDE DOOR INNER PANEL LOWER ENERGY ABSORBER REPLACEMENT

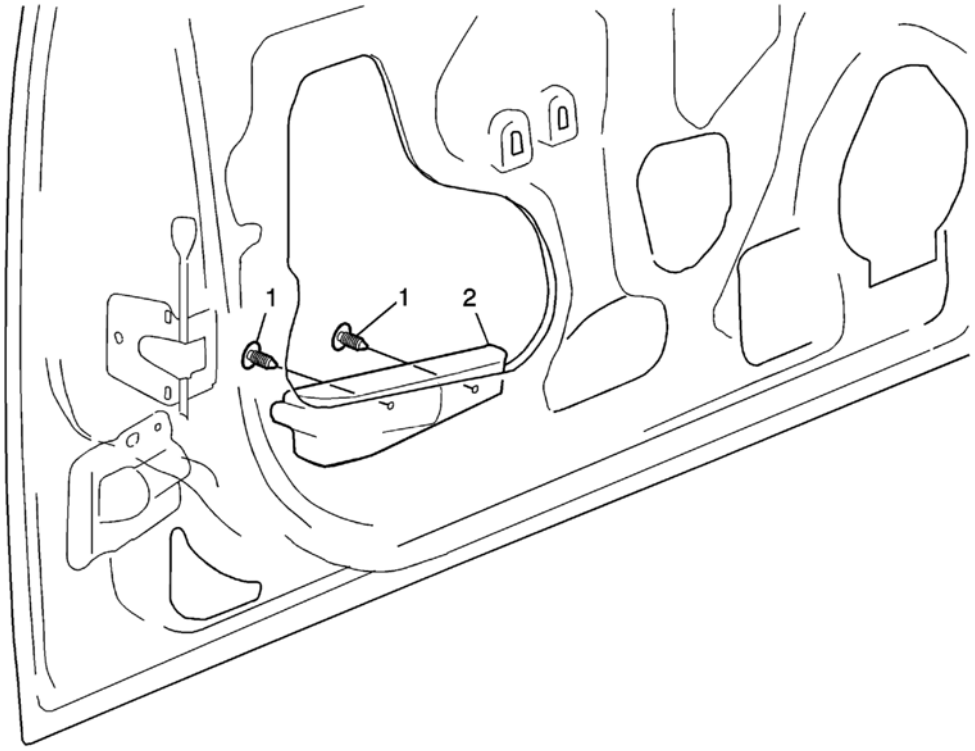

Fig. 6: Inner Front Energy Absorber Pad
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** 1. Remove the interior trim panel. Refer to **Rear Side Door Trim Panel Replacement**. 2. Remove the water deflector. Refer to **Rear Side Door Water Deflector Replacement**.	
1	Retainer, Push Pin (Qty: 2)
2	Absorber, Front Side Door Energy **TIP:** Pull the absorber from the door to release the retainers and adhesive.

FRONT SIDE DOOR WATER DEFLECTOR REPLACEMENT (IMPALA LIMITED)

Removal Procedure

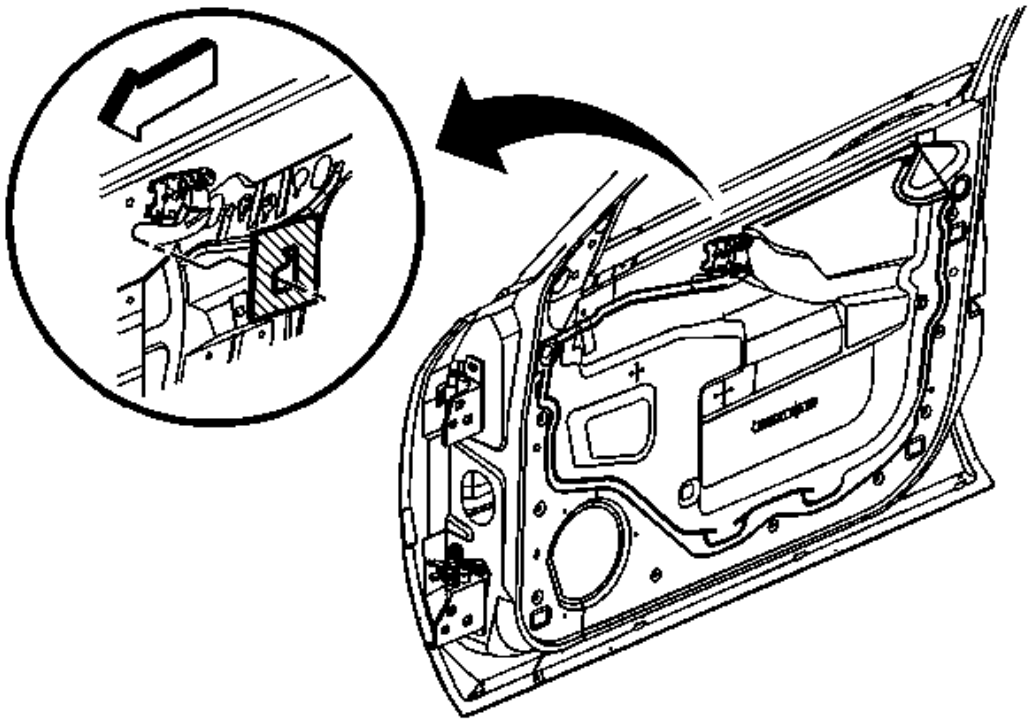

Fig. 7: Front Door Water Deflector (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Remove the front door trim panel. Refer to **Front Side Door Trim Panel Replacement**.
2. Remove the front door pull handle bracket from the front door inner panel.
3. Disconnect all of the required electrical connectors.
4. Remove the inside door handle gasket.
5. Remove the front door water deflector from the front door inner panel.

Installation Procedure

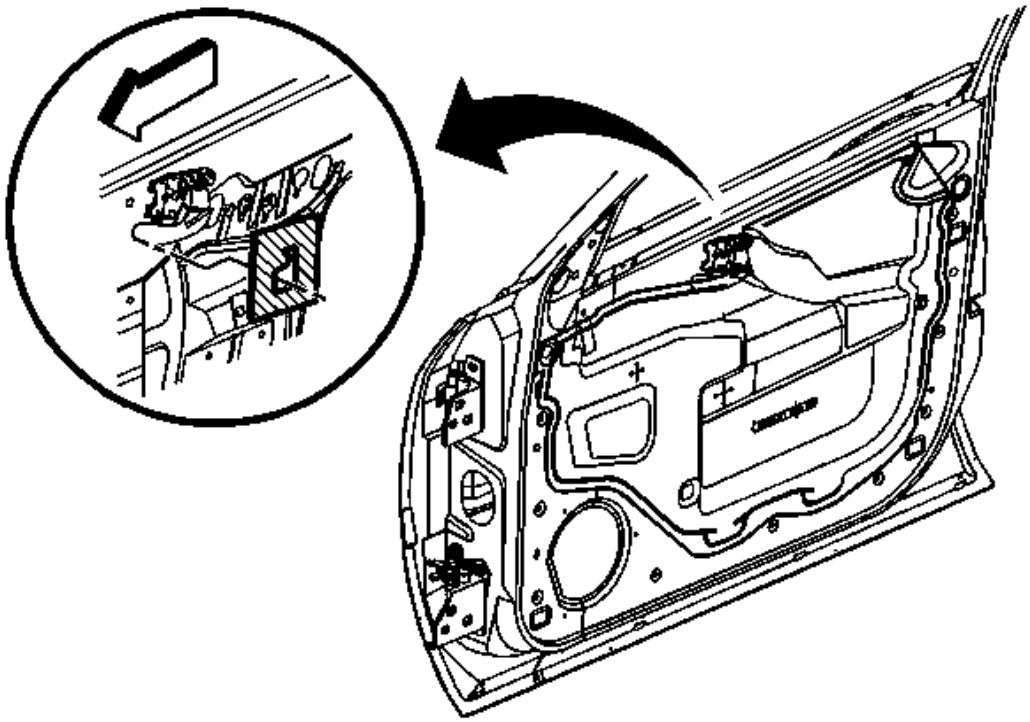

Fig. 8: Front Door Water Deflector (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Align the front door water deflector to the front door inner panel. Secure the water deflector at the corners.
2. Pull the front door wiring harness leads through the slits in the front door water deflector.
3. Install the front door water deflector, start pressing the adhesive pattern at the bottom center and working outward and upward in order to prevent puckering.
4. Install the inside door handle gasket.
5. Connect all of the required electrical connectors.
6. Install the front door pull handle bracket to the front door inner panel.
7. Install the front door trim panel. Refer to **Front Side Door Trim Panel Replacement**.

REAR SIDE DOOR WATER DEFLECTOR REPLACEMENT

Removal Procedure

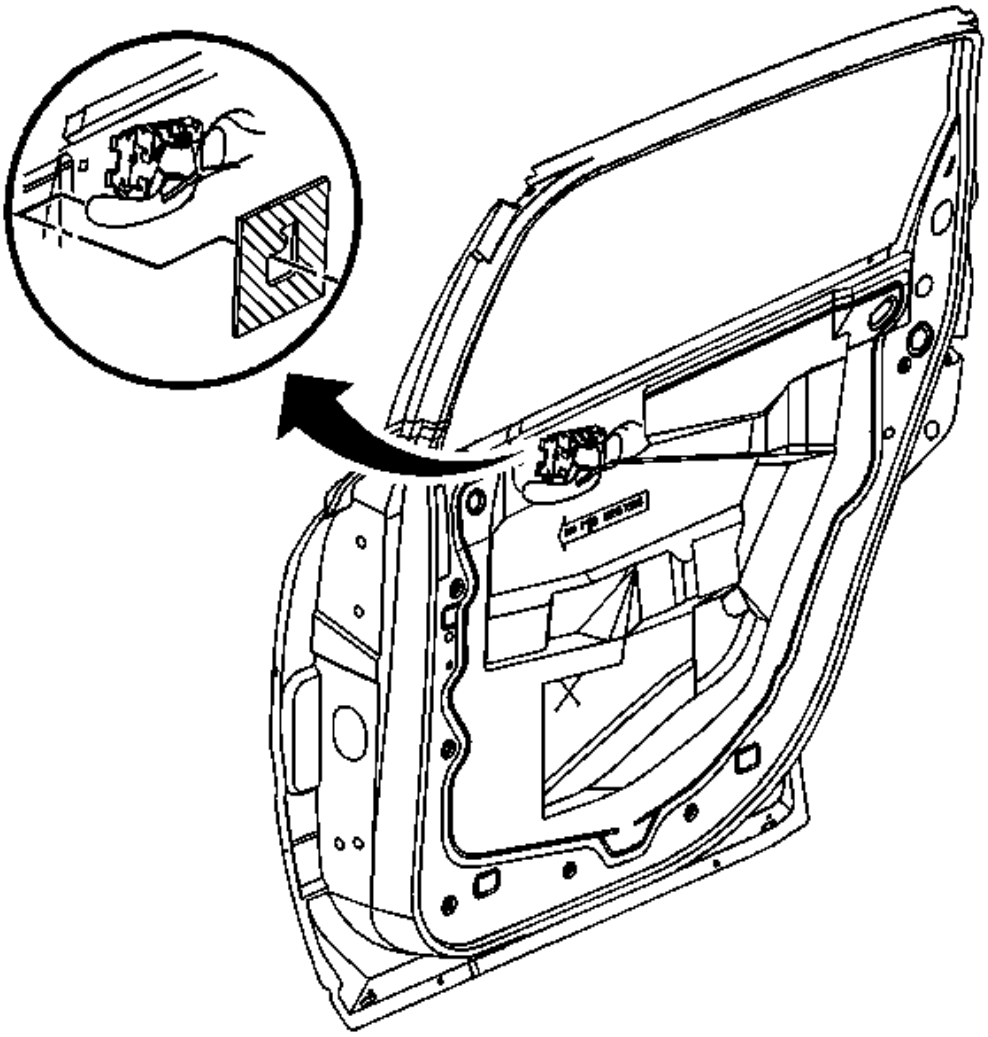

Fig. 9: Rear Door Water Deflector (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Remove the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement**.
2. Remove the rear door pull handle bracket from the rear door inner panel.
3. Disconnect all of the required electrical connectors.
4. Remove the inside door handle gasket.
5. Remove the rear door water deflector from the rear door inner panel.

Installation Procedure

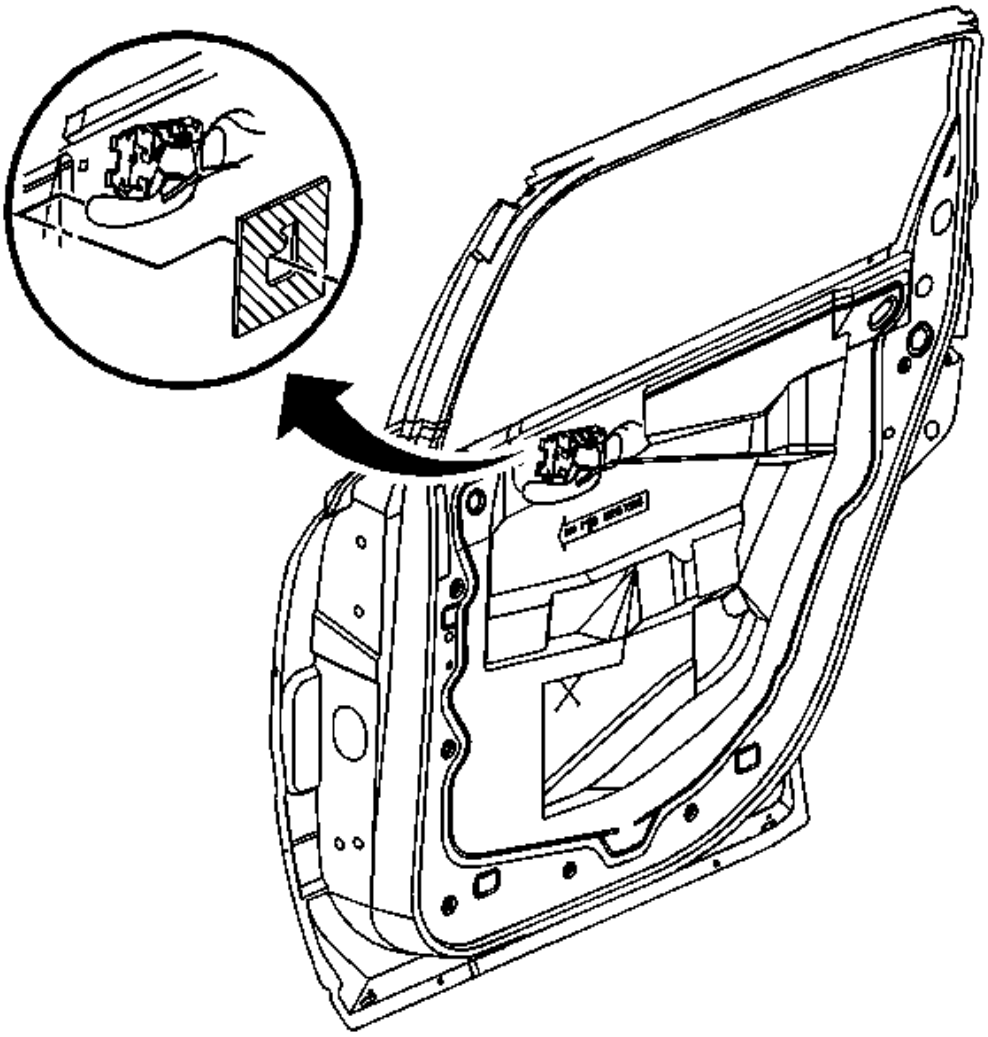

Fig. 10: Rear Door Water Deflector (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

1. Align the rear door water deflector to the rear door inner panel. Secure the water deflector at the corners.
2. Pull the rear door wiring harness leads through the slits in the rear door water deflector.
3. Install the rear door water deflector, start pressing the adhesive pattern at the bottom center and working outward and upward in order to prevent puckering.
4. Install the inside door handle gasket.
5. Connect all of the required electrical connectors.
6. Install the rear door pull handle bracket to the rear door inner panel.
7. Install the rear door trim panel. Refer to **Rear Side Door Trim Panel Replacement**.

FRONT SEAT ARMREST CUP HOLDER REPLACEMENT

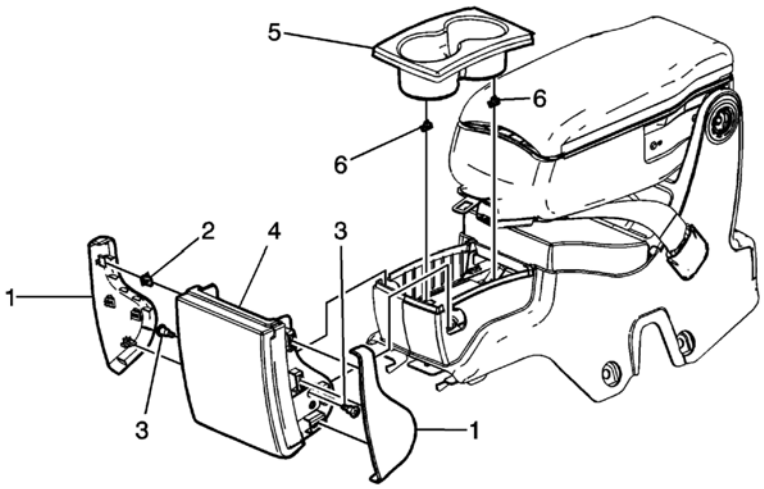

Fig. 11: Identifying Front Seat Armrest Cup Holder
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Cup Holder End Cap (Qty: 2)
2	End Cap Retainer Clip (Qty: 8)
3	Front Seat Panel Pivot Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 3 N.m (25 lb in)
4	Front Seat Panel Assembly
5	Front Center Seat Cup Holder
6	Front Center Seat Cup Holder Clip (Qty: 2)

ASSIST HANDLE REPLACEMENT

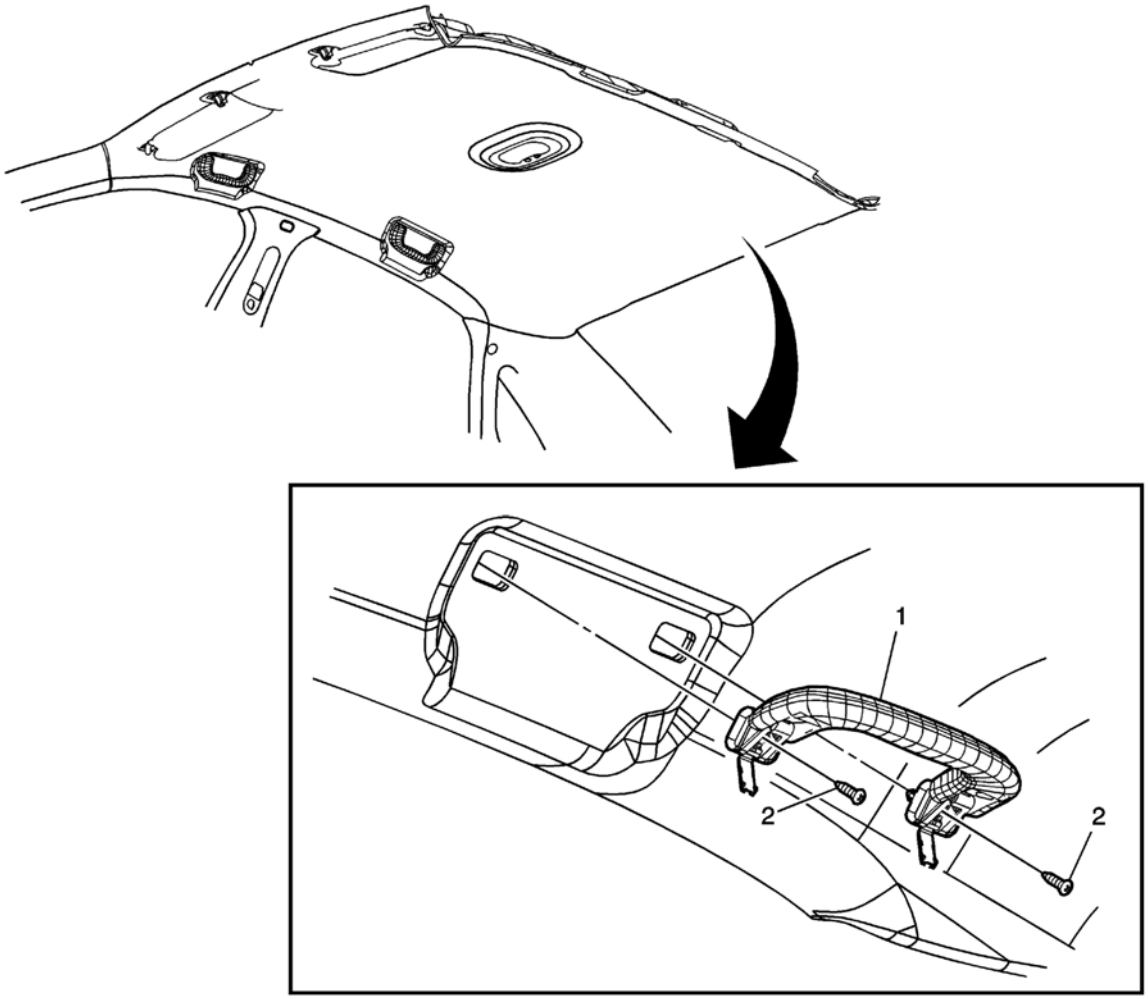

Fig. 12: Assist Handle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Assist Handle Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Assist Handle Assembly

SUNSHADE REPLACEMENT

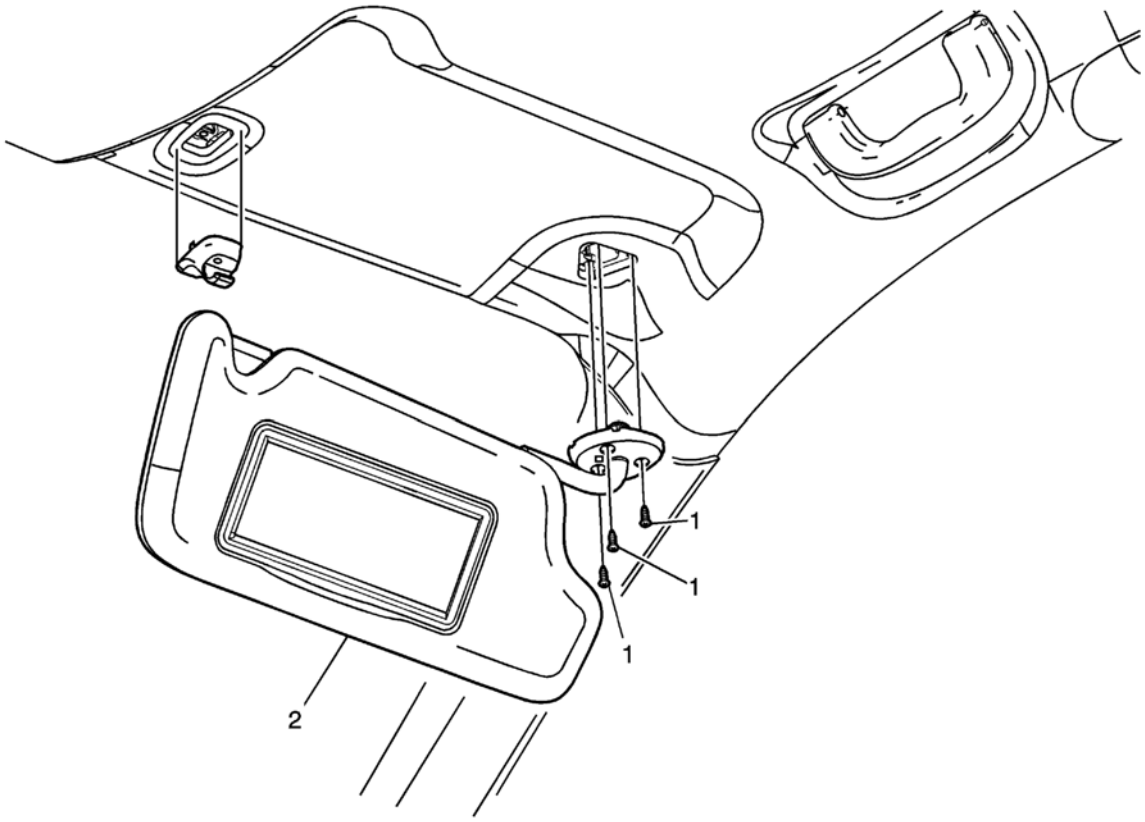

Fig. 13: Sunshade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the windshield pillar trim. Refer to **Windshield Pillar Garnish Molding Replacement**.	
1	Sunshade Assembly Screw (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
2	Sunshade Assembly **Procedure**

Callout	Component Name
	1. Lower the front of the headliner enough to gain access to the sunshade electrical connector which is glued to the headliner. 2. Disconnect the electrical connector.

SUNSHADE ANCHOR REPLACEMENT

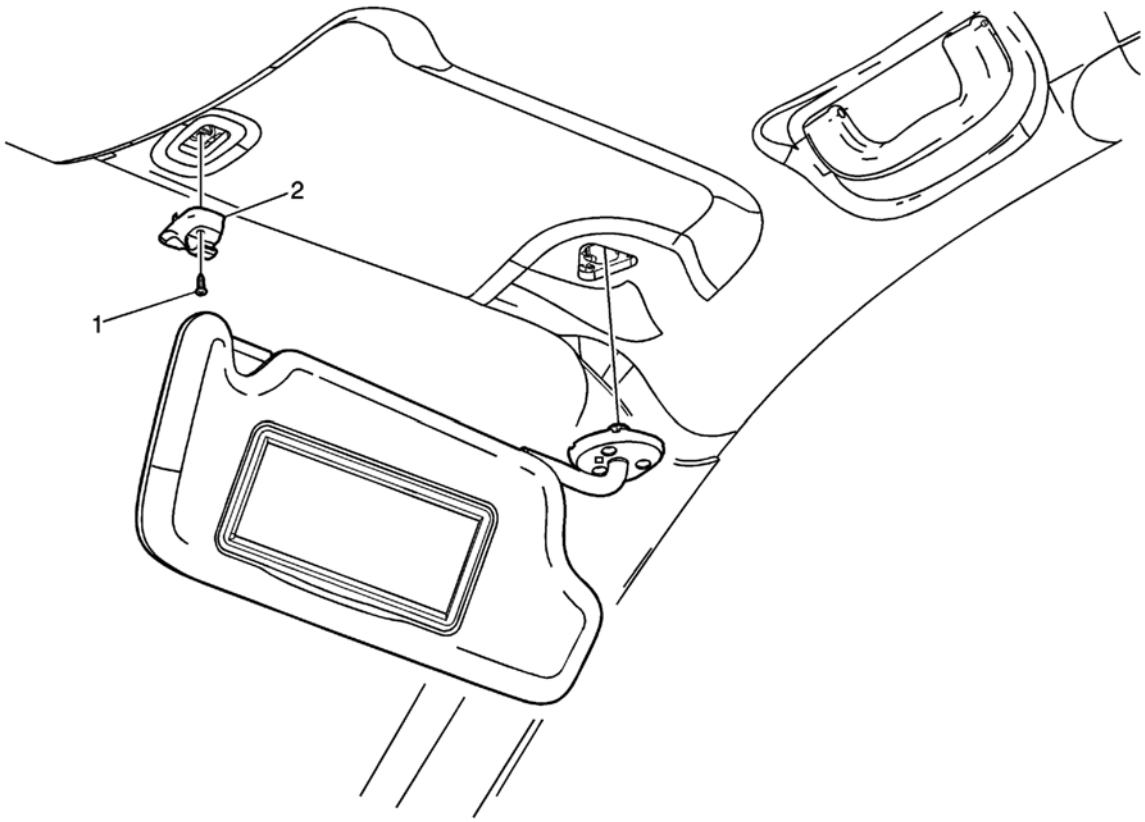

Fig. 14: Sunshade Anchor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Sunshade Anchor Screw **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Tighten 2 N.m (18 lb in)
2	Sunshade Anchor

WINDSHIELD PILLAR GARNISH MOLDING REPLACEMENT

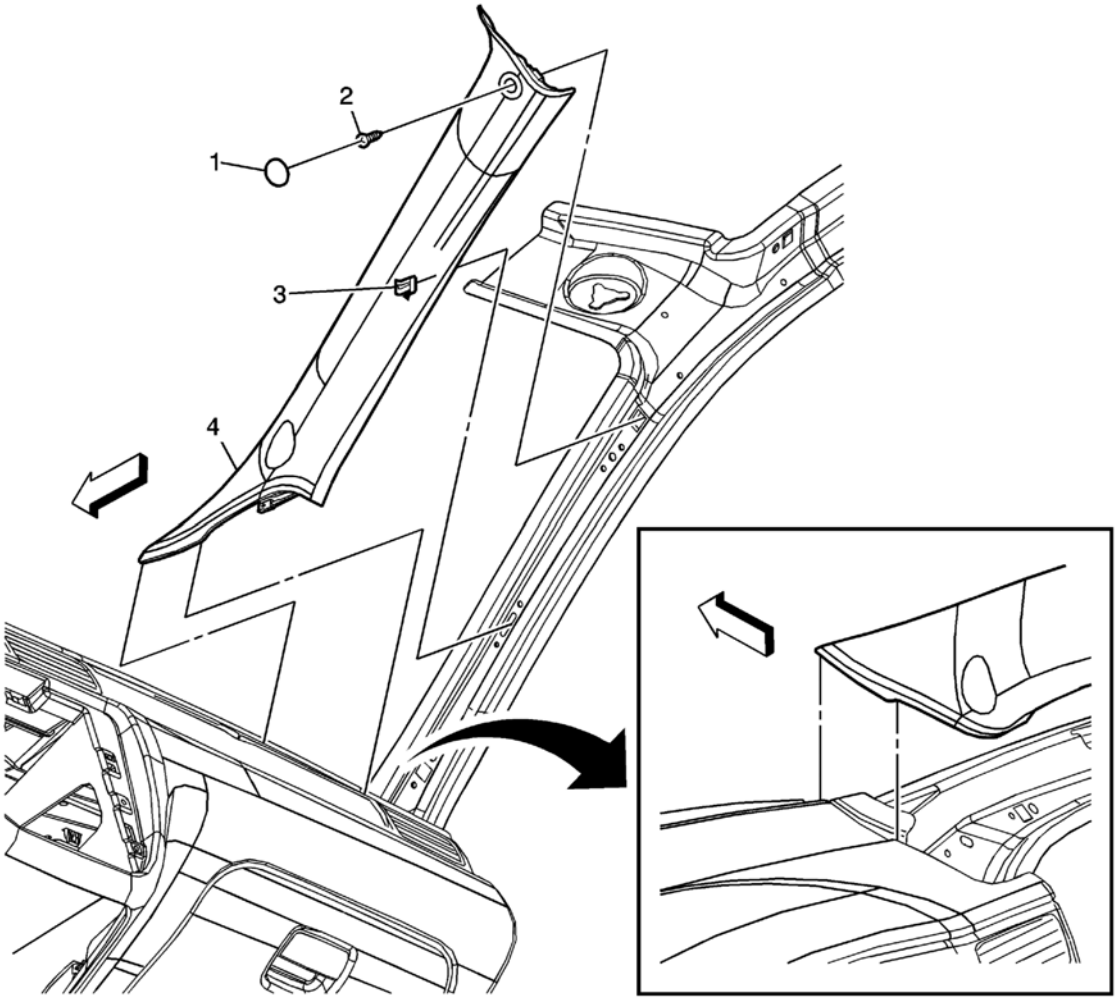

Fig. 15: Windshield Pillar Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel outer trim panels. Refer to **Instrument Panel Outer Trim Cover Replacement - Right Side** , or **Instrument Panel Outer Trim Cover Replacement - Left Side** . 2. Disconnect the windshield garnish molding speaker electrical connector.	
1	Windshield Side Upper Garnish Screw Cover

Callout	Component Name
2	Windshield Side Upper Garnish Screw **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
3	Windshield Side Upper Garnish Retainer Clip
4	Windshield Side Upper Garnish Molding Assembly

CENTER PILLAR UPPER TRIM PANEL REPLACEMENT

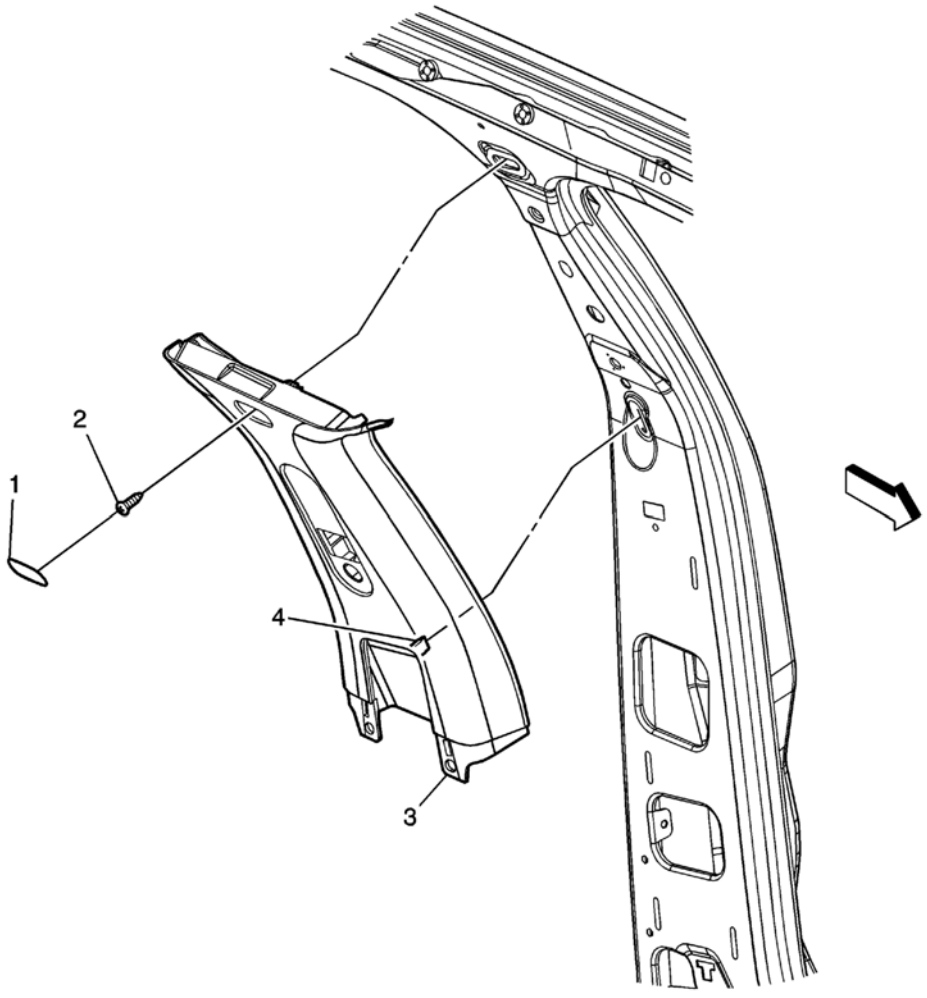

Fig. 16: Upper Center Pillar Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedure Remove the lower center pillar trim. Refer to **Center Pillar Lower Trim Panel Replacement**.	
1	Center Pillar Upper Trim Screw Cover
2	Center Pillar Upper Trim Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
3	Center Pillar Upper Trim **Procedure** 1. Remove the seat belt D-ring from the adjuster assembly. 2. Pull the trim panel toward the inside of the vehicle to disengage the retainers. **Tighten** 42 N.m (31 lb ft)
4	Center Pillar Upper Trim Clip

CENTER PILLAR LOWER TRIM PANEL REPLACEMENT

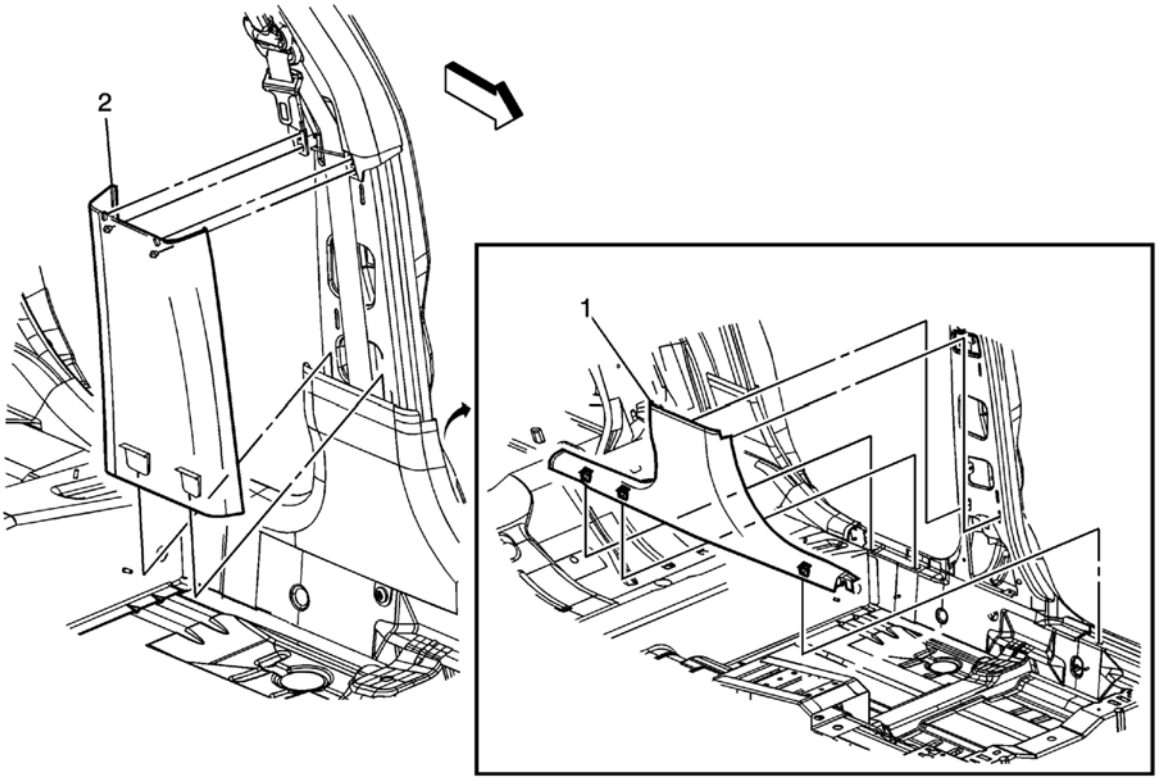

Fig. 17: Lower Center Pillar Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front and Rear Side Door Opening Retainer Assembly
2	Center Pillar Lower Trim Panel Assembly

QUARTER UPPER TRIM PANEL REPLACEMENT

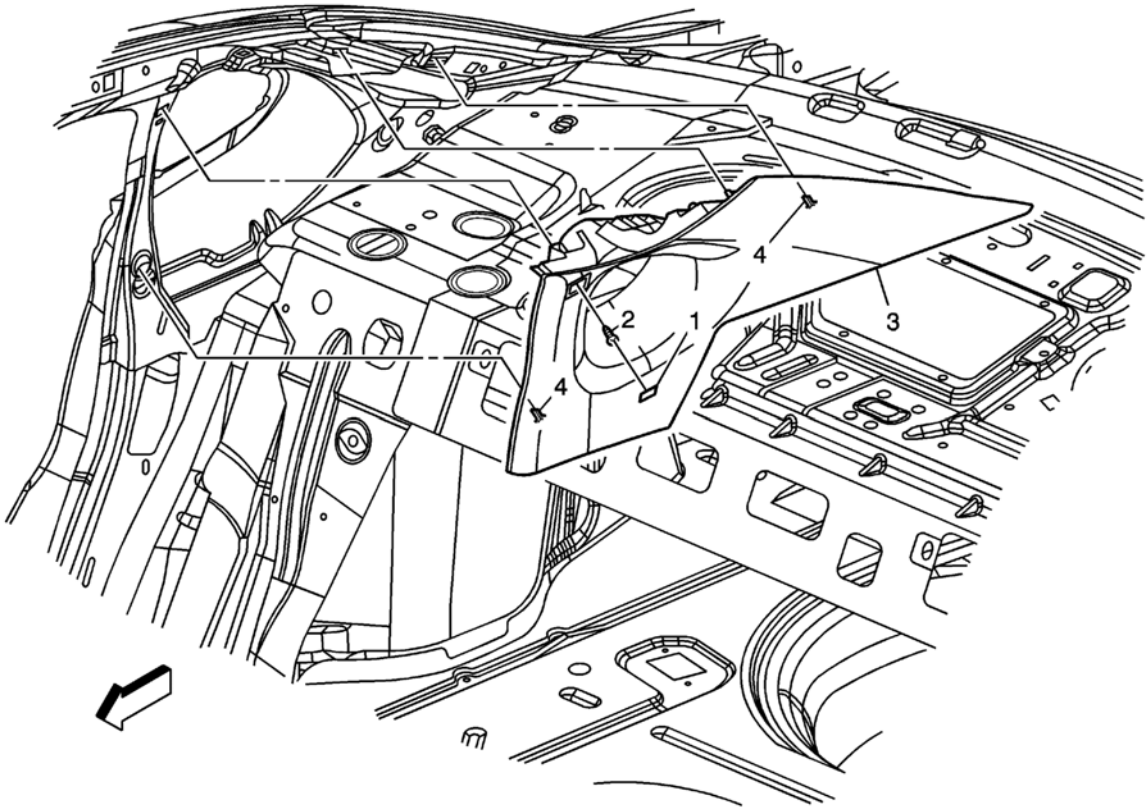

Fig. 18: Rear Quarter Upper Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Upper Quarter Upper Trim Panel Screw Cover
2	Upper Quarter Upper Trim Panel Screw **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 2 N.m (18 lb in)
3	Upper Quarter Upper Trim Panel Assembly
4	Upper Quarter Upper Trim Clip

QUARTER LOWER REAR TRIM PANEL REPLACEMENT (IMPALA LIMITED)

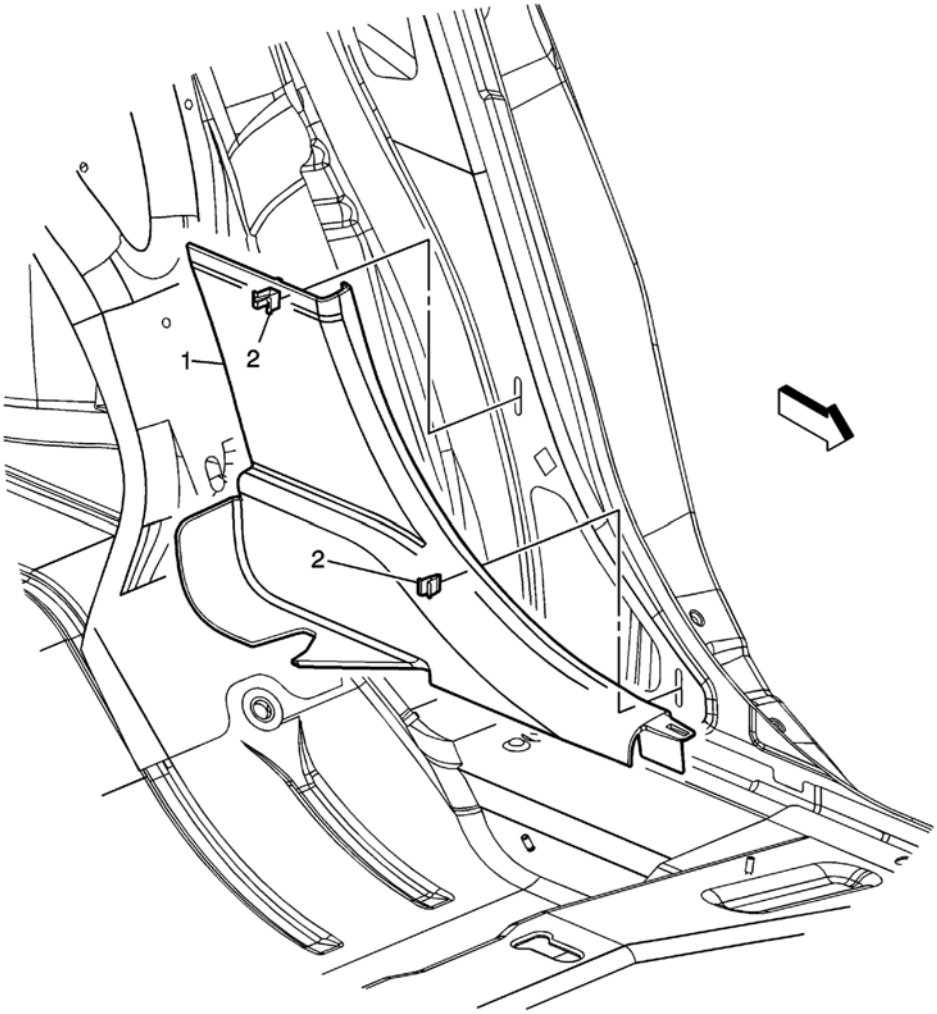

Fig. 19: Rear Quarter Lower Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Remove the lower center pillar trim. Refer to **Center Pillar Lower Trim Panel Replacement**.	
1	Quarter Lower Trim Finish Panel Assembly
2	Quarter Lower Trim Finish Panel Retainer Clip (Qty: 2)

REAR WINDOW SHELF TRIM PANEL REPLACEMENT

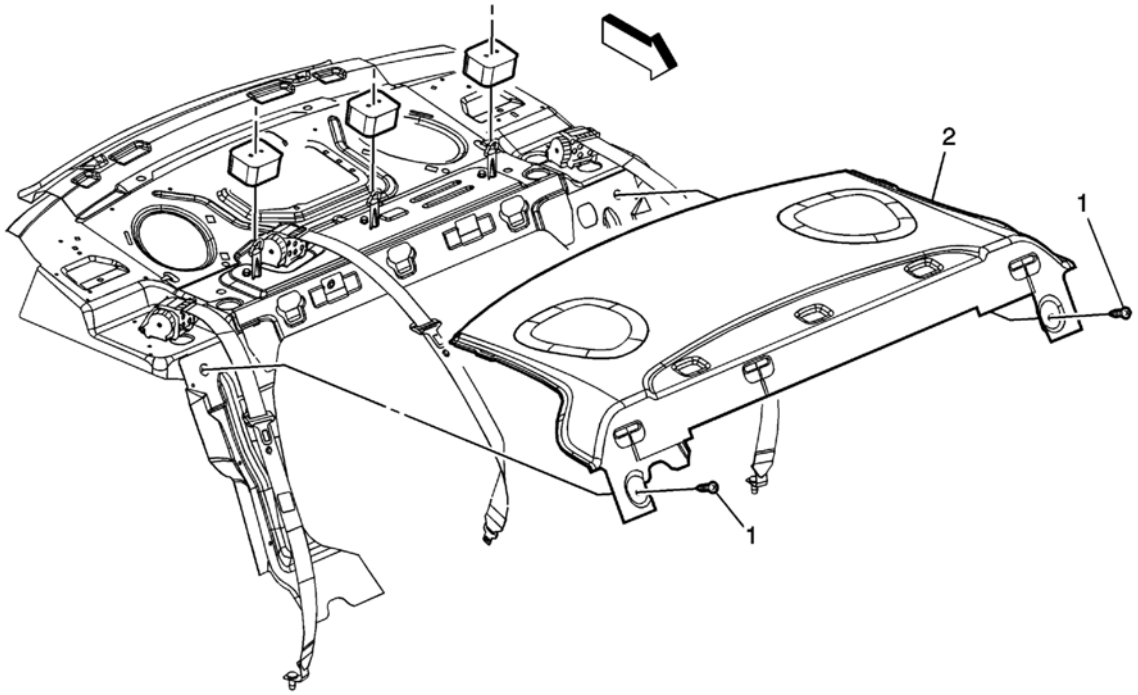

Fig. 20: Rear Window Shelf Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear quarter upper trim panel. Refer to **Quarter Upper Trim Panel Replacement**. 2. Remove the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala)** . 3. Remove the rear seat belt bolts.	
1	Rear Window Trim Panel Retainer
2	Rear Window Trim Panel Assembly

REAR COMPARTMENT SILL TRIM PLATE REPLACEMENT

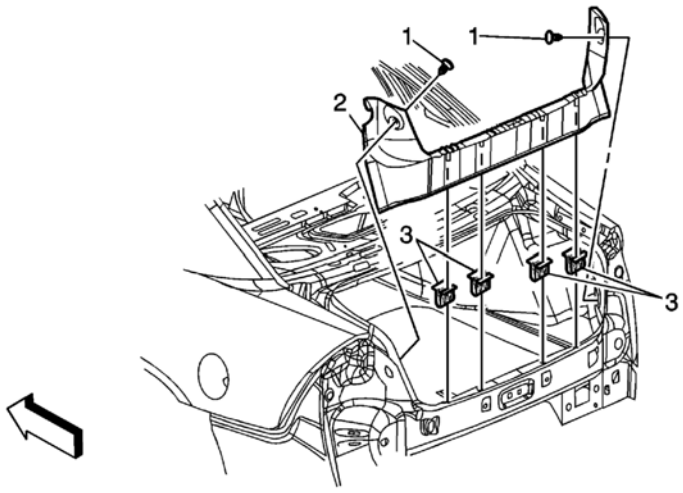

Fig. 21: Rear Compartment Sill Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Compartment Sill Trim Plate Assembly Retainer (Qty: 2)
2	Rear Compartment Sill Trim Plate Assembly
3	Rear Compartment Sill Trim Plate Assembly Retainer (Qty: 4)

REAR COMPARTMENT LID INNER PANEL TRIM REPLACEMENT

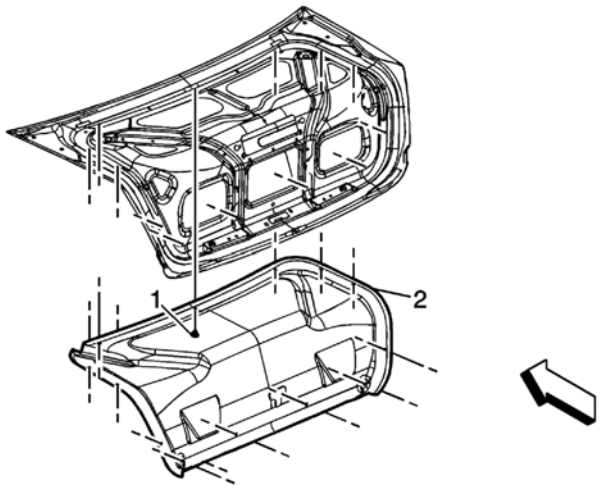

Fig. 22: Rear Compartment Lid Trim
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Retainer, Rear Compartment Lid Inner Panel Trim (Qty: 12)
2	Trim, Rear Compartment Lid Inner Panel

REAR COMPARTMENT SIDE TRIM REPLACEMENT - LEFT SIDE

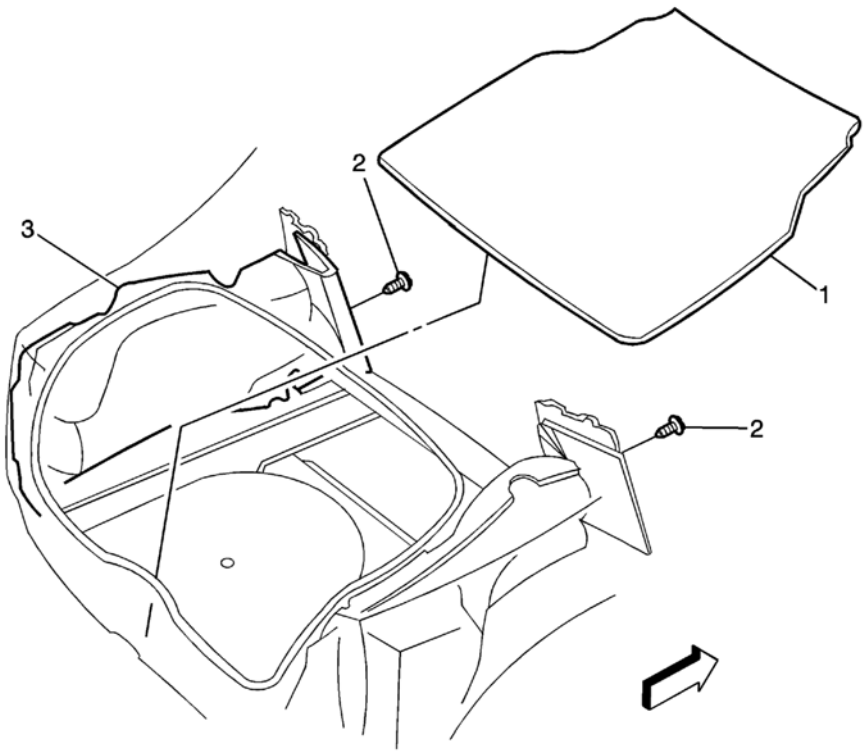

Fig. 23: LH Rear Compartment Side Trim
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala)** . 2. Remove the rear compartment sill plate. Refer to **Rear Compartment Sill Trim Plate Replacement**.	
1	Rear Compartment Floor Panel Trim
2	Rear Compartment Trim Panel Retainer
3	Rear Compartment Side Panel Trim

REAR COMPARTMENT SIDE TRIM REPLACEMENT - RIGHT SIDE

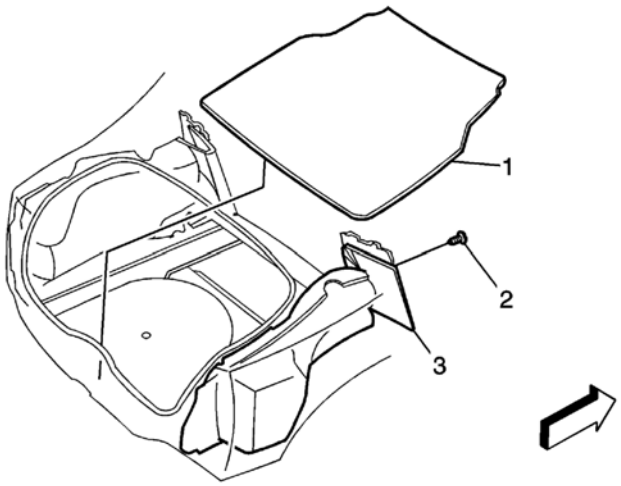

Fig. 24: RH Rear Compartment Side Trim
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat back . Refer to **Rear Seat Back Cushion Removal and Installation (Impala)** . 2. Remove the rear compartment sill plate. Refer to **Rear Compartment Sill Trim Plate Replacement**.	
1	Rear Compartment Floor Panel Trim
2	Rear Compartment Trim Panel Retainer
3	Rear Compartment Side Panel Trim

FRONT FLOOR CONSOLE CUP HOLDER REPLACEMENT (IMPALA LIMITED)

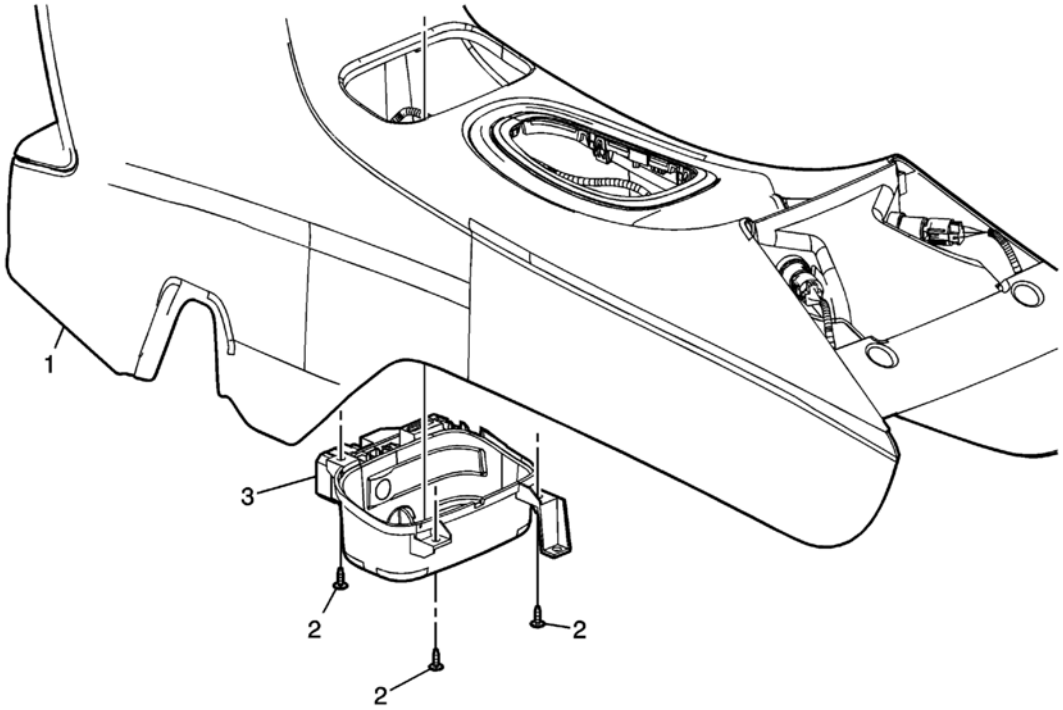

Fig. 25: Front Floor Console Cupholder
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Floor Console **TIP:** Remove the front floor console. Refer to **Front Floor Console Replacement** .
2	Front Floor Console Cup Holder Screw (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 2 N.m (18 lb in)
3	Front Floor Console Cup Holder Assembly

PRESSURE RELIEF VALVE REPLACEMENT

Removal Procedure

1. Open the rear compartment.
2. Remove the rear bumper fascia. Refer to **Rear Bumper Fascia Replacement** .
3. Pull back the right rear compartment trim panel as needed.
4. Use a small, flat-bladed tool to release the snaps on the pressure relief valve. Apply pressure at two upper locations and two lower locations.

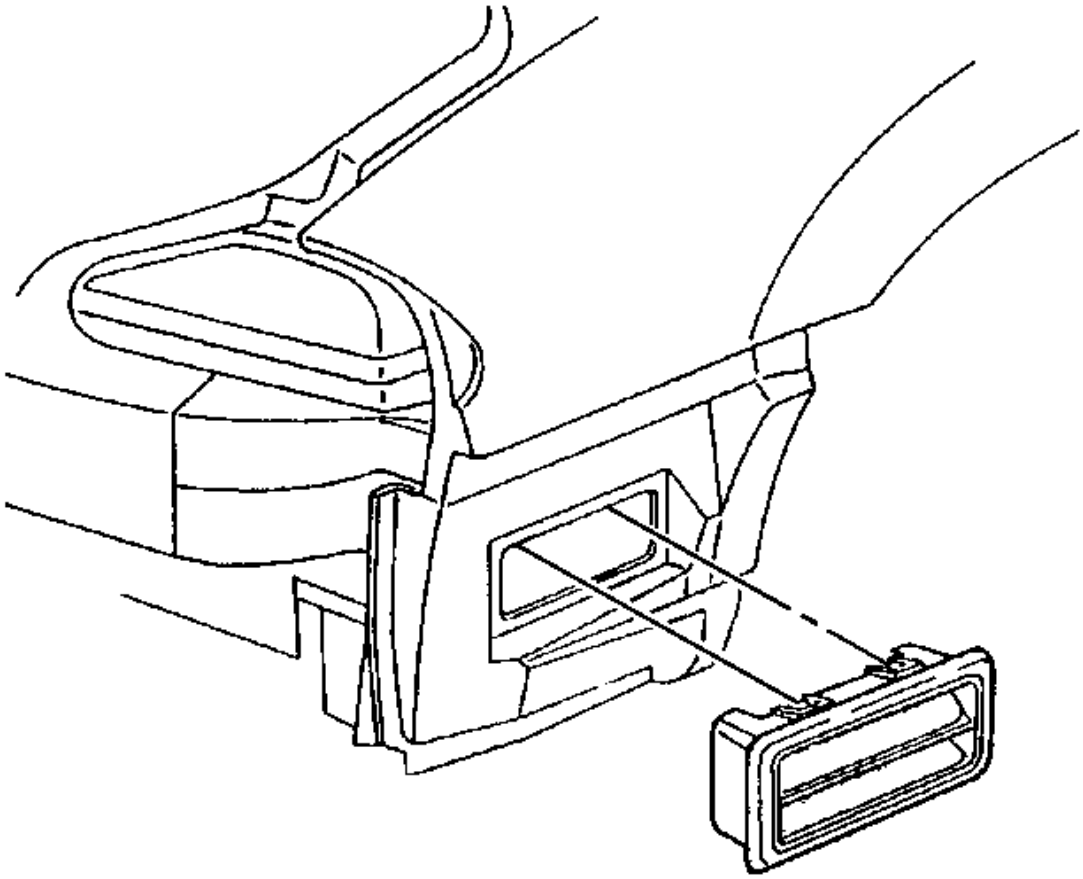

Fig. 26: Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

5. Remove the pressure relief valve from the lower quarter panel.

Installation Procedure

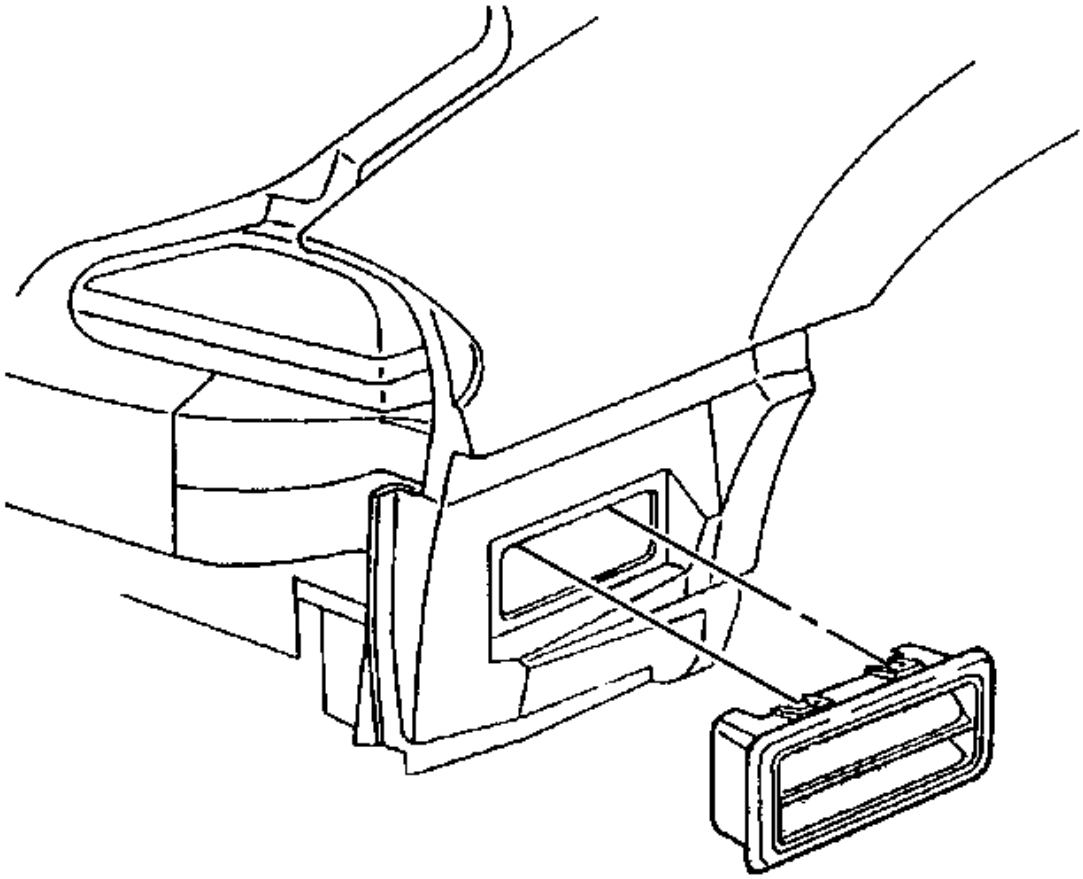

Fig. 27: Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

1. Install the pressure relief valve in the lower quarter panel.
2. Press the pressure relief valve into the quarter lower panel until the snaps lock into place at the upper and lower locations.
3. Install the rear compartment trim panel.
4. Install the rear bumper fascia. Refer to **Rear Bumper Fascia Replacement** .
5. Close the rear compartment.

INTRODUCTION

BASECOAT/CLEARCOAT PAINT SYSTEMS

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the

manufacturers of painting materials, equipment, and protective gear.

All paint finish repairs of rigid exterior surfaces must meet GM standards. Refer to the latest revision of the GM Approved Refinish Materials book to identify the paint systems you may use that have been engineered to meet GM standards. The GM Approved Refinish Materials book supplies all approved products, including volatile organic compound (VOC) compliant regulations recommended by the individual manufacturer, and detailed procedures for materials used in their paint system.

The latest revision of the GM Approved Refinish Materials booklet is located on the Genuine GM Parts website at www.genuinegmparts.com.

ANTI-CORROSION TREATMENT AND REPAIR

Corrosion Preventative Paint (Chassis Coating) and Primer Coatings

NOTE: **Always use these products according to their manufacturer's recommendations. Corrosion Resistant paint and primers will only function properly when mixed properly and when applied to a properly prepared metal surface. Always follow paint manufacturers recommendations for application and use of Corrosion Preventative Paint Products.**

Corrosion Preventative Primers are also referred to as Direct to Metal or DTM primers. Extensive testing is done for corrosion resistance and adhesion of these products. Most paint manufacturers require a bare metal treatment chemical first be applied before the paint or primer product is applied. These coatings are very important to providing a properly prepared metal surface for the paint or primer to perform properly. The GM Approved Primers are listed in the GM Approved Refinish Materials book. The latest revision of the GM Approved Refinish Materials booklet is located on the GM Genuine Parts website at www.genuinegmparts.com.

Corrosion Preventative Paint Products are recommended for under-carriage areas like frames, drive line and suspension components that often show corrosion and need to be painted in the field. Any place where bare metal is exposed for stud repair or where corrosion prevention is desired from a paint like product that will not likely be top coated with color can use this Corrosion Preventative Paint. A Phosphate metal treatment MUST be applied to the cleaned and dried surface that is free of corrosion scale. This Phosphate prep works well on both Aluminum and steel. While sandblasting can be performed for corrosion removal, it is not necessary for these products to work properly. Application of this product must be performed to Manufacturer's recommendations for them to work properly. See product listing below for Corrosion Preventative Paint Products.

Stock number	Type	Description
36500 or 36502	Kryptonite Solvent Based Chassis Coating	Solvent based rust protective coating for all areas of under vehicle corrosion protection on aluminum and steel.
25418	Pure Prep Phosphate Metal Treatment	Phosphate bare metal treatment for metal preparation of clean or oxidized metal surfaces, areas of under vehicle corrosion protection on aluminum and steel

Undercoating and Closed Cavity Coatings

WARNING: **When applying sound deadeners, or anti-corrosion materials due care and preventative measures must be exercised to prevent any material from being sprayed into door and quarter panel mechanisms such as door locks, window run**

channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody, particularly the parking brake cable. After material application, be sure that all body drain holes are open. Improper application may increase chance of corrosion damage or limit the operation of moving parts, resulting in personal injury.

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anti-corrosion material is essential.

After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and reprimed. Refer to the GM Approved Refinish Materials book which identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the GM Genuine Parts website at www.genuinegmparts.com.

After a collision, some vehicle structure areas such as frame rails, cross-members and rocker panel sections may need to be repaired. In most cases, the anti-corrosion materials need to be removed to perform these repairs. These materials are classified into two types: Closed Cavity coatings and Undercoat coatings. The primary difference is the way the products set up or "dry". Both are intended to protect the surface they are applied to from corrosion caused by water, salt water or Magnesium Chloride blended de-icing compounds used to thaw icy winter roads. They also can provide a measure of sound deadening.

The Closed Cavity coatings remain sticky to the touch and will seep into seams initially and over extended periods of time. Closed Cavity coatings provide the best corrosion protection inside of rocker panel sections, pillar sections, frame rails, cross-members, doors, rear compartment lids and closed areas of hoods - anywhere that is concealed or closed off to exterior surfaces.

The Undercoat coatings are "dry to the touch" and offer the best corrosion protection and sound deadening for floor pans, wheelhouses, inside rear compartment and underhood areas - anywhere the coated surface is exposed.

Below is a listing of Undercoat coatings and Closed Cavity coatings that GM believes to be reliable. While others may exist, we have found these products, or equivalents to them, can be used with satisfactory results. Always use these products according to their manufacturer's recommendations.

The following products are available from *Automotive International/Valugard. Contact them at 1-800-543-7156, or at www.valugard.net

Stock number	Type	Description
VG-104	WAX/SOLVENT BASED UNDERCOAT	Traditional Wax/Solvent based Undercoating available in aerosol or spray gun canister Meets OE specifications for corrosion resistance
VG-076M	HYBRID (SOLV./WATER) UNDERCOAT	Meets OE specifications for corrosion resistance
VG-140	WATER BASED UNDERCOAT	Meets OE specifications for corrosion resistance
VG-101	WAX BASED CLOSED CAVITY COATING	Meets OE specifications for corrosion resistance
VG-UCG	CANISTER UNDERCOATING GUN	High quality undercoating gun uses canister packaging of undercoating

Stock number	Type	Description
VG-CRG	CANISTER CLOSED CAVITY COATING GUN	High quality closed cavity coating gun uses canister packaging of coating and comes with 30 in inner panel application tube with nozzle

The following products are available through your local *3MÂ® distributor. Information about 3MÂ® product retailers in your area may be obtained at 1-866-364-3577 or at www.mmm.com/automotive.

Stock number	Type	Description
08804	No Cleanup Water-Based Undercoating - Black	Coarse texture SBR rubber and acrylic applied with 3M No-Cleanup Gun 08801
08964	No Cleanup Undercoating - Black	Smooth texture SBR rubber applied with 3M No-Cleanup Gun 08801
08881	16 oz aerosol Undercoating	Calcium Carbonate and asphalt based undercoating
08882	17 oz aerosol Underseal™ Undercoating - Black	Rubber based, paintable undercoating
08883	19.7 oz aerosol Rubberized Undercoating - Black	Synthetic polymer based undercoating
08891	Rust Fighter - 1 Amber Closed Cavity Coating - quart canister	Synthetic Resin remains tacky seeps into crevices; Applied with 3M Applicator Gun 08997 and Application Wand 08998
08892	Rust Fighter - 1 Amber Closed Cavity Coating - 24 oz aerosol	Synthetic Resin remains tacky seeps into crevices; aerosol can
08801	No Cleanup Undercoating Gun	-

The following products are available from *Crest Industries, Inc. at 1-800-822-4100 or www.crestauto.com.

Stock number	Type	Description
AH-C	HONEY COAT/WAX BASED CLOSED CAVITY COATING	16.5 OZ AEROSOL CAN AMBER COLORED SEEPS INTO CREVICES AND REMAINS PLIABLE 36 in spray wand with 360 degree nozzle available (WA-HC)
BZ-BAC BZ-BACB	AMBER COAT/WAX BASED CLOSED CAVITY COATING	GALLON - AMBER COLORED (BZ-BAC) OR BLACK (BZ-BACB) SEEPS INTO CREVICES AND REMAINS PLIABLE APPLIED WITH WZ-GRP GUN AND SIPHON HOSE Flexible spray wand also available (WA-ND)
AC-R	RUBBER COAT/RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
AR-C	SUPER RUBBER COAT/LOW V.O.C. RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
BA-C	AUTO COAT/RUBBER BASED UNDERCOATING, PAINTABLE	28.7 FL OZ CONE-TOP CAN AND GALLON APPLIED WITH GU-C UNDERCOATING GUN
GU-C	UNDERCOATING GUN	ATTACHES TO BA-C CONE-TOP CAN

Stock number	Type	Description
WZ-GRP	GUN AND SIPHON HOSE	USED WITH BZ-BAC AND BZ-BACB
WA-ND	FLEXIBLE SPRAY WAND	USED WITH WZ-GRP

The following products are available from *Kent Automotive. Contact them at 1-888-YES-KENT (888-937-5368) or at www.kent-automotive.com.

Stock number	Type	Description
P60305	Wax Based Inner Panel Rustproofer - CLOSED CAVITY COATING	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14912	Rubber Guard Low VOC Rubber Based Undercoating	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14725	Aerosol Extension Wand Kit	36 in wand and 360 degree nozzle
KT14796	Rubber Guard Low VOC Rubber Based Undercoating	QUART - Applied with undercoating gun
P30025	Siphon Feed Gun	-
P86079	360 Degree Wand for siphon feed gun	-

Weld Thru Coating

Part Number	Description
4353	Weld-Through Primer

*We believe these sources and their products to be reliable. There may be additional manufacturers of such material. General Motors does not endorse, indicate any preference for or assume any responsibility for the products from these firms or for any such items which may be available from other sources.

Seam Sealers

Sealers are intended to prevent water and dust from entering the vehicle and also are anti-corrosion barriers. Sealers are applied to such areas as rear compartment lid hem flanges, wheelhouse, quarter outer, floor, cowl, roof, and various other panel to panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing. Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints, and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer in order to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required in order to restore repaired areas such as hood, fenders, doors, quarters, lid, roof, engine compartment, underbody, and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat buildup, and color application techniques should be followed.

Deadener materials, spray-on type, are used on various metal panels in order to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, are removed during repair operations, or a new replacement panel is installed, the

deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anti-corrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces.

PAINT IDENTIFICATION

WARNING: **Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment, and protective gear.**

NOTE: **Always refer to the GM Approved Refinish Materials book . This book identifies the paint systems you may use.**

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

Use the service parts identification label to identify the type of paint technology, paint codes, trim level, and any special order paint colors on the vehicle. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .

REPAIR INSTRUCTIONS

CLEARCOAT REPAIR WITHOUT REPAINTING

Repair Procedure

1. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or the equivalent.
2. Environmental damage may be corrected. Refer to **Environmental Fallout (Acid Rain)**, or **Rail Dust Damage Repair**.

   IMPORTANT: Follow all of the instructions from the manufacturer of the polishing material.

3. Use a paint gauge before, during, and after sanding and/or polishing, to avoid removing too much clearcoat. Refer to **Paint Gauges**.

ENVIRONMENTAL FALLOUT (ACID RAIN)

CAUTION: **Refer to Clearcoat/Ultraviolet Screeners Caution .**

NOTE: **Always refer to the manufacturer's packaged instructions for the detailed procedures of materials used for compounding and/or polishing.**

Since the severity of the condition varies from area to area, proper diagnosis of the contamination extent is critical to the success of the repairs. Perform the diagnosis under high intensity fluorescent lighting on the horizontal surfaces (hood, roof panel, rear compartment lid), after the surfaces have been properly cleaned by washing the vehicle with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.

There are 3 basic types of acid rain damage:

Surface Level Contamination

May be repaired by simply washing the vehicle, cleaning the surface with a silicone wax and grease remover, neutralizing acidic residue, and finesse polishing-Refer to Surface Level Contamination Repair.

Clearcoat Etching

Slight etching is still noticeable after the above washing and finesse polishing procedure. Refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Basecoat Etching

Severe etching beyond the clearcoat into the basecoat in the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

Surface Level Contamination Repair

1. Thoroughly wash and dry the contaminated area with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.
2. Clean the affected area with silicone, wax and grease remover.
3. Remove and neutralize acidic residue by cleaning the contaminated areas with a mixture of baking soda and water (1 tablespoon of baking soda per 1 liter or 1 quart of water). Rinse thoroughly and dry the panel completely.
4. Apply finesse-type polish with a foam panel. If damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad. Refer to **Clearcoat Repair Specifications - 3M Products**.
5. If some damage remains, refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small contaminated test area.
2. Film thickness should be taken prior to the sanding and polishing. Refer to **Paint Gauges**.
3. Wet sand and finesse polish the contaminated test area. Refer to **Clearcoat Repair Specifications - 3M Products**, . If during the polishing you suspect or observe that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding, or base color is transferred to the polishing pad during polishing, then the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

PAINT GAUGES

Paint thickness gauges measure the total thickness of the vehicle finish. It is important to accurately measure the thickness of the finish on each vehicle as the thickness of the finish will vary on each vehicle. Use a paint gauge before the sanding process in order to accurately measure how much finish there is to remove before, during, and after the sanding process. Paint gauges range from magnetic pull type to sophisticated electronic types, and are available from a variety of sources. The older magnetic type gauges, at best have a 5 percent accuracy range and are not sensitive enough to detect removal of 0.02 mm 0.5 mil (0.0005 in) clearcoat. The newer type magnetic gauges have improved accuracy ranges. Most gauges are confined to checking either ferrous metal, steel, non-ferrous metal, or aluminum panel. At this time, there are no viable gauges for reading film thickness on composite (SCM doors, RIM fenders) panels. The more sophisticated (ETG) electronic paint thickness gauges digital type gauges are able to read film thickness on both ferrous and non-ferrous metal panel. Digital ETG gauges may have

an accuracy range of 1 percent and include thickness standards for recalibration. The following paint thickness gauges are available. Call 1-800-GM-TOOLS for information:

Paint Thickness Gauges

- 147-5437-ETG Standard model
- 147-5437-ETG-P Standard model with print option
- 147-5437-N-ETG-N Non-ferrous model for aluminum panels
- 147-5437-NP-ETG-NP Non-ferrous model with print option
- 147-54437-SD-ETG Steel and aluminum gauge

CLEARCOAT THICKNESS

The clearcoat on the vehicle is typically 0.059-0.078 mm (1.5-2 mils [0.0015-0.0020 in]) thick. The clearcoat contains ultraviolet screeners. Removing more than 0.5 mils (0.019 in) of the clearcoat may result in early paint failure.

RAIL DUST DAMAGE REPAIR

WARNING: **Refer to Eye Protection Warning .**

NOTE: **If rail dust has penetrated into the basecoat, the panel requires refinishing. Ensure all the rail dust has been removed prior to refinishing or the rust spots will return.**

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of, or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust colored spots in the paint.

1. Move the vehicle to a cool shaded area and ensure the vehicle surfaces are cool during the removal process.
2. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870, or equivalent.
3. Wipe the area dry.
4. Clean the affected area with silicone, wax and grease remover.
5. Perform the removal process according to the manufacturer's directions of the type of repair material used (Gel Type Oxalic Acid or Clay Type Non-Acid Based). If, upon inspection, some particles are still present, the process may be repeated. If the damage has been repaired, complete the repair to the entire panel.
6. Polish the entire panel after the removal process. Refer to **Clearcoat Repair Specifications - 3M Products**, . If small pits remain in the clearcoat after all of the damage has been repaired, refer to **Clearcoat Repair without Repainting**.

REPAIR INSTRUCTIONS

GENERAL PLASTIC REPAIR

WARNING: **In order to reduce the risk of personal injury when exposed to toxic fumes while grinding, cutting, or applying repair material on any type of sheet molded compound or RIM rigid plastic, observe the following guidelines:**

- **Work in a properly ventilated area**
- **Apply protective cream to any exposed skin**
- **Remove any mixture that comes into contact with skin**
- **Wash skin with cold water to remove glass and resin dust**
- **Use a sander with a vacuum attachment**
- **Follow the repair material manufacturer's instructions**

Also, always wear the following:

- **An approved respirator, or air supplied respirator**
- **Eye protection**
- **Rubber gloves**
- **Earplugs**
- **Protective clothing**

The following procedures should be followed when repairing all types of thermoset plastic:

- Follow the manufacturer's application and curing recommendations.
- Do not intermix systems. Use the supplies and the repair materials from the same manufacturer.
- Clean the inner and outer surfaces of the repair area with a soap impregnated scouring pad in order to remove any dirt or mold release agent.
- Clean the area with a wax and grease remover, using only enough of the remover to dampen a cloth. Allow the panel to dry thoroughly.
- Remove the surface finish from the area to be repaired. Adhesives are designed to adhere to the plastic substrate, not the finish.
- Prime a metal surface before applying the repair material.
- Inspect the rear side of the work area before making repairs in order to avoid possible damage to wires, motors, etc.

DESCRIPTION AND OPERATION

HOW TO IDENTIFY PLASTIC PARTS

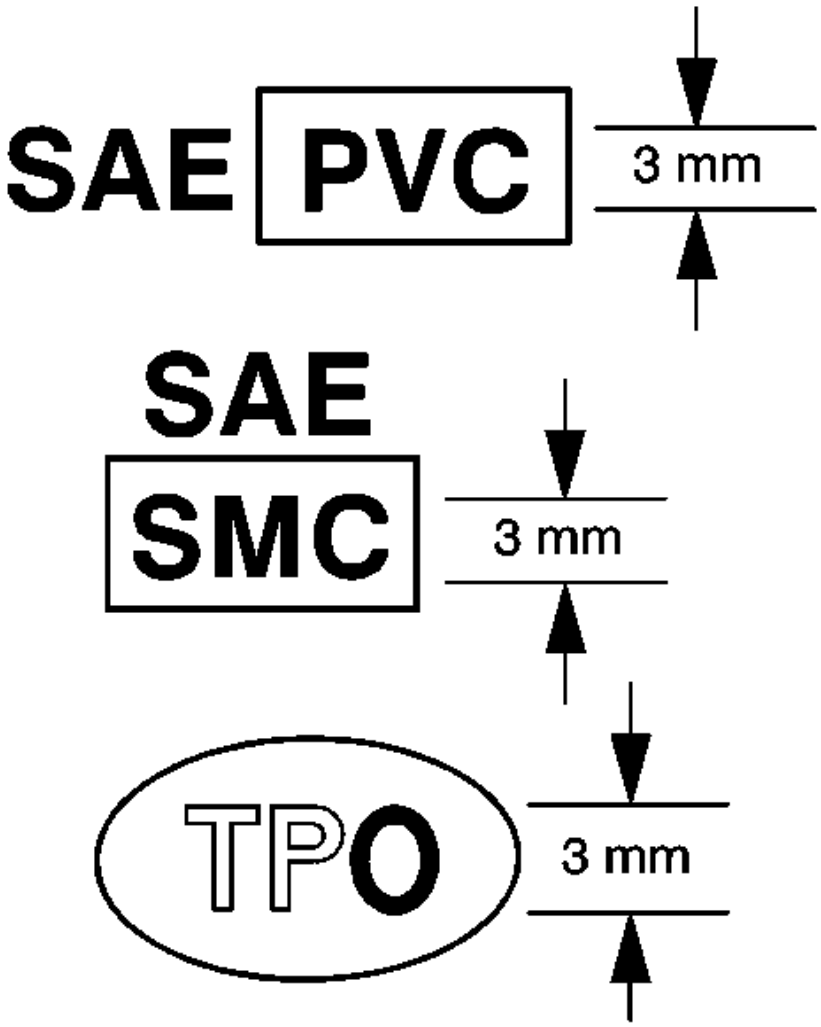

Fig. 1: Identifying SAE Code
Courtesy of GENERAL MOTORS COMPANY

Plastic parts can be identified by the SAE code, which is usually found on the rear of the part, and/or by the characteristics of the plastic. Knowing the type of plastic aids in selecting the proper repair materials and in selecting the proper repair procedure.

Look for the SAE code stamped into the part.

Code Found

Match the code to those in the plastic identification chart to determine whether the plastic is thermoplastic or thermoset plastic, and whether the plastic is rigid or flexible. Refer to **Plastic Identification and Refinishing Systems**.

No Code Found

WARNING: Do NOT use a plastic burn test to distinguish the type of plastic. The burn test produces vapors which are harmful.

Perform one or both of the following tests to determine if the part is thermoplastic polyolefin or thermoset non-polyolefin.

Float Test

1. Cut a shaving of plastic from the back of the part.

   The shaving should be free of mold release agents and paint.

2. Place the shaving in a container of water.
   - Thermoplastic polyolefin floats.
   - Thermoset non-polyolefin sinks.

Abrasion Test

- Sand a spot near the damaged area with Grade 36 Roloc Disc.
- Thermoplastic polyolefin material melts or frays when sanded.
- Thermoset non-polyolefin material sands cleanly.

Thermoplastic and thermoset plastics can be either rigid or flexible. Thermoplastic plastic parts are best repaired with a hot iron plastic material-feed welder, but are usually replaced. Thermoset plastic can be repaired with epoxy or other more rigid 2 package repair material.

- For rigid thermoset repair materials, refer to **Rigid Plastic Part Repair Materials**.
- For flexible thermoset repair materials, refer to **Flexible Plastic Part Repair Materials**.
- For general repair instructions, refer to **General Plastic Repair**.

PLASTIC IDENTIFICATION AND REFINISHING SYSTEMS

Identifying Symbol- Old Symbol in ( )s	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common / Trade Names	Type of Plastic

REPAIR INSTRUCTIONS

FRONT SEAT REMOVAL AND INSTALLATION - BUCKET (IMPALA LIMITED)

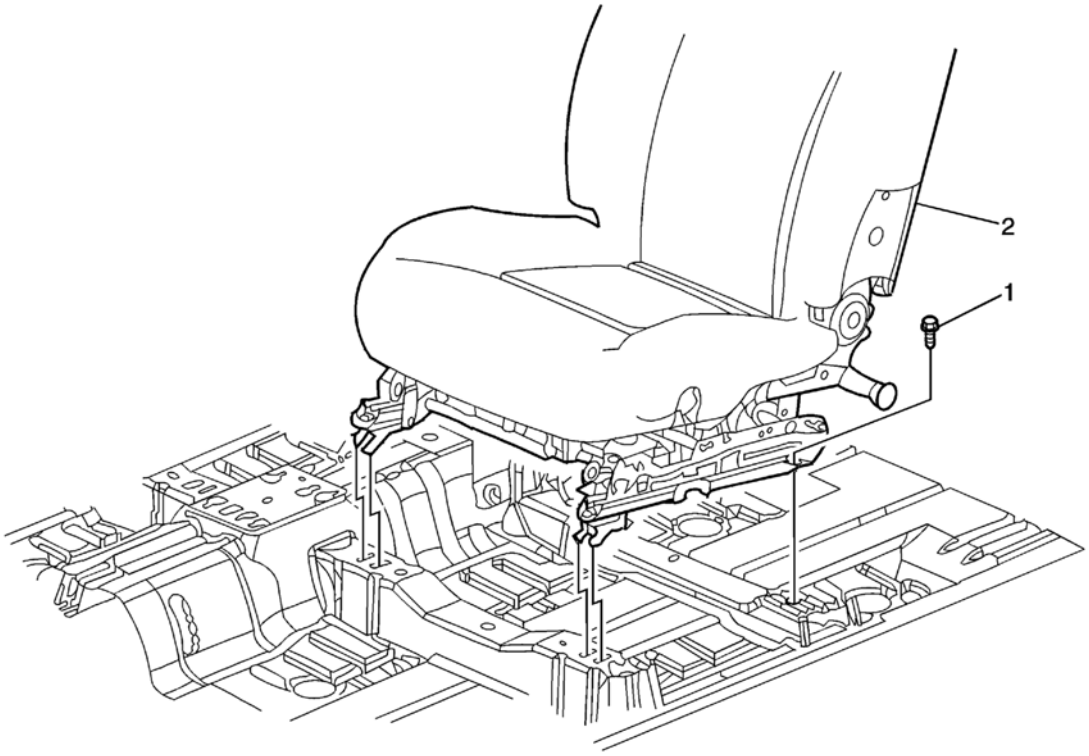

Fig. 1: View Of Front Bucket Seat (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Disconnect the seat belt from the seat. Refer to **Seat Belt Retractor Pretensioner Replacement - Front** .	
1	Seat Adjuster Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener** **Caution** . **Procedure** Remove the front seat track covers to access the bolts. **Tighten** 45 N.m (33 lb ft)
2	Seat Assembly **Procedure** Disconnect the electrical connectors.

FRONT CENTER SEAT REMOVAL AND INSTALLATION

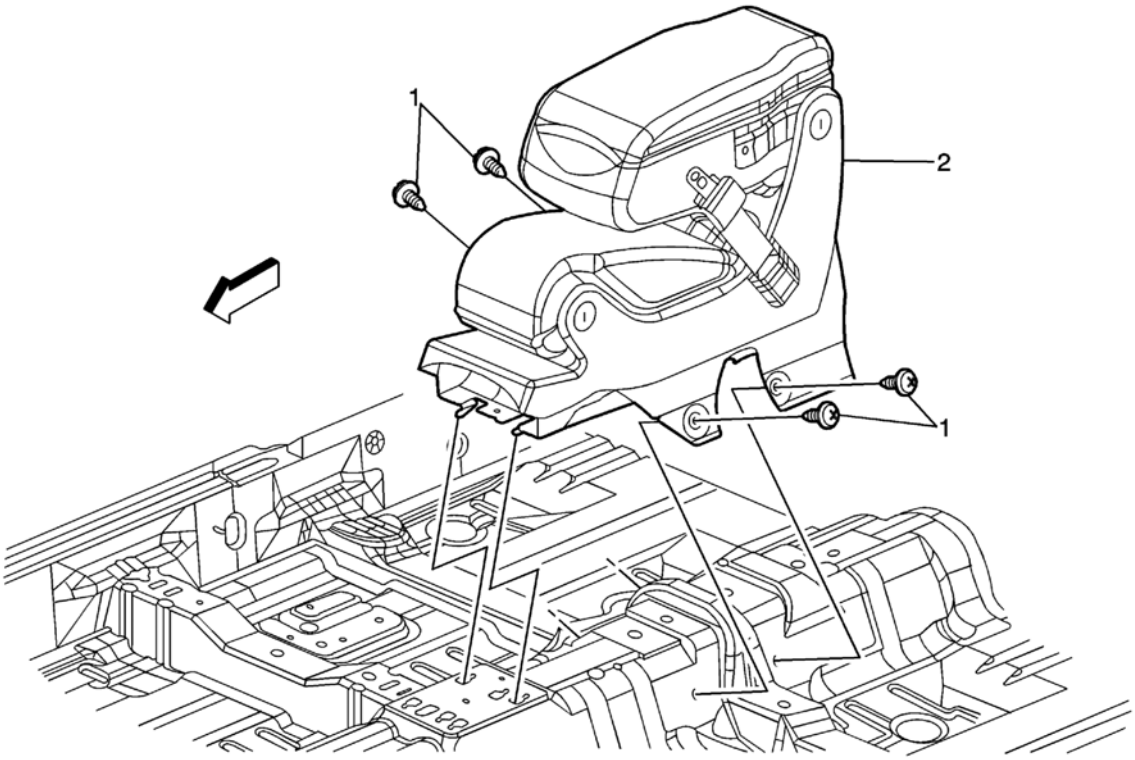

Fig. 2: Center Seat
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Move the driver and passenger seats forward or rearward.	
1	Front Center Seat Assembly Bolt (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution .** **TIP:** Remove the plastic caps that cover the bolts. **Tighten** 44 N.m (32 lb ft)
2	Front Center Seat Assembly • Slide the center seat assembly forward and lift up to disengage the retaining hooks at the front of the seat. • Disconnect the electrical connectors.

FRONT SEAT ADJUSTER REPLACEMENT

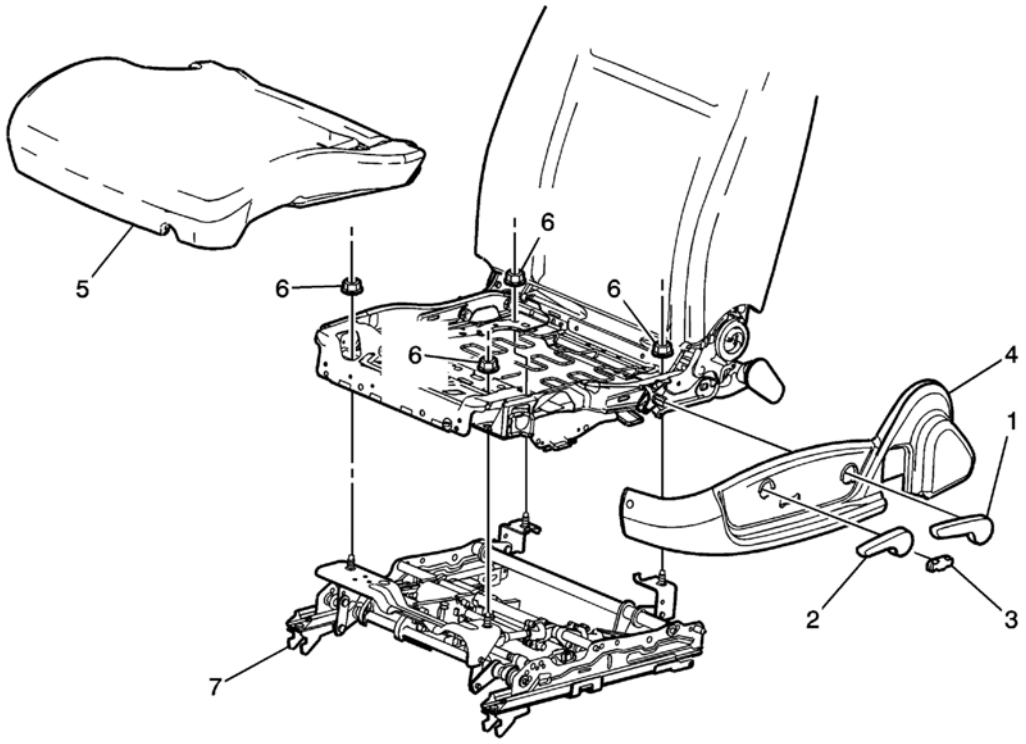

Fig. 3: Locating Front Seat Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**.	
1	Recliner Handle **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.
2	Lumbar Actuator Handle **TIP:** Pull outward to remove.
3	Power Seat Switch Knob **TIP:** Pull outward to remove.
4	Seat Cushion Outer Trim Panel Refer to **Seat Cushion Outer Trim Panel Replacement**.
5	Seat Cushion Cover **Procedure** 1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.
6	Front Seat Cushion Frame Nut (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 9 N.m (80 lb in)
7	Front Seat Adjuster Assembly

PASSENGER SEAT ADJUSTER REPLACEMENT (IMPALA LIMITED W/O AG2)

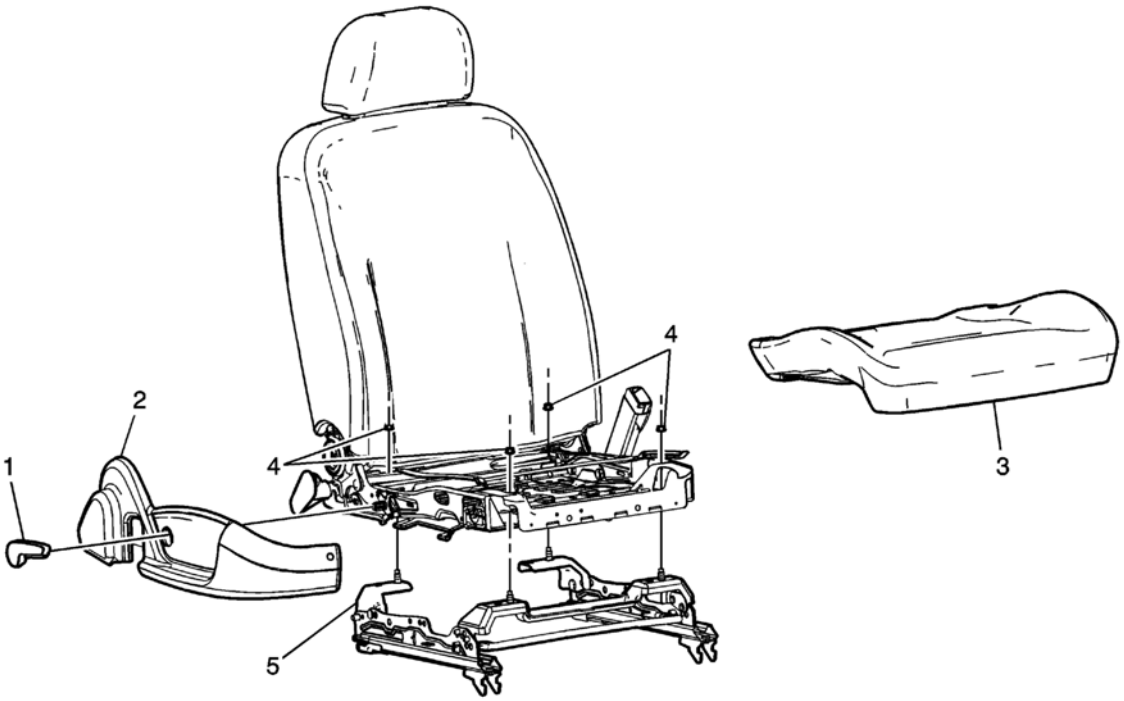

Fig. 4: Passenger Side Seat Adjuster (Impala Limited w/o AG2)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**.	
1	Recliner Handle **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.
2	Seat Cushion Outer Trim Panel Refer to **Seat Cushion Outer Trim Panel Replacement**.
3	Seat Cushion Cover **Procedure**

Callout	Component Name
	1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.
4	Front Seat Cushion Frame Nut (Qty: 4) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 9 N.m (80 lb in)
5	Front Seat Adjuster Assembly

FRONT SEAT ARMREST LATCH REPLACEMENT (IMPALA LIMITED)

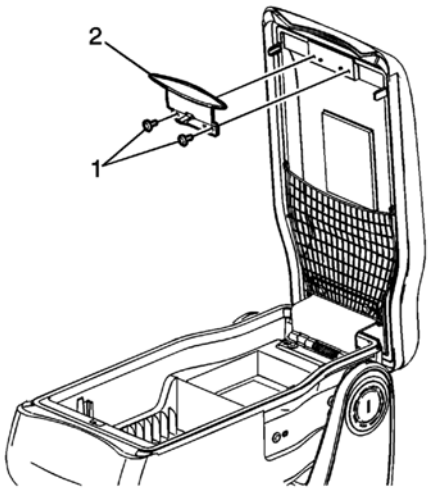

Fig. 5: Identifying Front Seat Armrest Latch (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 3 N.m (25 lb in)

Callout	Component Name
2	Front Seat Armrest Latch Assembly

FRONT SEAT ARMREST REPLACEMENT (IMPALA LIMITED)

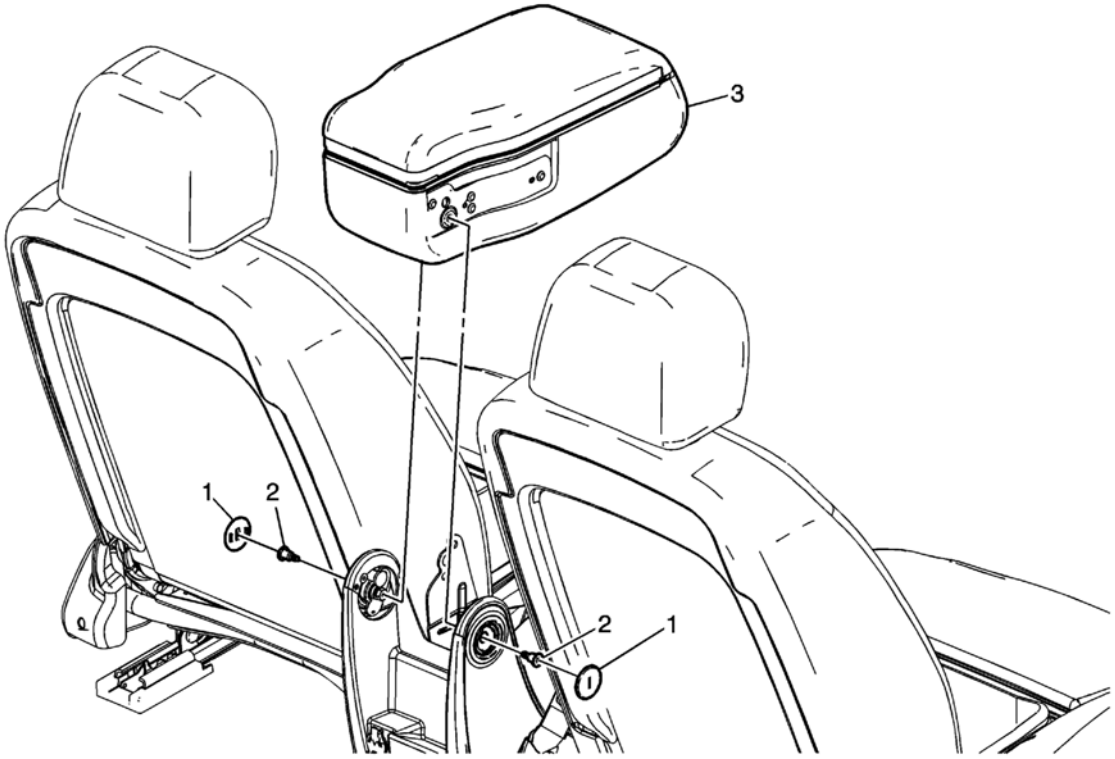

Fig. 6: Front Seat Armrest (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Center Seat Armrest Bolt Cover (Qty: 2) **TIP:** Move the front bucket seats forward far enough to gain access to the armrest bolt cover.
2	Front Center Seat Armrest Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 3 N.m (25 lb in)
3	Front Center Seat Armrest Assembly

FRONT SEAT ARMREST HINGE REPLACEMENT (IMPALA LIMITED)

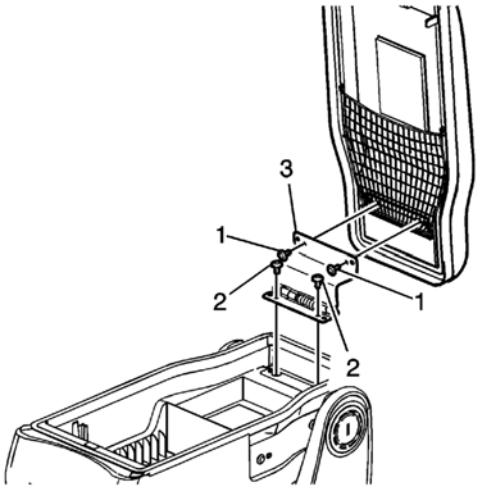

Fig. 7: Identifying Front Seat Armrest Hinge (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:** **Refer to** Fastener Caution . **Tighten** 3 N.m (25 lb in)
2	Front Seat Armrest Hinge Screw (Qty: 2) **Tighten** 3 N.m (25 lb in)
3	Front Seat Armrest Hinge

FRONT SEAT ARMREST LID REPLACEMENT (IMPALA LIMITED)

Callout	Component Name
1	Front Seat Armrest Hinge Screw (Qty: 2) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 3 N.m (25 lb in)
2	Front Seat Armrest Lid Assembly
3	Front Seat Armrest Bin Screw (Qty: 8) **Tighten** 3 N.m (25 lb in)
4	Front Seat Armrest Stowage Compartment Assembly

DRIVER OR PASSENGER SEAT HEAD RESTRAINT REPLACEMENT (IMPALA LIMITED)

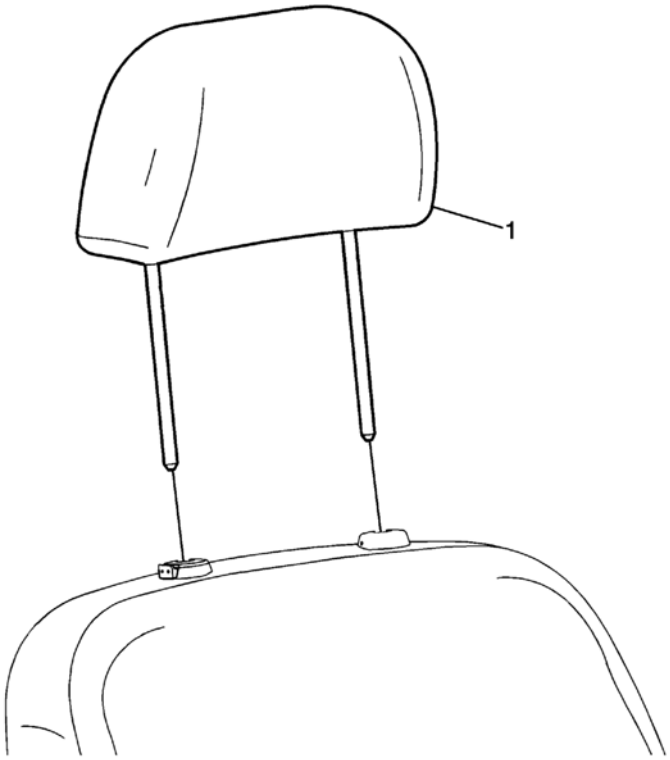

Fig. 10: Front Seat Head Restraint (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Seat Head Restraint **Procedure** 1. Depress the button on the inboard head restraint guide to raise the head restraint to the full up position. 2. Insert a small diameter tool into the hole on the inboard side of the outboard head

Callout	Component Name
	restraint guide and pull upward to remove.

DRIVER OR PASSENGER SEAT HEAD RESTRAINT GUIDE REPLACEMENT (IMPALA LIMITED)

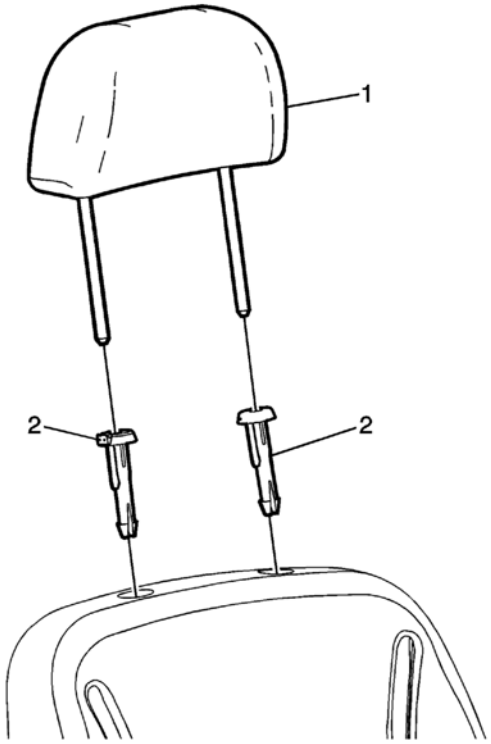

Fig. 11: Front Seat Head Restraint Guide (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat back panel. Refer to **Front Seat Back Cushion Finish Panel Replacement (Impala Limited)**.	
1	Front Seat Head Restraint **Procedure** 1. Depress the button on the inboard head restraint guide to raise the head restraint to the full up position. 2. Insert a small diameter tool into the hole on the inboard side of the outboard head restraint guide and pull upward to remove.
2	Front Seat Head Restraint Guide (Qty: 2) **TIP:** Reach up and into the top of the seat back, while pressing the tabs on the bottom of the head restraint guide, pull the guide from the seat back frame.

DRIVER SEAT ADJUSTER HORIZONTAL PINION GEAR SHAFT REPLACEMENT

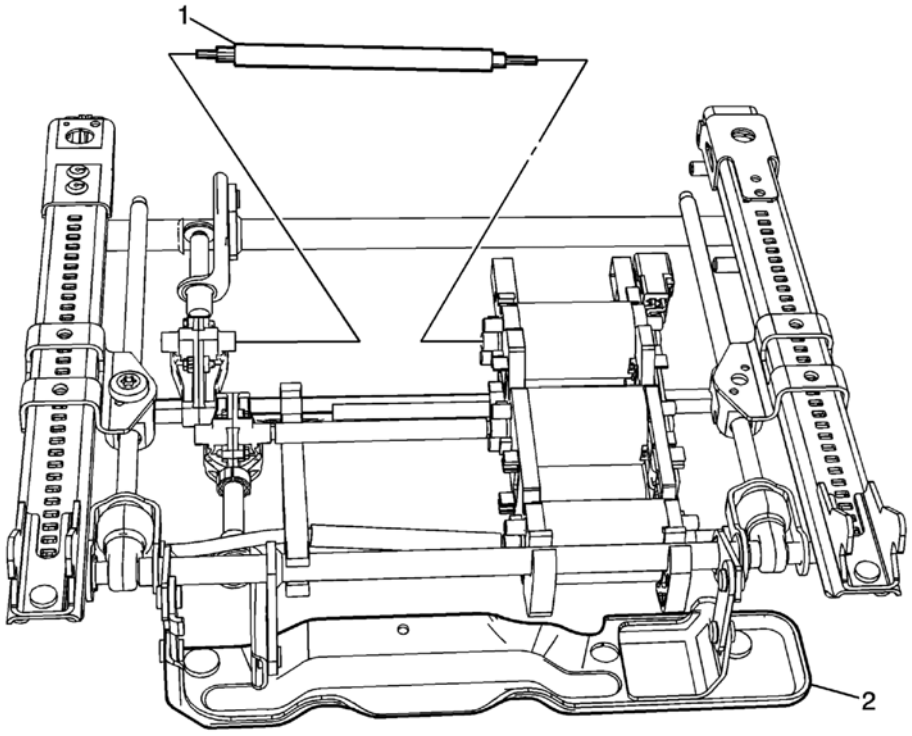

Fig. 12: Driver Seat Adjuster Horizontal Pinion Gear Shaft Replacement
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat adjuster. Refer to **Front Seat Adjuster Replacement**.	
1	Driver Seat Adjuster Horizontal Pinion Gear Shaft **TIP:** Remove the cable by pulling on the end of each side.
2	Driver Seat Adjuster Horizontal Pinion Gear Shaft **Procedure** Follow the steps below to reinstall the seat adjuster horizontal pinion gear shaft 1. Ensure both inboard and outboard tracks fully rearward position. 2. Reinstall seat adjuster horizontal pinion gear shaft cable 3. activated the motor ensure the adjuster is operating normal.

DRIVER OR PASSENGER SEAT CUSHION FRAME REPLACEMENT

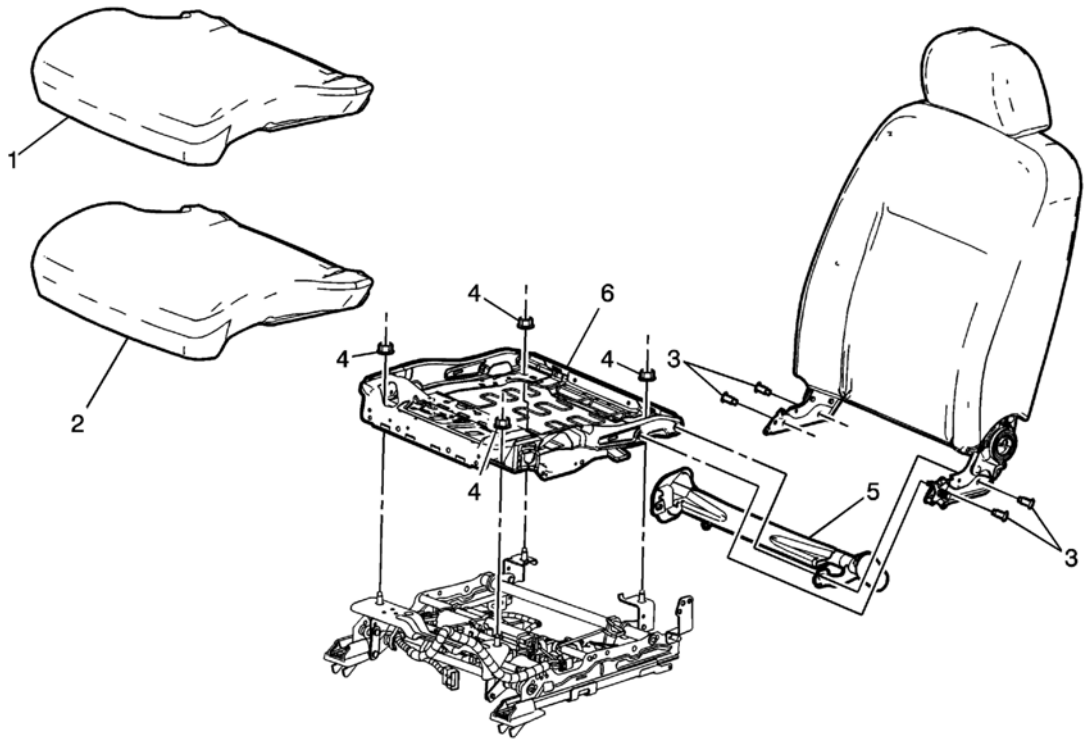

Fig. 13: Front Seat Cushion Frame
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**. 2. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala Limited)**. 3. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala Limited)**. 4. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala Limited)** . 5. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**.	
1	Seat Cushion Cover Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)**.
2	Seat Cushion Pad Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)**.
3	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 45 N.m (33 lb ft)
4	Front Seat Cushion Frame Nut (Qty: 4) **Tighten** 9 N.m (80 lb in)
5	Seat Cushion Frame Rear Reinforcement
6	Front Seat Cushion Frame **Procedure** 1. Remove the heated seat module, if equipped. Refer to **Front Seat Heater Control Module Replacement (Impala Limited)** . 2. Remove the inflatable restraint passenger presence system if working on the passenger seat. Refer to **Inflatable Restraint Passenger Presence System Replacement - Front** . 3. Disconnect the wiring harness from the seat cushion. 4. Re-zero the inflatable restraint passenger presence system whenever the seat cushion or any component of the passenger presence system is removed. Refer to **Passenger Presence System Programming and Setup** .

SEAT CUSHION OUTER TRIM PANEL REPLACEMENT

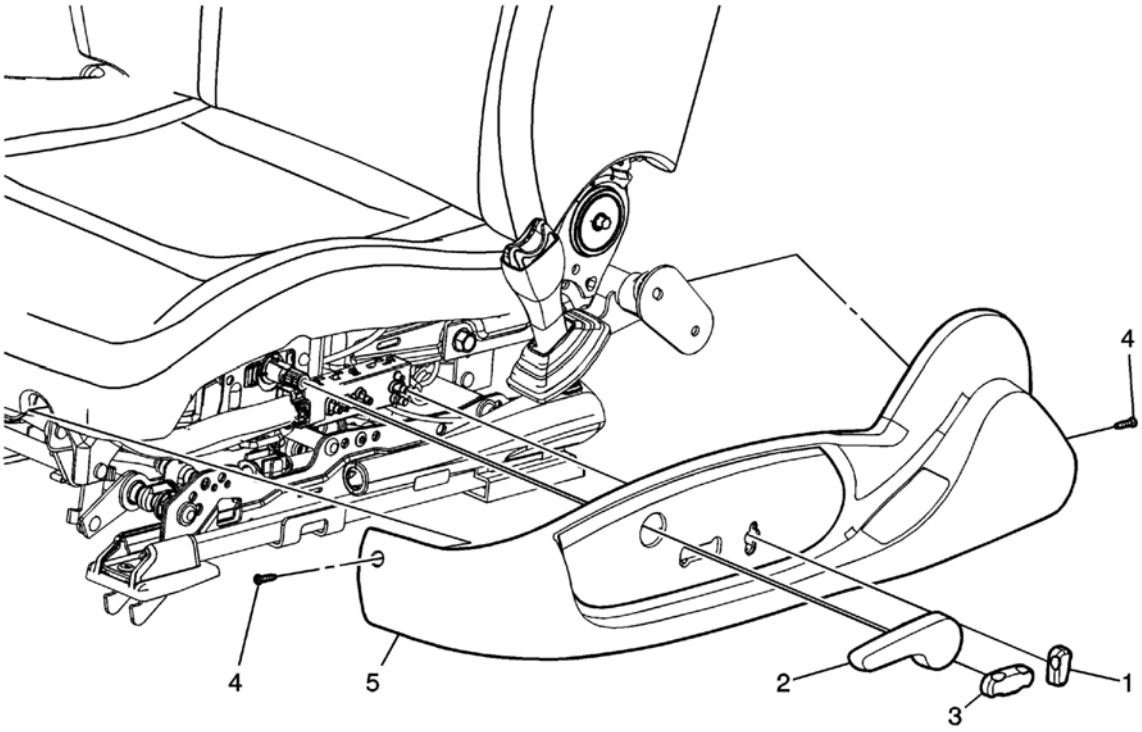

Fig. 14: Seat Cushion Outer Trim Panel & Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Recliner Knob (If equipped) **TIP:** Pull outward to remove.
2	Lumbar Actuator Handle (If equipped) **TIP:** Pull outward to remove.
3	Power Seat Switch Knob (If equipped) **TIP:** Pull outward to remove.
4	Seat Cushion Outer Trim Panel Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
5	Seat Cushion Outer Trim Panel **Procedure** 1. Disconnect the electrical connector. 2. Remove the seat cushion outer trim panel by pulling it upward over the pretensioner

Callout	Component Name
	upper and lower boot. 3. If replacing the cover, transfer components as necessary.

FRONT SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA LIMITED)

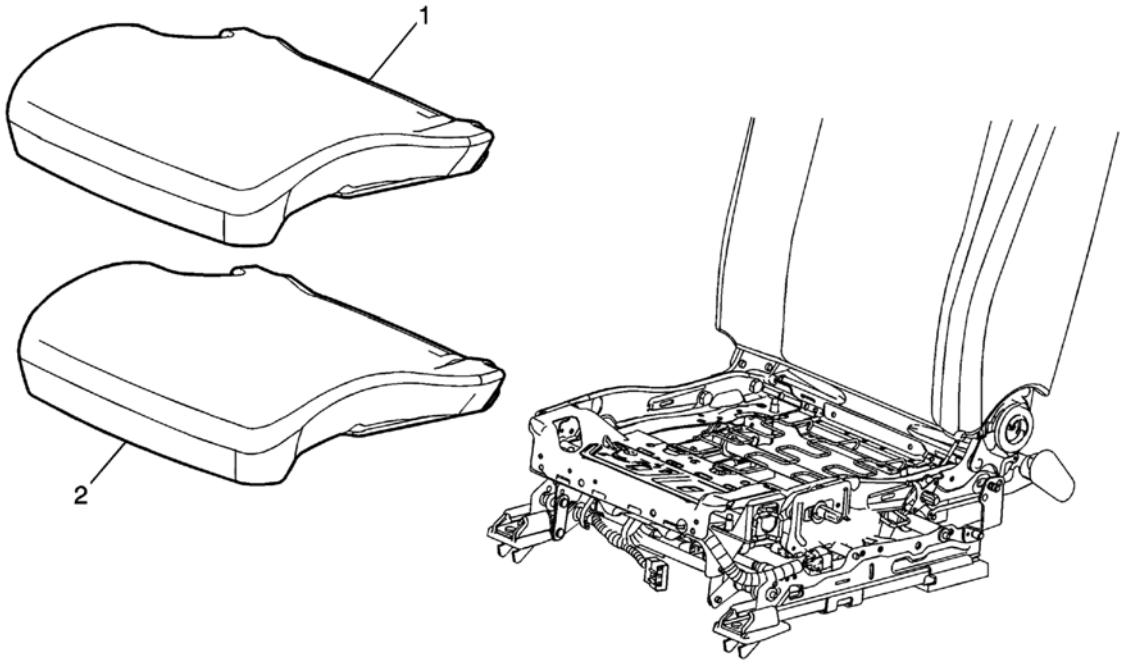

Fig. 15: Front Seat Cushion Cover And Pad (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seats. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**. 2. Remove the front seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**.	
1	Seat Cushion Cover **Procedure** 1. Release the j-channel from the seat cushion frame. 2. Disconnect the seat cushion heater electrical connector, if equipped. 3. Remove the seat cushion cover and pad as an assembly from the frame.

Callout	Component Name
2	Seat Cushion Pad **Procedure** 1. Remove the seat cushion pad from the cover by pulling away to release to hook and loop fasteners. 2. When working on the passenger seat re-zero the passenger presence system. Refer to **Control Module References** .

SEAT BACK COVER AND PAD REPLACEMENT (IMPALA LIMITED)

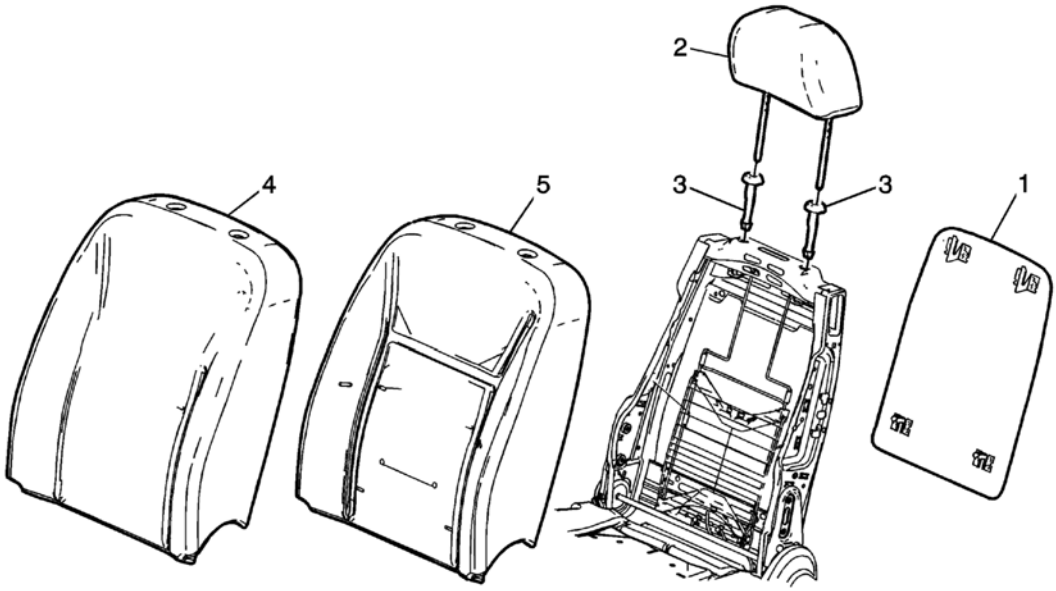

Fig. 16: Seat Back Cover And Pad (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**. 2. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**.	
1	Seat Back Cushion Finish Panel Refer to **Front Seat Back Cushion Finish Panel Replacement (Impala Limited)**.

Callout	Component Name
2	Front Seat Head Restraint Refer to **Driver or Passenger Seat Head Restraint Replacement (Impala Limited)**.
3	Front Seat Head Restraint Guides Refer to **Driver or Passenger Seat Head Restraint Guide Replacement (Impala Limited)**.
4	Seat Back Cushion Cover **Procedure** 1. Disconnect the j-channel from the seat back frame. 2. Remove the 2 lower push pin retainers that secures the cover to the frame. 3. Remove the pad and cover as an assembly.
5	Seat Back Cushion Pad **Procedure** 1. Remove the cover from the pad by pulling apart to release the hook and loop fasteners. 2. Disconnect the electrical connector, if equipped.

DRIVER OR PASSENGER SEAT BACK CUSHION PAD SUPPORT REPLACEMENT

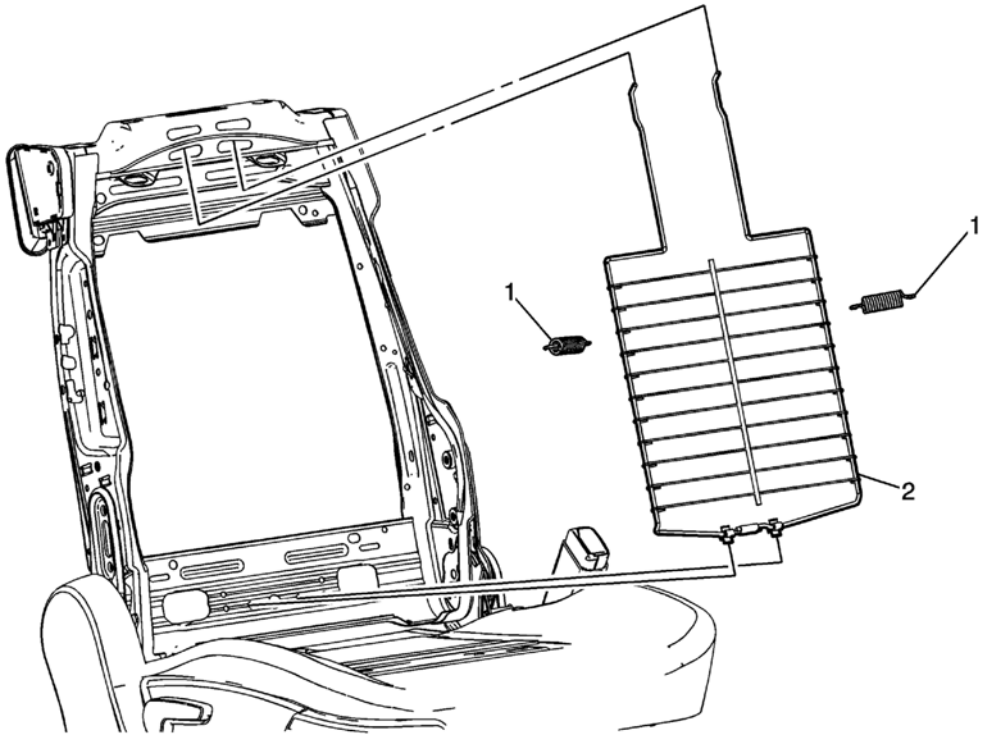

Fig. 17: Front Seat Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala Limited)**.	
1	Front Seat Lumbar Spring (Qty: 2)
2	Front Seat Back Cushion Pad Support **Procedure** 1. Push the retainers at the bottom out of the seat back frame to release the bottom of the lumbar assembly. 2. Tilt and pull down and forward to remove the top portion of the lumbar assembly from the seat back frame.

DRIVER OR PASSENGER SEAT BACK CUSHION FRAME REPLACEMENT (IMPALA LIMITED)

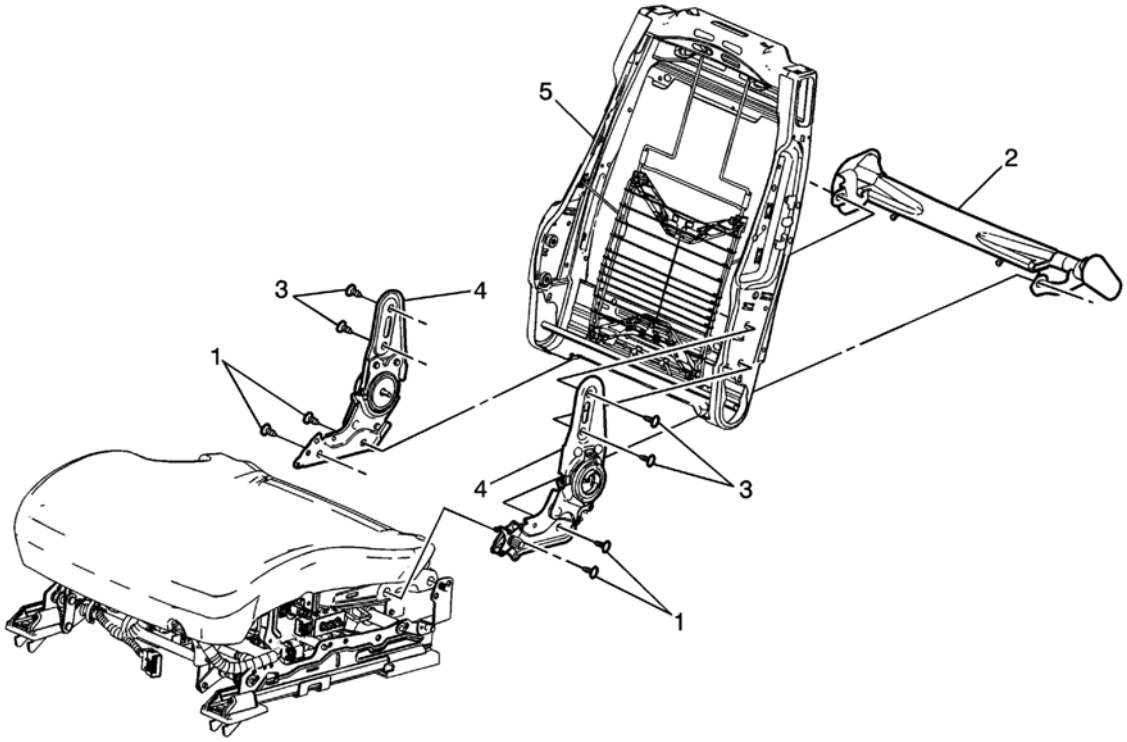

Fig. 18: Identifying Front Seat Back Frame (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**. 2. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala Limited)**.	

Callout	Component Name
3. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala Limited)**. 4. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala Limited)** . 5. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**. 6. Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala Limited)**. 7. Remove the lumbar assembly. Refer to **Driver or Passenger Seat Lumbar Support Replacement**.	
1	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 45 N.m (33 lb ft)
2	Seat Cushion Frame Rear Reinforcement
3	Front Seat Back Cushion Frame Bolt (Qty: 4) **Tighten** 45 N.m (33 lb ft)
4	Seat Recliner Assembly
5	Seat Back Frame Assembly

DRIVER OR PASSENGER SEAT RECLINER REPLACEMENT (IMPALA LIMITED)

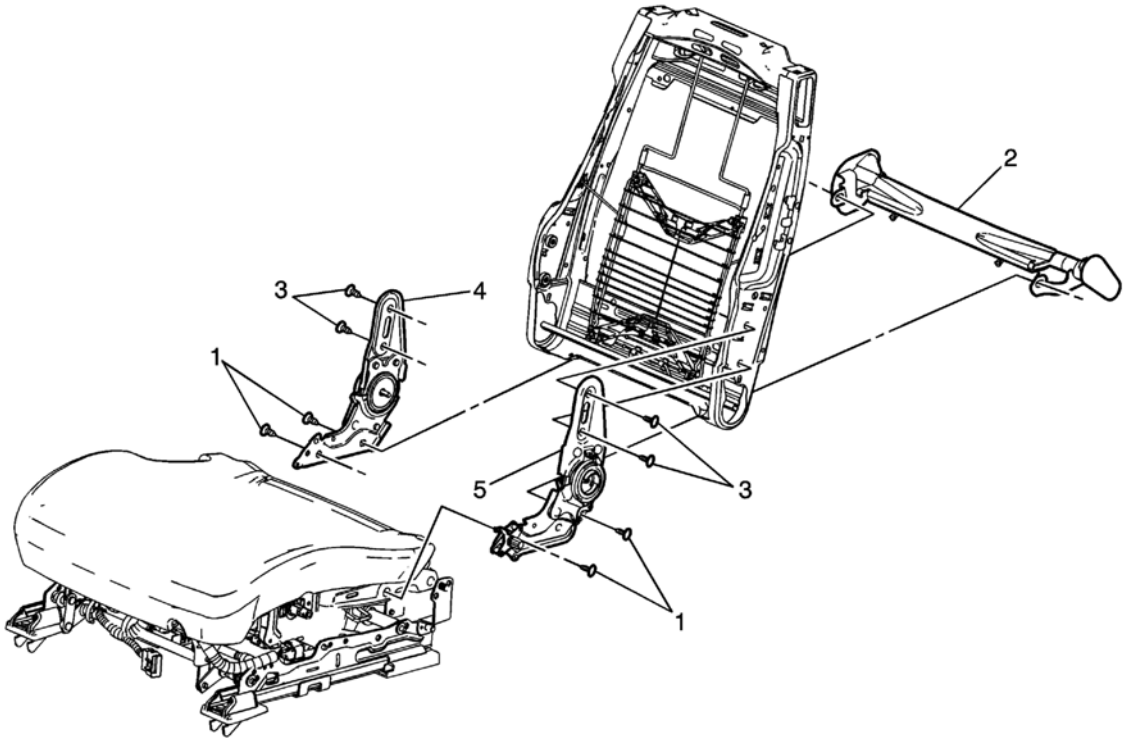

Fig. 19: Seat Back Recliner (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**. 2. Remove the lumbar actuator knob. Refer to **Lumbar Support Knob Replacement (Impala Limited)**. 3. Remove the recliner handle. Refer to **Front Seat Back Recliner Handle Replacement (Impala Limited)**. 4. Remove the power seat switch knob. Refer to **Driver or Passenger Seat Adjuster Switch Knob Replacement (Impala Limited)** . 5. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement**. 6. Remove the front seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala Limited)**. 7. Remove the lumbar assembly. Refer to **Driver or Passenger Seat Lumbar Support Replacement**.	
1	Front Seat Cushion Frame Bolt (Qty: 4) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 45 N.m (33 lb ft)
2	Seat Cushion Frame Rear Reinforcement
3	Front Seat Back Cushion Frame Bolt (Qty: 4) **Tighten** 45 N.m (33 lb ft)
4	Seat Inner Recliner Assembly
5	Seat Outer Recliner Assembly

FRONT SEAT BACK RECLINER HANDLE REPLACEMENT (IMPALA LIMITED)

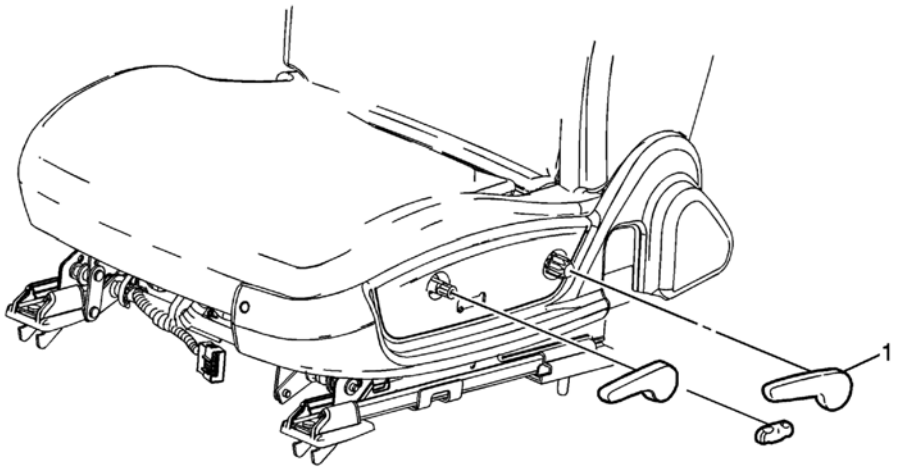

Fig. 20: Front Seat Back Recliner Handle (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to Fastener Specifications.	
1	Handle, Recliner **TIP:** Using a flat-bladed tool, push the retainer clip downward and pull outward to release the handle.

FRONT SEAT BACK CUSHION FINISH PANEL REPLACEMENT (IMPALA LIMITED)

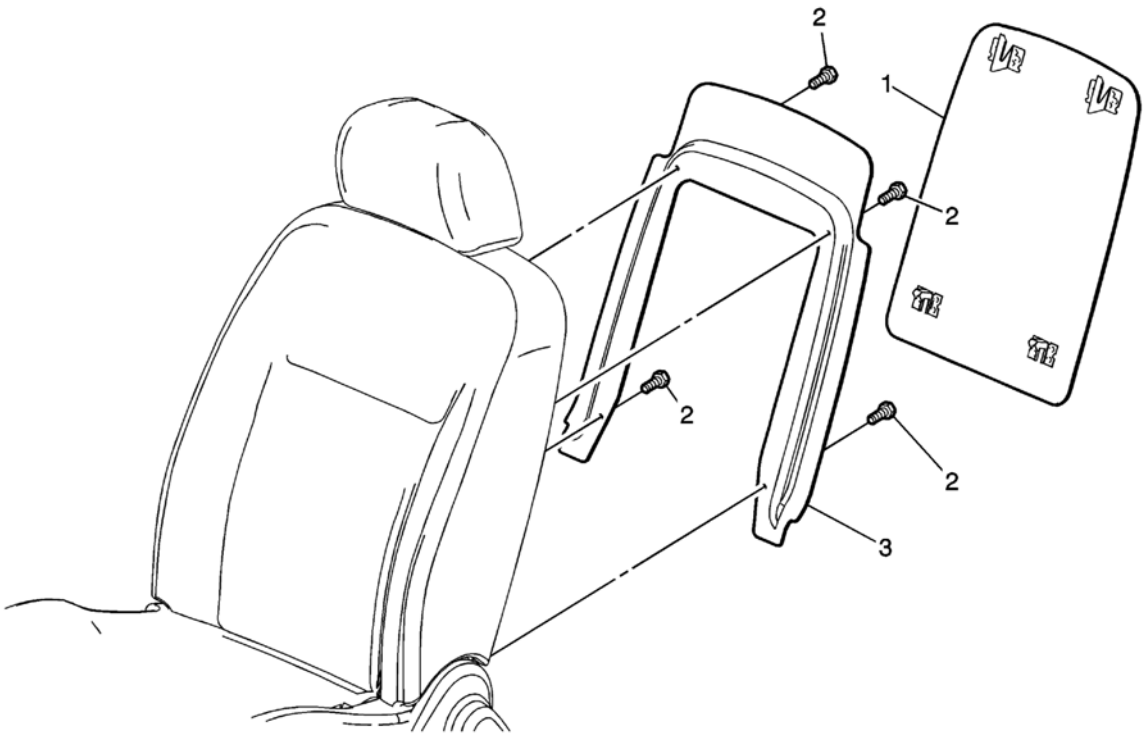

Fig. 21: Front Seat Back Panel (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Seat Back Cushion Finish Panel **Procedure** Pull up on the bottom of the panel while bowing the panel outward in the center, and when the panel disengages then pull rearward.
2	Seat Back Cushion Rear Finish Retainer (Qty: 4) **Procedure** Release the rear seat back cover j-channel retainers and reposition the cover to gain access to the retainers.
3	Seat Back Cushion Rear Finish Panel

DRIVER OR PASSENGER SEAT LUMBAR SUPPORT REPLACEMENT

Removal Procedure

1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**.
2. Remove the front seat back cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala Limited)**.
3. Remove the front seat cushion cover and pad. Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)**.

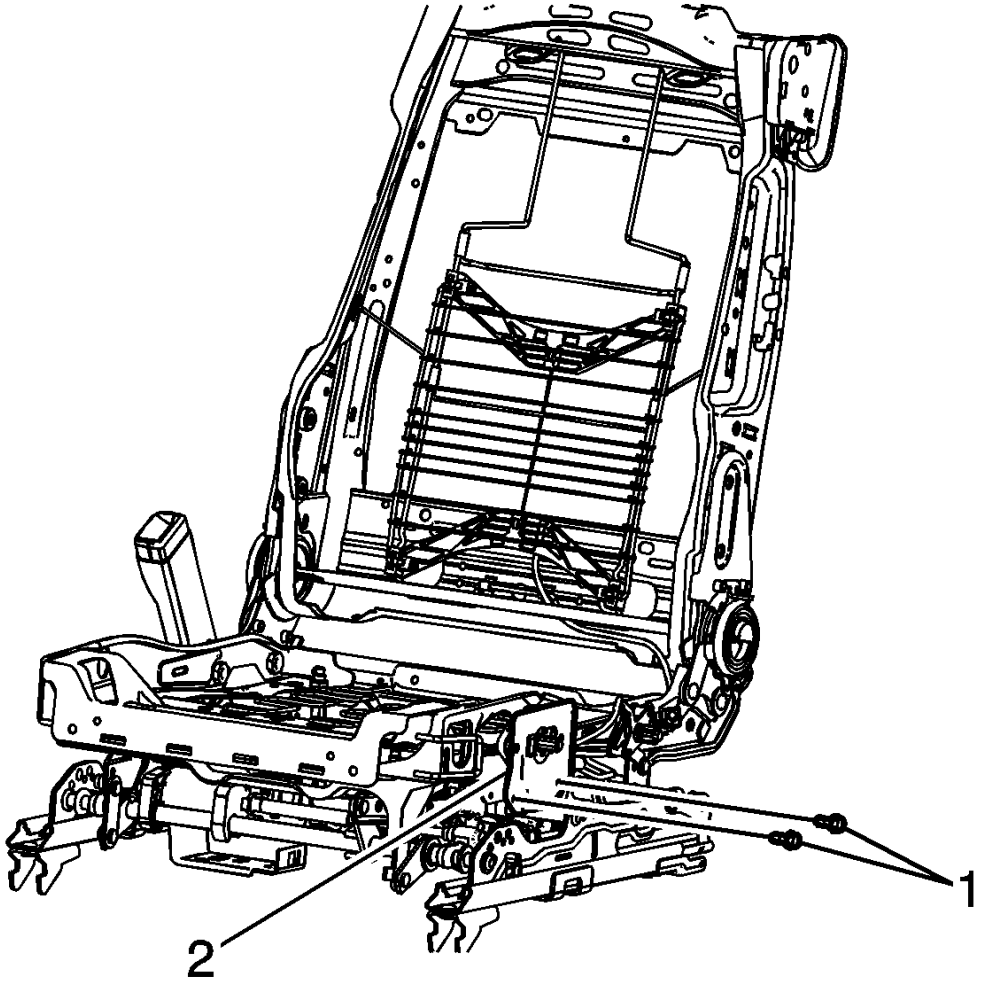

Fig. 22: Identifying Lumbar Support Actuator Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the screws (1) that retain the lumbar actuator to the seat cushion pan.

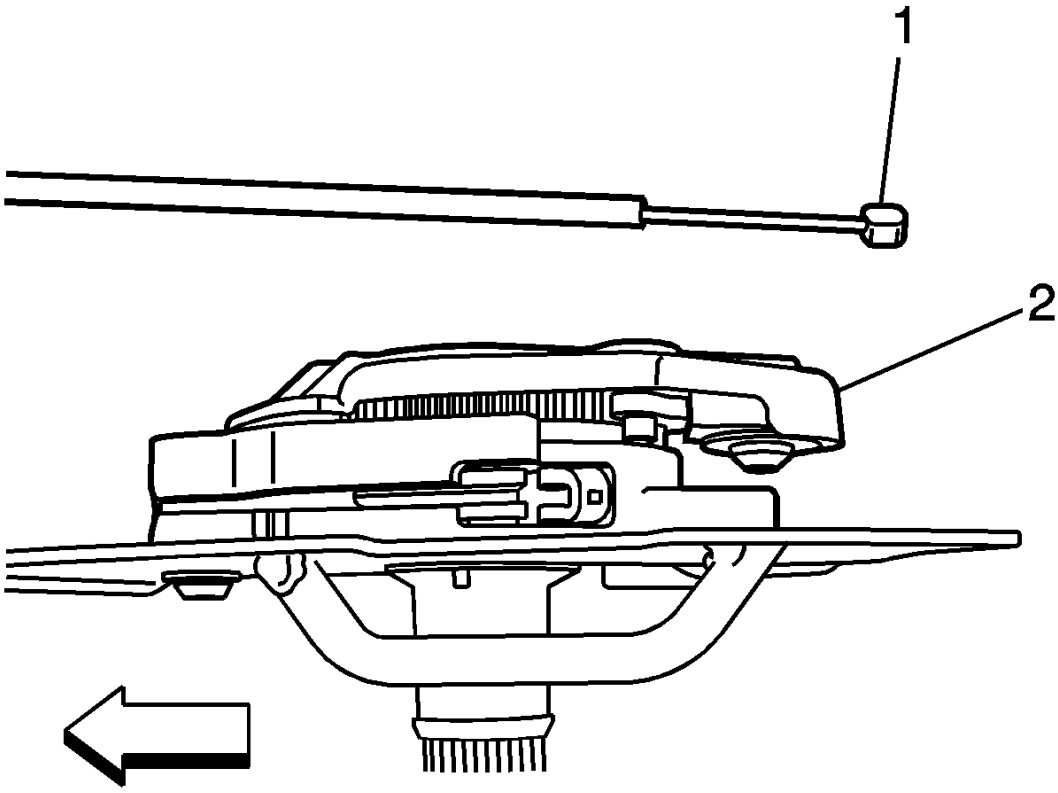

Fig. 23: Identifying Lumbar Cable & Lumbar Actuator
Courtesy of GENERAL MOTORS COMPANY

5. Move the lumbar actuator away from the seat far enough to disconnect the lumbar cable (1) from the actuator (2).

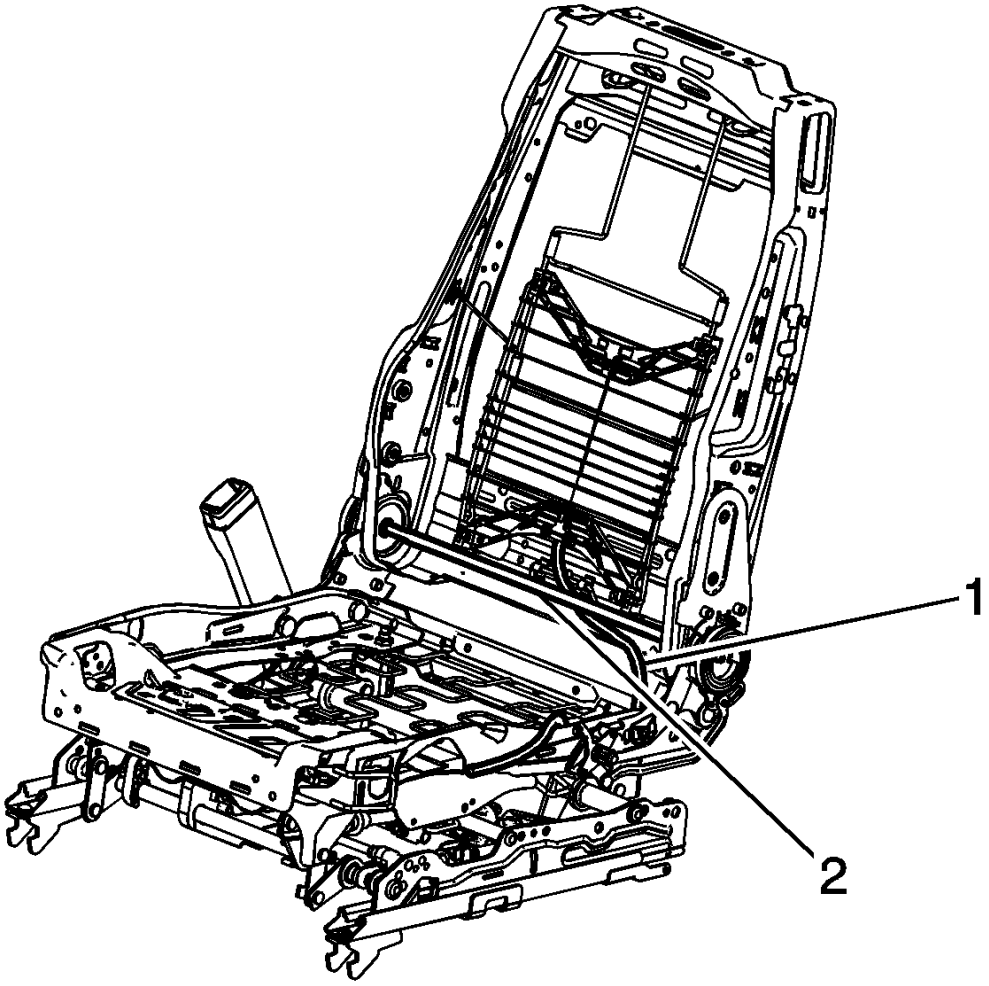

Fig. 24: Locating Lumbar Support Cable & Recliner Rod
Courtesy of GENERAL MOTORS COMPANY

6. Note the routing of the cable for installation purposes, the cable (1) must route between the recliner rod (2) and the seat back frame.

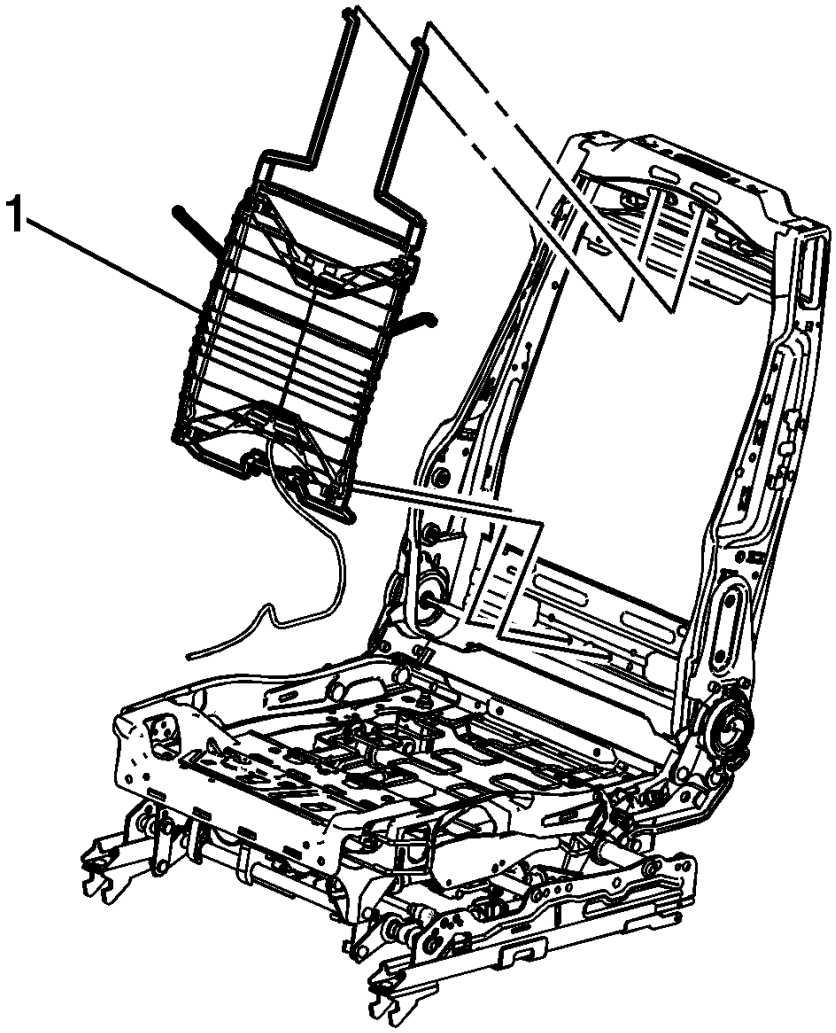

Fig. 25: View Of Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Remove the lumbar assembly (1) from the seat back frame by doing the following:
    - Disconnect the lumbar assembly (1) from each side of the seat back frame.
    - Pull the bottom of the lumbar assembly (1) forward to disengage the retainers from the seat back frame.
    - Slide the lumbar assembly (1) downward and forward to release from the seat back frame.

Installation Procedure

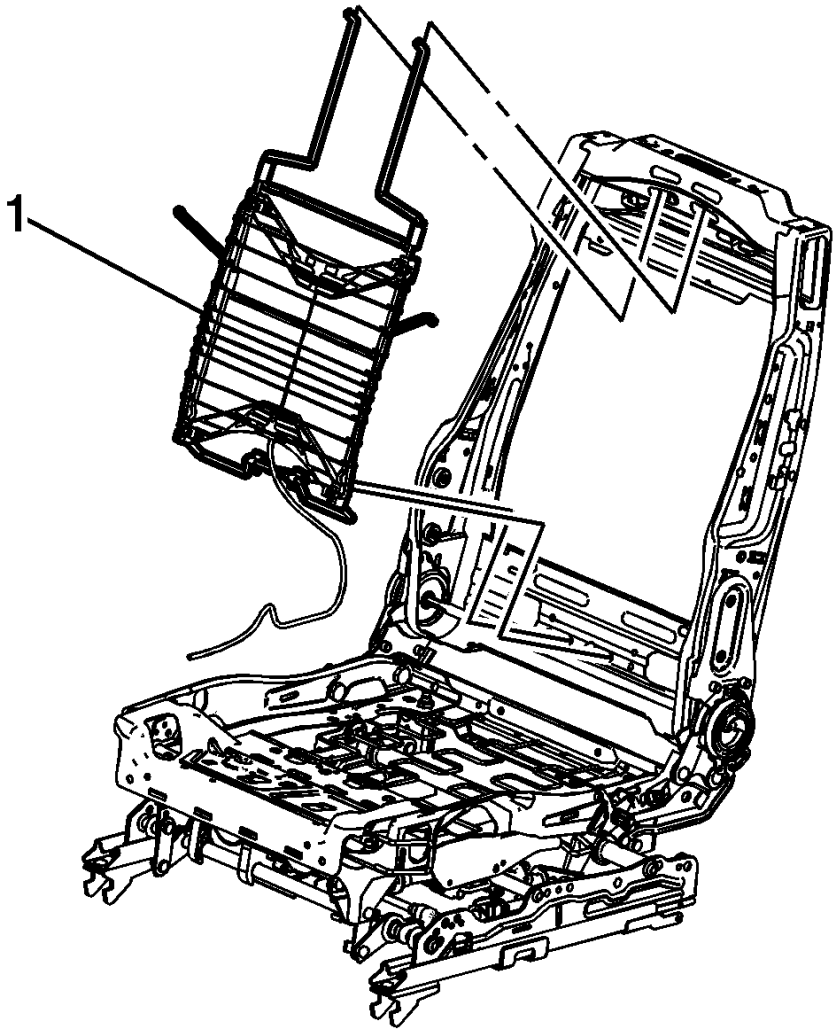

Fig. 26: View Of Lumbar Support Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the lumbar assembly (1) to the front seat back frame by doing the following:
    - Insert the top of the lumbar assembly (1) into the upper locations on the seat back frame.
    - Secure the lower portion of the lumbar assembly (1) by pushing the retainers firmly into the seat back frame.
    - Attach the sides of the lumbar assembly (1) to the sides of the seat back frame.

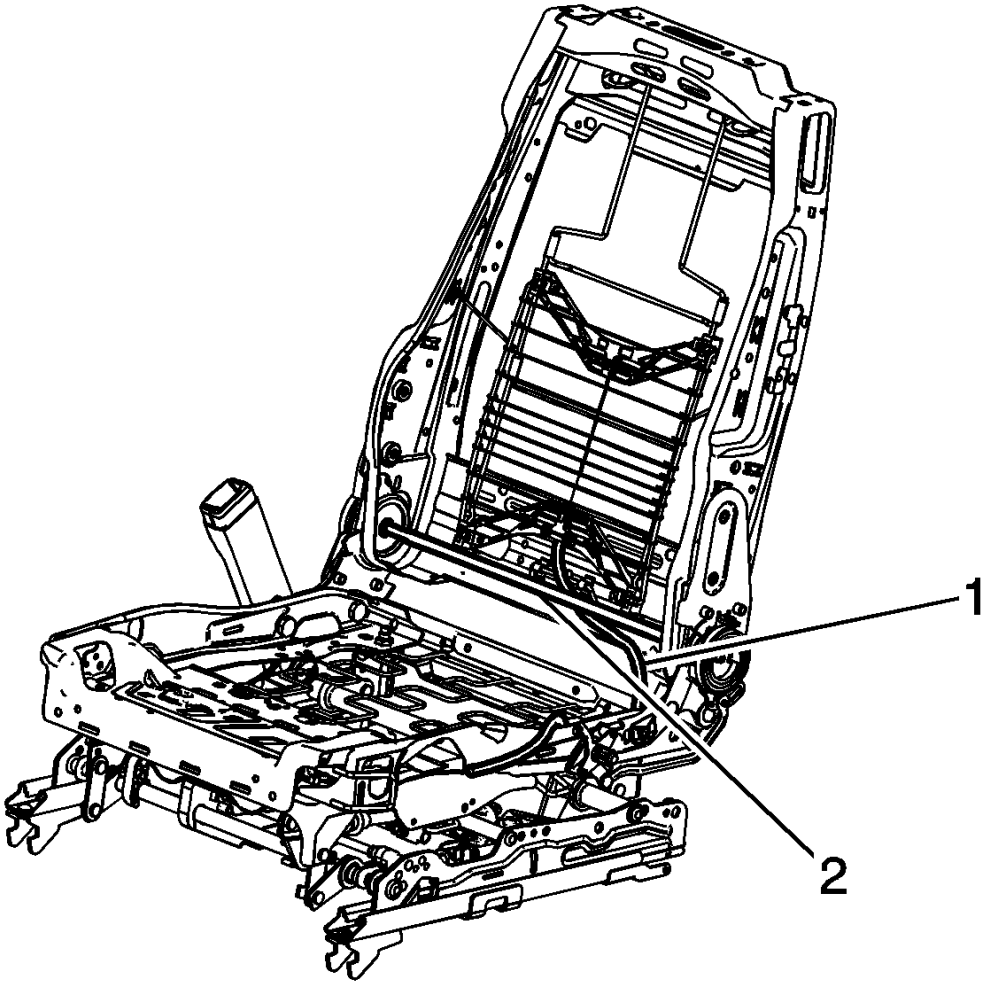

Fig. 27: Locating Lumbar Support Cable & Recliner Rod
Courtesy of GENERAL MOTORS COMPANY

2. Route the lumbar cable (1) between the front seat back frame and the recliner rod (2).

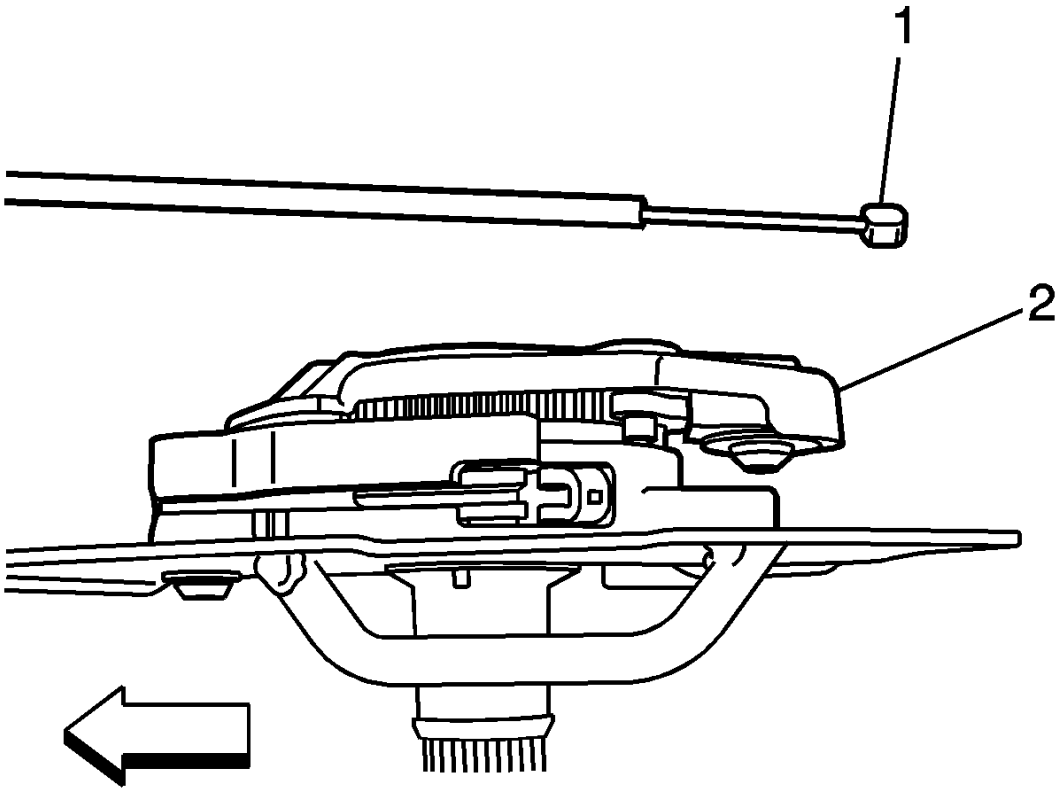

Fig. 28: Identifying Lumbar Cable & Lumbar Actuator
Courtesy of GENERAL MOTORS COMPANY

3. Connect the lumbar cable (1) to the lumbar actuator (2).

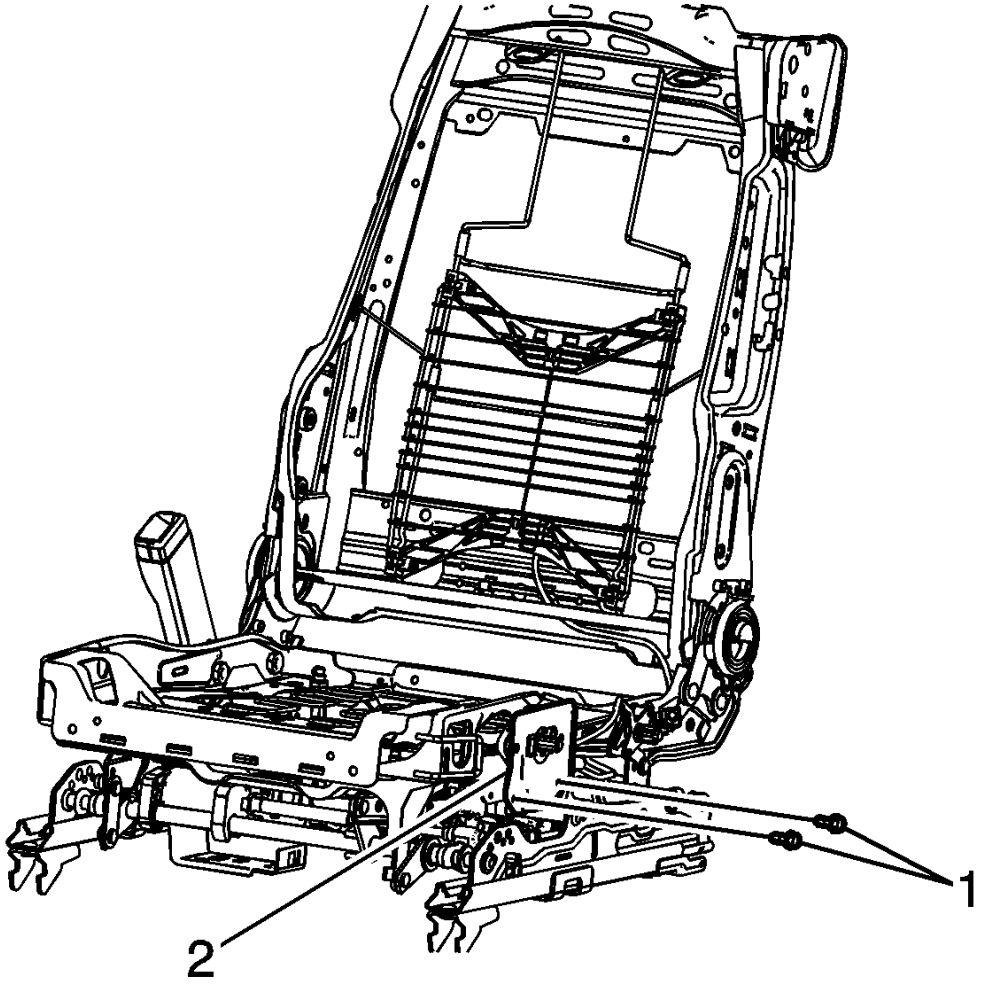

Fig. 29: Identifying Lumbar Support Actuator Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Position the lumbar actuator to the seat cushion frame and install the 2 screws that secure the lumbar actuator to the seat cushion frame.

   Tighten

   Tighten the bolts to 6 N.m (53 lb in).

5. Install the seat cushion cover and pad. Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)**.
6. Install the seat back cushion cover and pad. Refer to **Seat Back Cover and Pad Replacement (Impala Limited)**.
7. Install the front seat to the vehicle. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)**.

LUMBAR SUPPORT KNOB REPLACEMENT (IMPALA LIMITED)

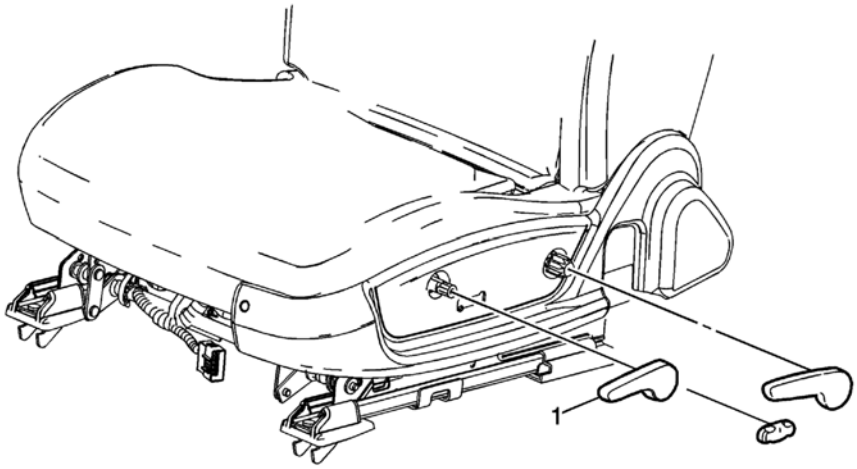

Fig. 30: Lumbar Support Knob (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Knob, Lumbar Actuator **TIP:** Pull outward to remove.

REAR SEAT ARMREST REPLACEMENT (IMPALA LIMITED W/AM9)

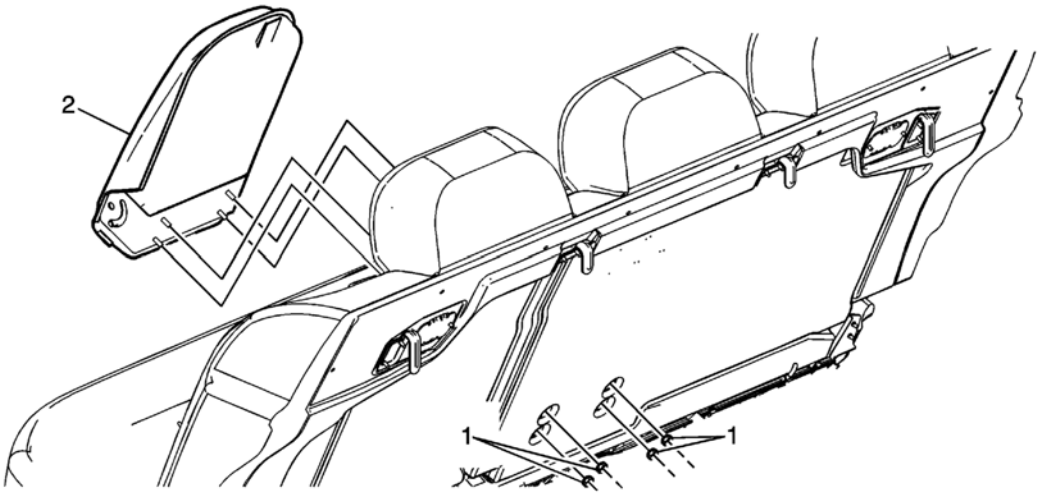

Fig. 31: Rear Seat Armrest (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Armrest Nut (Qty: 4) **CAUTION:** **Refer to** **Fastener** **Caution .**

Callout	Component Name
	Procedure 1. Fold the rear seat back cushion forward to gain access to the nuts. 2. Release J-Channel at bottom of seat-back Trim Cover and fold cover open to gain access to the nuts. **TIP:** Armrest is only serviced as an assembly. **Tighten** 3 N.m (25 lb in)
2	Rear Seat Armrest Assembly

REAR SEAT PULL STRAP REPLACEMENT

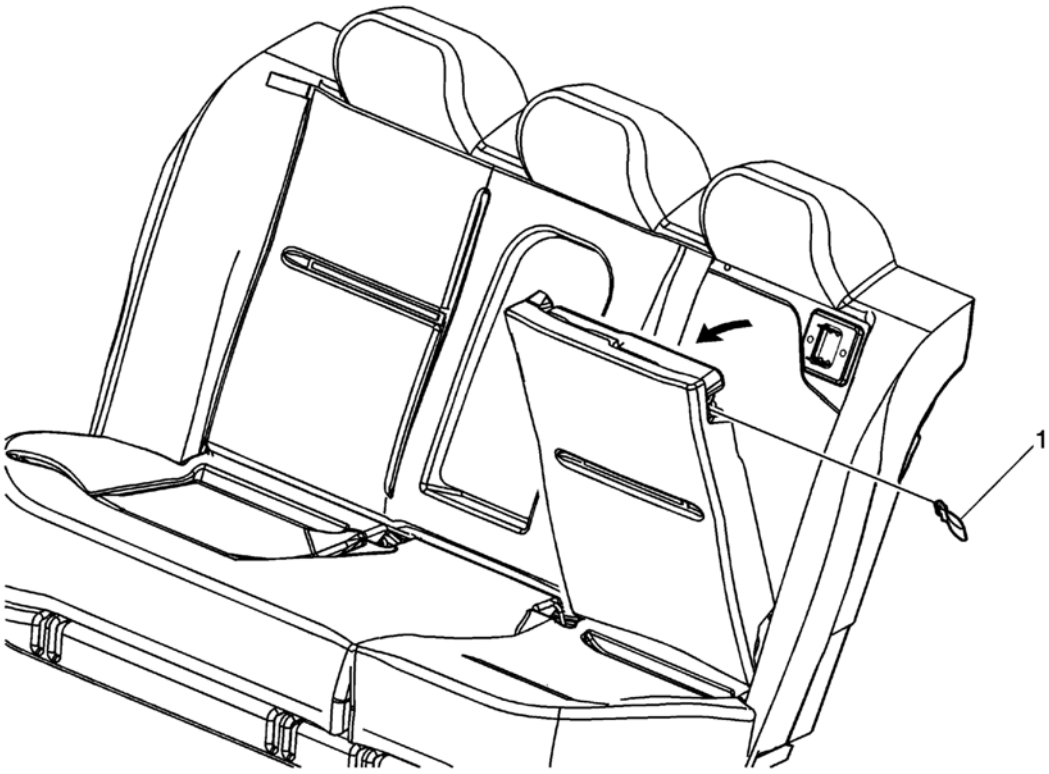

Fig. 32: Rear Seat Pull Strap
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Pull Strap **Procedure** Lay the seat back down before removing the pull strap from the latch.

REAR SEAT HINGE BRACKET REPLACEMENT (REAR SPLIT FOLDING)

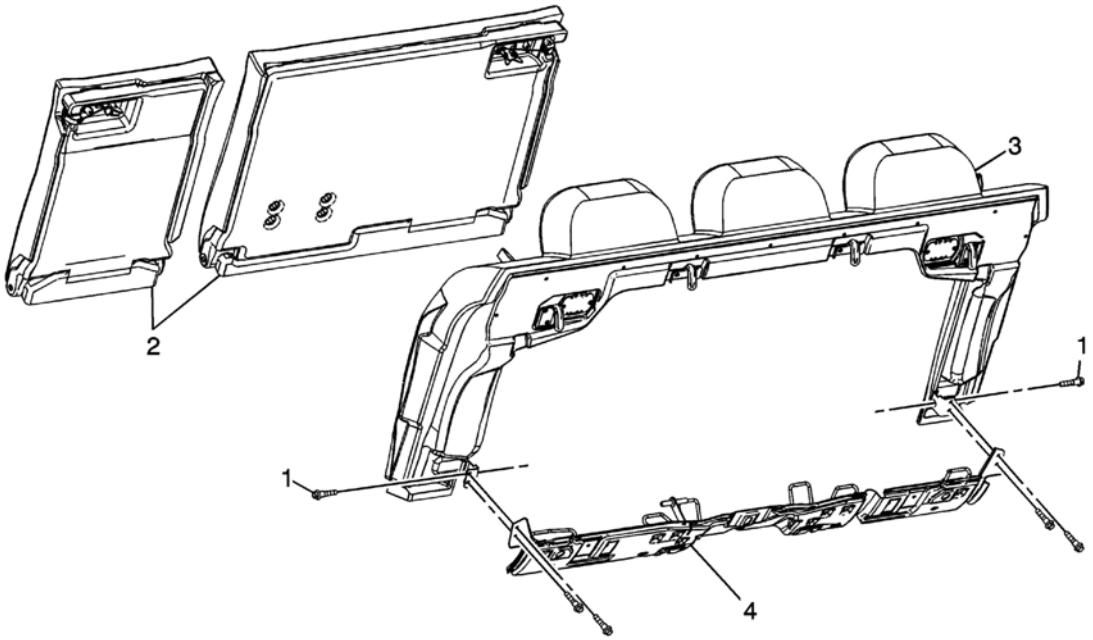

Fig. 33: Identifying Rear Seat Hinge Bracket (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Back Cushion Pivot Support Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 15 N.m (11 lb ft)
2	Rear Seat Back Cushion Assembly (Qty: 2) **TIP:** Tilt and slide outward to remove the rear seat back cushion assembly from the rear seat back hinge.
3	Rear Seat Back Hinge Bolt (Qty: 4) **Tighten** 15 N.m (11 lb ft)
4	Rear Seat Back Cushion Hinge Bracket

REAR SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA LIMITED)

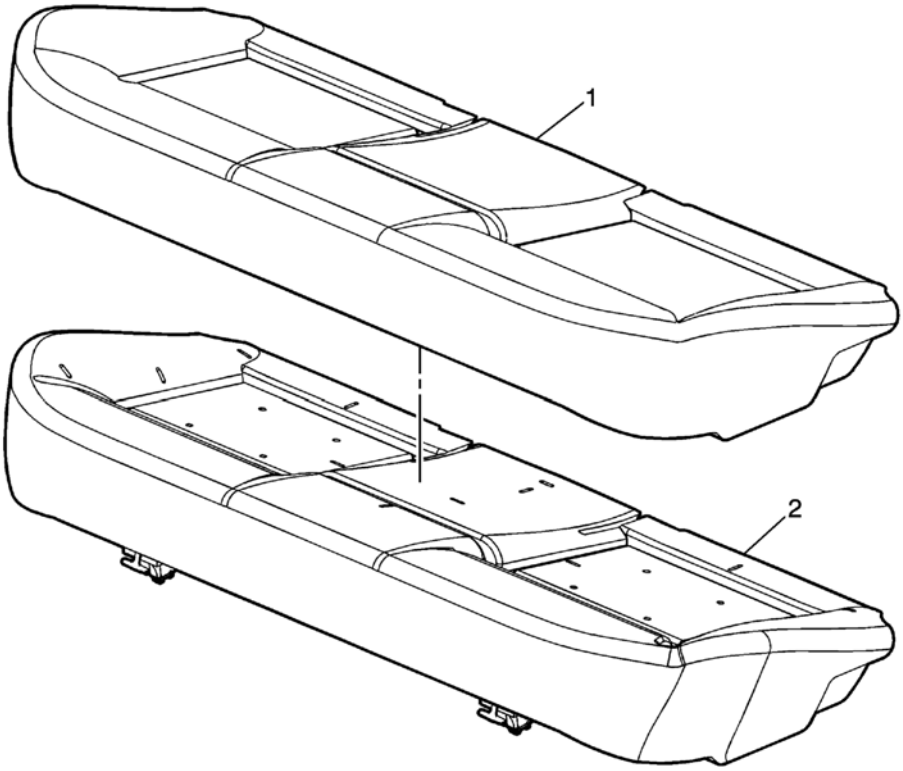

Fig. 34: Rear Seat Cushion Cover And Pad (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Cushion Cover **TIP:** The cushion cover and pad are serviced as an assembly.
2	Rear Seat Cushion Pad

REAR SEAT CUSHION COVER AND PAD REPLACEMENT (IMPALA LIMITED W/AM9)

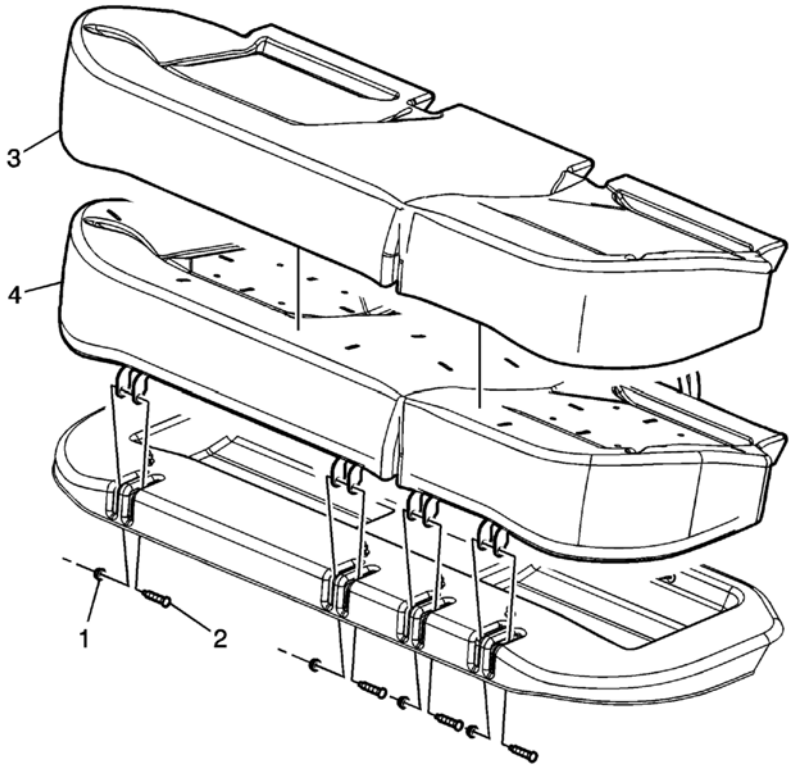

Fig. 35: Rear Seat Cushion Cover and Pad (Impala Limited w/AM9)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Cushion Compartment Tray Nut (Qty 4) **Procedure** With the seat assembly on bench (up-side down), remove the nuts on the underside of the compartment tray at the cushion hinge locations.
2	Rear Seat Cushion Compartment Tray Hinge Pin (Qty 4) **Procedure** Gently tap the hinge pins outward until the cushion assembly is free of the stowage compartment.
3	Rear Seat Cushion Cover
4	Rear Seat Cushion Pad **TIP:** The cushion cover and pad are serviced as an assembly.

REAR SEAT CUSHION FLOOR STOWAGE COMPARTMENT REPLACEMENT (IMPALA LIMITED W/AM9)

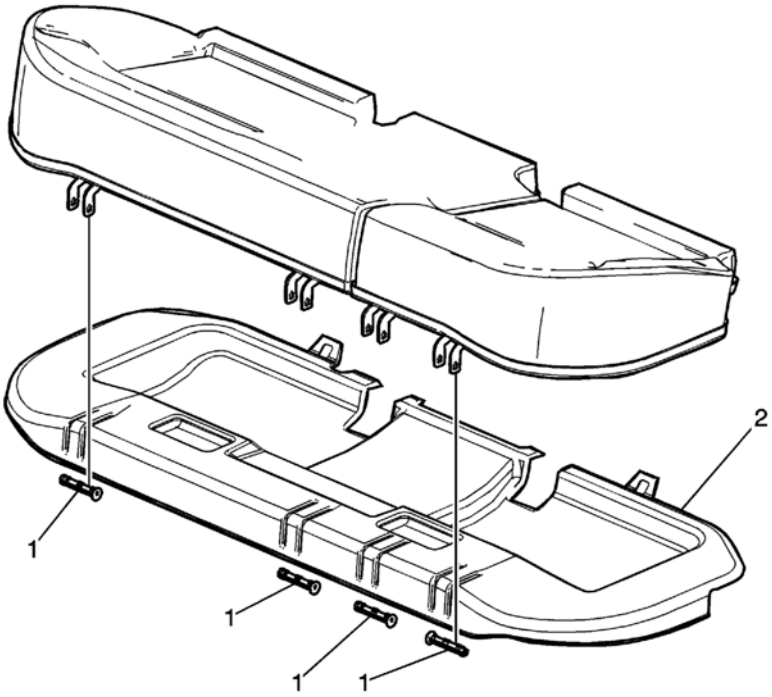

Fig. 36: Rear Seat Cushion Floor Stowage Compartment (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)** 2. Remove the rear seat cushion cover and pad. Refer to **Rear Seat Cushion Cover and Pad Replacement (Impala Limited)Rear Seat Cushion Cover and Pad Replacement (Impala Limited w/AM9)**	
1	Rear Seat Cushion Hinge Pin (Qty: 4)
2	Rear Seat Cushion Floor Stowage Compartment **TIP:** Floor stowage compartment is only serviced as an assembly.

REAR SEAT CUSHION REMOVAL AND INSTALLATION (IMPALA LIMITED)

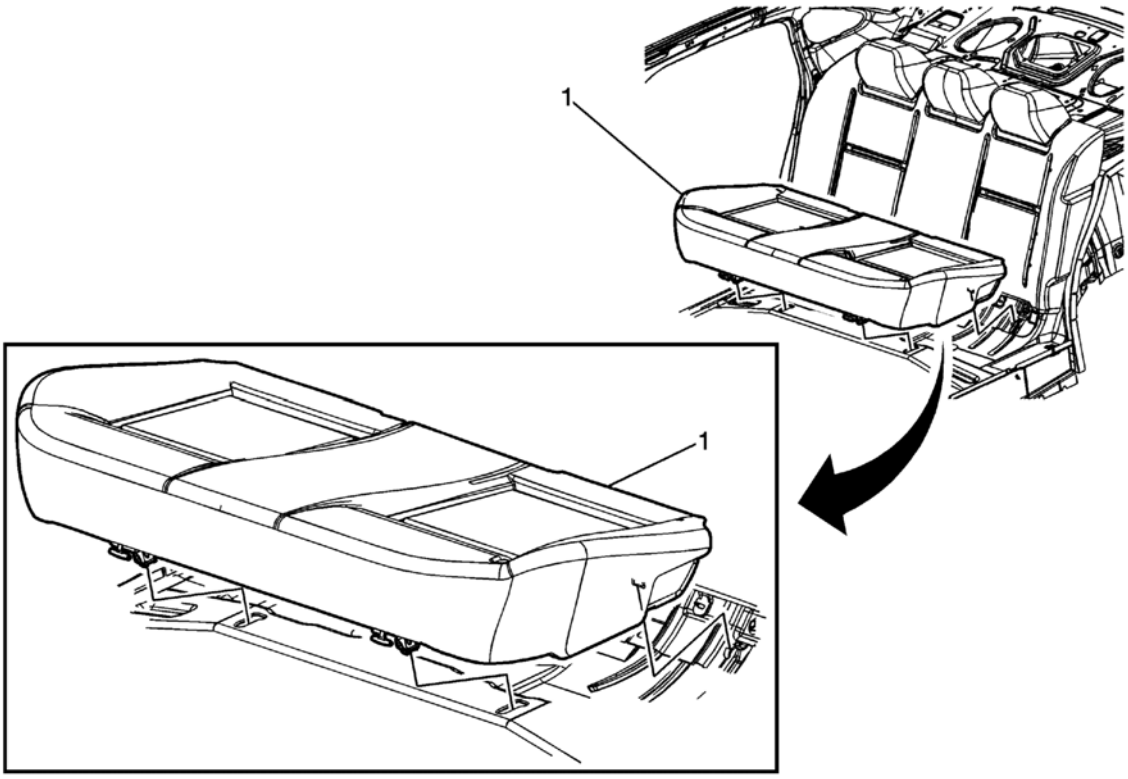

Fig. 37: Identifying Rear Seat Cushion (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Cushion Assembly **Procedure** 1. Reach under the seat cushion and locate both the left and the right "T" handles. 2. Press down on the seat and pull the handles to release the seat retainer. 3. Remove the seat cushion by lifting the cushion up and pulling the cushion outward from the seat back. **TIP:** The handles are hidden from view by the floor stowage compartment for the flip folding seat.

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (IMPALA LIMITED)

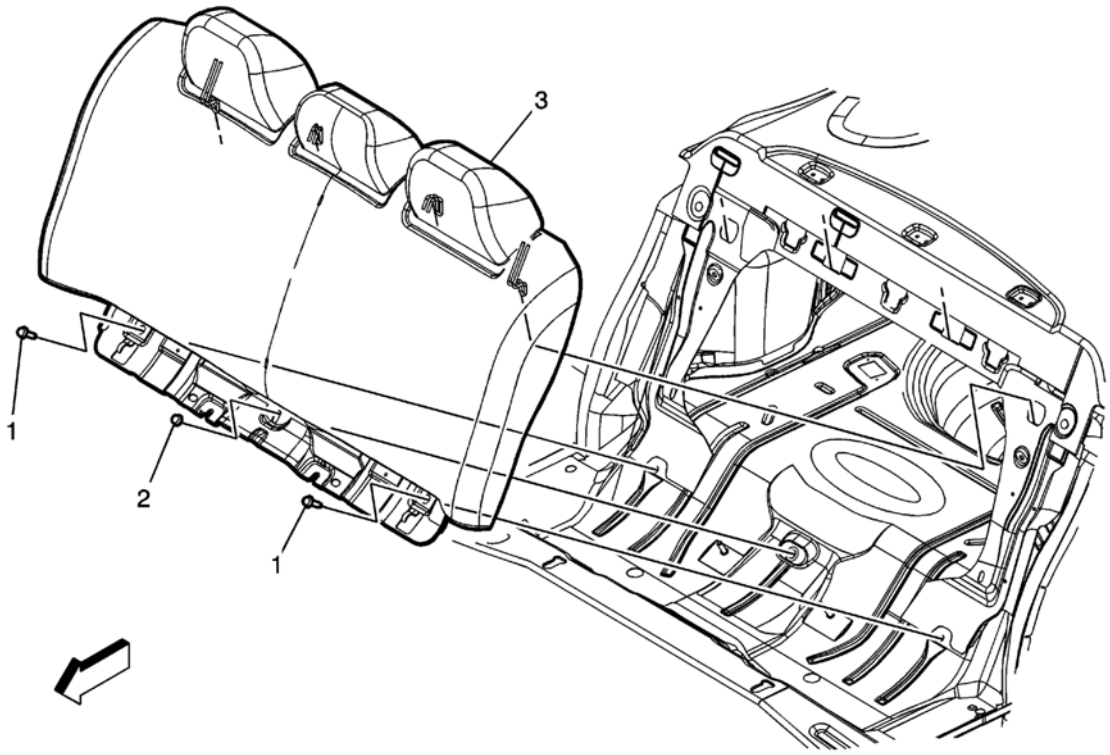

Fig. 38: Rear Seat Back (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the seat belt buckles. Refer to **Rear Seat Buckle Side Belt Replacement (Impala Limited without AM9)** **Rear Seat Buckle Side Belt Replacement (Impala Limited with AM9)** . 2. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Back Cushion Bolts (Qty: 3) **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 45 N.m (33 lb ft)
2	Rear Seat Back Cushion Nut **Tighten** 45 N.m (33 lb ft)
3	Rear Seat Back Cushion • Lift upward to clear the retaining hooks on the seat back to remove.

Callout	Component Name
	• The removal and installation for the standard and the split bench seat are the same.

REAR SEAT BACK CUSHION OPENING TRIM COVER AND OUTER COVER PAD REPLACEMENT (REAR SPLIT FOLDING)

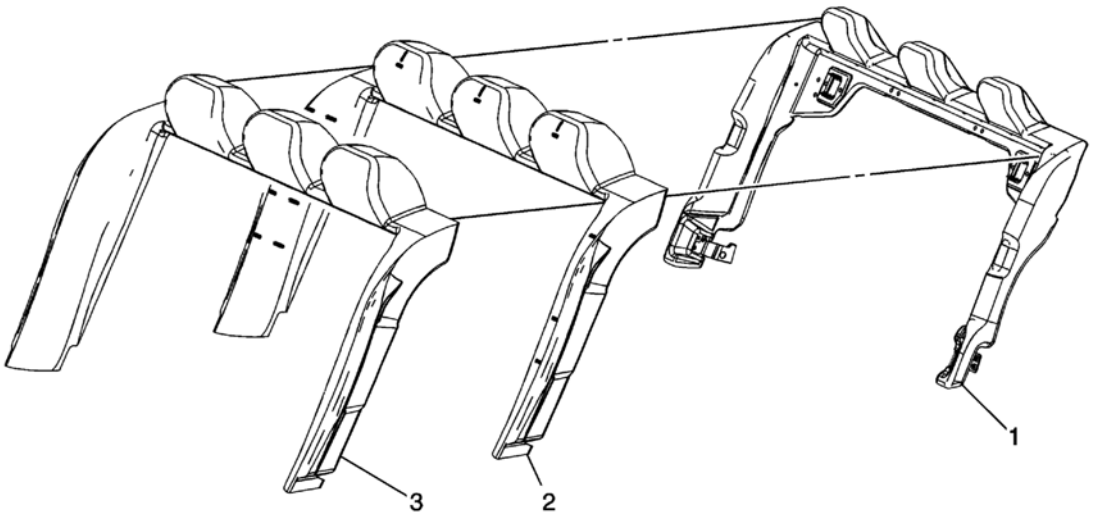

Fig. 39: Rear Seat Back Cushion Opening Trim Cover and Outer Cover Pad (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Back Cushion Opening Panel Refer to **Rear Seat Back Cushion Opening Panel Replacement**.
2	Rear Seat Back Cushion Opening Trim Cover
3	Rear Seat Back Cushion Outer Cover Pad

REAR SEAT BACK CUSHION PANEL REPLACEMENT (REAR SPLIT FOLDING)

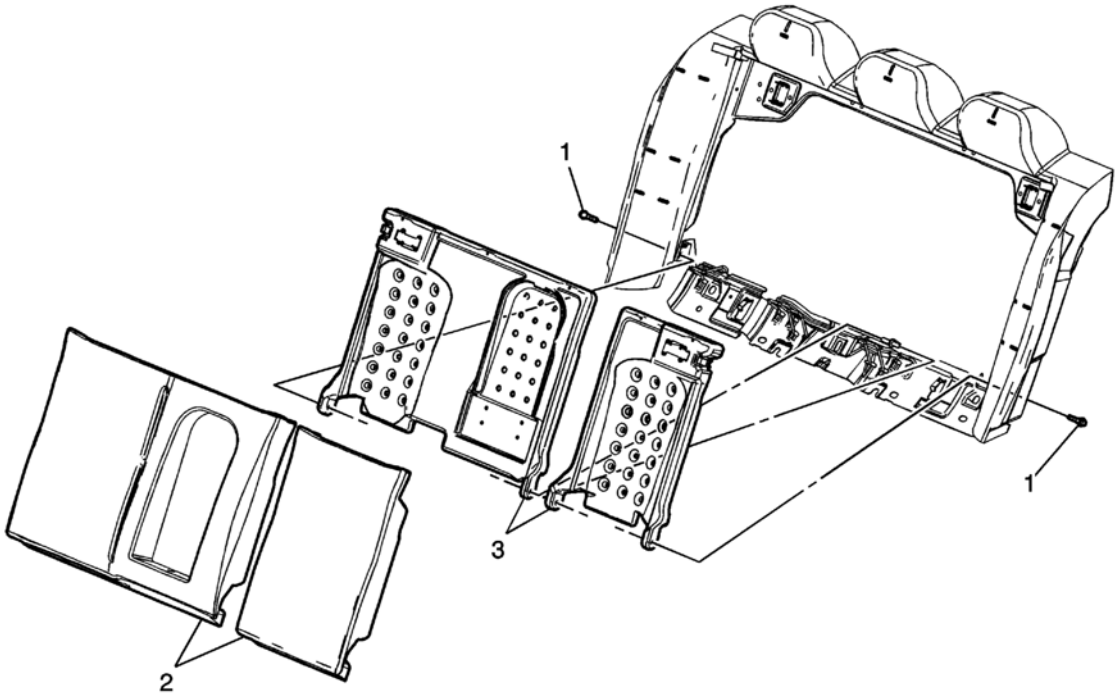

Fig. 40: Identifying Rear Seat Back Cushion Panel (Rear Split Folding)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)**. 2. Remove the rear seat armrest. Refer to **Rear Seat Armrest Replacement (Impala Limited w/AM9)**.	
1	Rear Seat Back Cushion Pivot Support Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 15 N.m (11 lb ft)
2	Rear Seat Back Cushion Cover **TIP:** Remove the seat back cover by disengaging the retainers securing the cover to the seat back cushion panel.
3	Rear Seat Back Cushion Panel

REAR SEAT BACK CUSHION OPENING PANEL REPLACEMENT

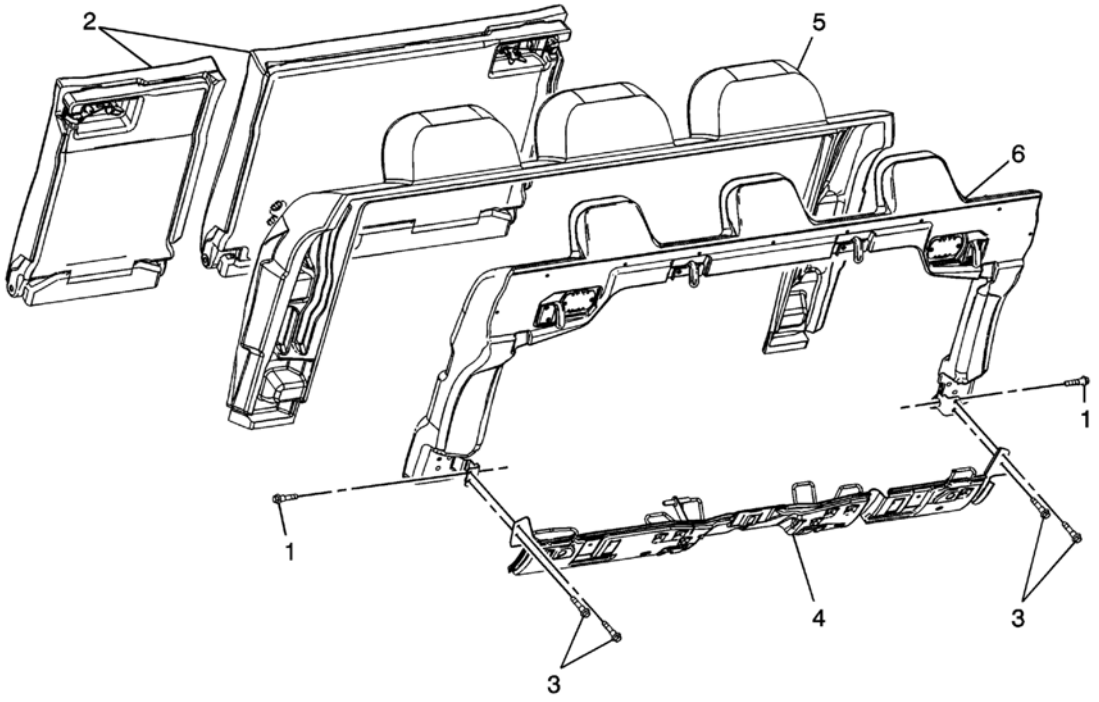

Fig. 41: Rear Seat Back Cushion Opening Panel & Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)**.	
1	Rear Seat Back Cushion Pivot Support Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 15 N.m (11 lb ft)
2	Rear Seat Back Cushion Assembly (Qty: 2) **TIP:** Tilt and slide outward to remove the rear seat back cushion assembly from the rear seat back hinge.
3	Rear Seat Back Hinge Bolt (Qty: 4) **Tighten** 15 N.m (11 lb ft)
4	Rear Seat Back Cushion Hinge Bracket
5	Rear Seat Back Cushion Opening Trim Cover and Pad
6	Rear Seat Back Cushion Opening Panel

REAR SPLIT FOLDING SEAT BACK CUSHION COVER AND PAD REPLACEMENT

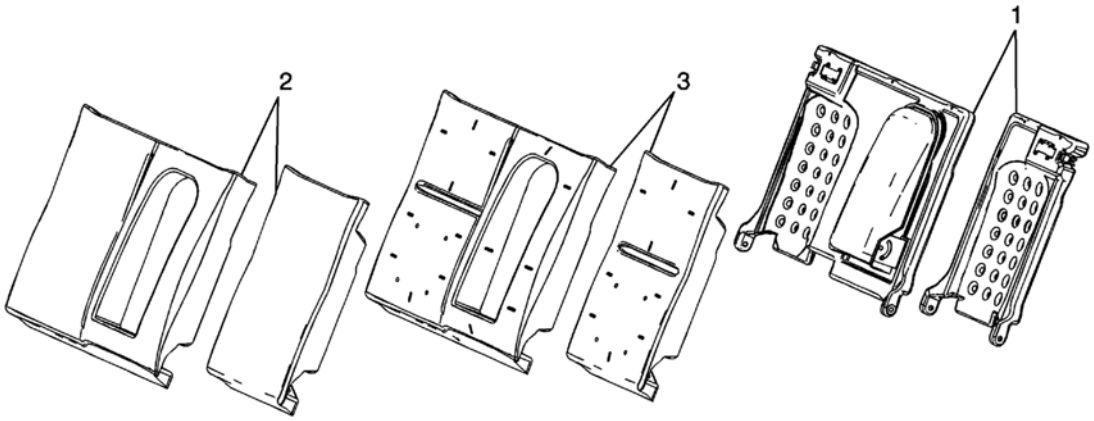

Fig. 42: Identifying Rear Split Folding Seat Back Cover & Pad
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Seat Back Cushion Panel Refer to **Rear Seat Back Cushion Panel Replacement (Rear Split Folding)**.
2	Rear Seat Back Cushion Cover (Qty: 2) **TIP:** Remove the seat back cover by disengaging the retainers securing the cover to the seat back cushion panel.
3	Rear Seat Back Cushion Pad (Qty: 2)

REAR SEAT BACK CUSHION COVER AND PAD REPLACEMENT (IMPALA LIMITED)

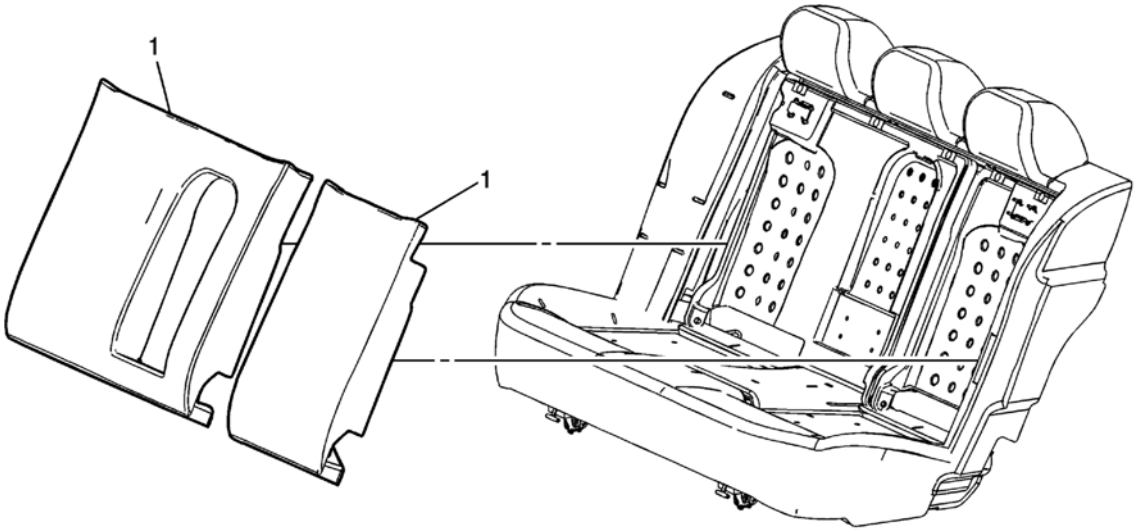

Fig. 43: Rear Seat Back Cover and Pad (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedures** 1. Remove the rear seat cushion. Refer to **Rear Seat Cushion Removal and Installation (Impala Limited)**. 2. Remove the rear seat back cushion. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)**. 3. Remove the rear seat center shoulder belt assemblies. Refer to **Rear Seat Buckle Side Belt Replacement (Impala Limited without AM9)** **Rear Seat Buckle Side Belt Replacement (Impala Limited with AM9)** . 4. Remove the rear seat armrest. Refer to **Rear Seat Armrest Replacement (Impala Limited w/AM9)**.	
1	Cover, Rear Seat Back Cushion 1. Fold the rear seat back cushion panels forward enough to gain access to the retainers for the seat back cushion cover. 2. Remove the rear seat back cushion cover and pad from the rear seat back panels. 3. The seat back cushion cover and pad are serviced as an assembly.

General Information

Squeaks and Rattles - Impala

DIAGNOSTIC INFORMATION AND PROCEDURES

SQUEAKS AND RATTLES

Special Tools

- **CH-39570** Chassis Ear
- **GE-41416** Ultrasonic Leak Detector

For equivalent regional tools, refer to **Special Tools**.

NOTE: **Squeaks and rattles are caused by improperly controlled relative motion between vehicle components. There are 4 ways to prevent squeaks and rattles.**

To aid in diagnosing, use CH-39570 ear or GE-41416 detector.

- Attach the component that squeaks or rattles securely.
- Separate the components that squeak or rattle to prevent contact.
- Insulate the components that squeak or rattle.
- Insulate low uniform friction surfaces to eliminate stickslip motion.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - ROOF

NOTE: **Complete the following procedures before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** in order to verify that all of the following conditions are true:
   - No DTCs are set.
   - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to learn the system functions. Refer to **Sunroof Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power sunroof system. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components for obvious damage or for conditions which can cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Sunroof Malfunction**
- **Retained Accessory Power Description and Operation** , if the power sunroof should operate longer than the retained accessory power (RAP) time-out.

POWER SUNROOF MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	-	-
Ignition	1	1	-	-
Sunroof Switch Close Signal	1	3	1	-
Sunroof Switch Open Signal	1	2	1	-
Sunroof Switch Low Reference	-	1	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Sunroof Control Module Ground	-	1	-	-
1. Power sunroof malfunction 2. Power sunroof does not open 3. Power sunroof does not close				

Circuit/System Description

Ignition voltage is supplied to the sunroof control module by the RAP fuse. B+ is applied to the sunroof motor via the S/ROOF fuse. The sunroof control module supplies each of the sunroof switch signal circuits with a 12-volt reference. When a switch is pressed the signal circuit is pulled low signaling the sunroof open or close request. The sunroof control module determines the motor direction based on inputs received from the sunroof switch. When the motor reverses the polarity of the applied voltage, the motor reverses direction.

Description and Operation

Sunroof Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. With the sunroof in the closed position, press the sunroof open switch. The sunroof should open.
2. With the sunroof in the open position, press the sunroof close switch. The sunroof should close.

Circuit/System Testing

IMPORTANT: Because of the accessibility of the sunroof switch, perform the sunroof switch component test before beginning the Circuit/System Testing.

1. Ignition OFF, disconnect the harness connector at the sunroof control module.
2. Test for less than 5.0 ohm between the ground circuit terminal 1 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.

3. Verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the sunroof control module.
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 3 and ground.
    - If the test lamp does not illuminate, test the ignition circuit for an open/high resistance. If the circuit tests normal, refer to **Retained Accessory Power Malfunction** .
5. Ignition OFF, connect the harness connector at the sunroof control module.
6. Disconnect the harness connector at the sunroof switch.
7. Test for less than 5.0 ohm between the low reference circuit terminal C and ground.
    - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the sunroof control module.

Apply ground to the module for no longer than 2 seconds at a time or the module could be damaged.

IMPORTANT: When performing the following tests, make sure that the sunroof is not at its end of travel position by switching the grounded jumper to the other signal circuit if the sunroof did not move in one direction.

8. Ignition ON, momentarily install a 10-amp fused jumper wire between the signal circuit terminal D and ground. The sunroof should move.
    - If the sunroof does not move, test the signal circuit for a short to ground, short to voltage or an open/high resistance. If the circuit test is normal, replace the sunroof control module.
9. Momentarily install a 10-amp fused jumper wire between the signal circuit terminal E and ground. The sunroof should move.
    - If the sunroof does not move, test the signal circuit for a short to ground, short to voltage or an open/high resistance. If the circuit test is normal, replace the sunroof control module.
10. If all circuits test normal, test or replace the sunroof switch.

Component Testing

1. With the ignition OFF, disconnect the harness connector at the sunroof switch.
2. Test for infinite resistance between the switch terminals listed below and the low reference terminal C with the switch in the neutral position.
    - Roof open terminal D
    - Roof close terminal E
    - If not the specified value, replace the sunroof switch.

IMPORTANT: If the switch tests open in any switch position other than Off, test the sunroof switch signal circuits for a short to voltage before replacing the switch.

3. Test for less than 5.0 ohm of resistance between the switch terminals listed below the low reference terminal C with the switch in the appropriate position.

- Roof open terminal D
- Roof close terminal E
- If greater than the specified range, replace the sunroof switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Sunroof Switch Replacement (Impala Limited)**
- **Control Module References** for sunroof motor/actuator replacement, setup, and programming

POWER SUNROOF DOES NOT CLOSE

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle or any time an existing sunroof motor actuator is removed from the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

POWER SUNROOF WINDOW IS SKEWED

Parallel positioning of the window track guides or lift mechanism and cable is crucial to the proper function of the system. If the guides are misaligned, refer to **Sunroof Track Timing/Synchronization (Impala Limited)**.

POWER SUNROOF WHEN OPERATED FROM VENT TO CLOSE ONE SIDE WILL DROP BEFORE THE OTHER

Parallel positioning of the window track guides or lift mechanism and cable is crucial to the proper function of the system. If the guides are misaligned, refer to **Sunroof Track Timing/Synchronization (Impala Limited)**.

POWER SUNROOF WHEN CLOSING FROM THE VENT POSITION THE WINDOW WILL REVERSE DIRECTION

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle or any time an existing sunroof motor actuator is removed from the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

POWER SUNROOF WILL STOP AT THE WRONG LOCATION

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle or any time an existing sunroof motor actuator is removed from the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

POWER SUNROOF WILL OVER TRAVEL THE OPEN POSITION AND STALL THE MOTOR

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle or any time an existing sunroof motor actuator is removed from the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

POWER SUNROOF WILL OVER TRAVEL THE CLOSE POSITION AND STALL THE MOTOR

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle or any

time an existing sunroof motor actuator is removed from the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

REPAIR INSTRUCTIONS

SUNROOF AIR DEFLECTOR REPLACEMENT (IMPALA LIMITED)

Removal Procedure

1. Remove the sunroof window. Refer to **Sunroof Window Replacement**.
2. Power sunroof tracks to the fully rear position.

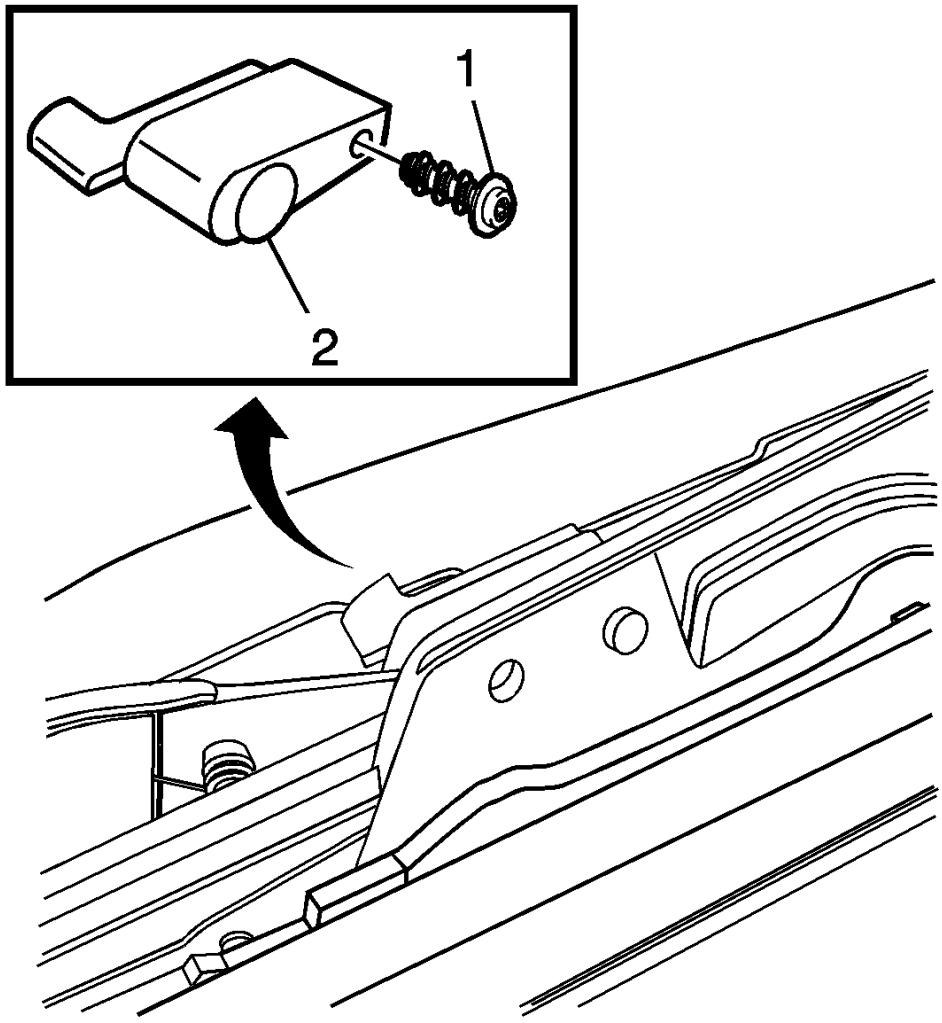

Fig. 2: Actuator Blocks
Courtesy of GENERAL MOTORS COMPANY

3. Remove the screw (1) from the actuator (2) located at the front of each window track.

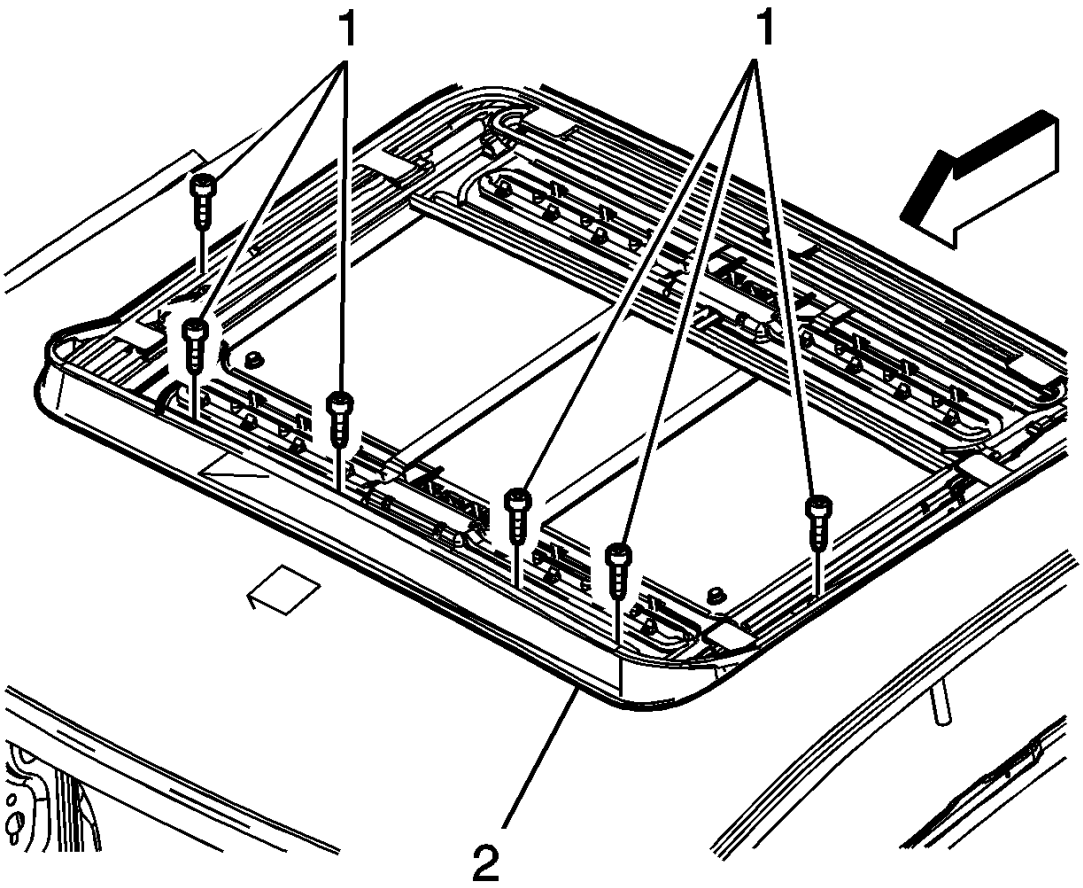

Fig. 3: View Of Screws In Sunroof Air Deflector
Courtesy of GENERAL MOTORS COMPANY

4. Remove the screws (1) from the sunroof air deflector.
5. Remove the sunroof air deflector from the sunroof module (2).

   Slide the air deflector rearward until it releases from the module.

Installation Procedure

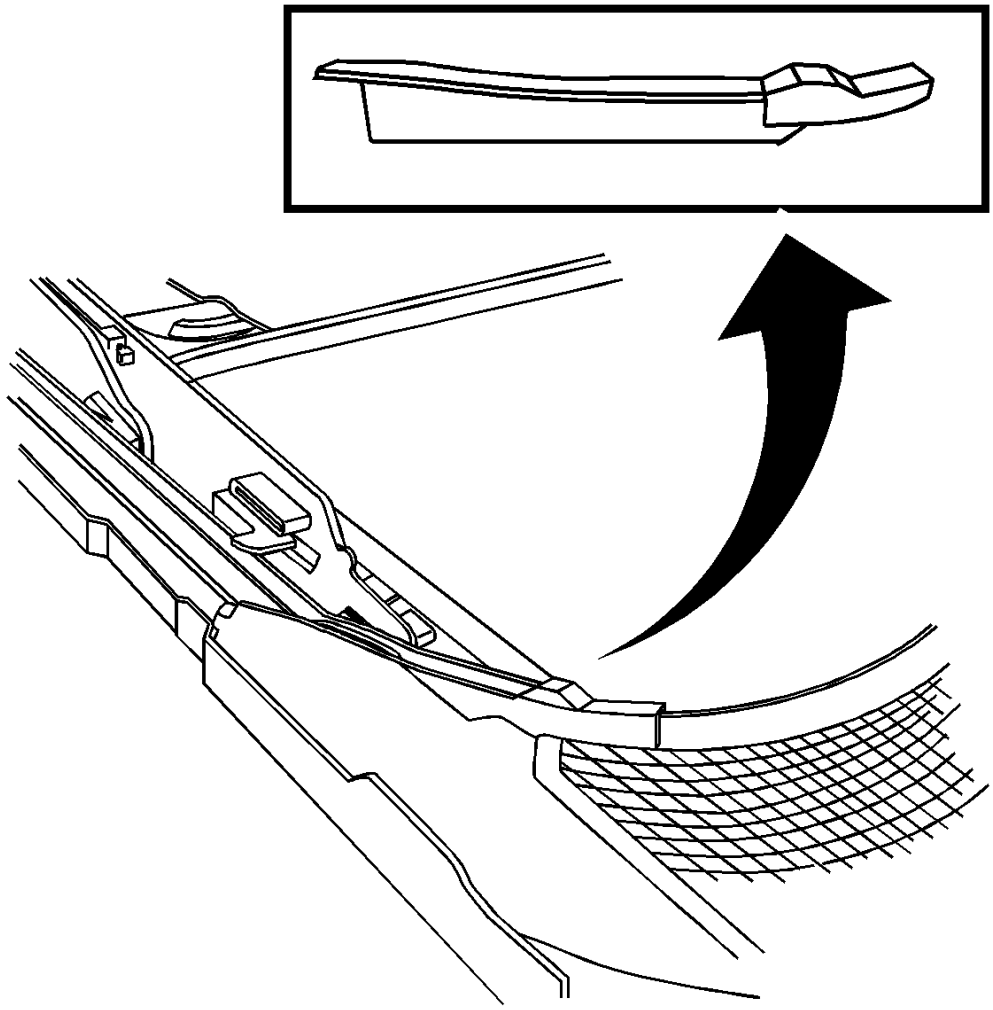

Fig. 4: Wear Plate
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Transfer the air deflector guides to the new air deflector. The air deflector guides can be replaced separately if damaged.**

1. Install the guides to the air deflector.

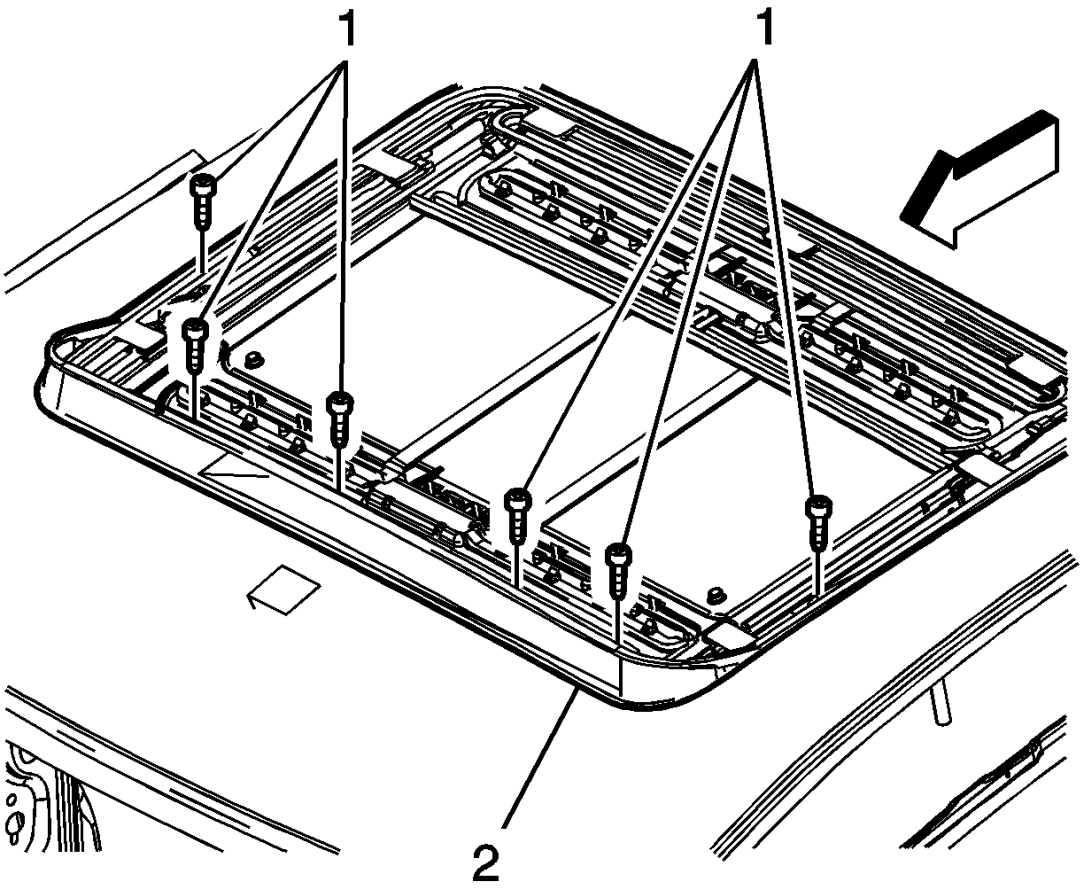

Fig. 5: View Of Screws In Sunroof Air Deflector
Courtesy of GENERAL MOTORS COMPANY

2. Position the sunroof air deflector to the sunroof module.

CAUTION: Refer to Fastener Caution .

3. Install the screws (1) attaching the sunroof air deflector to the sunroof module (2).

Tighten

Tighten the screws to 3 N.m (26 lb in).

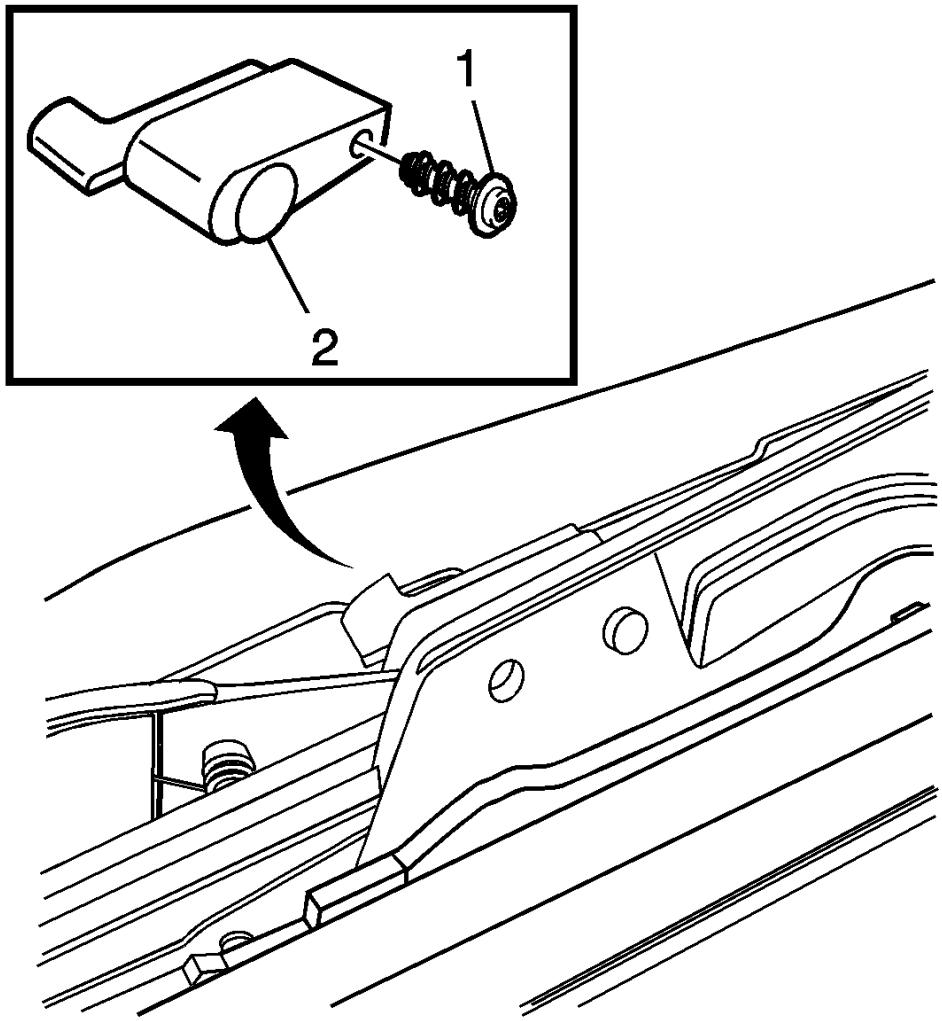

Fig. 6: Actuator Blocks
Courtesy of GENERAL MOTORS COMPANY

4. Install the screw (1) to the actuator (2) located at the front of each window track.

   Tighten

   Tighten the screws to 2 N.m (18 lb in).

5. Power the sunroof window tracks to the close position.
6. Install sunroof window. Refer to **Sunroof Window Replacement**.
7. Verify that the spring action of the sunroof air deflector is operating.
8. Close the sunroof window.

SUNROOF DRAIN INSPECTION AND CLEANING

Drain Hose Routing

NOTE: **If the headliner is wet DO NOT remove any interior trim. Do the Plugged Drain Hose test first.**

A drain trough encircles the sunroof window panel and water is drained off by the drain hoses located at each corner of the housing. A drain channel spans across the sunroof module at the rear of the window panel and directs water into the trough.

1. The front drain hoses are routed down the windshield pillars and out the center of the pillar between the door hinges. The front hoses are installed in a rubber grommet and retained by clips.
2. The rear drain hoses are routed through the rear pillars and out of the rocker panel. In some vehicle the drain hoses are routed out through the metal roof slots and routed to the lower wheelhouse to drain out of the vehicle. The rear hoses are installed in a rubber grommet and retained by clips.

Plugged Drain Hose

If a waterleak has occurred check for a plugged drain hose at each corner of drainage system.

1. Open the sunroof window.
2. To test for blockage, pour a small container of water into the module housing drain trough. Check each corner to confirm the drain hose is draining water.

WARNING: Wear safety glasses in order to avoid eye damage.

3. Use compressed air, 241 kPa (35 psi) or less to blow out any drain hose that is plugged.
4. Test the system again.
5. If the hose remains plugged, check to see it is properly routed and does not have a kink. Refer to **Sunroof Housing Front Drain Hose Replacement**, or **Sunroof Housing Rear Drain Hose Replacement**.
6. Remove the blockage using the following steps.
    1. Push mechanics wire through the hose to remove the obstruction.
    2. Use compressed air in order to blow out any remaining material.

Disconnected Drain Hose

Inspect the drainage system for disconnected drain hoses. Complete the following steps in order to obtain partial access to drain hoses and check for a disconnected hose.

1. Open the sunroof window panel.
2. Lower the headliner as needed. Refer to **Headlining Trim Panel Replacement** .
3. Connect any disconnected hoses.
4. Ensure that the rear drain hoses are properly routed in the metal roof slot and taped in place.

SUNROOF FRAME REPLACEMENT

Removal Procedure

NOTE: A new sunroof frame assembly will not have the sunroof window or the sunshade as components of the new service part.

1. The old sunroof window and sunshade will need to be installed to the new sunroof frame assembly.

   Remove the sunroof window. Refer to **Sunroof Window Replacement**.

2. Remove the sunshade panel. Refer to **Sunroof Sunshade Replacement (CF5)**.
3. Remove the air deflector. Refer to **Sunroof Air Deflector Replacement (Impala Limited)**.

NOTE: **It is only necessary to lower the headliner. Only do the steps in headliner replacement that will lower the headliner enough to gain access.**

4. Lower the headliner. Refer to **Headlining Trim Panel Replacement** .
5. Disconnect the electrical connector on the sunroof actuator.
6. Remove the sunroof motor/actuator. Refer to **Sunroof Motor/Actuator Replacement**.
7. Cut the tie straps securing the electrical harness to the sunroof cable rear drive tube.

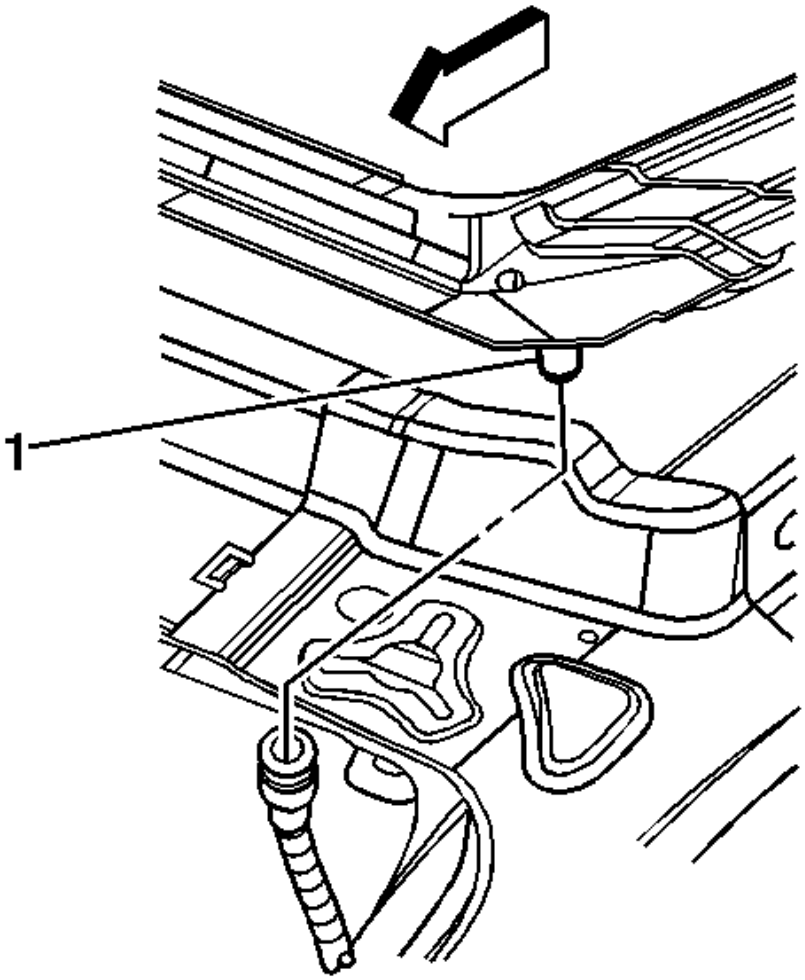

Fig. 7: Identifying Drain Spout
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the drain hoses from the front sunroof frame drain spouts (1).

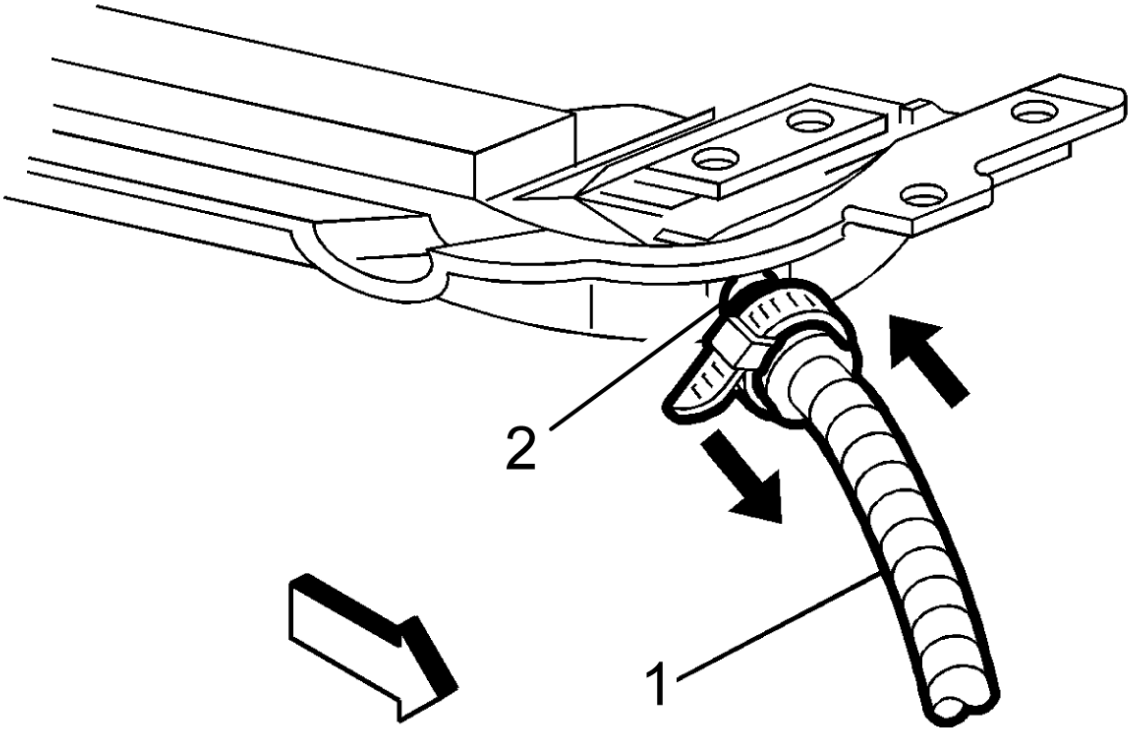

Fig. 8: Identifying Drain Hose At Drain Spout On Rear Of The Sunroof Module
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the drain hoses (1) from the rear sunroof frame drain spouts (2).

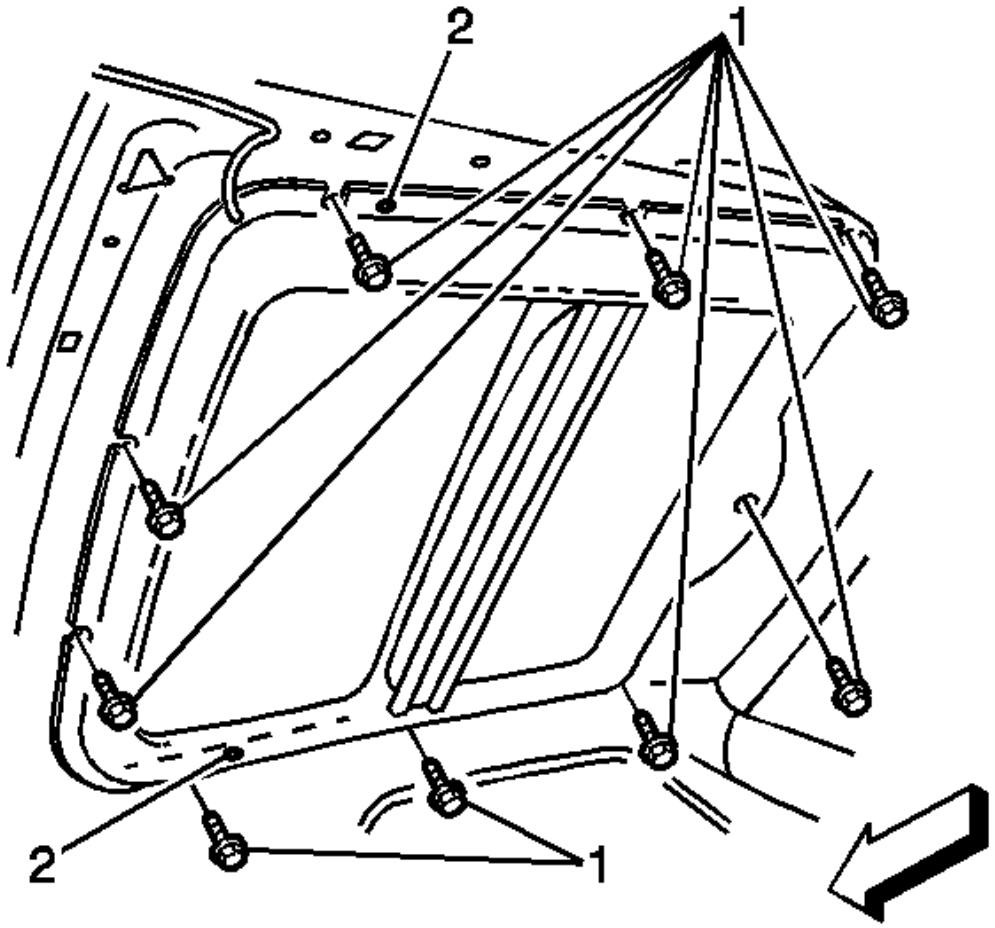

Fig. 9: Locating Sunroof Module-To-Roof Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the sunroof bolts (1) from the sunroof frame.
11. Remove the 2 center bolts (1) last in order to help support the sunroof frame to the roof ring.
12. With the aid of an assistant, lower the sunroof frame assembly from the alignment pins (2) and remove frame assembly out the passenger side door.

Installation Procedure

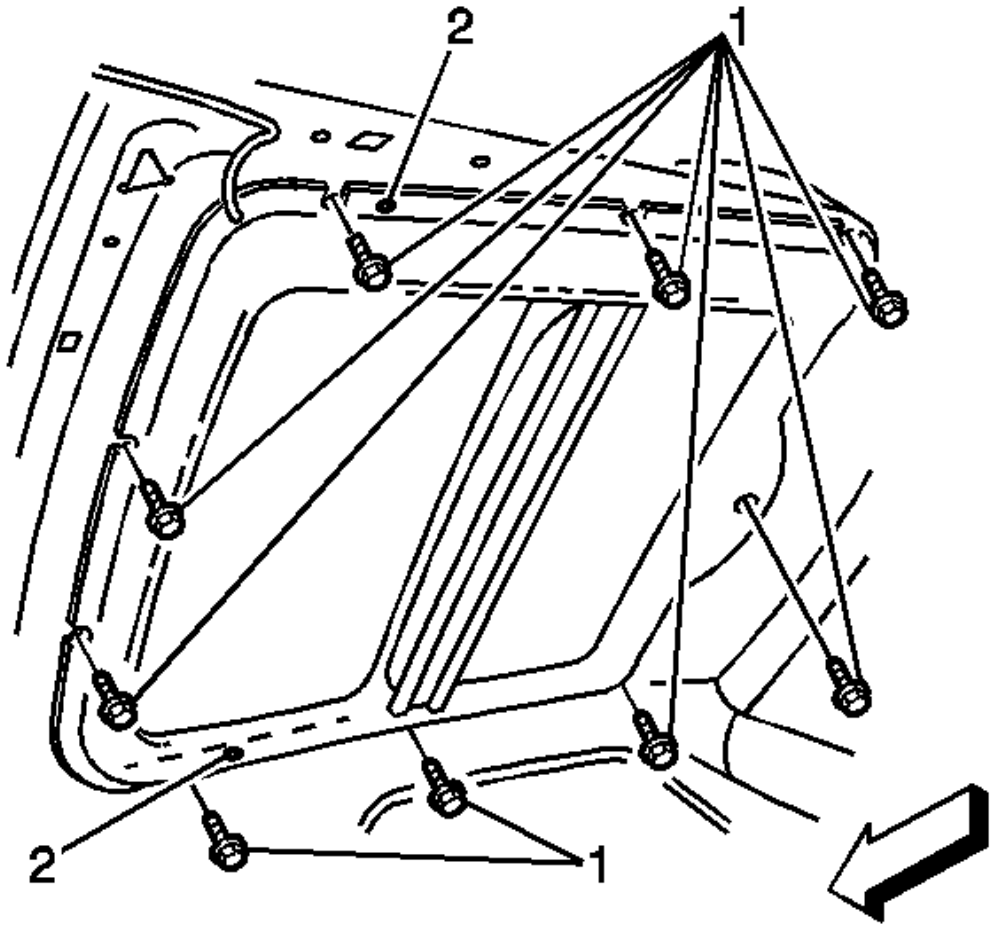

Fig. 10: Locating Sunroof Module-To-Roof Bolts
Courtesy of GENERAL MOTORS COMPANY

1. With the aid of an assistant, position the new sunroof frame assembly into the alignment pins (2) located on the roof ring.
2. Hand start the 2 center sunroof bolts (1) in order to hold the sunroof frame into place.
3. Finger tighten the 2 center sunroof bolts (1).

CAUTION: Refer to Fastener Caution .

4. Install the remaining sunroof bolts (1) to the sunroof frame and tighten the bolts to 9 N.m (80 lb in).

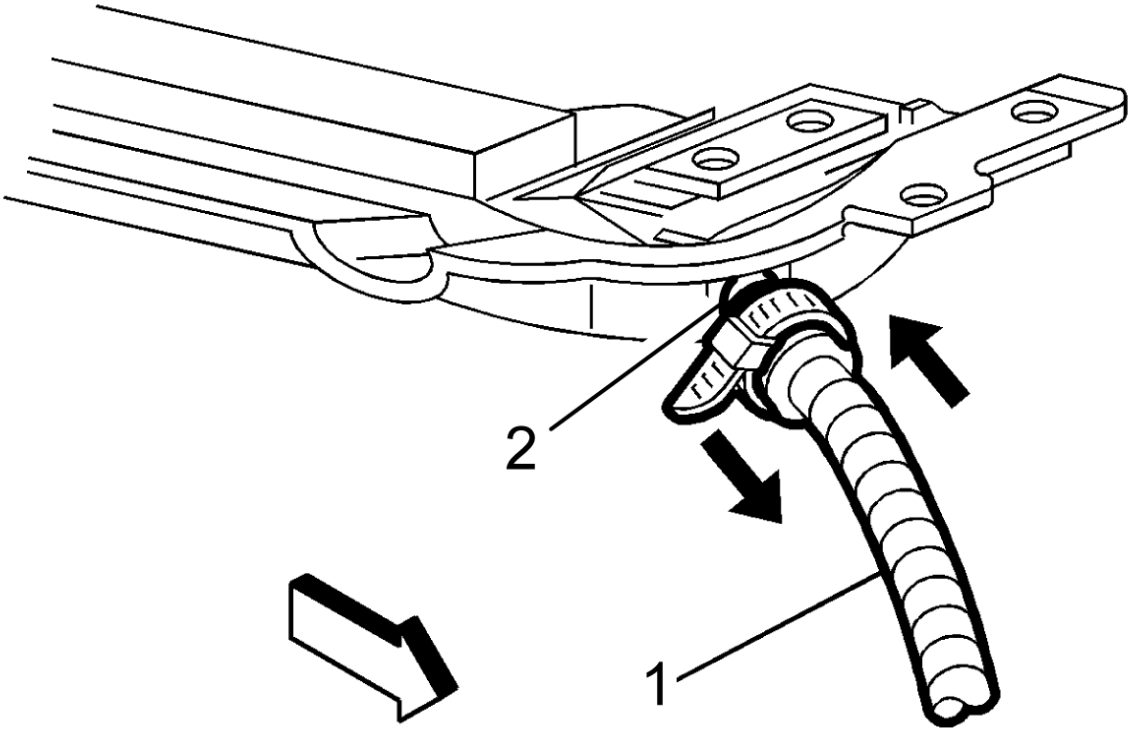

Fig. 11: Identifying Drain Hose At Drain Spout On Rear Of The Sunroof Module
Courtesy of GENERAL MOTORS COMPANY

5. Install the drain hoses (1) to the rear sunroof frame drain spouts (2).

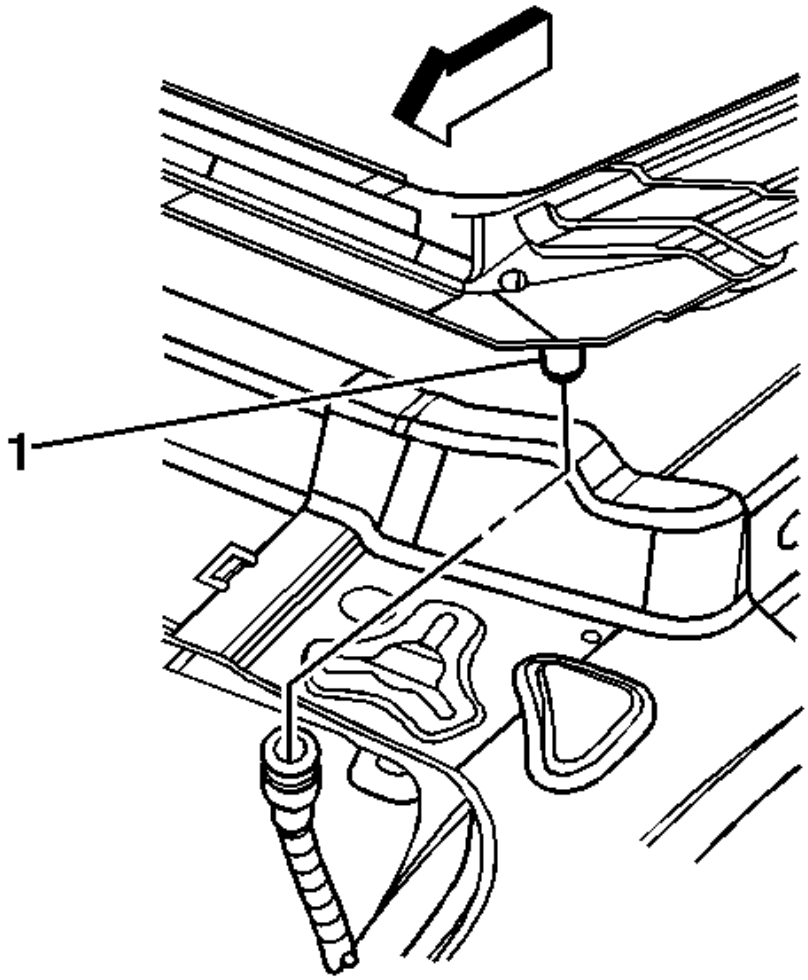

Fig. 12: Identifying Drain Spout
Courtesy of GENERAL MOTORS COMPANY

6. Connect the front drain hoses to the drain spouts (1) on the sunroof frame.
7. Install the sunroof motor/actuator. Refer to **Sunroof Motor/Actuator Replacement**.
8. Connect the electrical connector to the sunroof motor/actuator.
9. Secure the harness with suitable straps.
10. Install the air deflector. Refer to **Sunroof Air Deflector Replacement (Impala Limited)**.
11. Install the sunshade. Refer to **Sunroof Sunshade Replacement (CF5)**.
12. Install the sunroof window and loosely install the screws. Refer to **Sunroof Window Replacement**.
13. Adjust the sunroof window. Refer to **Sunroof Window Height and Opening Fit Adjustment**.
14. Verify the proper operation of the sunroof before securing the headliner.
15. Initialization/Teach the sunroof motor. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.
16. Raise and install the headliner, with the aid of an assistant. Refer to **Headlining Trim Panel Replacement** .

SUNROOF HOUSING FRONT DRAIN HOSE REPLACEMENT

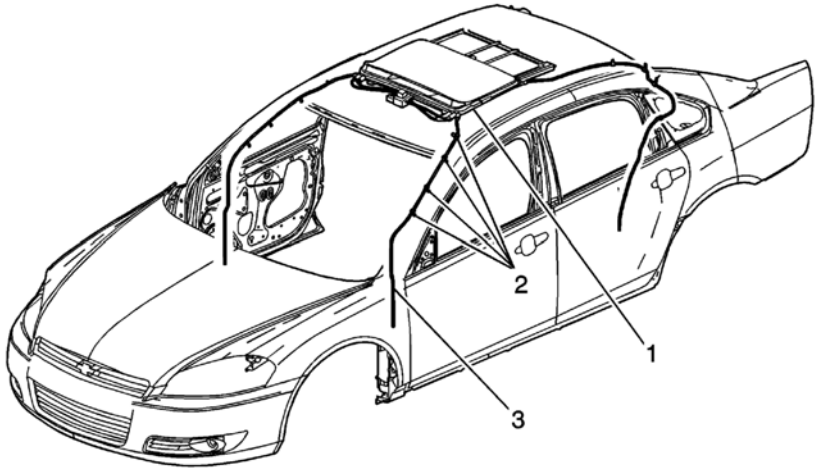

Fig. 13: Sunroof Housing Front Drain Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** . 2. Remove the sunshade. Refer to **Sunshade Replacement** . 3. Remove the pillar garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** . 4. Remove the upper center pillar. Refer to **Center Pillar Upper Trim Panel Replacement** . 5. Remove the rear upper quarter trim. Refer to **Quarter Upper Trim Panel Replacement** . 6. Remove the rear window trim. Refer to **Rear Window Shelf Trim Panel Replacement** . 7. Remove the headliner. Refer to **Headlining Trim Panel Replacement** .	
1	Sunroof Module Spigot **Procedure** Disconnect the front sunroof drain hose from the module spigot.
2	Sunroof Drain Hose Retainer (Qty: 3)
3	Sunroof Drain Hose **Procedure** 1. Reposition the carpet in order to gain access to the access hole in the front pillar. 2. Remove the grommet at the end of the front sunroof drain hose from the hole in the front pillar. 3. Remove the front sunroof drain hose from the front pillar. **TIP:** Tie a string to the hose at the module end of the front sunroof drain hose. Pull the hose from the access hole in the front pillar, allowing the string to remain in the pillar.

SUNROOF HOUSING REAR DRAIN HOSE REPLACEMENT

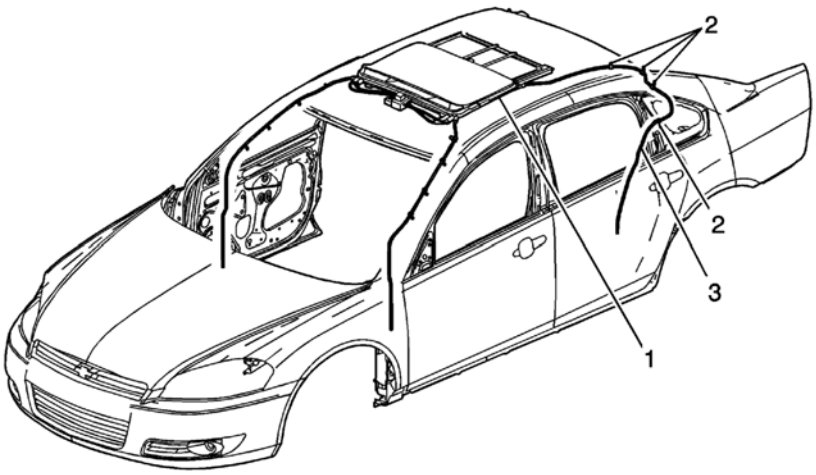

Fig. 14: Sunroof Housing Rear Drain Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** . 2. Remove the sunshade. Refer to **Sunshade Replacement** . 3. Remove the pillar garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** . 4. Remove the upper center pillar. Refer to **Center Pillar Upper Trim Panel Replacement** . 5. Remove the rear upper quarter trim. Refer to **Quarter Upper Trim Panel Replacement** . 6. Remove the rear window trim. Refer to **Rear Window Shelf Trim Panel Replacement** . 7. Remove the rear seat. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)** . 8. Remove the headliner. Refer to **Headlining Trim Panel Replacement** .	
1	Sunroof Module Spigot **Procedure** Disconnect the rear sunroof drain hose from the module spigot.
2	Sunroof Drain Hose Retainer (Qty: 3)

Callout	Component Name
3	Sunroof Drain Hose **Procedure** 1. Reposition the carpet in order to gain access to the access hole in the rear quarter panel. 2. Remove the grommet at the rear end of the sunroof drain hose from the hole in the quarter panel. 3. Remove the rear sunroof drain hose from the rear quarter panel. **TIP:** Tie a string to the hose at the module end of the rear sunroof drain hose. Pull the hose from the access hole in the rear quarter panel, allowing the string to remain in the quarter panel.

SUNROOF OPENING TRIM FINISH LACE REPLACEMENT

Removal Procedure

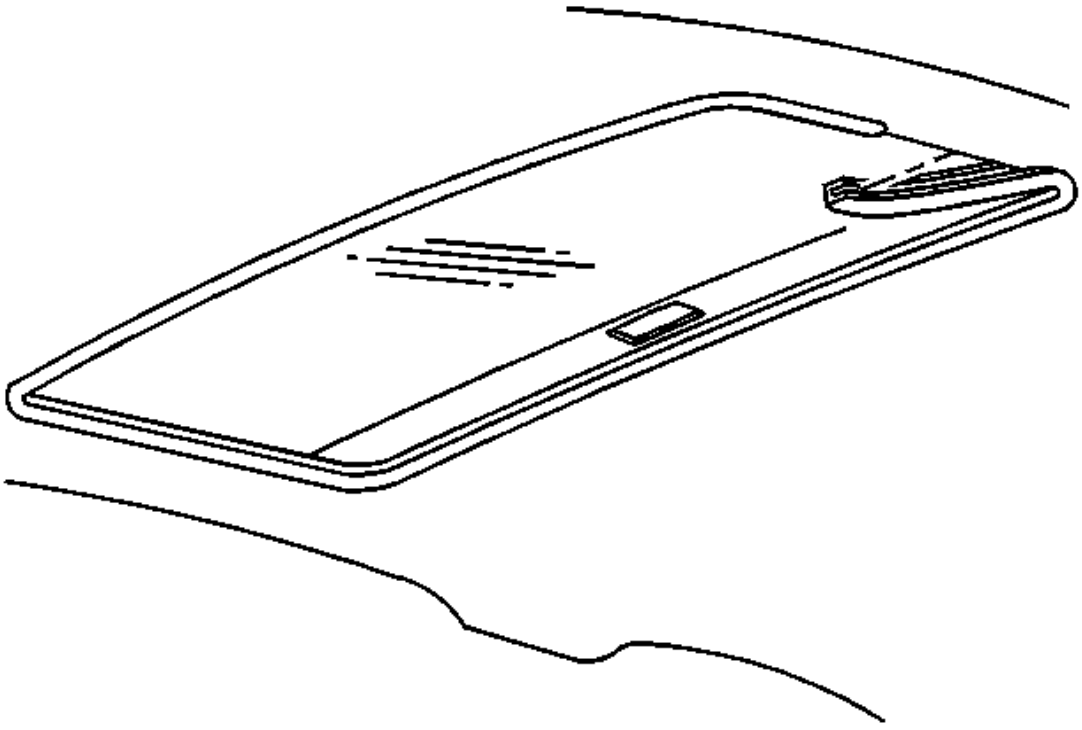

Fig. 15: Identifying Sunroof Opening Finishing Lace
Courtesy of GENERAL MOTORS COMPANY

1. Beginning at the joint, pull the sunroof opening trim lace from the headliner.
2. Remove the sunroof opening trim lace from the headliner.

Installation Procedure

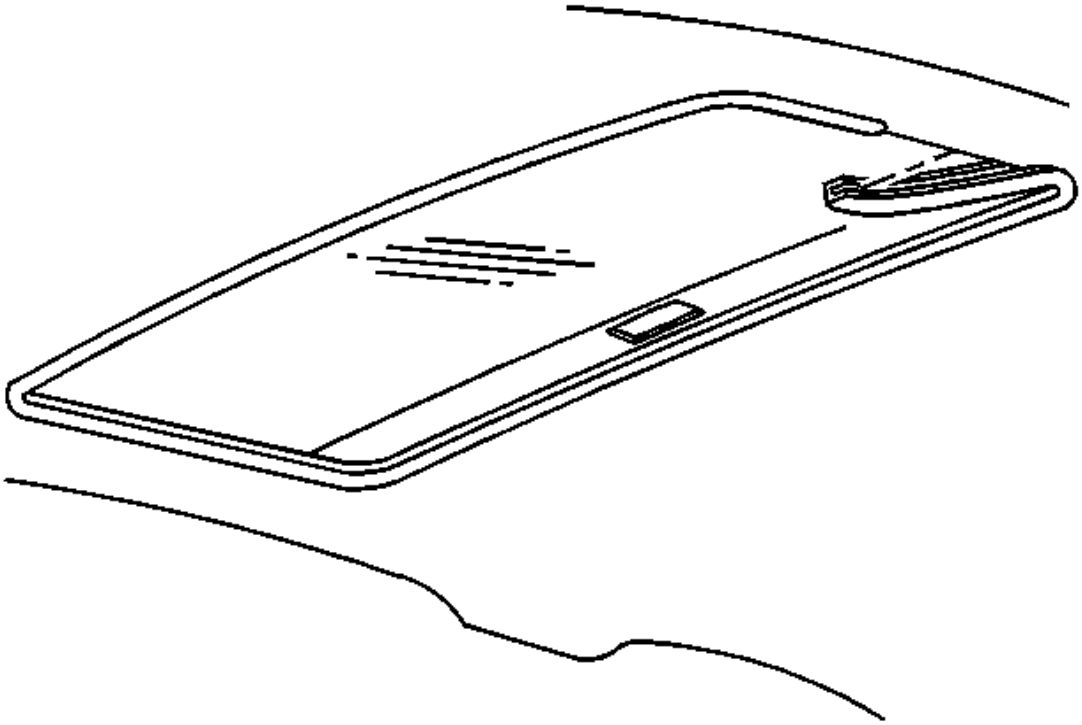

Fig. 16: Identifying Sunroof Opening Finishing Lace
Courtesy of GENERAL MOTORS COMPANY

1. Beginning at the joint, install the sunroof opening trim lace into place around the sunroof opening.
2. Ensure the sunroof trim lace is fully seated to the headliner.

SUNROOF MOTOR/ACTUATOR INITIALIZATION/TEACH PROCESS

Perform the Initialization/Teach Process any time a new sunroof motor actuator is installed in the vehicle.

1. Ensure that the electrical harness on the headliner is connected to the sunroof.

2. Press the sunroof switch to the close position until the window stops at the front hard stop in the fully closed position, then moves slightly back to the soft stop position. Release the switch. (This is the initialization portion).
3. Within 6 seconds, press and hold the close switch again. After 3 more seconds, the sunroof window will move toward the open position . (This is the teach portion).
4. Continue holding the switch until the sunroof window moves back to the close and stops at the closed position. Release the button. The initialization/Teach procedure is complete.
5. Verify the operation of the sunroof.

IMPORTANT: Re-Initialization/Teach for the original motor.

1. Perform the Reinitialization/Teach process any time the sunroof motor in removed form the sunroof.
2. Ensure that the electrical harness on the headliner is connected to the sunroof.
3. Press the sunroof switch to the close position until the window stops at the front soft stop in the fully closed position. Release the switch then press to the close position again and hold for 10 seconds or greater. The sunroof will then stall at the hard stop, and move back sightly to the soft stop position. Release the switch. (This is the re-initialization portion).
4. Within 6 seconds, press and hold the close switch again. After 3 more seconds, the sunroof window will move toward the open position. (This is the teach portion).
5. Continue holding the switch until the sunroof window moves back to the close and stops at the closed position. Release the button. The initialization/Teach procedure is complete.
6. Verify the operation of the sunroof.

IMPORTANT:

If in the Initialization/Teach Process is not complete, the following actions must take place before the initialization cycle is done:

- The sunroof switch is not held in the close position.
- The ignition and/or battery power has been removed.
- The glass panel has not reached the closed position.

The Initialization/Teach Process must be restarted if the procedure is not carried out completely.

SUNROOF MOTOR/ACTUATOR REPLACEMENT

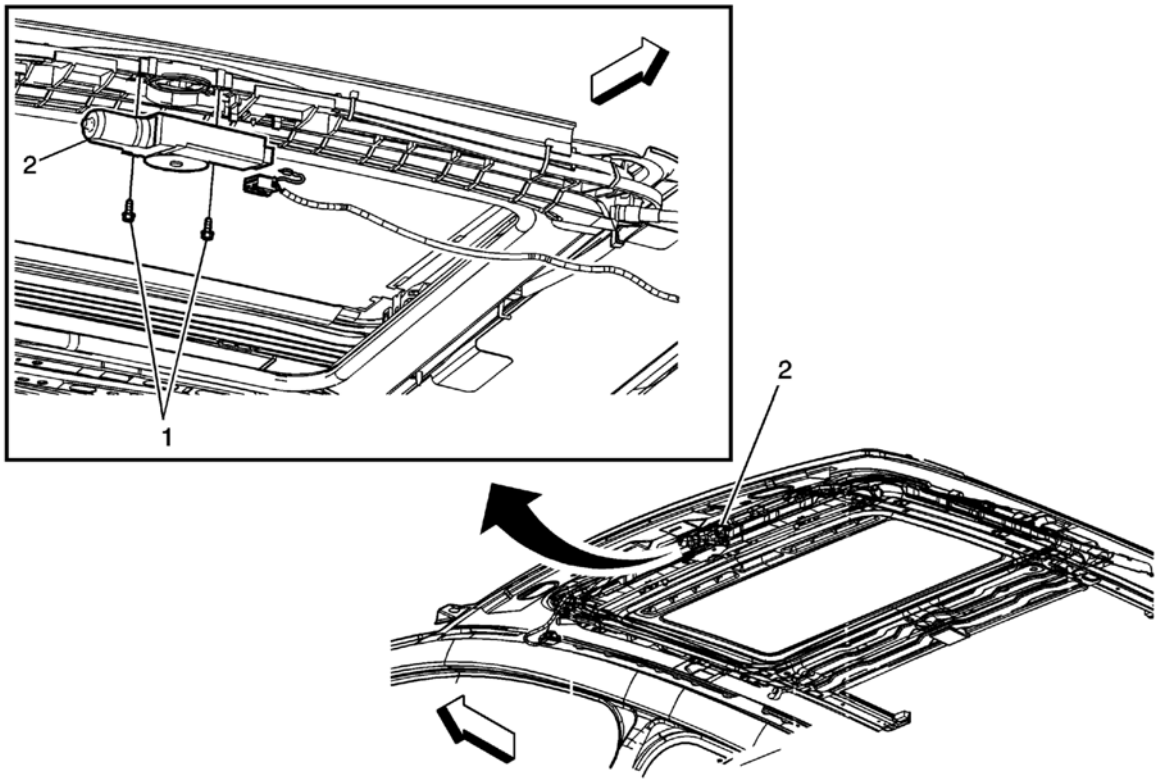

Fig. 17: View Of Sunroof Motor/Actuator Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Motor Sunroof Bolts (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Procedure** It is only necessary to lower the headliner. Only do those steps in headliner replacement that will lower the headliner enough to gain access to the parts. Refer to **Headlining Trim Panel Replacement** **Tighten** 10 N.m (89 lb in)
2	Sunroof Motor **Procedure** After install the sunroof motor it will be necessary to initialization teach process. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.

SUNROOF SUNSHADE REPLACEMENT (CF5)

Removal Procedure

1. Remove the sunroof frame from the vehicle. Refer to **Sunroof Frame Replacement**.

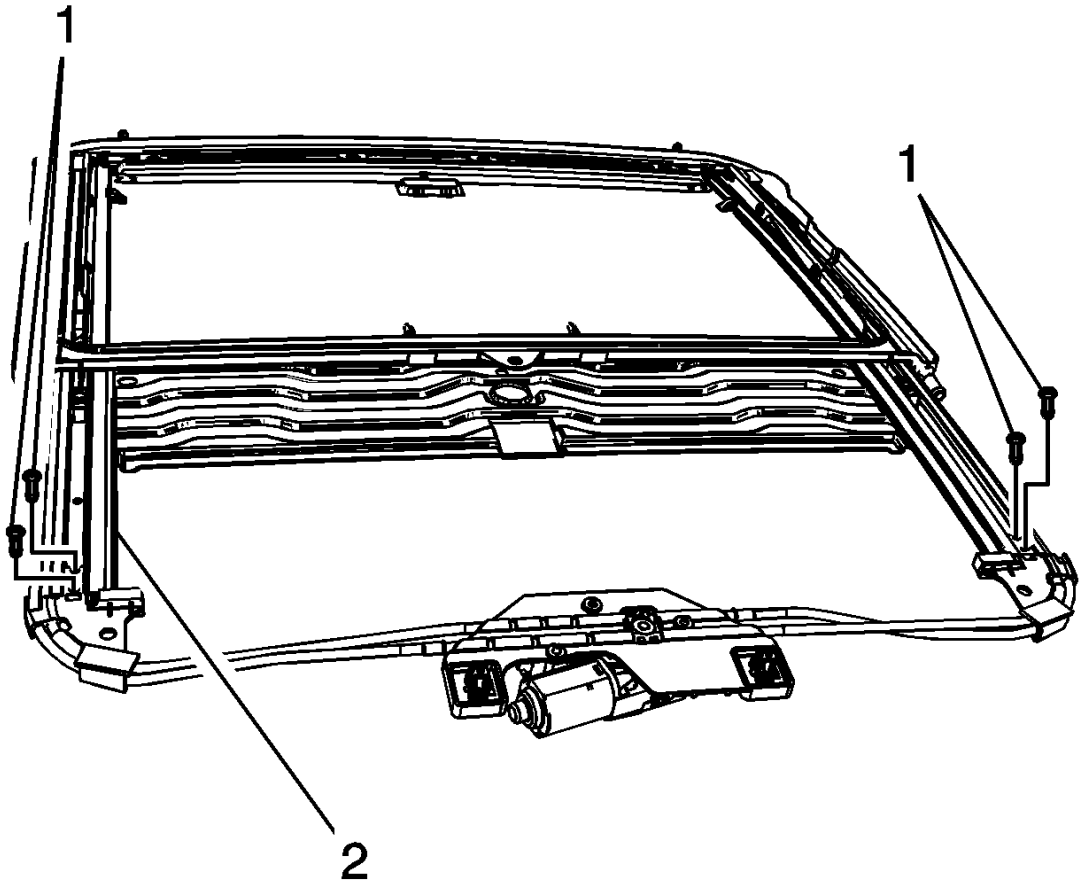

Fig. 18: Sunroof Sunshade Rivets
Courtesy of GENERAL MOTORS COMPANY

WARNING: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

2. Use the appropriate tool, drill out the rivets (1) from the sunroof guide tracks.

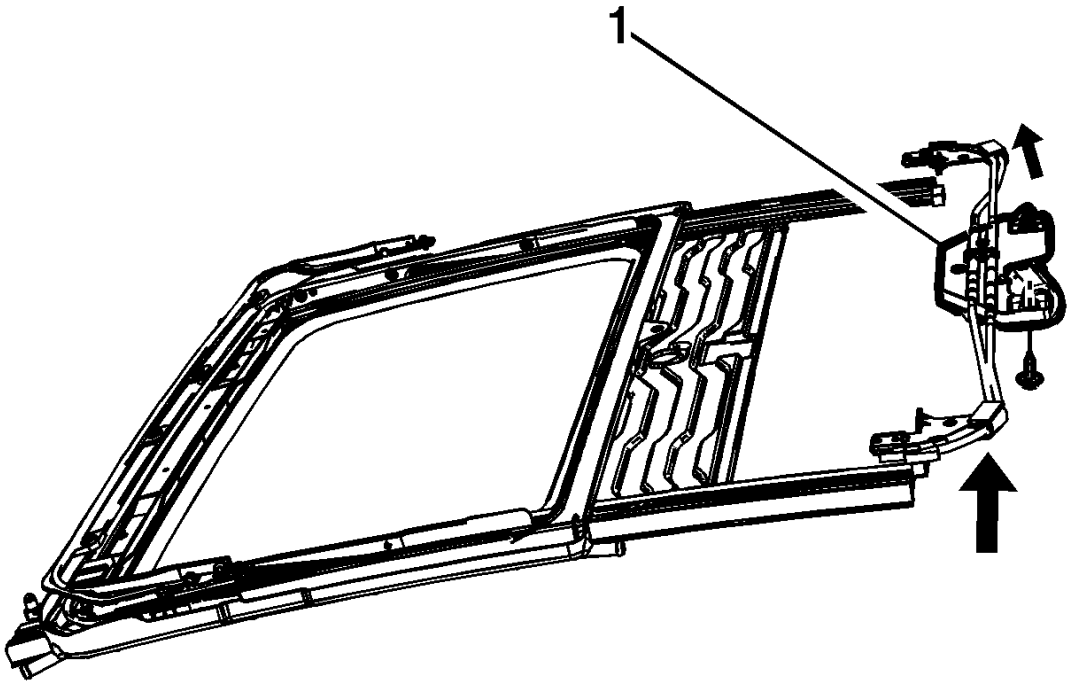

Fig. 19: Sunroof Sunshade Cable Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not remove motor/actuator and cable assembly from the sunroof frame.**

3. Slide the motor and cable assembly (1) rearward allowing the sunshade to clear.

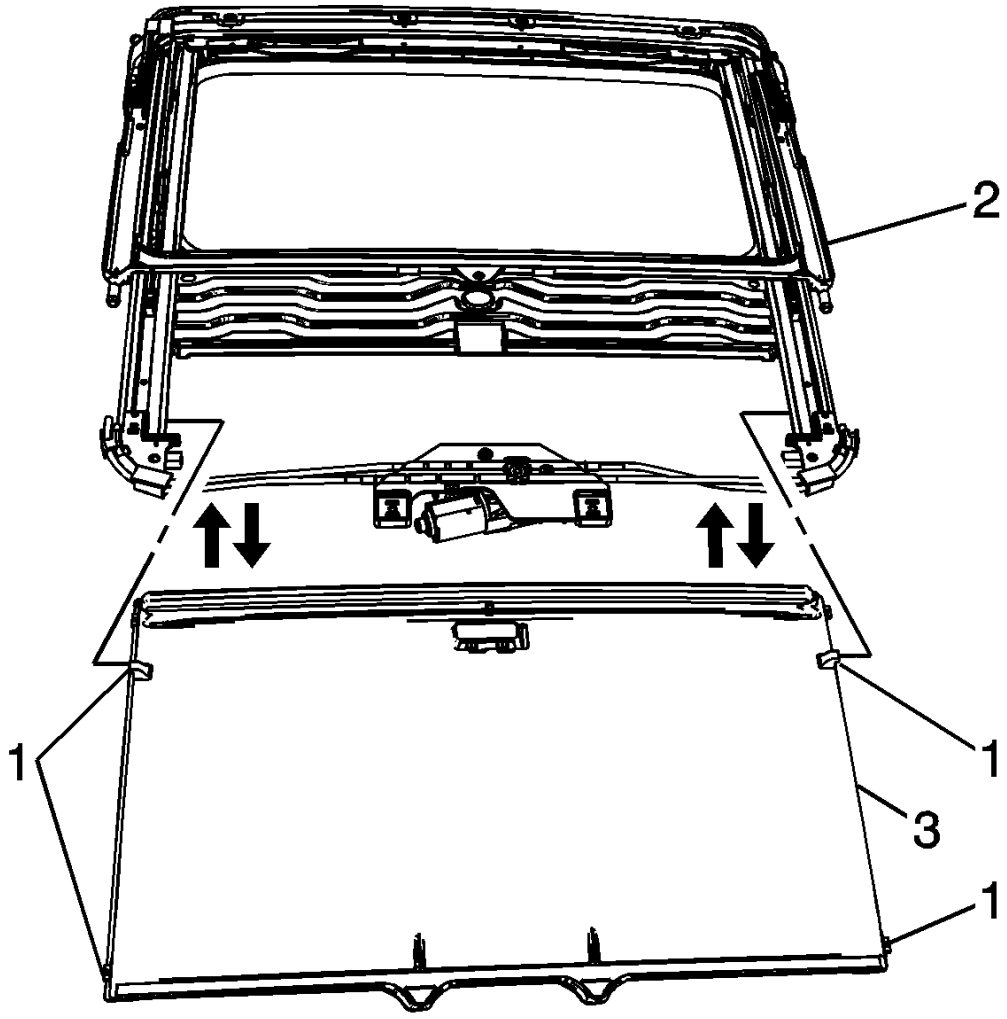

Fig. 20: Sunroof Sunshade
Courtesy of GENERAL MOTORS COMPANY

4. Remove the sunroof sunshade (3) from the sunroof frame as follows:
    1. Sliding the sunshade rearward.
    2. Lift upward in the rear center of the sunshade until the guide tabs (1) releases the sunroof guide tracks (2).

Installation Procedure

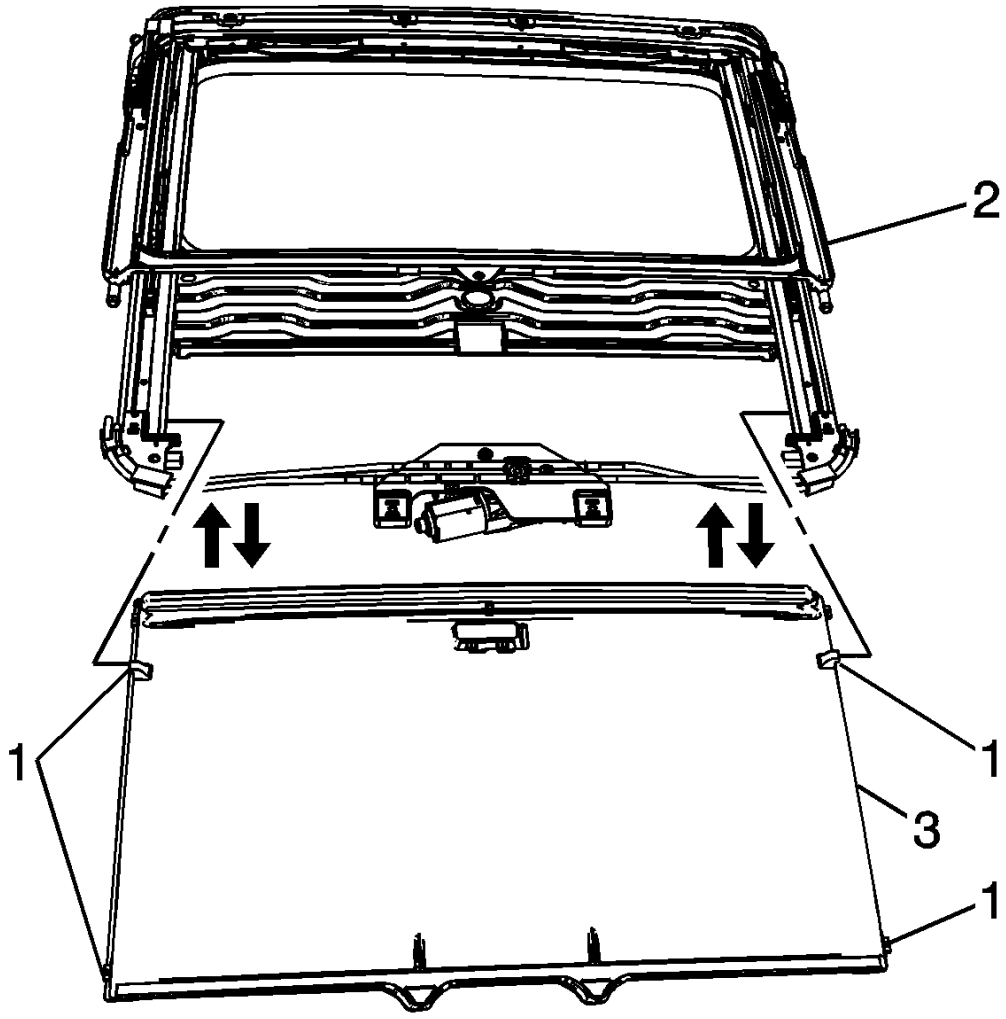

Fig. 21: Sunroof Sunshade
Courtesy of GENERAL MOTORS COMPANY

1. Install the sunshade (3) front tabs (1) to the left and right corners of sunroof guide tracks (2) .
2. Slide the sunshade forward until all the tabs (1) are inserted in the sunroof guide tracks (2).
3. Ensure that the sunshade is sliding back and forth in the sunroof guide tracks freely.

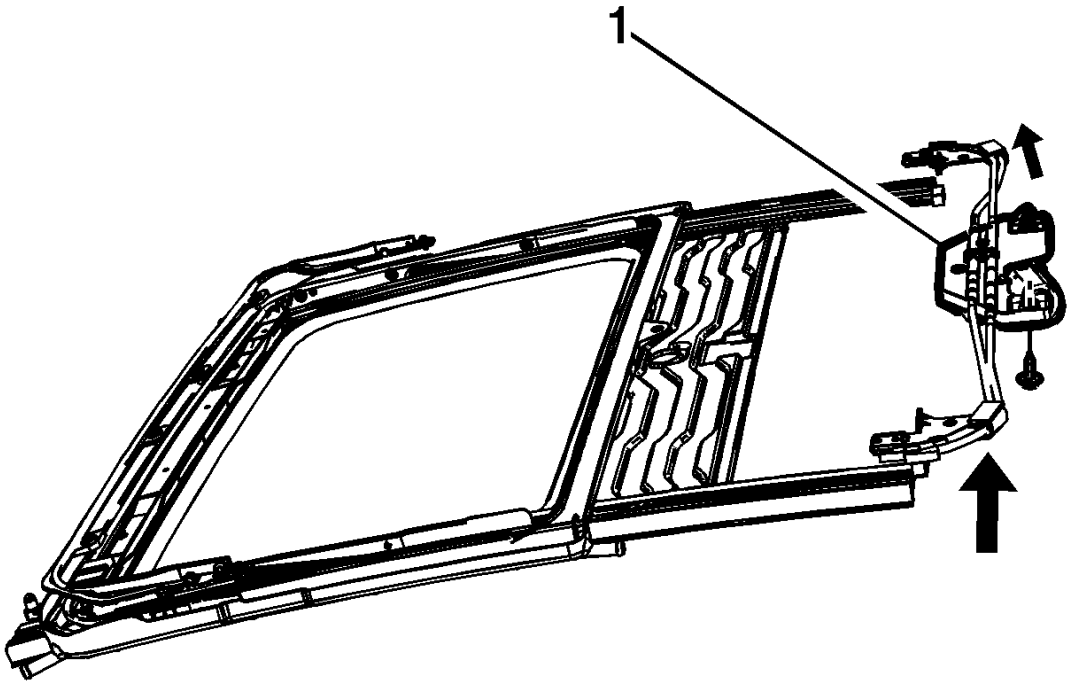

Fig. 22: Sunroof Sunshade Cable Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Slide the motor and cable assembly (1) back in place.

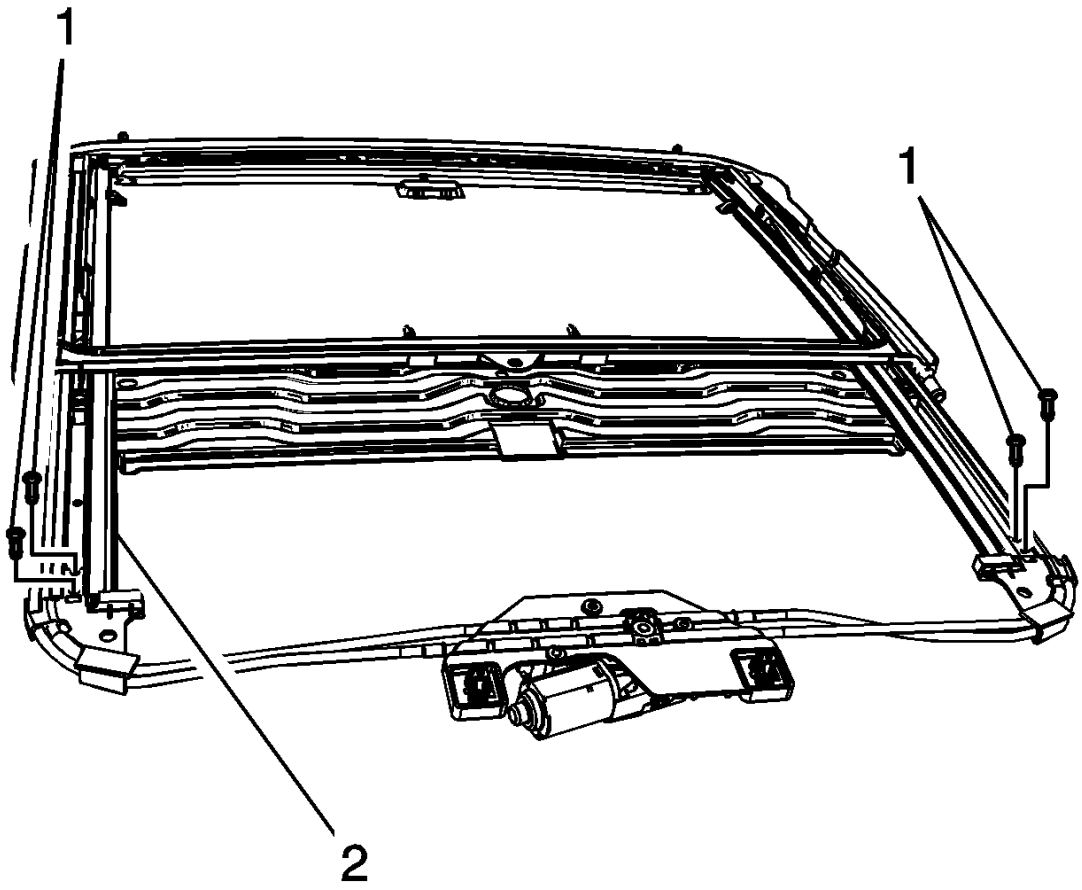

Fig. 23: Sunroof Sunshade Rivets
Courtesy of GENERAL MOTORS COMPANY

5. Use the appropriate tool, install the rivets (1) to the sunroof guide tracks (2).
6. Install the sunroof frame in the vehicle. Refer to **Sunroof Frame Replacement**.
7. While seated inside the vehicle with the sunshade in the closed position, verify that the front of the sunroof is not bent upward.
8. Perform the Initialization/Teach Process any time the sunroof motor actuator is installed in the vehicle. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.
9. Before install the interior trim verify all that all position of the sunroof and sunshade assembly are working properly.

SUNROOF WINDOW SEAL REPLACEMENT

Removal Procedure

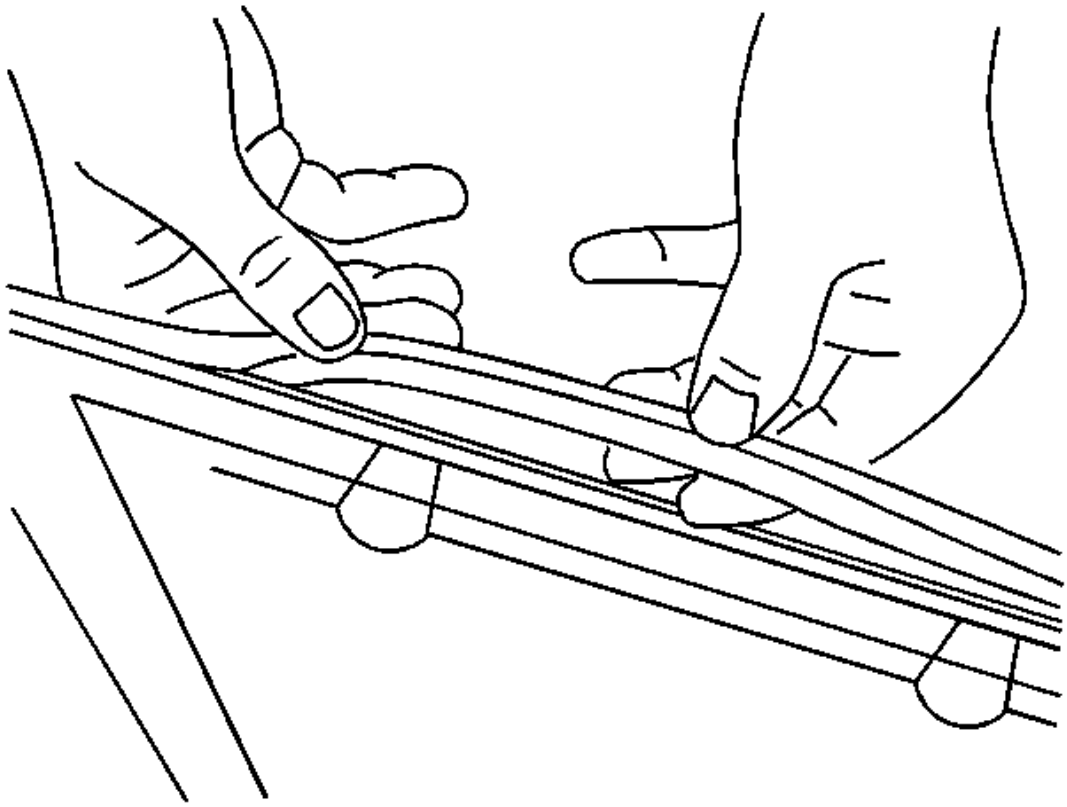

Fig. 24: Sunroof Window Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

1. Remove the sunroof window . Refer to **Sunroof Window Replacement**.
2. Remove the sunroof window seal from the sunroof window frame by pulling the sunroof window seal away at one point and continuing around the perimeter of the sunroof window frame.
3. Wipe the perimeter of the sunroof window frame area with a clean, dampened cloth using window cleaner GM P/N 1050427 (Canadian P/N 992727), or isopropyl alcohol in order to clean the surface of the perimeter of the sunroof window frame.

   Allow to air dry.

Installation Procedure

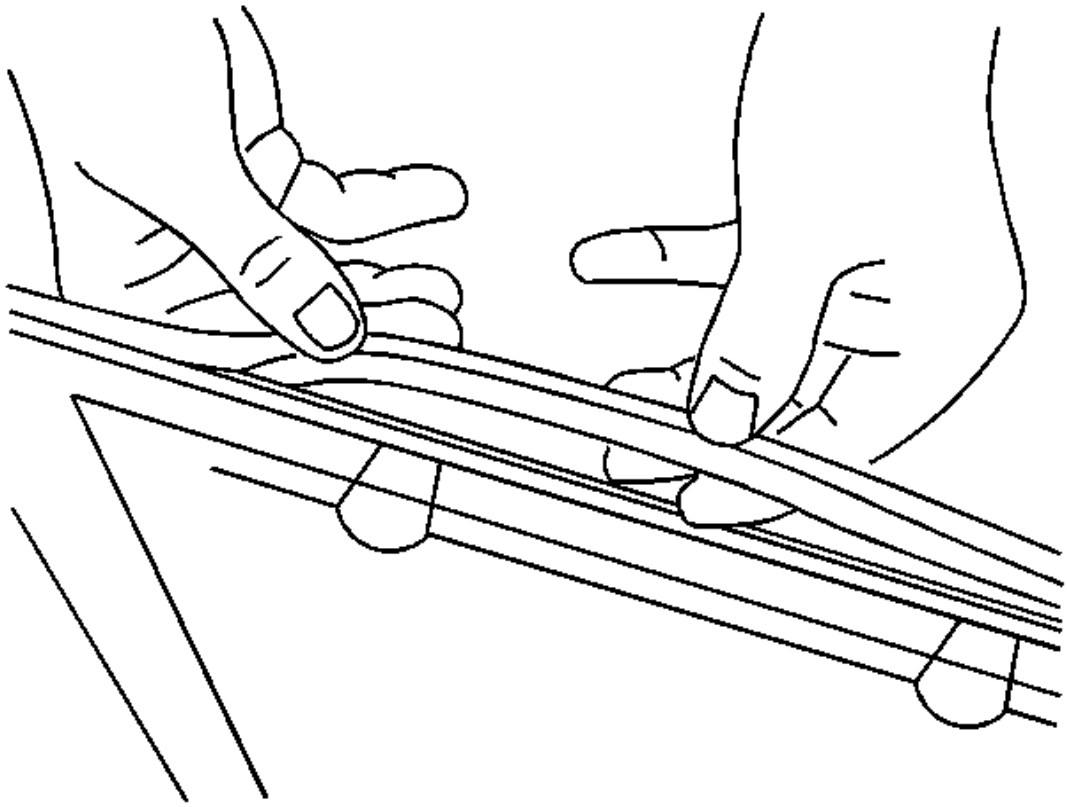

Fig. 25: Sunroof Window Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

1. Position the sunroof window seal into the gutter of the sunroof window frame.

   IMPORTANT: Ensure that the sunroof window seal is properly seated around the entire perimeter of the sunroof window frame.

2. Firmly press the sunroof window seal into place.
3. Install the sunroof window. Refer to **Sunroof Window Replacement**.

SUNROOF SWITCH REPLACEMENT (IMPALA LIMITED)

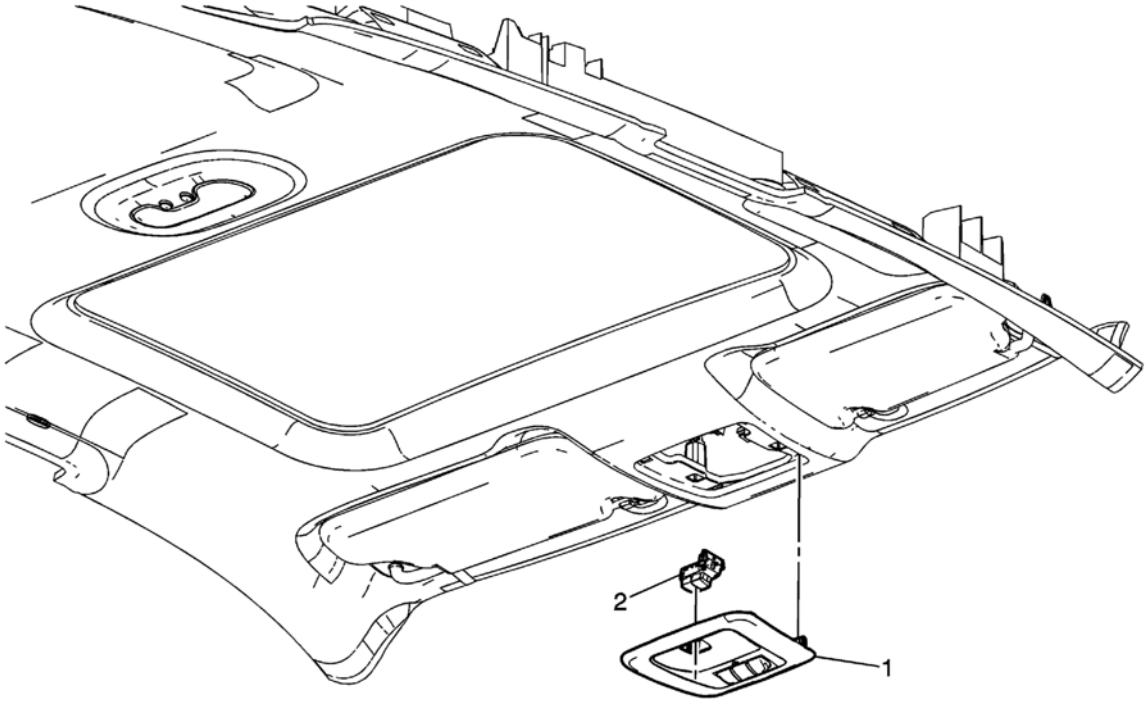

Fig. 26: Sunroof Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Overhead Console Assembly Refer to **Roof Console Replacement** **TIP:** Disconnect the electrical connector.
2	Sunroof Switch Assembly

SUNROOF TRACK TIMING/SYNCHRONIZATION (IMPALA LIMITED)

Removal Procedure

1. Place the module in the full open position.
2. It is only necessary to lower the headliner. Only do those step in headliner replacement that will lower the headliner enough to gain access to the part. Refer to **Headlining Trim Panel Replacement** .
3. Disconnect the electrical connector from the motor/actuator.
4. Remove the motor. Refer to **Sunroof Motor/Actuator Replacement**.
5. Push the window guides rearward on the track until the guides are positioned against the rear hard stop.

Installation Procedure

1. Install the motor. Refer to **Sunroof Motor/Actuator Replacement**.
2. Connect the electrical connector to the motor/actuator.
3. Install the headliner. Refer to **Headlining Trim Panel Replacement** .

4. Perform the Initialization/Teach Procedure. Refer to **Sunroof Motor/Actuator Initialization/Teach Process**.
5. Verify the operation of the sunroof.

SUNROOF WINDOW HEIGHT AND OPENING FIT ADJUSTMENT

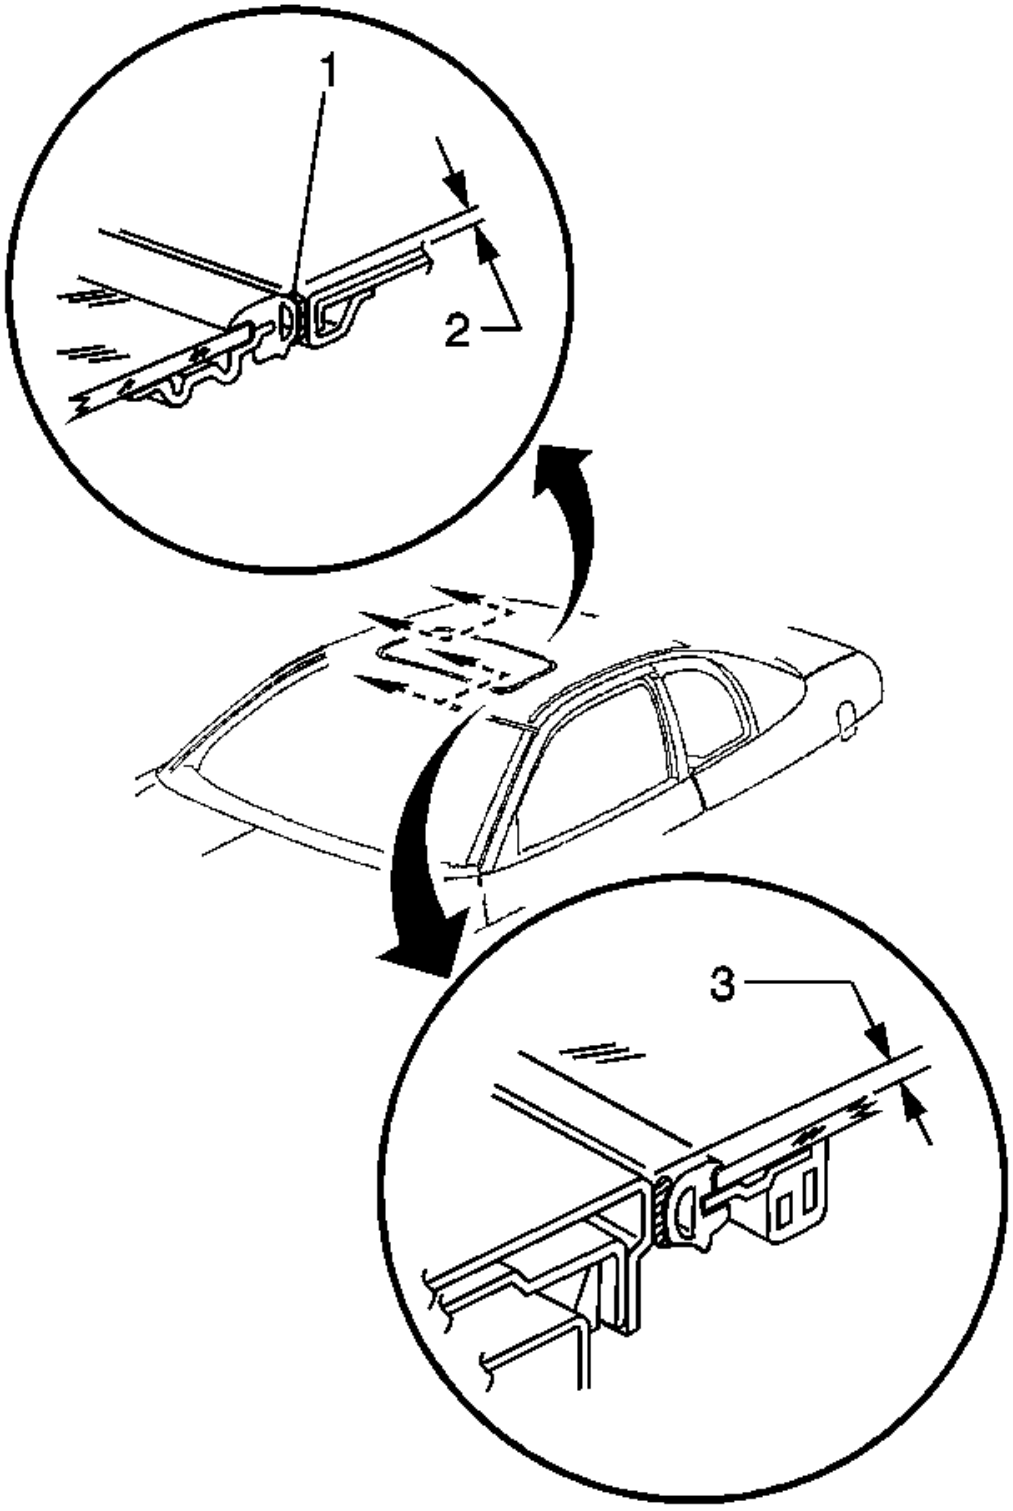

Fig. 27: Adjusting Sunroof Window Panel

Courtesy of GENERAL MOTORS COMPANY

1. Slide the sunroof sunshade to the open position.
2. Move the sunroof glass panel to the fully closed position.
3. Loosen the sunroof glass panel screws.
4. Individually adjust the 4 corners (1) of the sunroof glass panel.
5. Adjust the front of the sunroof glass panel to 1.5 mm (0.050 in) below the top surface of the roof panel (3).
6. Adjust the rear of the sunroof glass panel to 1.5 mm (0.050 in) above the top surface of the roof panel (2).

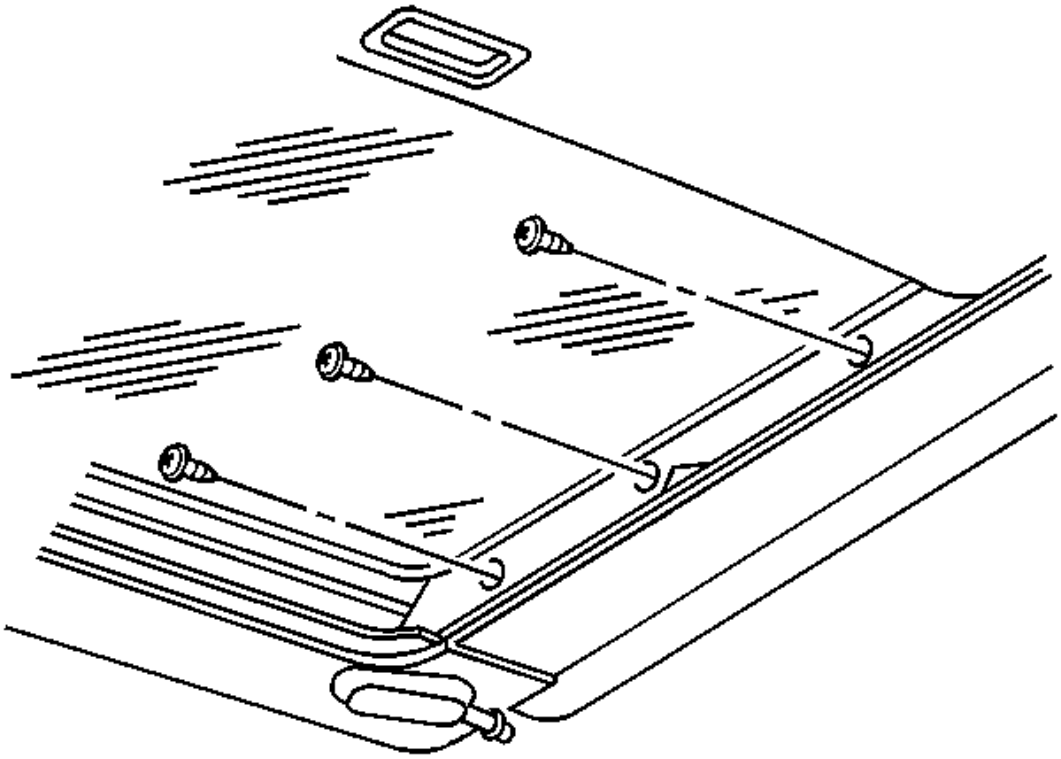

Fig. 28: View Of Sunroof Window Panel Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

7. Tighten the sunroof glass panel screws.

Tighten

Tighten the screws to 4 N.m (35 lb in).

SUNROOF WINDOW REPLACEMENT

Removal Procedure

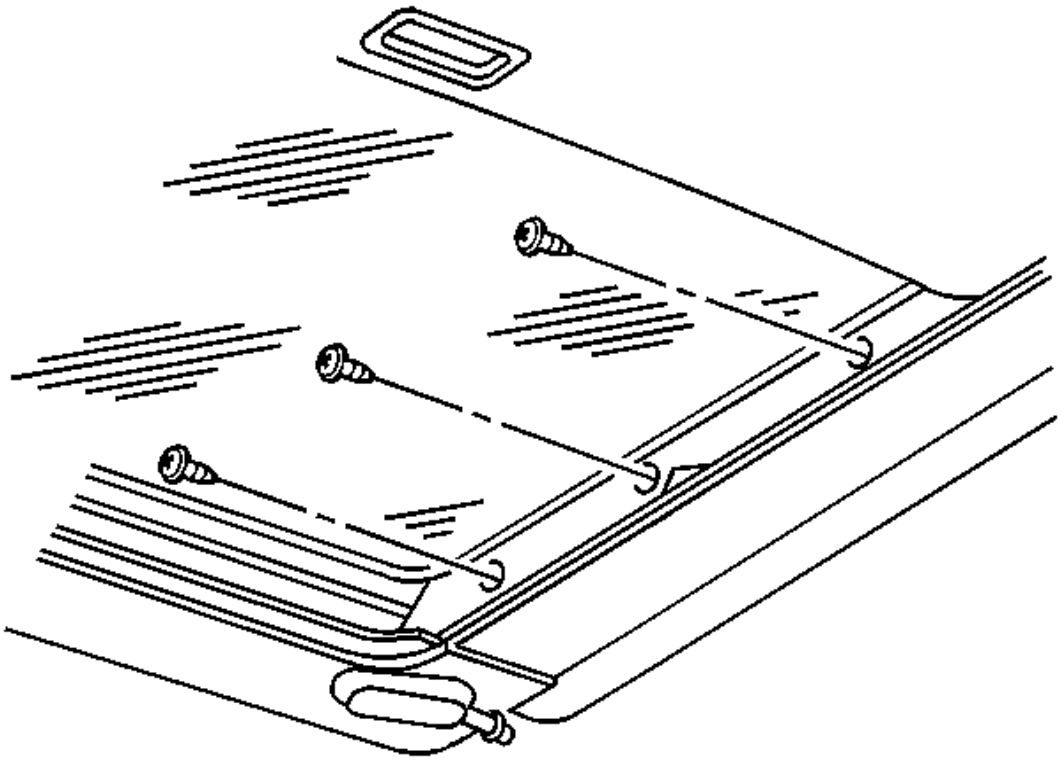

Fig. 29: View Of Sunroof Window Panel Screws
Courtesy of GENERAL MOTORS COMPANY

1. Position the sunshade panel fully rearward.
2. Position the sunroof window panel to the vent position.
3. Remove the sunroof window panel screws from the sunroof window panel.
4. Remove the sunroof window panel from the sunroof module.

Installation Procedure

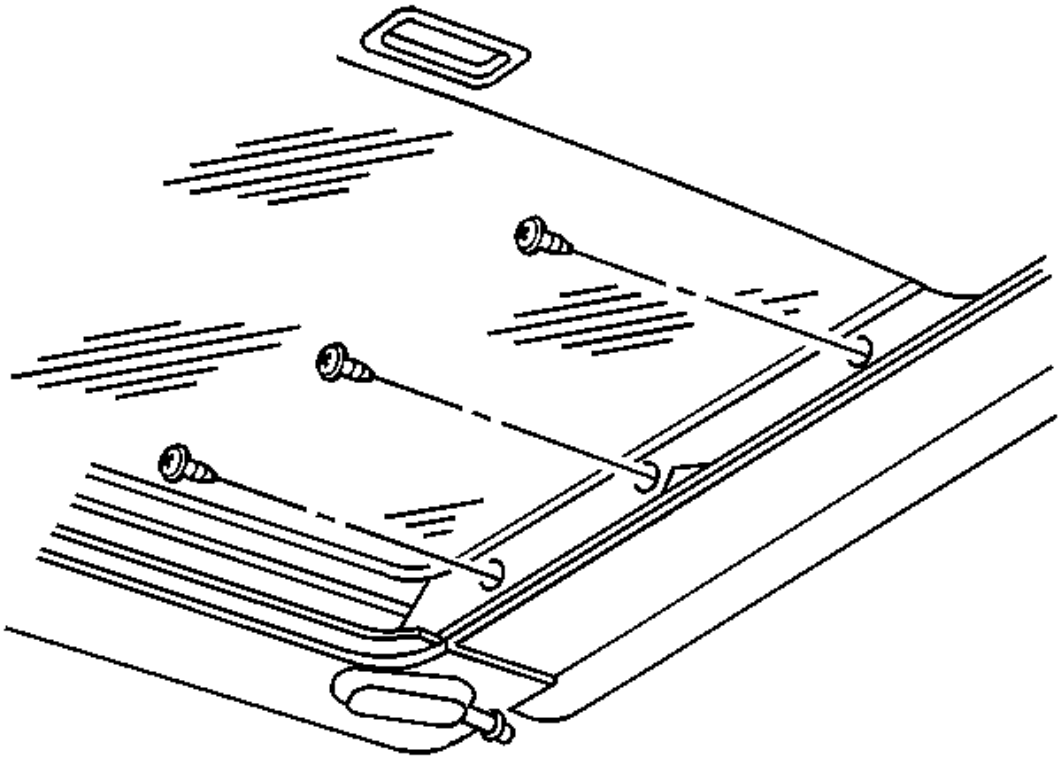

Fig. 30: View Of Sunroof Window Panel Screws
Courtesy of GENERAL MOTORS COMPANY

1. Position the sunroof window panel to the sunroof module.

   Ensure that the information logo stencil is towards the rear of the sunroof opening.

   CAUTION: Refer to Fastener Caution .

2. Install the sunroof window panel screws to the sunroof window panel.

   Tighten

   Tighten the sunroof window panel screws to 4 N.m (35 lb in).

3. Adjust the sunroof window panel as necessary. Refer to **Sunroof Window Height and Opening Fit Adjustment**.
4. Inspect the sunroof window panel for proper operation.

DESCRIPTION AND OPERATION

SUNROOF DESCRIPTION AND OPERATION

Power Sunroof System Components

The Power Sunroof System consists of the following components:

- Sunroof control module
- Sunroof switch
- Sunroof glass
- Rail and track assembly upon which the sunroof glass rides
- Sunroof sunshade
- S/ROOF 20A Fuse
- Ground G301

Power and Grounds

Battery positive voltage is supplied at all times to the sunroof control module from the 20 A S/ROOF fuse located in the instrument panel fuse block. Ground is supplied to the sunroof control module through the module ground circuit and G301.

Ground is supplied to the sunroof switch through the switch ground circuit and G301.

Power Sunroof Operation

The Power Sunroof System will operate only with the ignition turned to the RUN or Accessory position, this allows for retained accessory power (RAP) control of the sunroof through the body control module (BCM). With the ignition in the run or accessory position, the BCM supplies the sunroof with ignition voltage which allows sunroof operation. Once the ignition switch is turned off the sunroof will continue to operate until any door is opened or when the RAP timer reaches its shut-off limit. For a description and operation of the RAP operation, refer to **Retained Accessory Power Description and Operation** .

IMPORTANT:

- If, during service, the sunroof control module has lost battery positive voltage or ground, or has been replaced, it will be necessary to initialize the control module once service has been completed. Refer to **Control Module References** .
- The sunroof can be manually cycled with a regular screwdriver, once the headliner is removed. This screwdriver fits into the drive gear, and when turned will operate the sunroof drive cables and simultaneously open or close the sunroof.

When the sunroof is commanded to open, it will move the sunshade to the open position as well. The sunshade can be manually opened and closed from inside of the vehicle while the sunroof is in the closed position. The sunshade is designed to stay in the open position while the sunroof is in the open position.

Any water that passes the roof seal is drained from the sunroof tray by 4 tubes that lead from the corners of the tray to the rocker panels of the vehicle. The tray which acts as a framework for the sunroof assembly, has a water channel that encircles the sunroof opening and directs the water to the drain tubes.

Sunroof Switch Operation

When the sunroof is in the closed position, it can be raised to the vent position by pressing the OPEN side of the switch once. The sunroof may then be expressed to the fully open position by momentarily pressing the OPEN side of the switch a second time, or it may be adjusted to any preferred open position by pressing and holding the OPEN switch until the sunroof has reached the desired position. To fully close the sunroof, press and hold the CLOSE side of the switch. Release the CLOSE side of the switch in order to stop the sunroof at any preferred closed position. Whenever the sunroof is in the express open mode, it can be stopped by momentarily pressing either side of the switch.

Sunroof Control Module

The sunroof control module is located between the headliner and the roof structure, while the sunroof switch is located above the rearview mirror. The sunroof control module supplies voltage to the contacts of the sunroof switch through the sunroof switch close signal circuit and the sunroof switch open signal circuit. The sunroof control module also supplies ground to the switch contacts through the sunroof switch low reference circuit. When the switch is operated, the contacts and signal circuit for the selected mode are closed to ground, the voltage is pulled low in the sunroof control module, and the appropriate signal is recognized by the sunroof control module. The sunroof control module then internally applies battery positive voltage and ground to the appropriate circuits of the reversible motor in order to move the sunroof glass to the open, close, or vent position.

Article GUID: A00737218

General Information

Waterleaks - Impala

DIAGNOSTIC INFORMATION AND PROCEDURES

WATERLEAK TEST PREPARATION

- GM vehicles are designed to operate under normal environmental conditions.
- The design criteria for sealing materials and components takes into consideration the sealing forces required to withstand the natural elements. These specifications cannot take into consideration any artificial conditions, i.e., high pressure car washes.
- The water leak test procedure has been correlated to the natural elements and will determine the ability of a vehicle to perform under normal operating conditions.
- The first step in diagnosing a leak is determining the conditions under which a leak occurs. If the general leak area can be found, the exact entry point can be isolated using a water hose or an air hose. Some trim panels or components may need to be removed in order to repair the leak.
- If leaks are found around a door, door window, rear compartment lid or liftgate area this does not necessarily indicate a bad weatherstrip. An adjustment to these areas may resolve the condition.

1. **Watertest Stand Assembly**

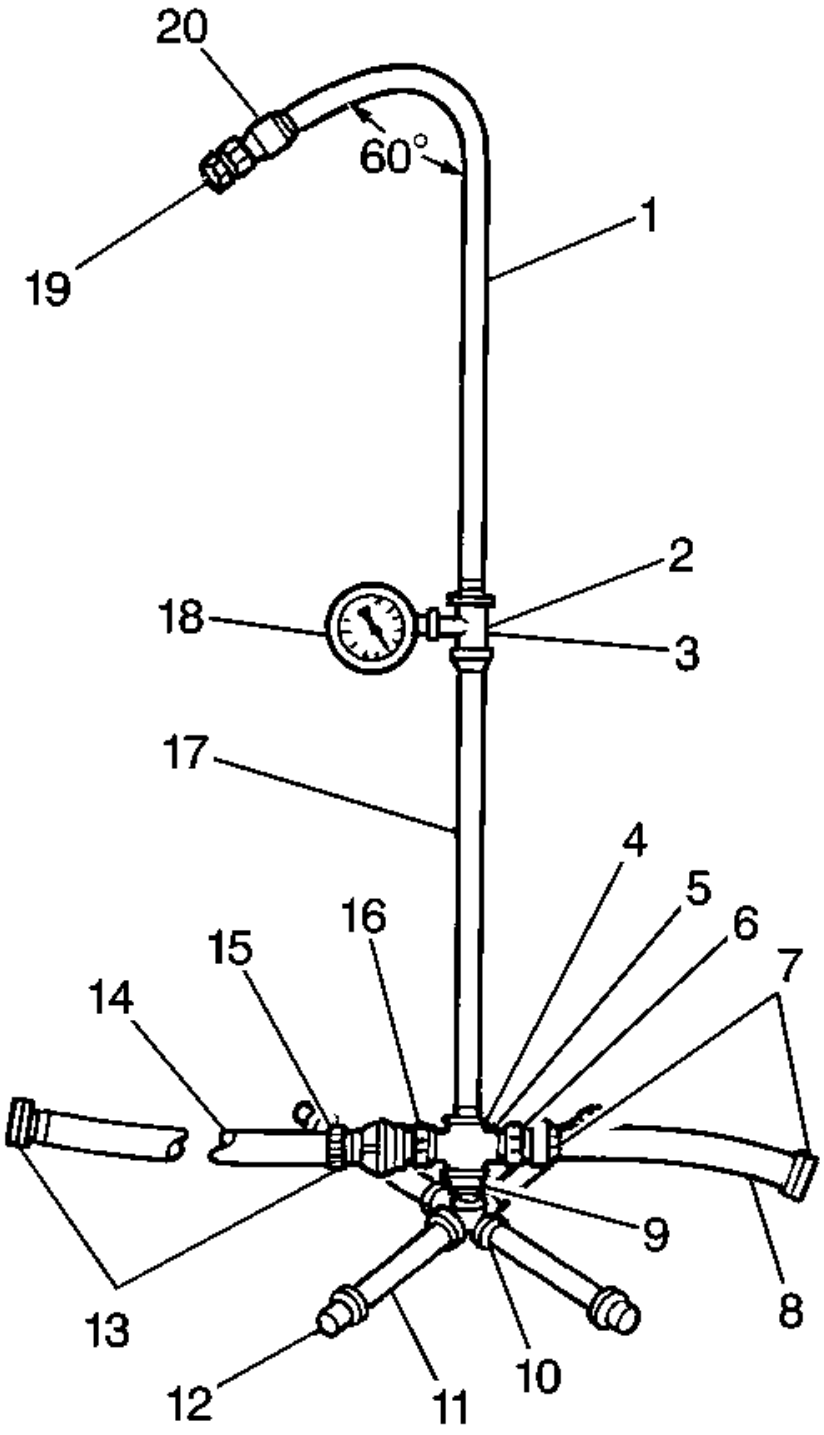

Fig. 1: View Of Watertest Stand Assembly
Courtesy of GENERAL MOTORS COMPANY

Assemble the water test stand as shown.

Callout	Component Name
1	Pipe (0.5 x 36 in)

Callout	Component Name
2	Reducing Tee, Right Stand Only (0.5 x 0.5 x 0.25 in)
3	Coupling, Left Stand Only, (0.5 in)
4	Tee, Left Stand Only (0.5 in)
5	Cross, Right Stand Only (0.5 in)
6	Pipe to Hose Nipple, Right Stand Only (0.5 in)
7	Female Hose Coupling (5/8 in)
8	Input Hose, Right Stand Only (2.0 ft) (5/8 in diameter)
9	Close Nipple (0.5 in)
10	Cross (0.5 in) with Weld-On Cap (0.5 in)
11	Nipple (0.5 x 12 in)
12	Cap (0.5 in)
13	Female Hose Coupling (5/8 in)
14	Cross Hose (12 ft) (5/8 in diameter)
15	Hose Quick Connect
16	Pipe to Hose Nipple (0.5 in)
17	Pipe (0.5 x 60 in)
18	Water Pressure Gauge, Right Stand Only
19	Full Jet Spray Nozzle, No. 1/2GG-25 or Equivalent
20	Coupling (0.5 in)

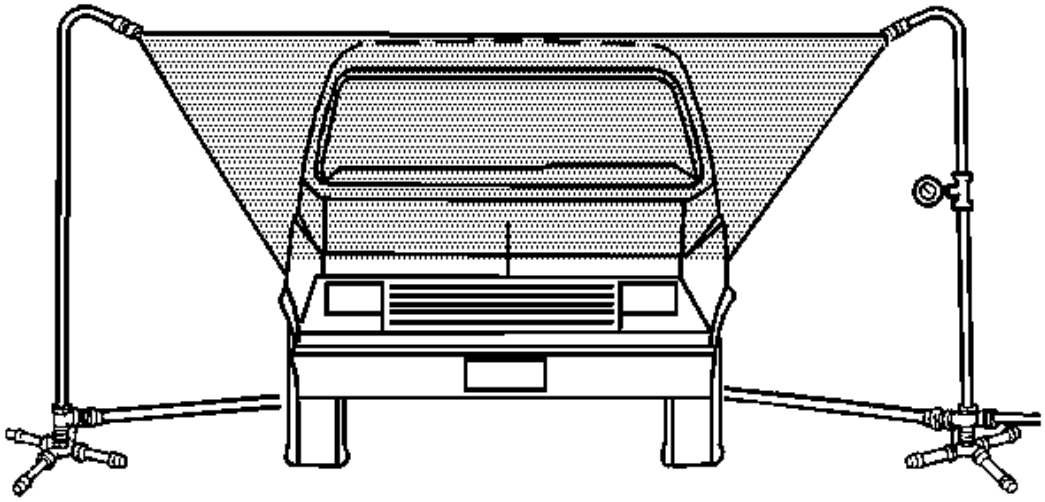

Fig. 2: Illustrating How Water Spray From Stands Should Overlap Vehicle
Courtesy of GENERAL MOTORS COMPANY

2. Position the stands as shown.

   The water spray from the stands should overlap the vehicle as shown.

3. Have an assistant inside of the vehicle during the test in order to locate any leaks.
4. The water pressure at the nozzle should maintain a 155 kPa (22 psi), for at least 4 minutes.

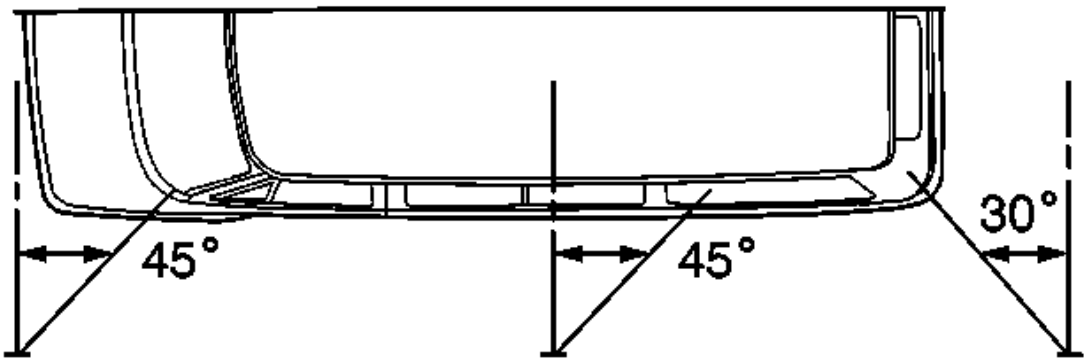

Fig. 3: Identifying Proper Water Spray Angles
Courtesy of GENERAL MOTORS COMPANY

5. In order to check the windshield, aim the water spray 30 degrees down and 45 degrees toward the rear.

   Aim the water towards the corner of the windshield.

6. In order to check the side windows for leaks, position the water stand towards the center of the rear quarter, aiming the water spray 30 degrees down and 45 degrees toward the rear.
7. In order to check the back window, aim the water spray 30 degrees down and 30 degrees toward the front.

DUST LEAKS

Dust may leak into the vehicle where water will not. This happens particularly in the lower portion of the interior.

Forward motion of the vehicle can create a slight vacuum which pulls air and dust into the vehicle.

In order to determine the location of dust leaks, perform the following steps:

1. Remove the mats from the floor.
2. Remove the mats from the kick panel.
3. Remove the insulation from the floor.
4. Remove the insulation from the kick panel.
5. Drive the vehicle on a dusty road.
6. Examine the interior.

   Dust in the shape of a small cone or slit will usually be found at the point of leakage.

7. Mark the points of leakage.

   NOTE: **Ensure that the interior is darkened when performing this step.**

8. Shine bright lamps on the underside of the floor and the cowl.
9. Have an assistant mark any points inside of the vehicle for any points where the light shines through.
   - Inspect the weld joints.
   - Inspect the body mounts.
10. Seal any leaks with an air-drying, body-sealing compound.

WATER HOSE TEST

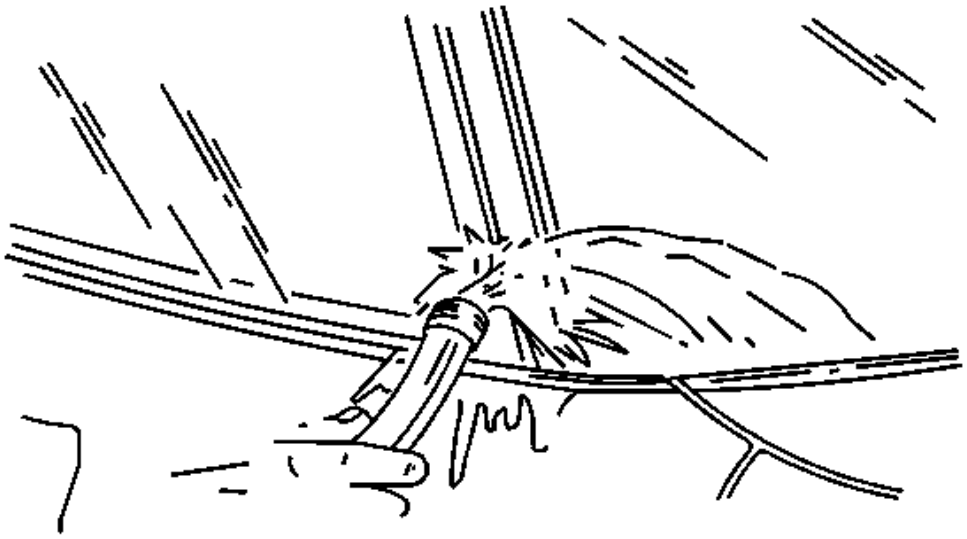

Fig. 4: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use a water hose without the nozzle attached.**

1. Have an assistant inside of the vehicle in order to locate the leak.
2. Begin testing at the base of the window or the windshield.
3. Slowly move the hose upward and across the top of the vehicle.

AIR HOSE TEST

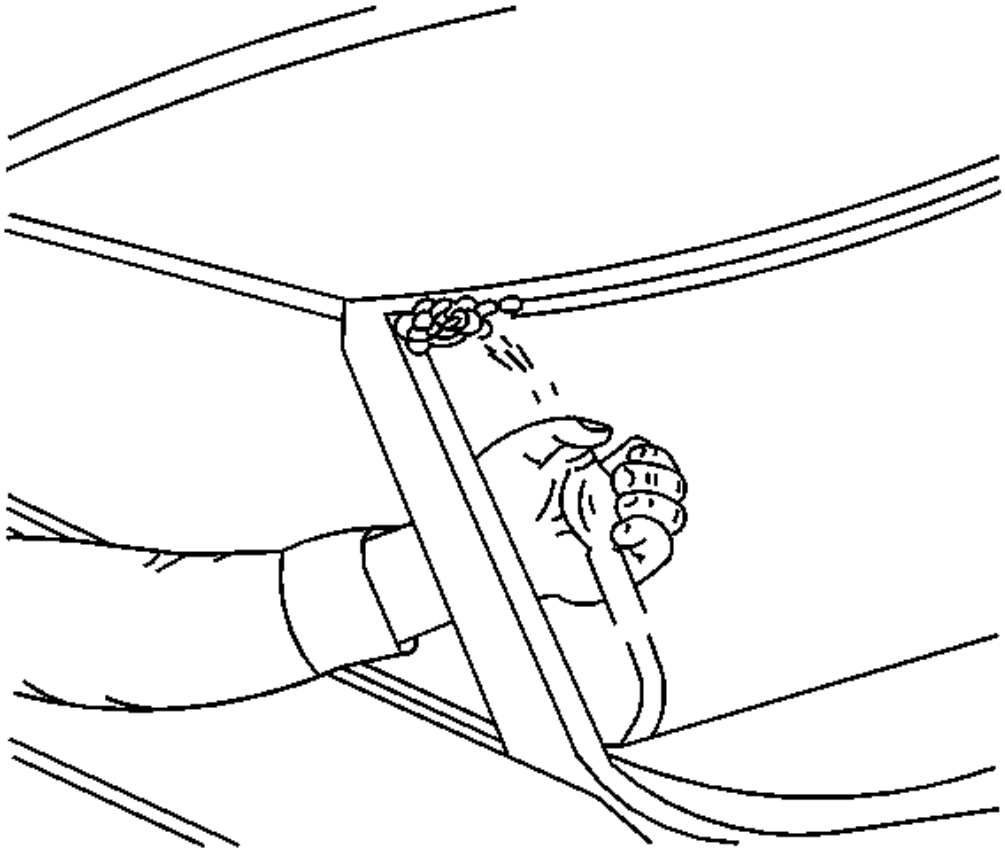

Fig. 5: Performing Air Hose Test
Courtesy of GENERAL MOTORS COMPANY

CAUTION: The air hose test should only be used on fully cured urethane adhesive. Otherwise, damage to the urethane adhesive bead could result in additional leaks.

1. Using a liquid detergent, diluted with water in a spray bottle, spray the window at the edges. Begin at the bottom and gradually move up and across the top.

NOTE: The compressed air should not exceed 205 kPa (30 psi).

2. Have an assistant inside of the vehicle with an air hose.
3. Have the assistant aim the compressed air at the suspected areas.

Bubbles will form in the soap solution at the location of the leak.

REPAIR INSTRUCTIONS

BODY WATERLEAK REPAIR

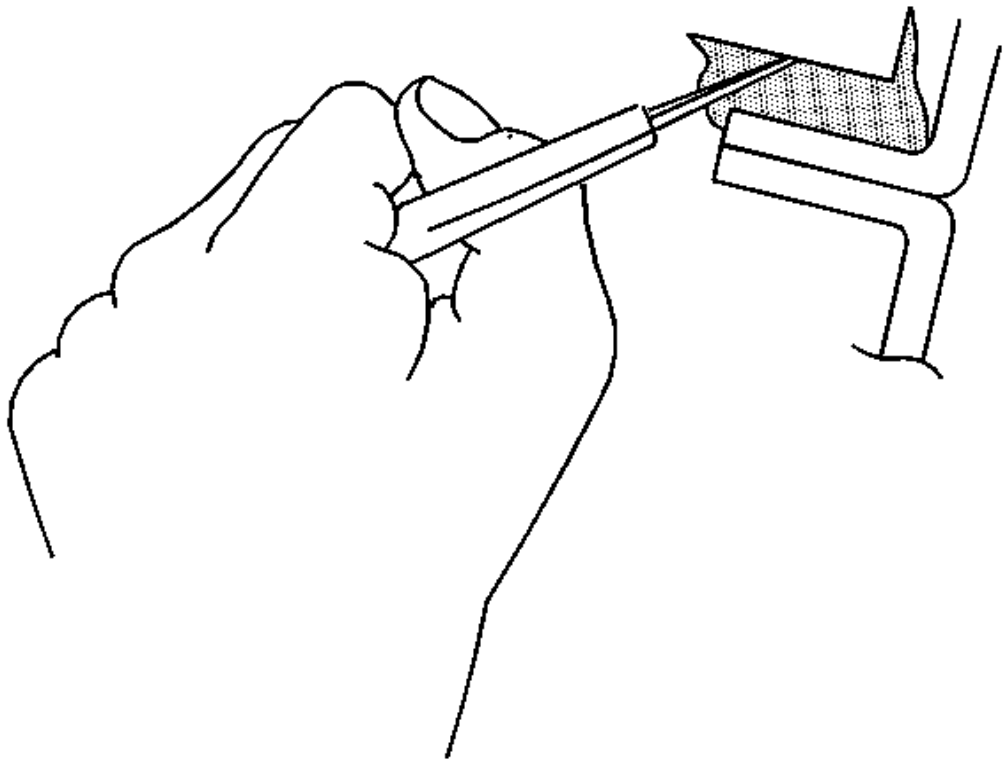

Fig. 6: Cutting Out A Portion Of The Adhesive Caulking (1 Of 2)
Courtesy of GENERAL MOTORS COMPANY

WARNING: If the vehicle interior is exposed to moisture and becomes soaked up to the level of the sensing and diagnostic module (SDM), the SDM and SDM harness connector must be replaced. The SDM could be activated when powered, which could cause airbag deployment and result in personal injury.

Depending on the location of the waterleak, you may have to remove certain interior components in order to repair the leak.

1. If the floor carpet is wet refer to **Floor Carpet Drying** .

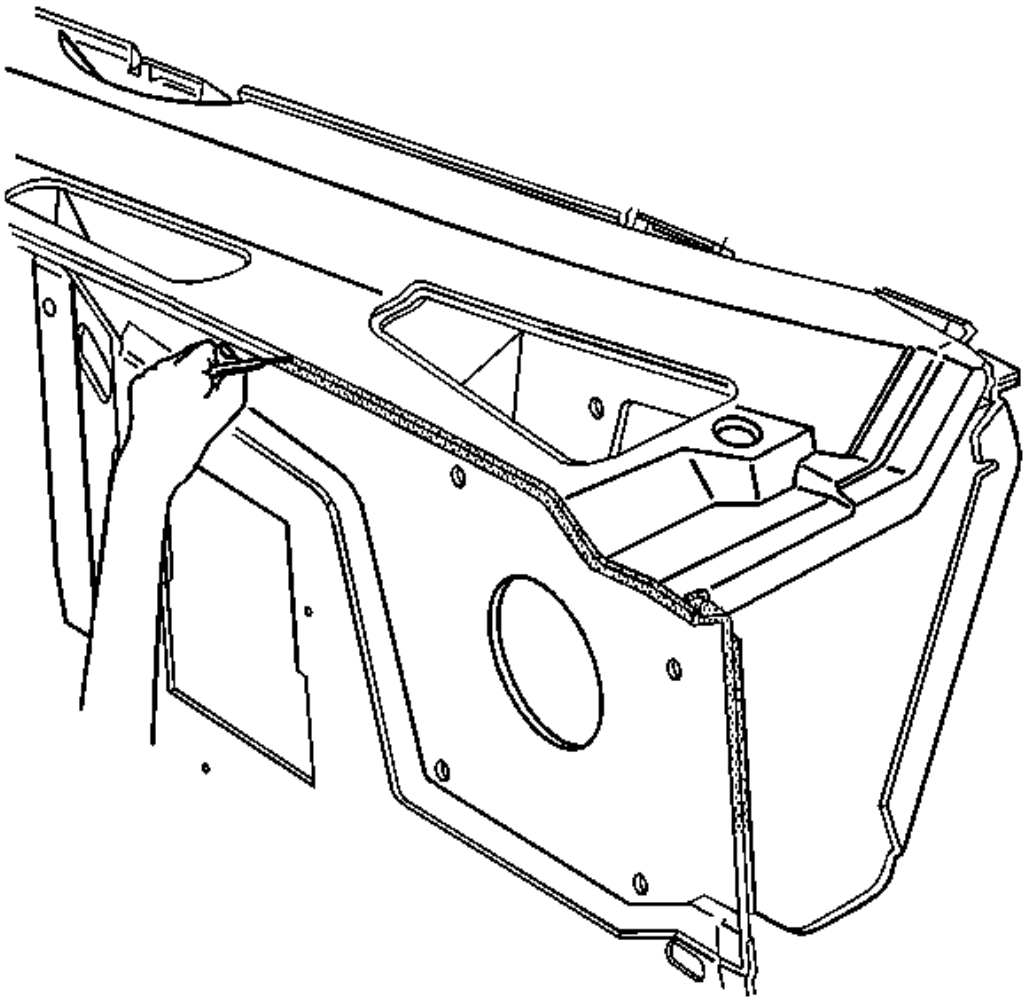

Fig. 7: Cutting Out A Portion Of The Adhesive Caulking (2 Of 2)
Courtesy of GENERAL MOTORS COMPANY

2. Cut out a portion of the adhesive caulking in the leak area from inside or outside of the vehicle.
3. Clean and remove all loose particles of the adhesive old caulking from the area.
4. Apply joint body and seam sealer where the old adhesive caulking was removed.
5. Allow the adhesive caulking to dry for several hours.
6. Test for leaks.
7. Install the trim, if removed.

STATIONARY WINDOW WATERLEAK REPAIR

WARNING: If any water enters the vehicle interior up to the level of the carpet or higher and soaks the carpet, the sensing and diagnostic module (SDM) and the SDM harness connector may need to be replaced. The SDM could be activated when powered, which could cause deployment of the air bag(s) and result in personal injury. Before attempting these procedures, the SIR system must be disabled. Refer to Disabling the SIR System.

With the ignition OFF, inspect the SDM mounting area, including the carpet. If any significant soaking or evidence of significant soaking is detected, you must perform the following tasks:

1. **Remove all water.**
2. **Repair the water damage.**
3. **Replace the SDM harness connector.**
4. **Replace the SDM.**

Failure to follow these tasks could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

1. If the floor carpet is wet refer to **Floor Carpet Drying** .
2. Remove the trim moldings or the headliner in order to repair the leak, if needed.
3. Determine the source of water entry.
4. If water is leaking at the edge of the windshield, reseal the windshield using Urethane Adhesive Systems which meet GM Specification GM 3651G.
5. If water leaks into the vehicle at the sides of the stationary windows, reseal the window using Urethane Adhesive Systems which meet GM Specification GM 3651G.

[1] Damaged rear wheel speed sensor ring can cause code to set.				

Circuit/System Description

As the wheel spins, the wheel speed sensor produces an AC signal. The electronic brake control module (EBCM) uses the frequency of the AC signal to calculate the wheel speed.

Conditions for Running the DTC

C0035 00-C0050 00

- The ignition is ON.
- Ignition voltage is greater than 8 volts.

C0035 0F-C0050 0F

- The ignition is ON.
- Ignition voltage is greater than 8 volts.
- The brake pedal is not pressed.
- A DTC is not set for the other wheel speed circuit on the same axle.

C0035 18-C0050 18

- The ignition is ON.
- Ignition voltage is greater than 8 volts.
- The brake pedal is not pressed.
- No other wheel speed circuit DTCs are set.
- At least two other wheel speeds are not 0 km/h.

Conditions for Setting the DTC

C0035 00-C0050 00 Open or Shorted Signal

- An open is detected on the wheel speed sensor signal circuit.
- A short to ground is detected on the wheel speed sensor signal circuit.
- A short to voltage is detected on the wheel speed sensor signal circuit.

C0035 0F-C0050 0F Sensor Dropout

Detects a missing sensor signal when the vehicle has been in motion with all sensors working.

- All wheel speeds have been read as greater than 12.9 km/h (8 mph).
- One wheel speed suddenly reads 0 km/h (0 mph) within 15 msec.
- Vehicle velocity remains greater than 12.9 km/h (8 mph).

OR

C0035 0F-C0050 0F Erratic Signal

- Any wheel speed changes by 17.7 km/h (11 mph) or more in 0.01 second.
- Vehicle velocity remains greater than 12.9 km/h (8 mph).

C0035 18-C0050 18 Missing Sensor

Detects a missing sensor signal (or signals) when the vehicle accelerates from a standstill.

- One wheel speed is less than 20 percent of the maximum of the others for 5 seconds.
- At least one of the remaining wheel speeds are greater than 12.9 km/h (8 mph).
- There has been no wheel acceleration/deceleration exceeding 21.9 mph/sec.

OR

- The 2 wheel speed sensor inputs are less than 20 percent of the maximum of the others for 120 seconds.
- At least one of the remaining wheel speeds are greater than 12.9 km/h (8 mph).
- There has been no wheel acceleration/deceleration exceeding 21.9 mph/sec.

Action Taken When the DTC Sets

- The EBCM disables the Antilock Brake System (ABS)/Traction Control System (TCS)/Vehicle Stability Enhancement System (VSES) for the duration of the ignition cycle.
- The dynamic rear proportion (DRP) does not function optimally.
- The ABS indicator turns ON.
- The Traction Control indicator turns ON.
- The driver information center (DIC) displays the Service Stability System message.

Conditions for Clearing the MIL/DTC

- The condition for setting the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- A damaged rear wheel speed sensor ring can cause failure type byte 04 (Erratic Signal) to set.
- If 2 or more wheel speed sensors are inoperative diagnose each wheel speed sensor individually.

C0035 18, 0F, 00-C0050 18, 0F, 00

If the customer comments that the ABS indicator is ON only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the wheel speed sensor wiring for signs of water intrusion. If the DTC is not current, clear all DTCs and simulate the effects of water intrusion by using the following procedure:

1. Spray the suspected area with a 5 percent saltwater solution. To create a 5 percent saltwater solution, add 2 teaspoons of salt to 8 fl oz of water (10 g of salt to 200 ml of water).
2. Test drive the vehicle over various road surfaces: bumps, turns, etc., above 40 km/h (25 mph) for at least 30 seconds.
3. Rinse the area thoroughly when completed.

Circuit/System Verification

With scan tool installed drive the vehicle in a straight line at a speed greater than 8 km/h (5 mph), all wheel speed sensors should read the same miles per hour.

Circuit/System Testing

IMPORTANT: Component Testing is performed before Circuit Testing when diagnosing wheel speed sensors.

1. With the ignition OFF, disconnect the EBCM connector.
2. With the ignition ON, measure for 0 volt between the sensor signal circuit terminal or the low reference circuit and ground at the EBCM connector.
    - If over 0 volt, repair short to voltage in sensor signal circuit or the low reference circuit.
3. With the ignition OFF, measure for infinite ohms of resistance between the wheel speed sensor signal or the low reference circuit and ground at the EBCM connector.
    - If less than infinite ohms, repair short to ground in the sensor signal or the low reference circuit.
4. Measure for 850-1350 ohms of resistance between the wheel speed sensor signal and low reference circuits at the EBCM connector.
    - If greater than 1350 ohms test for an open/high resistance in the circuit or faulty wheel speed sensor.
    - If less than 850 ohms test for a short between the circuits or faulty wheel speed sensor.
5. If all circuits test normal replace the EBCM.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate wheel speed sensor.
2. Test for 850-1350 ohms between the signal terminal A and the low reference signal terminal B. During the test, check for an intermittent circuit condition by gentle moving the wheel speed sensor pigtail harness.
    - If not within the specified range, replace the wheel speed sensor.
3. Test for infinite resistance between each terminal and the steering knuckle. Reverse the test leads, test for infinite resistance between each terminal and the steering knuckle again.
    - If less than the specified value, replace the appropriate wheel speed sensor.
4. Spin the wheel while monitoring the voltage between the signal terminal A and the low reference terminal B. The voltage should be greater than 100 mV AC.
    - If less than the specified range, replace the wheel speed sensor.

Pump Motor Ground	-	1	-	-
EBCM Battery Positive Voltage	-	1	-	-
Pump Motor Circuit	-	C0110 04	C0110 07	C0110 61 C0110 00
1-Circuit Inoperative				

Circuit/System Description

The electronic brake control module (EBCM) supplies ground to activate the Antilock Brake System (ABS) pump motor. An internal system relay in the EBCM supplies battery positive voltage to the pump motor when the ignition is turned ON. The EBCM monitors pump motor feedback voltage after activation to detect a stalled or binding pump motor.

Conditions for Running the DTC

C0110 04

- System and ignition voltage is above 10.5 volts.
- The system enable relay is ON.
- The pump motor has been commanded OFF for 2.5 seconds.

C0110 61

- The ignition is ON.
- The system enable relay is ON.
- The pump motor has been commanded ON, OFF and ON again.

Conditions for Setting the DTC

C0110 04

The EBCM detects an open in the pump motor circuit when the feedback voltage remains greater than 0.75 volt for more than 50 msec.

C00110 61

The pump motor continues to rotate briefly after activation creating a feedback voltage. The EBCM sets the code if the measured feedback voltage indicates a binding or stalled pump motor.

Action Taken When the DTC Sets

- The EBCM disables the ABS and the Traction Control System (TCS) (JL9) for the duration of the ignition cycle.
- The ABS indicator turns ON.
- The Traction Control indicator turns ON.
- The driver information center (DIC) displays the SERVICE TRACTION CONTROL message.

Conditions for Clearing the DTC

- The ABS indicator may remain illuminated after repairs are made and DTCS are cleared, until the vehicle is operated at speeds greater than 13 km/h (8 mph) and the self test is completed.
- The condition for the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

The pump motor is integral to the brake pressure modulator valve (BPMV). The pump motor is not serviceable.

Circuit/System Testing

1. Ignition OFF, disconnect the EBCM harness connector and connect a test lamp between the battery positive voltage circuit terminal, and to chassis ground.
2. Verify that the test lamp illuminates.
    - If the test lamp does not illuminate, repair the open or high resistance in the battery positive voltage circuit.
3. Connect a test lamp between the battery positive voltage circuit and pump motor ground circuit at the EBCM connector, verify that the test lamp illuminates.
    - If the test lamp does not illuminate, repair the open or high resistance in the pump motor ground circuit.
4. Ignition OFF, remove the EBCM from the BPMV.
5. Inspect the EBCM to BPMV connector for conditions such as damage, corrosion, or presence of brake fluid.
    - If connector corrosion or damage is evident, replace BPMV and/or EBCM as necessary.
    - If brake fluid is present, replace both BPMV and EBCM.
6. Connect the EBCM harness to the EBCM with the BPMV still separated.
7. Connect a test lamp between the pump motor circuits, internal EBCM side.
8. Ignition ON, use the scan tool to perform the Pump Motor Test.
    - If test lamp illuminates replace the BPMV.
    - If test lamp does not illuminate replace the EBCM.

Repair Instructions

DTC C0131: ANTILOCK BRAKE SYSTEM (ABS) TRACTION CONTROL SYSTEM (TCS) PRESSURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0131 00

Antilock Brake System (ABS) Traction Control System (TCS) Pressure Circuit

Circuit/System Description

The electronic brake control module (EBCM) monitors the internal brake pressure sensor signal, and correlates the reading with brake pedal position parameter.

Conditions for Running the DTC

- Ignition ON.
- System voltage is above 9 volts.
- The vehicle speed is greater than 40 km/h (24 mph).

Conditions for Setting the DTC

- A short to voltage, a short to ground, or an open high resistance is detected with the internal brake pressure sensor.
- Brake pedal signal does not correlate to brake pressure signal.
- Signal is erratic.

Action Taken When the DTC Sets

- The EBCM disables the VSES for the duration of the ignition cycle.
- A driver information center message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Circuit/System Testing

1. Verify that DTC C0277, C0297, B3445 or B3884 is not set.
   - If any of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Ignition ON, observe the scan tool EBCM, BPP Signal parameter. The parameter should be Released when the brake pedal is not applied, and change to Applied when the brake pedal is applied.
   - If not within the specified value, perform the scan tool BCM, BPP Sensor Calibration procedure. Refer to **Brake Pedal Position Sensor Calibration** . If the DTC resets, replace the brake pedal position sensor.
3. Replace the brake pressure modulator valve assembly and verify the DTC does not reset. If the DTC resets, replace the EBCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Brake Pedal Position Sensor Replacement**
- **Brake Pressure Modulator Valve Replacement**
- **Control Module References** for EBCM replacement, programming and setup

DTC C0161: ANTILOCK BRAKE SYSTEM (ABS) BRAKE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0161 00

Antilock Brake System (ABS) Brake Switch Circuit

Circuit/System Description

The brake pedal position (BPP) sensor is an input to the body control module (BCM). The BCM activates the brake lamps when the BPP is in an applied state. The BCM then sends a brake pedal applied state status via high speed GMLAN serial data messages to the electronic brake control module (EBCM). The brake pressure modulator valve (BPMV) sensor monitors the brake pressure and sends a variable voltage signal to the EBCM.

Conditions for Running the DTC

- The vehicle speed is greater than 16 km/h (10 mph).

- The ignition voltage is greater than 9.5 volts.

Conditions for Setting the DTC

- The EBCM detects the vehicle speed greater than 21 km/h (13 mph), the brake pedal is Applied for 1 minute, and brake pressure is not increasing.
- The EBCM detects the brake pedal is Released and the vehicle speed is decreasing while brake pressure is increasing.

Action Taken When the DTC Sets

- The EBCM disables the antilock brake system (ABS), traction control system (TCS) and vehicle stability enhancement system (VSES) for the duration of the ignition cycle.
- A driver information center message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

The DTC C0161 00 can be set if the brake pedal is applied while accelerating, the brake pedal position sensor is out of adjustment, or the pedal is binding causing residual brake pressure to be detected, without the brake light signal detected.

Circuit/System Verification

NOTE: **Diagnose all other brake light DTCs or Symptoms prior to performing this diagnostic procedure.**

1. Verify that DTC C0277 or C0297 is not set.
   - If DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Apply and release the brake pedal. Verify brake lamps operate properly.
   - If brake lamps do not operate properly, refer to **Symptoms - Lighting** .
3. Verify the brake pedal position sensor or the brake pedal is not binding causing residual brake pressure to be detected, while the brake lights operate properly.
   - If a condition is found, repair or replace the applicable component.
4. Replace the brake pressure modulator valve assembly (BPMV). Verify DTC does not reset. If DTC resets, replace the EBCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Brake Pressure Modulator Valve Replacement**
- **Control Module References** for EBCM replacement, programming and setup

DTC C0179: SYSTEM THERMAL TEMPERATURE HIGH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0179 00

System Thermal Temperature High

Circuit/System Description

The electronic brake control module (EBCM) monitors traction control system activation in order to calculate an estimate of the EBCM solenoid valve temperatures. In most cases high solenoid valve temperatures are caused by traction control system extended activation. If the EBCM calculates that the solenoid valve temperatures are too high, the EBCM will temporarily suspend the traction control system function until the solenoid valves cool.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The EBCM detects the temperature of the solenoid valves is too high.

Action Taken When the DTC Sets

- The EBCM disables the traction control system/vehicle stability enhancement system.
- A driver information center message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The EBCM calculates the brakes have cooled sufficiently.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

DTC C0179 does not indicate a malfunction has occurred. Most occurrences of this DTC are caused by excessive traction control activation or braking. This DTC indicates there was excessive ABS or traction control activation.

Circuit/System Verification

Verify that the DTC sets outside of the Conditions for Running and Setting. Since most occurrences of this DTC are caused by an excessive braking or traction control usage, review with the customer the conditions under which the DTC set.

- If the DTC set within the Conditions for Running and Setting, the brake system is operating as designed.

DTC C0186: LATERAL ACCELEROMETER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0186

Lateral Accelerometer Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference	C0292	C0292	C0292	-
Yaw Rate Sensor Signal	C0196	C0196	C0196	-
Lateral Accelerometer Signal	C0186	C0186	C0186	-
Ground	C0186 C0196	C0186, C0196	C0186, C0196	C0196
Yaw Rate Sensor test control	C0196	C0196	C0196	-
Longitudinal Accelerometer Sensor Signal	-	-	-	-

Circuit/System Description

The lateral accelerometer and the yaw rate sensors are combined into one sensor external to the electronic brake control module (EBCM). The vehicle stability enhancement system (VSES) uses the lateral accelerometer input when calculating the desired yaw rate. The usable output voltage range for the lateral accelerometer is 0.25-4.75 volts.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

- The yaw/lateral combination sensor fails an internal self test.
- Ignition voltage to the yaw/lateral combination sensor is less than 9.5 volts.
- Communication is lost between the EBCM and the yaw/lateral combination sensor.

Action Taken When the DTC Sets

- The EBCM turns OFF the 5-volt reference circuit, until the ignition is cycled.
- The driver information center (DIC) displays the Service Stabilitrak message.
- The ABS indicator turns ON.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- If the yaw and lateral acceleration sensor is disconnected, DTCs will set and the EBCM will not provide 5-volt reference.
- The yaw rate and lateral accelerometer sensors are located in one unit and cannot be serviced separately.
- A poor ground connection for the EBCM may cause this DTC to set.

Circuit/System Description

The vehicle stability enhancement system (VSES) is activated by the electronic brake control module (EBCM) calculating the desired yaw rate and comparing it to the actual yaw rate input. The desired yaw rate is calculated from measured steering wheel position, vehicle speed, and lateral acceleration. The difference between the desired yaw rate and actual yaw rate is the yaw rate error, which is a measurement of oversteer or understeer. If the yaw rate error becomes too large, the EBCM will attempt to correct the vehicle yaw motion by applying differential braking to the wheels.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 volts.

Conditions for Setting the DTC

C0196 00

- The vehicle speed has reached at least 15 km/h (9 mph) from a stop more three times during the same ignition cycle. Then during the time the vehicle is stationary, the yaw rate signal value is more than 7 deg/sec for 2 seconds.
- When vehicle speed is more than 25 km/h (16 mph) in a turn the difference between the yaw rate, steering angle, lateral acceleration, and wheel speed sensor values are not correlated three consecutive times.
- Yaw rate changes greater than 20 deg/sec in 6 ms 4 times in 1 second.
- The yaw/lateral combination sensor fails an internal self test.

C0196 28

The yaw frequency measured is not between 13400.0-14600.0 Hz for more than 200 msec.

Action Taken When the DTC Sets

- The EBCM turns OFF the 12-volt reference circuit, until the ignition is cycled.
- The driver information center (DIC) displays the Service Stabilitrak message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

IMPORTANT: When testing the yaw rate diagnostic frequency circuit include all bulkhead, and splice connectors in the harness between the EBCM and the sensor.

- If DTC C0292 is set, diagnose that DTC first.
- If the yaw and lateral accelerometer sensor is disconnected, DTCs will set and the EBCM will not provide 12-volt reference.
- The yaw rate and lateral accelerometer sensors are located in one unit and cannot be serviced separately.
- A poor ground connection for the EBCM may cause this DTC to set.

Circuit/System Testing

C0196 00

1. Visually inspect the yaw rate sensor/lateral accelerometer for proper and secure mounting.
    - If the sensor is improperly secured, remove and properly install the sensor.
2. Ignition OFF, disconnect the harness connector at the yaw rate sensor/lateral accelerometer.
3. Ignition OFF for 30 seconds, test for less than 1 ohm between the low reference circuit terminal 6 and ground.
    - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the EBCM.
4. Ignition ON, test for 12-volts between the 12-volt reference circuit terminal 1 and ground.
    - If greater than the specified value, test the 12-volt reference circuit for a short to voltage. If the circuit tests normal, replace the EBCM.
    - If less than the specified range, test the 12-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the EBCM.
5. Ignition OFF, disconnect the harness connector at the EBCM.
6. Ignition ON, test for less than 1 volt between the following signal circuits and ground:
    - Yaw rate signal terminal 3
    - Lateral accelerometer signal terminal 2
    - If greater than the specified range, test the signal circuit for a short to voltage.
7. Test for less than infinite resistance between the following signal circuits and ground:
    - Yaw rate signal terminal 3
    - Lateral accelerometer signal terminal 2
    - If not the specified value, test the signal circuit for a short to ground.
8. Test for less than 2 ohms between the following signal circuit terminals:
    - Terminal 3 at the sensor harness connector and terminal 21 at the EBCM harness connector

- Terminal 2 at the sensor harness connector and terminal 33 at the EBCM harness connector
- If greater than the specified range, test the signal circuit for an open/high resistance.

9. If all circuits test normal, test or replace the yaw rate sensor/lateral accelerometer. After replacement and programming, operate the vehicle within the conditions for running the DTC and verify DTC C0196 00 does not set.
    - If the DTC sets, replace the EBCM.

C0196 28

1. Verify DTC C0196 00 is not set.
    - If DTC C0196 00 is set, refer to the above diagnostic procedure for C0196 00 before proceeding.
2. Ignition OFF, disconnect the harness connector at the yaw rate sensor/lateral accelerometer.
3. Test for 2.5k-6.5k ohms between the yaw rate diagnostic signal circuit terminal 4 and ground.
    - If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the EBCM.
    - If less than the specified range, test the signal circuit for short to ground. If the circuit tests normal, replace the EBCM.
4. If all circuits test normal, test or replace the yaw rate sensor/lateral accelerometer. After replacement and programming, operate the vehicle within the conditions for running the DTC and verify DTC C0196 28 does not set.
    - If the DTC sets, replace the EBCM.

DTC C0201: ANTILOCK BRAKE SYSTEM (ABS) ENABLE RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0201 00

Antilock Brake System (ABS) Enable Relay Contact Circuit

Circuit/System Description

The solenoid relay, located within the electronic brake control module (EBCM), supplies battery voltage to all of the valve solenoids.

Conditions for Running the DTC

- Ignition ON.
- The solenoid relay is commanded ON.

Conditions for Setting the DTC

One or more of the following conditions exists:

- The EBCM detects no change in voltage when the relay is commanded.
- The EBCM detects a stuck closed solenoid valve relay.

Action Taken When the DTC Sets

The EBCM sends a serial data message to illuminate the warning indicator/message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

DTC C0242 OR P0856: TCS MALFUNCTION/TRACTION CONTROL TORQUE REQUEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0242 71

Engine Control Module (ECM) Indicated TCS Malfunction Invalid Serial Data Received

DTC C0242 75

Engine Control Module (ECM) Indicated TCS Malfunction Signal Above Allowable Range

DTC P0856 00

Traction Control Torque Request Circuit

Circuit/System Description

The electronic brake control module (EBCM) and the engine control module (ECM) simultaneously control the traction control. The EBCM sends a serial data message to the ECM requesting torque reduction. When certain ECM DTCs are set, the ECM will not be able to perform the torque reduction for traction control. A serial data message is sent to the EBCM indicating that traction control is not allowed.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 volts.

Conditions for Setting the DTC

The ECM diagnoses a condition preventing the engine control portion of the traction control function and sends a serial data message to the EBCM indicating that torque reduction is not allowed. The ECM will typically set DTC P0856 and the EBCM will set C0242.

Action Taken When the DTC Sets

- The EBCM disables the TCS for the duration of the ignition cycle.
- The Traction Off indicator turns ON.

- The DIC displays the Service Traction Control message.
- The ABS remains functional.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present and the DTC is cleared with a scan tool.
- The electronic brake control module (EBCM) automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Circuit/System Verification

Verify that no DTCs are set in the ECM.

- If DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

DTC C0245: WHEEL SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0245 00

Wheel Speed Sensor Frequency

Circuit/System Description

The wheel speed sensor receives ignition voltage from the electronic brake control module (EBCM) and provides an output signal back to the EBCM. As the wheel spins the sensor sends a DC square wave signal to the EBCM. The EBCM uses the frequency of this signal to calculate the wheel speed.

Conditions for Running the DTC

- Brake is not applied.
- Vehicle is not cornering.
- No wheel speed sensor faults exist.
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

Wheel speed differences between one wheel and the others is greater than 25 percent.

Action Taken When the DTC Sets

- A DIC message may be displayed.
- A instrument cluster warning indicator may be displayed.
- The EBCM disables the traction control system and the vehicle stability enhancement system for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

NOTE: **During normal diagnostic and/or repair verification technicians may find that the ABS, Traction Control and/or Stability indicators may be ON with NO DTCs displayed by the EBCM. Do not replace the EBCM for this condition.**

If the ABS, Traction Control and/or Stability indicators are ON with no DTCs set, perform the following steps:

1. Remove the key from the ignition, open and close the driver's door to turn off retained accessory power, and wait 60 seconds.
2. Ignition ON, if the ABS, Traction Control and/or Stability indicators are still illuminated, operate the vehicle at speeds greater than 16 km/h (10 MPH) to complete the self test. The EBCM should request all indicators to turn OFF.
3. If the indicators remain ON with no DTCs set after the drive cycle, disconnect the battery for at least 60 seconds then reconnect the battery.
4. Operate the vehicle at speeds greater than 40 km/h (25 MPH), the EBCM should request all indicators to turn OFF.

Diagnostic Aids

- Faulty wheel speed sensor will not set this DTC.
- A vehicle using a space saver spare will not set this code.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool Wheel Speed Sensor parameters while spinning the wheels. The readings should be analog to the wheel speeds.

Circuit/System Testing

1. Verify that all tires have the proper air pressure.
    - If not the proper air pressure, adjust the air pressure for all tires to specification and verify the DTC does not reset. If the DTC resets, replace the EBCM.
2. Verify that all wheels and tires are the proper size.
    - If incorrect wheel or tire size, replace the incorrect wheel or tire and verify the DTC does not reset. If the DTC resets, replace the EBCM.
3. If all components test normal, replace the EBCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for EBCM replacement, programming and setup

DTC C0292: VSES COMBINATION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0292 00

VSES Combination Sensor Circuits

DTC C0292 02

VSES Combination Sensor Circuit Short to Ground

DTC C0292 07

VSES Combination Sensor Circuit Voltage Above Threshold

Circuit/System Description

The electronic brake control module (EBCM) supplies 12 V to the yaw rate sensor/lateral acceleration sensor and the steering angle sensor. The sensor supply voltage is monitored via an internal feedback circuit to the EBCM microprocessor.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The EBCM detects that the sensor supply voltage feedback indicates that the voltage level is less than 8.0 V or greater than 16.0 V for more than 30 msec, a fault is set.

Action Taken When the DTC Sets

- The EBCM turns OFF the 12 V reference circuit, until the ignition is cycled.
- The EBCM disables the traction control system (TCS)/vehicle stability enhancement system (VSES) for the duration of the ignition cycle.
- The driver information center (DIC) displays the Service Stabilitrak message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

If the yaw and lateral accelerometer sensor is disconnected, DTCs will set and the EBCM will not provide 12 V reference.

DTC C0558: CALIBRATION DATA NOT PROGRAMMED/LEARNED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0558 00

Calibration Data Not Programmed/Learned

Circuit/System Description

The electronic brake control module (EBCM) must be programmed using the service programming system (SPS).

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 volts.

Conditions for Setting the DTC

The EBCM has not been programmed.

Actions Taken When DTC Sets

- The EBCM disables the traction control system for the duration of the ignition cycle.
- The ABS remains functional.
- The Traction OFF Indicator turns ON.
- A driver information center message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present and the DTC is cleared with a scan tool.
- The electronic brake control module (EBCM) automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

DTC C0561 74

System Disabled Information Stored Invalid Serial Data Received value of signal protection calculation incorrect

DTC C0561 75

System Disabled Information Stored Invalid Serial Data Received signal above allowable range

Circuit/System Description

The electronic brake control module (EBCM) receives messages from other modules over GMLAN which are needed to perform antilock brake system (ABS) or traction control system (TCS) functions.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- Ignition voltage is greater than 8 volts.

Conditions for Setting the DTC

The EBCM receives an invalid message from another module over GMLAN which causes the EBCM to deactivate ABS, and TCS, etc.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- The EBCM disables the TCS until the DTC becomes a history DTC.
- The ABS remains functional.
- The Traction Off indicator turns ON.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present and the DTC is cleared with a scan tool.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

This DTC is for information only. As an aid to the technician, this DTC indicates that there are no problems in the ABS/TCS. The ECM and BCM should be checked for a possible fault .

Circuit/System Description

The steering angle sensor supplies 2 analog inputs, position signal A and position signal B, to the electronic brake control module (EBCM). The 2 input signals are approximately 90 degrees out of phase. By interpreting the relationship between the 2 inputs, the EBCM can determine the position of the steering wheel and the direction of the steering wheel rotation.

Conditions for Running the DTC

C0710 5A, and 17

- The ignition is ON.
- Ignition voltage is greater than 8 volts.
- The steering wheel position sensor has been powered ON for 0.2 seconds.
- The steering wheel position sensor is centered.
- The steering rate of position signal A is less than 80 degrees per second.

C0710 5A

Fault is set when the calculated steering angle from the sensor does not correlate with the steering angle calculated from the yaw rate.

C0710 4B

- The ignition is ON.
- Ignition voltage is greater than 8 volts.
- The steering wheel position sensor has been powered ON for 0.2 seconds.
- The steering wheel position sensor is centered.
- Steering Wheel Position Sensor not calibrated after installation.

Conditions for Setting the DTC

C0710 4B, 5A, and 17

Both position signal A and position signal B are greater than 4.9 volts or less than 0.2 volts for 1.6 seconds.

C0710 4B, 5A, and 17

The steering bias is greater than 40 degrees.

C0710 4B, 5A, and 17

The difference in the phase angle between position signal A and position signal B is greater than 106 degrees or less than 84 degrees continuously for 0.25 seconds.

C0710 4B, 5A, and 17

The changes in position signal A or position signal B is greater than 36 degrees between consecutive scans of the signal.

Action Taken When the DTC Sets

- The EBCM disables the vehicle stability enhancement system (VSES) for the duration of the ignition cycle.
- The vehicle dynamic caution (VDC) indicator illuminates.
- The driver information center (DIC) displays the SERVICE TRACTION message.
- The ABS remains functional.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The electronic brake control module (EBCM) clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- Inspect the vehicle for proper alignment. The car should not pull in either direction while driving straight on a level surface.
- The Snapshot function on the scan tool can help find an intermittent DTC.
- Possible causes for this DTC are the following conditions:
  - One of the steering wheel position sensor inputs are open, shorted to ground, or shorted to battery.
  - Internal steering angle sensor malfunction.
  - Noise on the steering wheel position signal circuits.
  - Yaw and lateral acceleration sensor malfunction causing drifting signal outputs.
  - Internal EBCM malfunction.

Scan Tool Reference

Control Module References for Scan Tool Information

Circuit System/Verification

1. With the scan tool perform the Steering Angle Sensor Centering.
2. Verify the DTC does not reset.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the steering angle sensor.
2. Ignition OFF, scan tool disconnected, all vehicle systems OFF, this may take up to 2 minutes, test for less than 10 Ω between the low reference circuit terminal 1 and ground.
    - If greater than the specified range, test for an open/high resistance in the low reference circuit. If the circuit tests normal, replace the EBCM.
3. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the EBCM.
4. Ignition OFF, disconnect the harness connector at the EBCM.
5. Ignition ON, test for less than 1 V between the EBCM Bus- communication terminal 33 and ground.
    - If greater than the specified value, test the communication circuit for a short to voltage.
6. Test for less than 1 V between the EBCM Bus- communication circuit terminal 21 and ground.
    - If greater than the specified value, test the communication circuit for a short to voltage.
7. Ignition OFF, test for infinite resistance between the EBCM Bus- communication circuit terminal 33 and ground.
    - If not the specified value, test the communication circuit for a short to ground.
8. Test for infinite resistance between the EBCM Bus- communication circuit terminal 21 and ground.
    - If not the specified value, test the communication circuit for a short to ground.
9. Test for less than 1 Ω of resistance between the EBCM communication circuit terminal 33 and Yaw Lateral Accelerometer Sensor terminal 2.

- If greater than the specified range, test the communication circuits for an open/high resistance.

10. Test for less than 1 Ω of resistance between the EBCM communication circuit terminal 21 and Yaw Lateral Accelerometer terminal 3.
    - If greater than the specified range, test the communication circuits for an open/high resistance.
11. Test for infinite resistance between the EBCM communication circuit terminal 21 and terminal 33.
    - If not the specified value, test the communication circuits for a short together.
12. If all circuits test normal, replace the steering wheel position sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Steering Angle Sensor Replacement**
- **Control Module References** for EBCM replacement, setup, and programming

SYMPTOMS - ANTILOCK BRAKE SYSTEM

The following steps must be completed before using the symptom tables.

IMPORTANT:

1. Perform the ABS Diagnostic System Check before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to **ABS Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the ABS. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

ABS Indicator Malfunction

ABS INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument panel cluster (IPC) momentarily illuminates the antilock brake system (ABS) indicator during the bulb check when the ignition is cycled ON. When the electronic brake control module (EBCM) detects a fault requiring ABS indicator ON, it sends a serial data message to the IPC to illuminate the ABS indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, with a scan tool command the IPC display test ON and OFF. The StabiliTrak indicator should turn ON and OFF.
    - If the indicator does not turn ON and OFF, replace the IPC.
2. Observe the scan tool BCM Traction Control Switch parameter while pressing and releasing the traction control switch. The reading should change between Active and Inactive.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the traction control switch.
2. Test for less than 1 ohm between the ground circuit terminal below and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool BCM Traction Control Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal for a short to ground. If the circuit tests normal, replace the BCM.
4. Install a 3A fused jumper wire between the signal circuit terminal and the ground circuit terminal. Verify the scan tool BCM Traction Control Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the traction control switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the traction control switch.
2. Test for infinite resistance between the signal terminal and the ground terminal with the switch in the open position.
    - If not the specified value, replace the traction control switch.
3. Test for less than 3 ohms between the signal terminal and the ground terminal with the switch in the closed position.
    - If greater than the specified range, replace the traction control switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Electronic Traction Control Switch Replacement**

REPAIR INSTRUCTIONS

ANTILOCK BRAKE SYSTEM AUTOMATED BLEED

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

NOTE:

- **Before performing the ABS Automated Bleed Procedure, first perform a manual or pressure bleed of the base hydraulic brake system. Refer to Hydraulic Brake System Bleeding (Manual) Hydraulic Brake System Bleeding (Pressure) .**
- **The automated bleed procedure must be performed when a new brake pressure modulator valve (BPMV) is installed, because the secondary circuits of the new BPMV are not prefilled with brake fluid.**

- **The automated bleed procedure is recommended when one of the following conditions exist:**
  - **Base brake system bleeding does not achieve the desired pedal height or feel**
  - **Extreme loss of brake fluid has occurred**
  - **Air ingestion is suspected in the secondary circuits of the brake modulator assembly**

The ABS Automated Bleed Procedure uses a scan tool to cycle the system solenoid valves and run the pump in order to purge any air from the secondary circuits. These circuits are normally closed off, and are only opened during system initialization at vehicle start up and during ABS operation. The automated bleed procedure opens these secondary circuits and allows any air trapped in these circuits to flow out away from the brake modulator assembly, which is then forced out at the brake corners by the pressure bleeder.

Automated Bleed Procedure

CAUTION: The Auto Bleed Procedure may be terminated at any time during the process by pressing the EXIT button. No further Scan Tool prompts pertaining to the Auto Bleed procedure will be given. After exiting the bleed procedure, relieve bleed pressure and disconnect bleed equipment per manufacturers instructions. Failure to properly relieve pressure may result in spilled brake fluid causing damage to components and painted surfaces.

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
3. Inspect the brake system for leaks and visual damage. Refer to **Symptoms - Hydraulic Brakes** . Repair or replace components as needed.
4. Lower the vehicle.
5. Prepare the brake bleeding equipment and the vehicle for a pressure bleed of the base hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** **Hydraulic Brake System Bleeding (Pressure)** .
6. Inspect the battery state of charge. Refer to **Battery Inspection/Test** .
7. Install a scan tool.
8. Turn the ignition ON, with the engine OFF.
9. With the scan tool, perform the following steps:
   1. Select Diagnostics
   2. Select the appropriate vehicle information
   3. Select Chassis
   4. Select Electronic Brake Control Module (EBCM)
   5. Select Special Functions
   6. Select Automated Bleed
10. With an assistant ready, raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

NOTE:

- **Apply the brake pedal when instructed, using moderate effort.**
- **Ensure the pedal remains applied until instructed to release by the scan tool.**
- **Do not exceed the time period allowed by the scan tool for having the bleeder valves open.**
- **The bleed sequence for each corner is as follows:**
  - **Left front**
  - **Right front**
  - **Right rear**
  - **Left rear**

11. Perform the automated bleed procedure as instructed by the scan tool.
12. If the automated bleed procedure is aborted, a malfunction exists. If a DTC is detected, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** to diagnose the DTC.
13. After completion of the automated bleed procedure, press and hold the brake pedal to inspect for pedal firmness.
14. If the brake pedal feels spongy, repeat the bleed procedure completely.
15. Remove the scan tool.
16. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
17. Lower the vehicle.
18. Adjust the brake fluid level. Refer to **Master Cylinder Reservoir Filling** .
19. Road test the vehicle while confirming the brake pedal remains high and firm.

STEERING ANGLE SENSOR REPLACEMENT

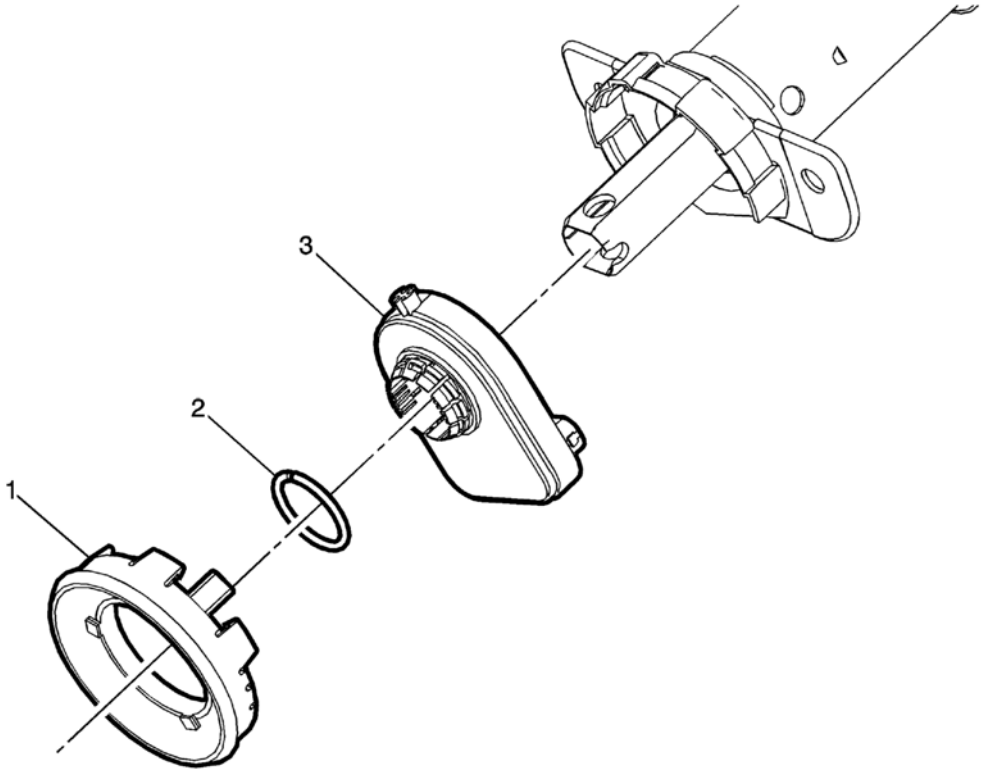

Fig. 4: Steering Angle Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the steering column. Refer to **Steering Column Replacement** .	
1	Steering Angle Sensor Retainer
2	Steering Angle Sensor Retaining Ring **CAUTION:** **Refer to Fastener Caution .** **Procedure** Remove and discard the old retaining ring. Do NOT reuse the retaining ring, replace with NEW only.
3	Steering Angle Sensor **Procedure** After the installation is complete, center the steering angle sensor. Refer to **Steering Angle Sensor Centering**.

STEERING ANGLE SENSOR CENTERING

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be

required after certain service procedures are performed. Some of these procedures are as follows:

- Steering gear replacement
- Steering column replacement
- Steering angle sensor replacement
- Intermediate shaft replacement
- Electronic brake control module (EBCM) replacement
- Collision or other physical damage

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align the front wheels forward.
2. Set the transmission in the PARK position.
3. Turn the ignition switch ON, with the engine OFF.
4. Clear any DTCs that may be set.
5. Select Steering Angle Sensor Centering in the Special Functions list.
6. Press the Reset button or follow the scan tool directions to complete the centering procedure.

ELECTRONIC BRAKE CONTROL MODULE REPLACEMENT

Removal Procedure

1. Place the ignition switch in the OFF position.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
4. Without draining the engine coolant and without disconnecting the hoses, remove the nuts and position aside the radiator surge tank. Refer to **Radiator Surge Tank Replacement** .
5. Clean the area surrounding the electronic brake control module (EBCM) to brake pressure modulator valve (BPMV) mating surfaces.

   CAUTION: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

6. Disconnect the EBCM electrical connector.

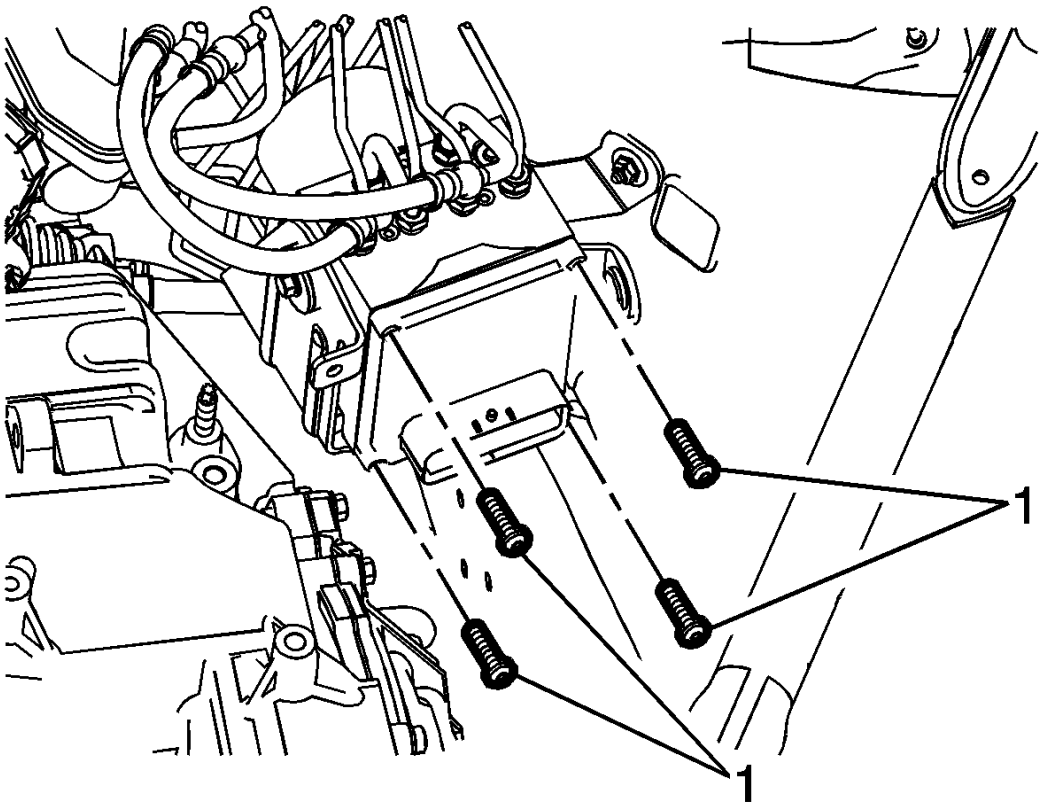

Fig. 5: Electronic Brake Control Module Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the EBCM bolts (1).

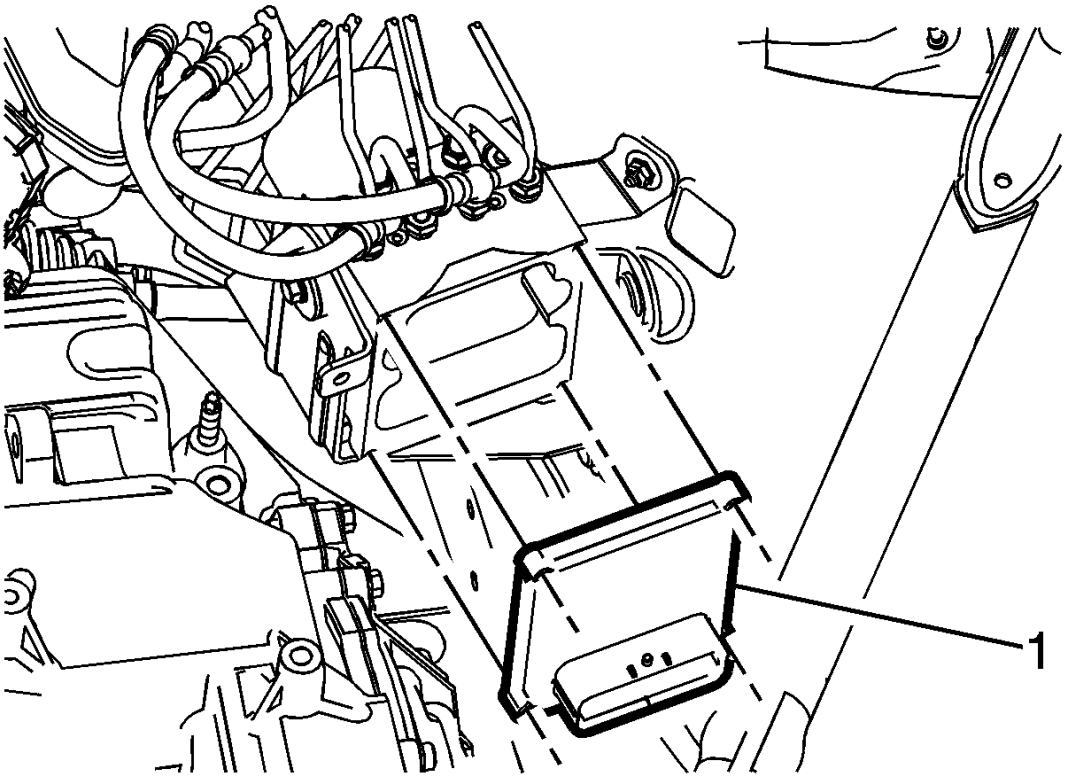

Fig. 6: Electronic Brake Control Module
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not pry the components apart.**

8. Separate the EBCM (1) from the BPMV.
9. Clean the sealing surfaces of the BPMV with denatured alcohol and a clean cloth.

Installation Procedure

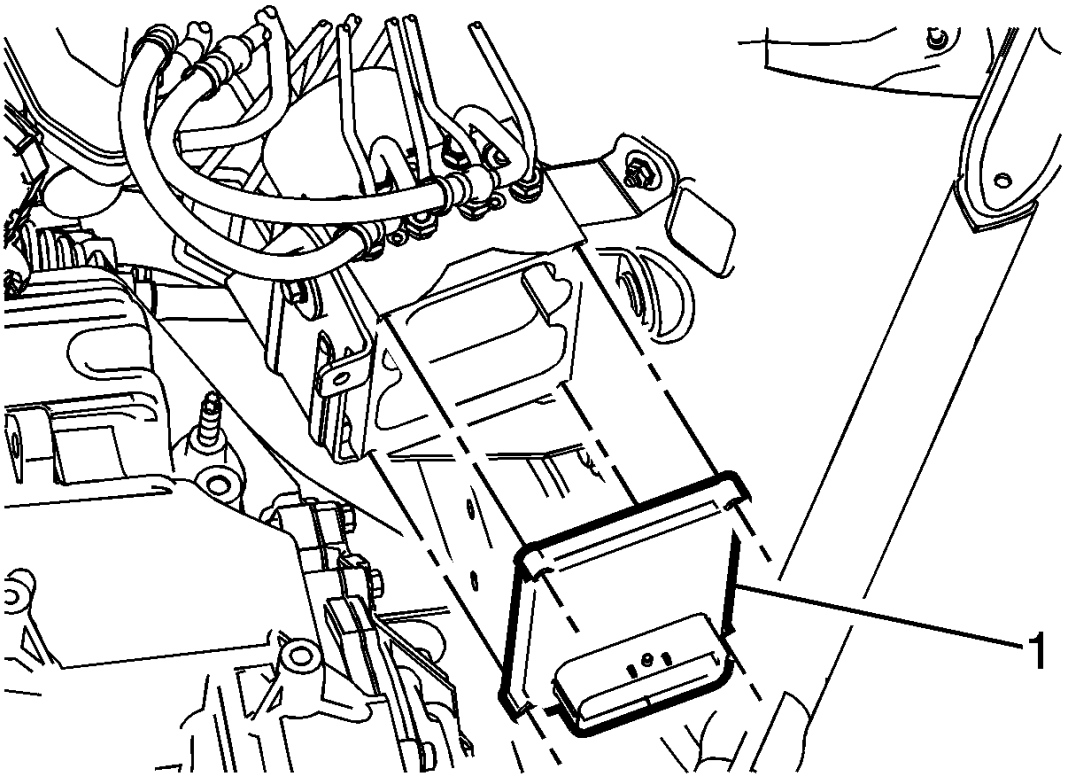

Fig. 7: Electronic Brake Control Module
Courtesy of GENERAL MOTORS COMPANY

1. Install the EBCM (1) to the BPMV.

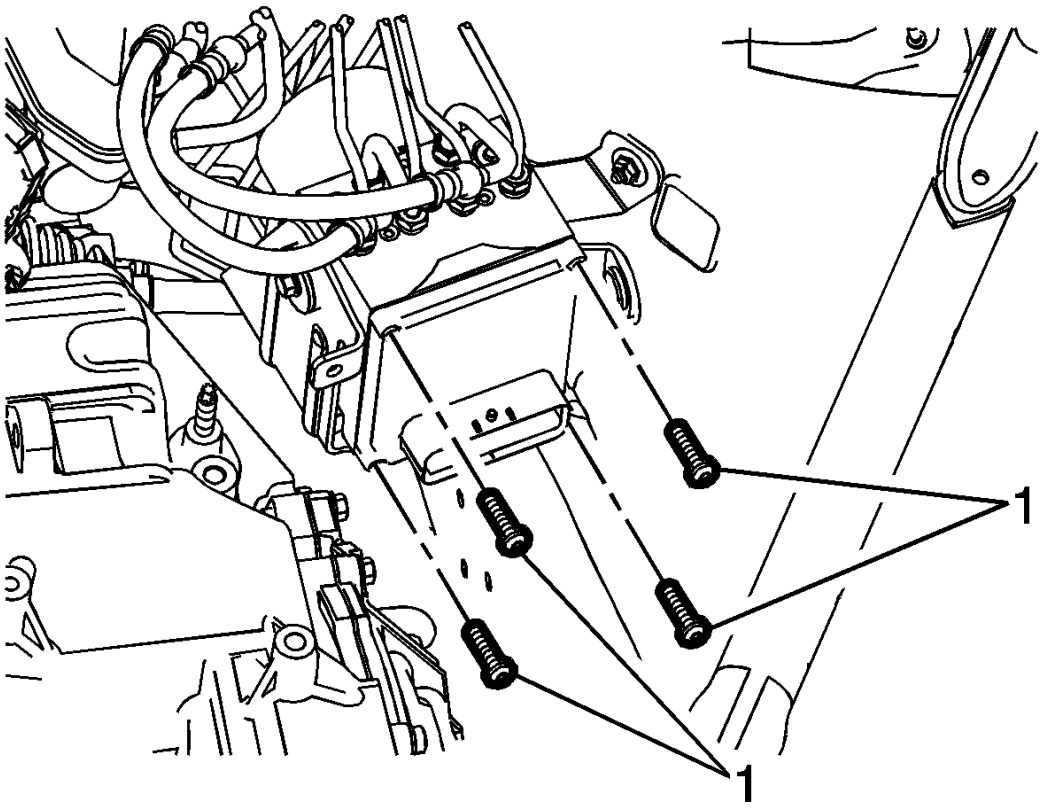

Fig. 8: Electronic Brake Control Module Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the EBCM bolts (1) and tighten to 3 N.m (27 lb in).
3. Connect the EBCM electrical connector.
4. Reposition the radiator surge tank and install the nuts. Refer to **Radiator Surge Tank Replacement** .
5. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
6. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
7. Program the EBCM. Refer to **Control Module References** .

BRAKE PRESSURE MODULATOR VALVE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Place the ignition switch in the OFF position.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
4. Without draining the engine coolant and without disconnecting the hoses, remove the nuts and position aside the radiator surge tank. Refer to **Radiator Surge Tank Replacement** .
5. Clean the area surrounding the electronic brake control module (EBCM) to brake pressure modulator valve (BPMV) mating surfaces.

CAUTION: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

6. Disconnect the EBCM electrical connector.

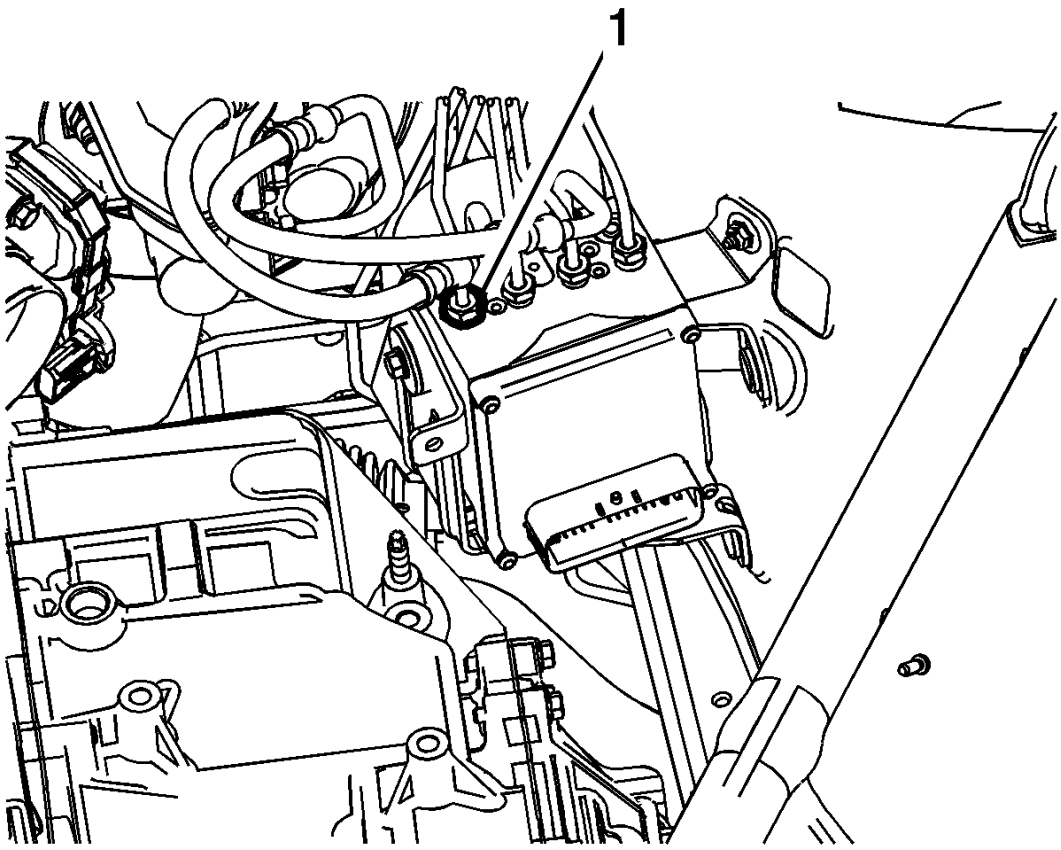

Fig. 9: Right Front Brake Pipe Fitting

15. Disconnect the master cylinder secondary brake pipe fitting (1) from the BPMV.
16. Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.

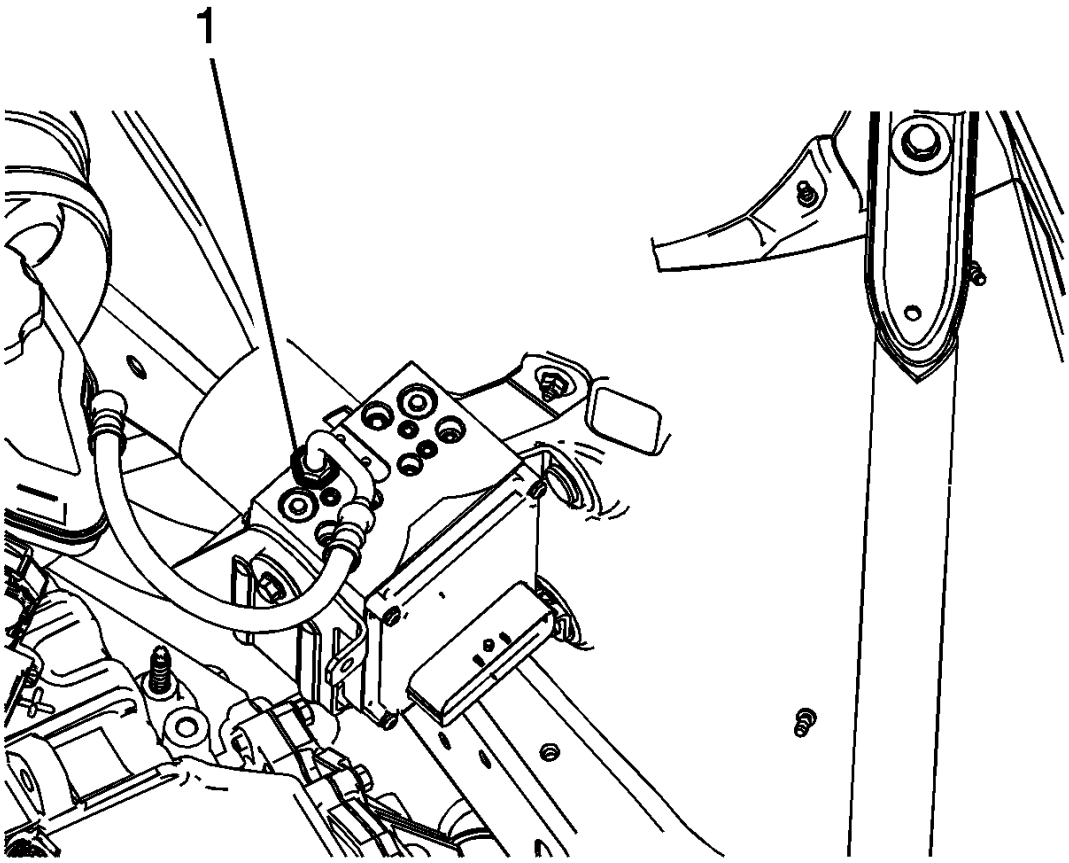

Fig. 14: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the master cylinder primary brake pipe fitting (1) from the BPMV.
18. Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.

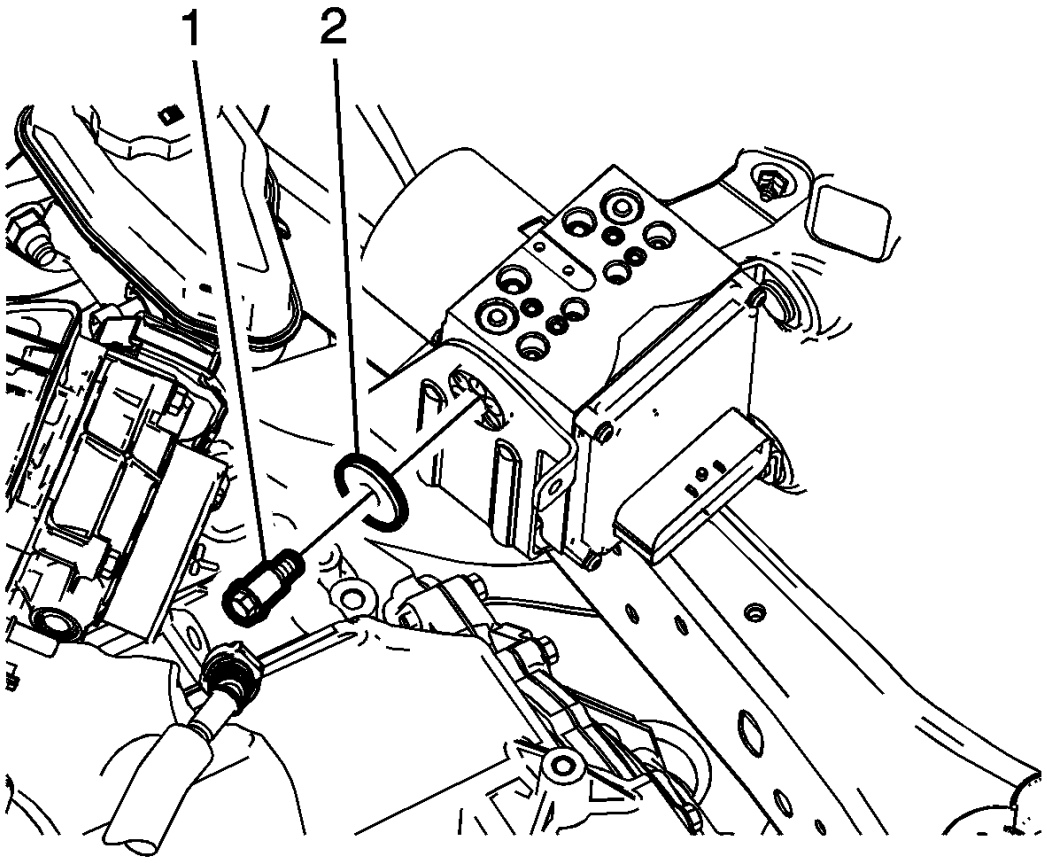

Fig. 15: Brake Pressure Modulator Valve Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

19. Remove the BPMV bolt (1) and washer (2).
20. Remove the BPMV assembly.
21. If necessary, remove the EBCM. Refer to **Electronic Brake Control Module Replacement**.

Installation Procedure

1. If removed, install the EBCM. Refer to **Electronic Brake Control Module Replacement**.
2. Install the BPMV assembly to the BPMV bracket.

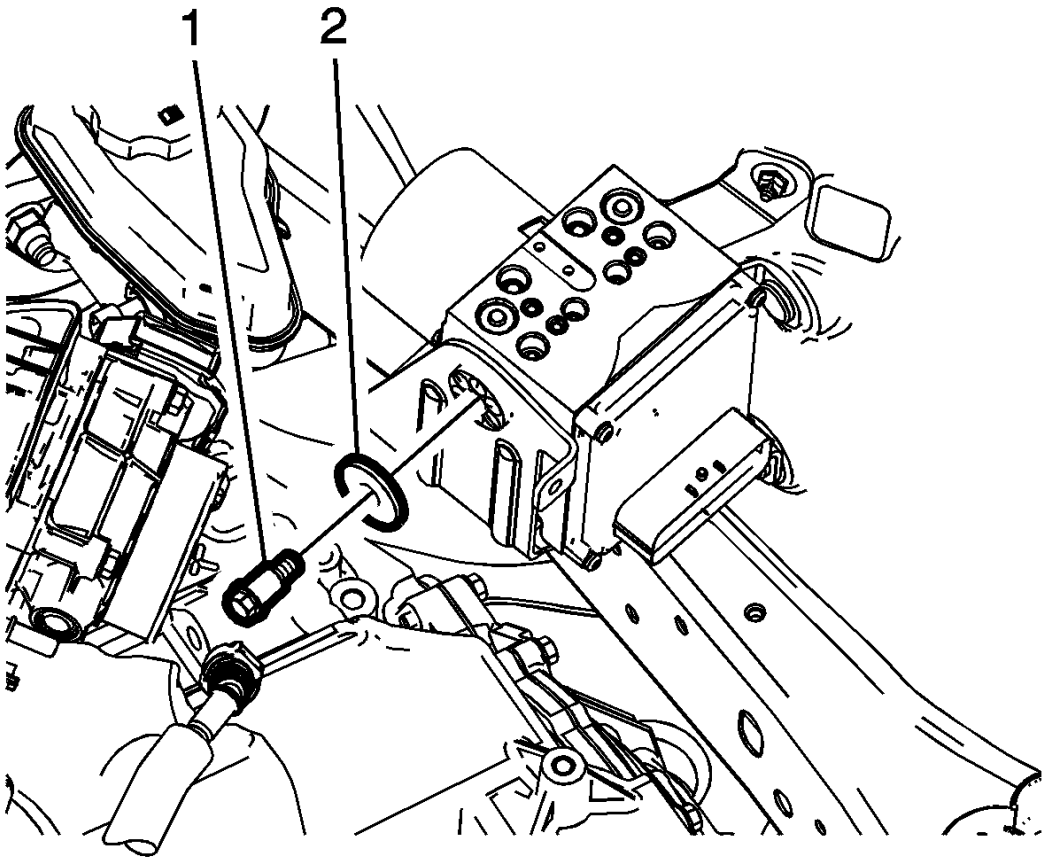

Fig. 16: Brake Pressure Modulator Valve Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the BPMV bolt (1) and washer (2) and tighten the bolt to 10 N.m (89 lb in).

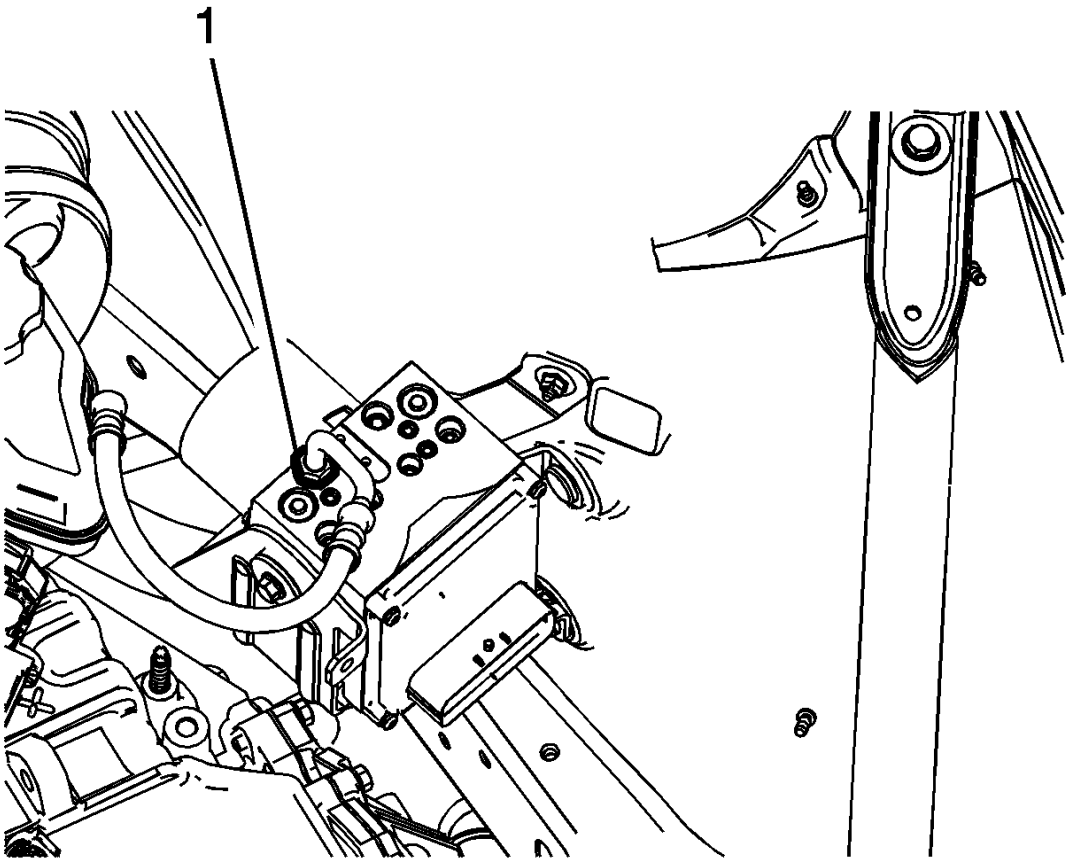

Fig. 17: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

4. Install the master cylinder primary brake pipe fitting (1) to the BPMV and tighten the fitting to 24 N.m (18 lb ft).

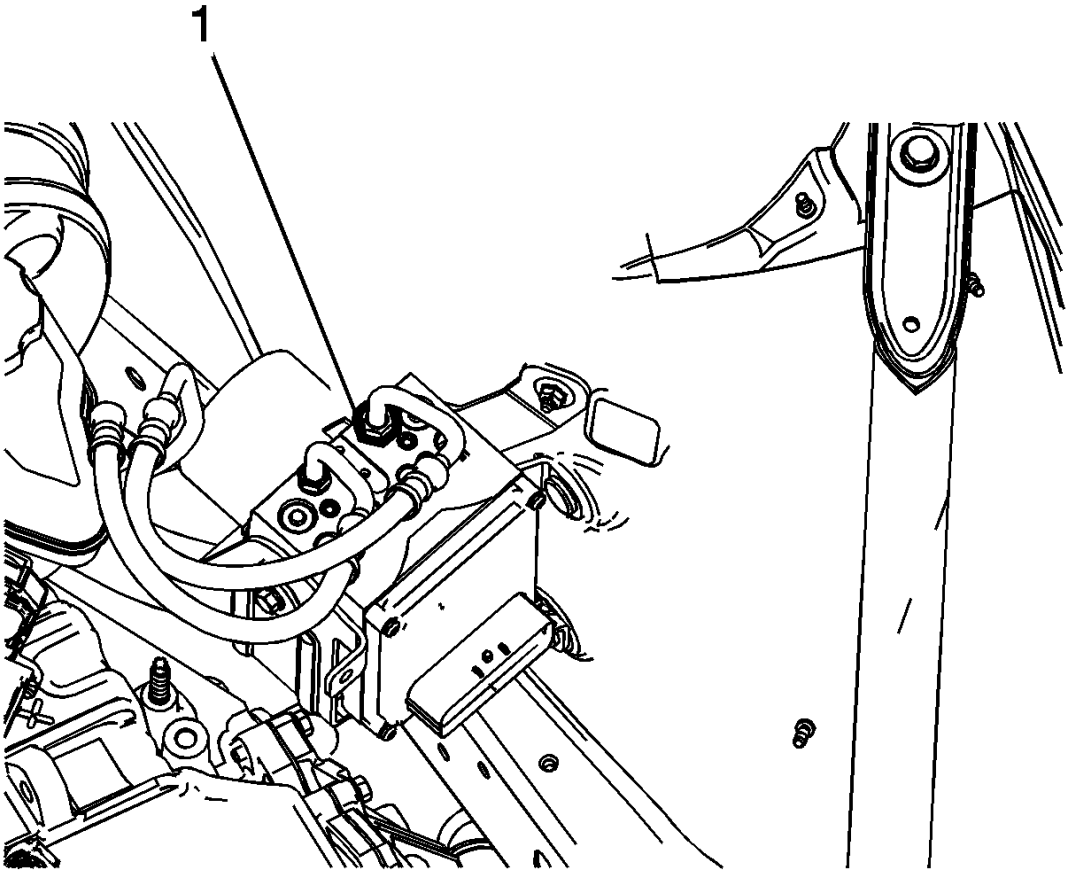

Fig. 18: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Install the master cylinder secondary brake pipe fitting (1) to the BPMV and tighten the fitting to 24 N.m (18 lb ft).

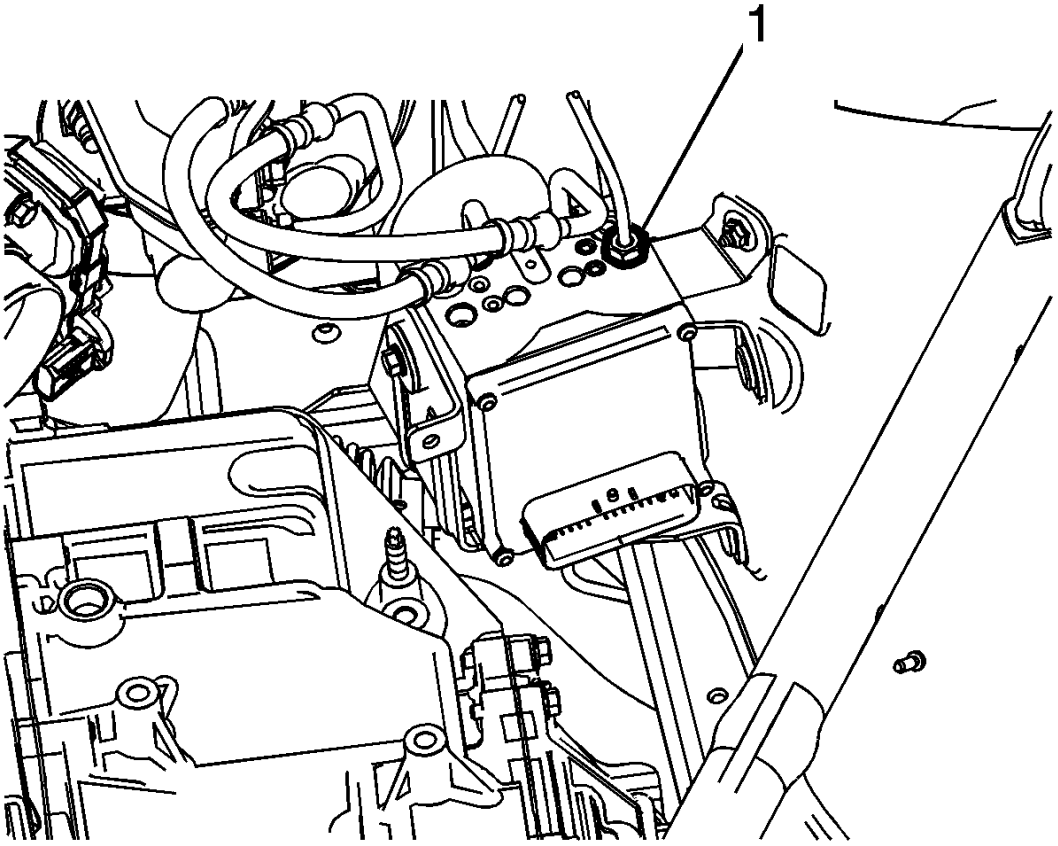

Fig. 19: Left Front Brake Pipe Fitting

7. Install the right rear brake pipe fitting (1) to the BPMV and tighten the fitting to 24 N.m (18 lb ft).

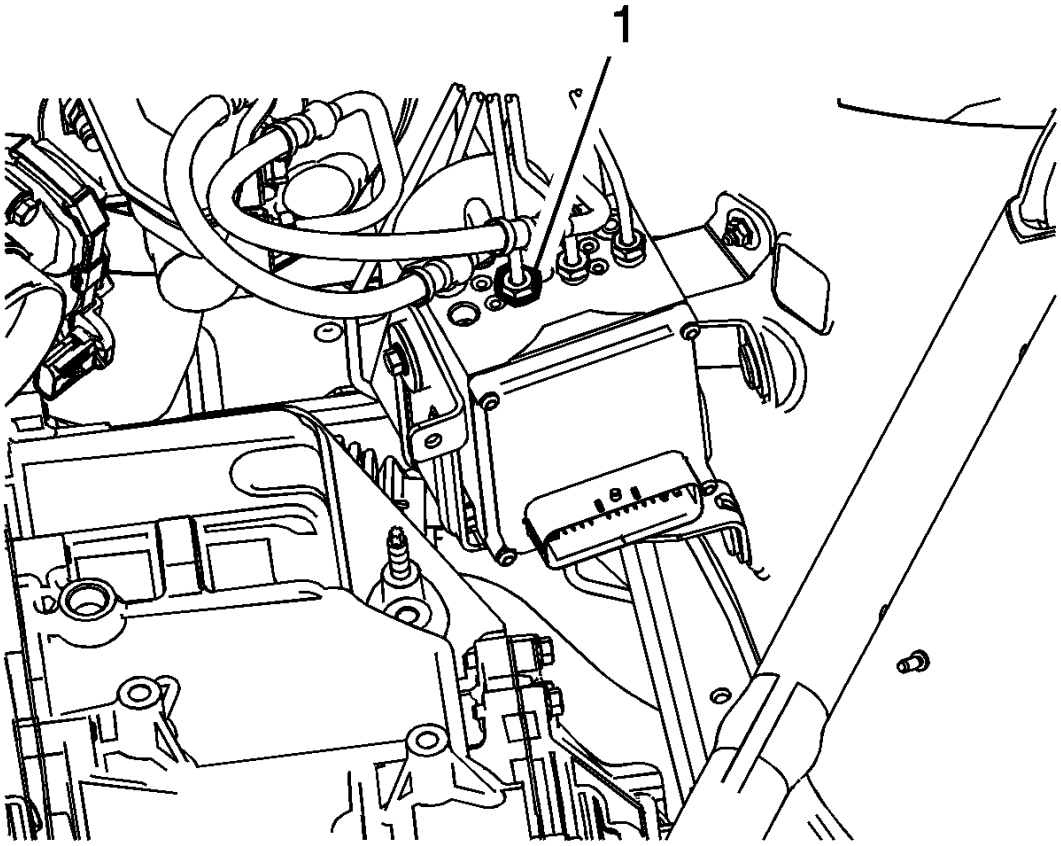

Fig. 21: Left Rear Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

8. Install the left rear brake pipe fitting (1) to the BPMV and tighten the fitting to 24 N.m (18 lb ft).

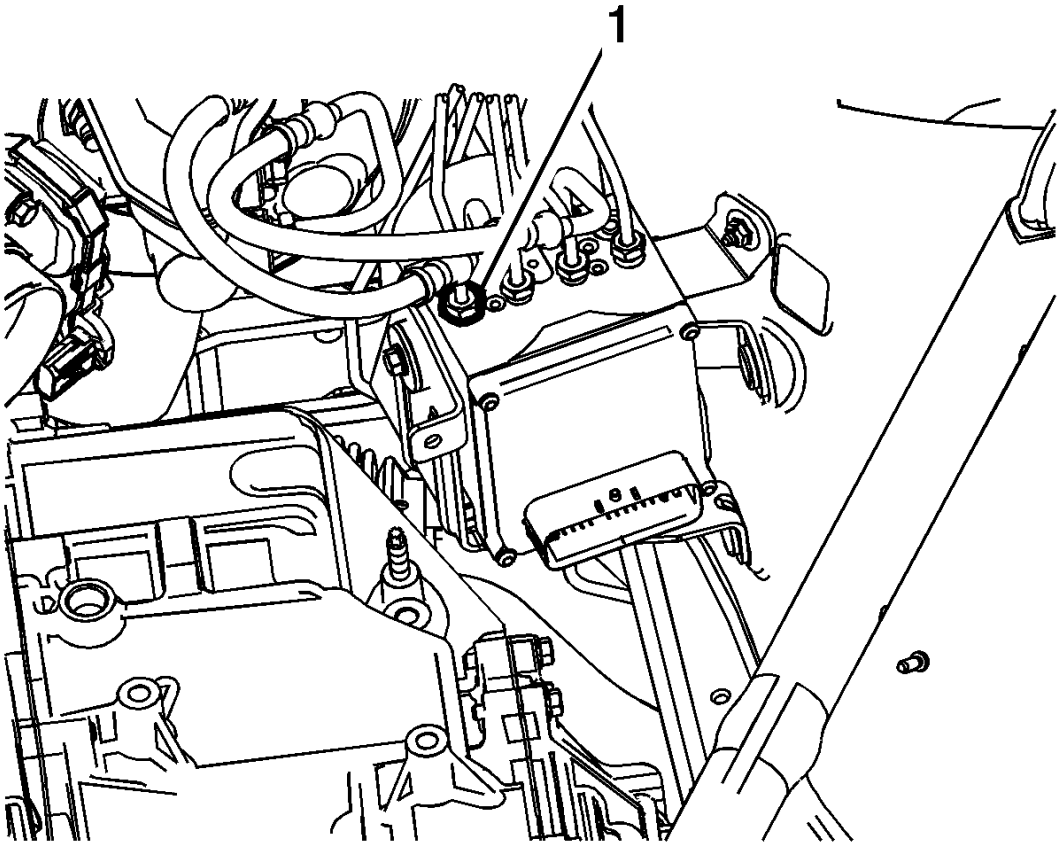

Fig. 22: Right Front Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

9. Install the right front brake pipe fitting (1) to the BPMV and tighten the fitting to 24 N.m (18 lb ft).
10. Connect the EBCM electrical connector.
11. Reposition the radiator surge tank and install the nuts. Refer to **Radiator Surge Tank Replacement** .
12. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
13. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
14. Bleed the antilock brake system. Refer to **Antilock Brake System Automated Bleed**.

BRAKE PRESSURE MODULATOR VALVE BRACKET REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the left front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

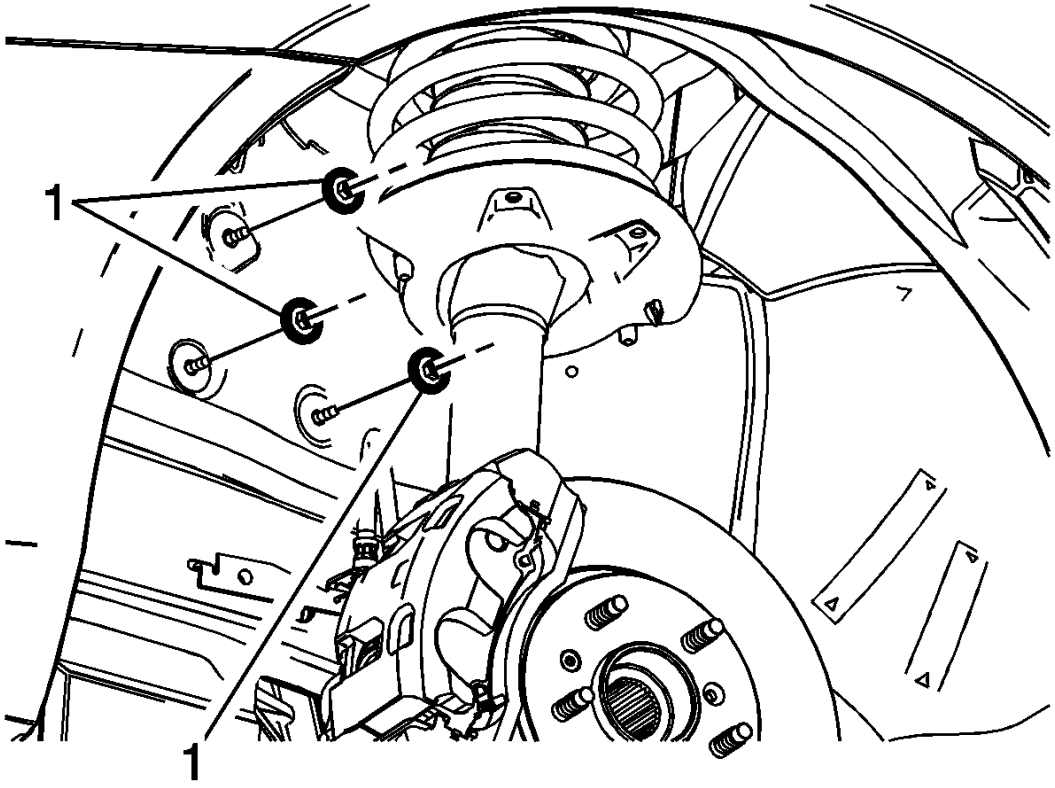

Fig. 23: Brake Pressure Modulator Valve Bracket Outer Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the brake pressure modulator valve (BPMV) bracket outer nuts (1).
4. Lower the vehicle to access the engine compartment.
5. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
6. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
7. Without draining the engine coolant and without disconnecting the hoses, remove the nuts and position aside the radiator surge tank. Refer to **Radiator Surge Tank Replacement** .

CAUTION: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

8. Disconnect the electronic brake control module (EBCM) electrical connector.

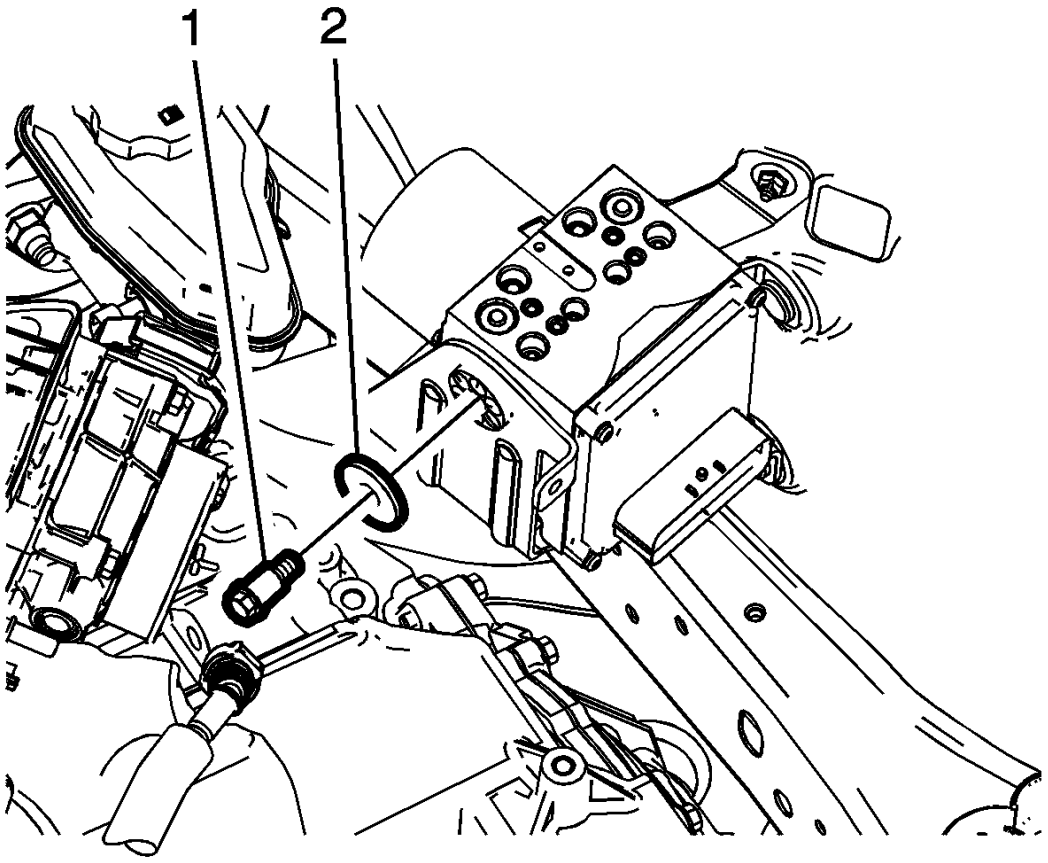

Fig. 24: Brake Pressure Modulator Valve Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

9. Remove the BPMV bolt (1) and washer (2).
10. Without disconnecting the brake pipes, carefully lift the BPMV assembly from the BPMV bracket and secure with heavy mechanics wire.

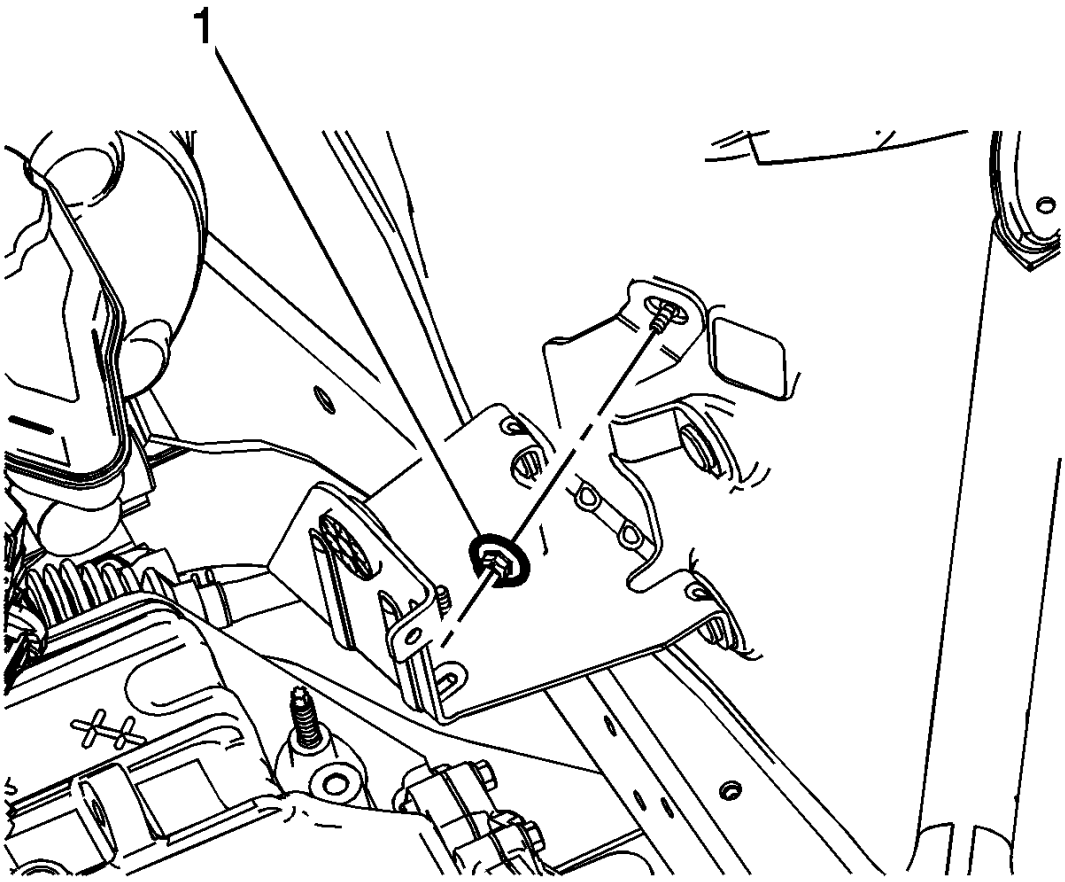

Fig. 25: Brake Pressure Modulator Valve Bracket Inner Nut
Courtesy of GENERAL MOTORS COMPANY

11. Remove the BPMV bracket inner nut (1).
12. Remove the BPMV bracket.

Installation Procedure

1. Install the BPMV bracket to the strut tower.

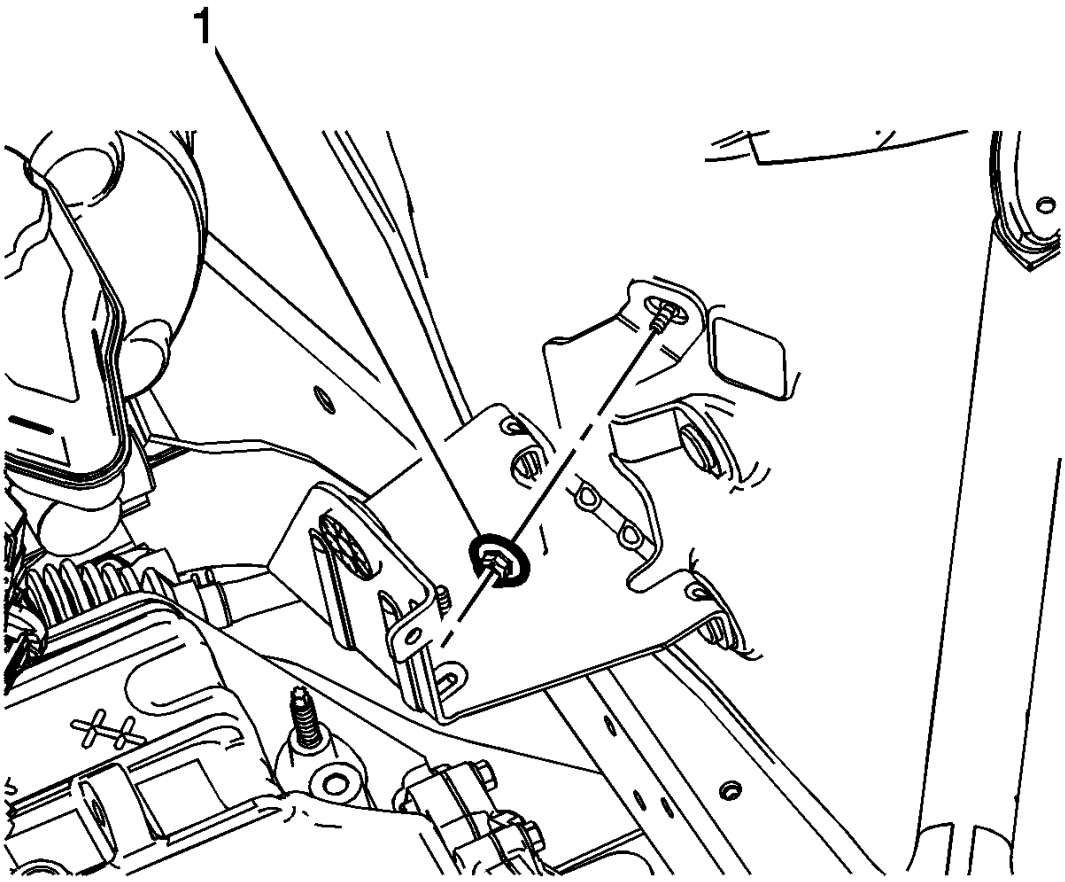

Fig. 26: Brake Pressure Modulator Valve Bracket Inner Nut
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the BPMV bracket inner nut (1) and tighten to 3 N.m (27 lb in).
3. Carefully position the BPMV assembly to the BPMV bracket.

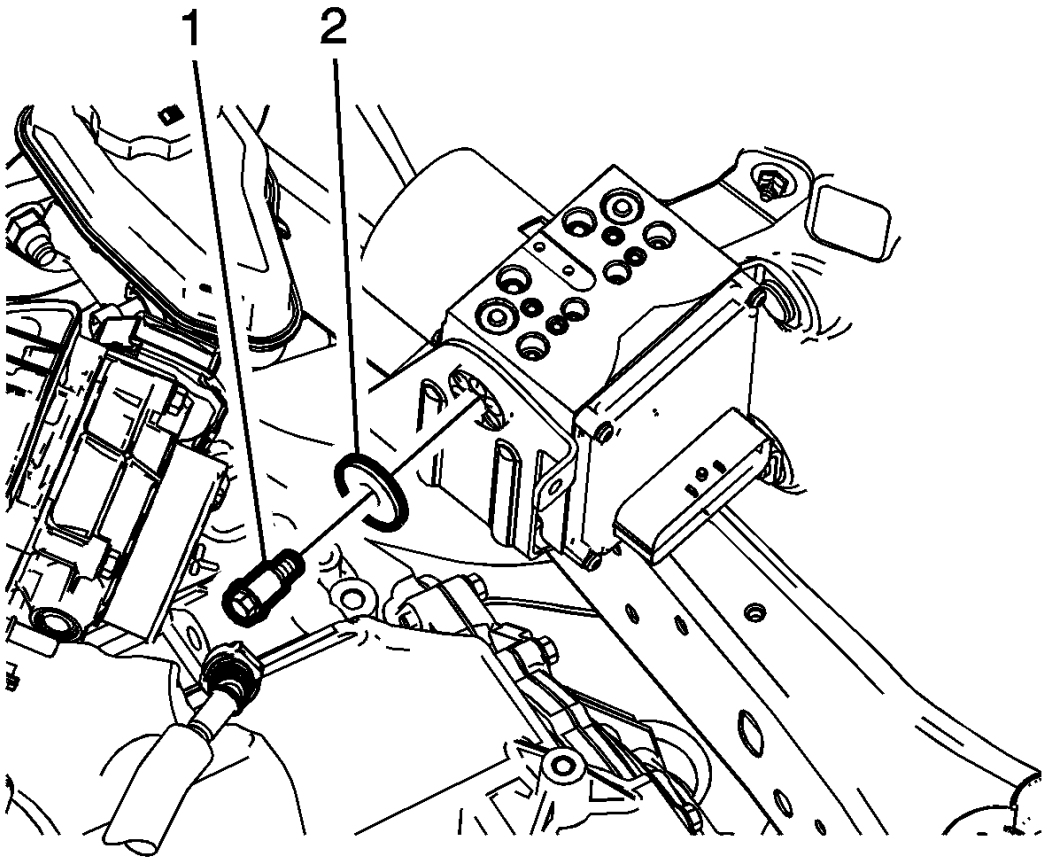

Fig. 27: Brake Pressure Modulator Valve Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

4. Install the BPMV bolt (1) and washer (2) and tighten the bolt to 10 N.m (89 lb in).
5. Connect the EBCM electrical connector.
6. Reposition the radiator surge tank and install the nuts. Refer to **Radiator Surge Tank Replacement** .
7. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
8. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
9. Raise and support the vehicle.

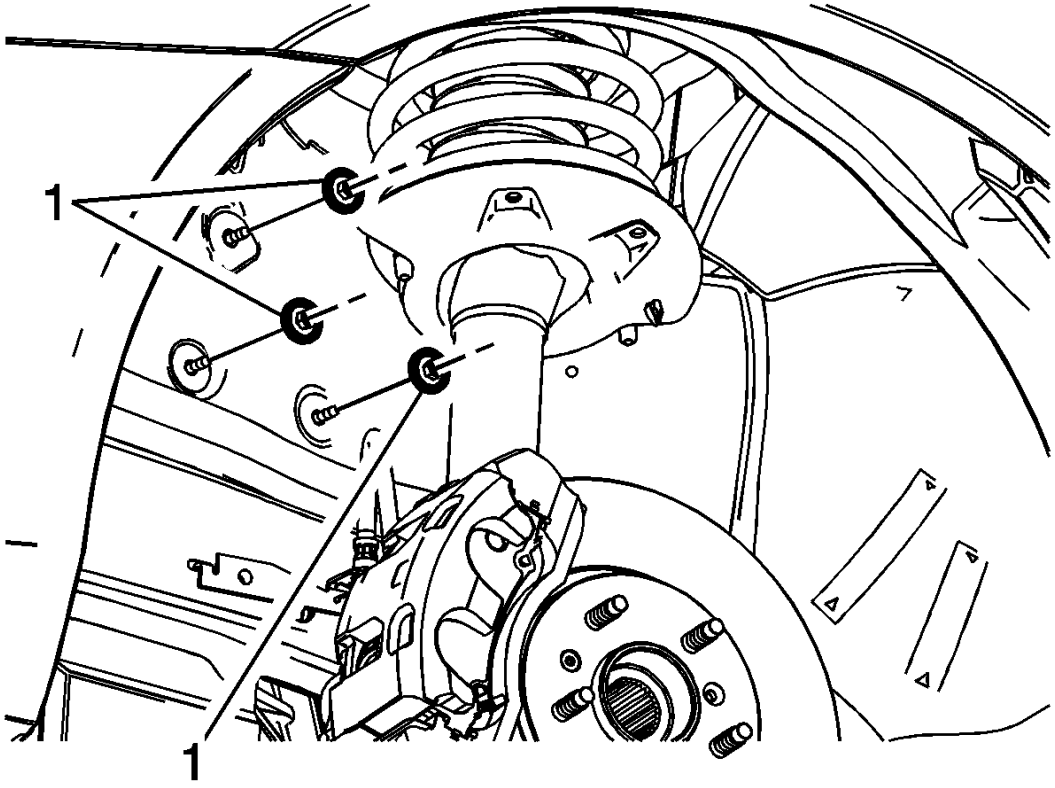

Fig. 28: Brake Pressure Modulator Valve Bracket Outer Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Install the BPMV bracket outer nuts (1) and tighten to 10 N.m (89 lb in).
11. Install the left front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

ELECTRONIC TRACTION CONTROL SWITCH REPLACEMENT

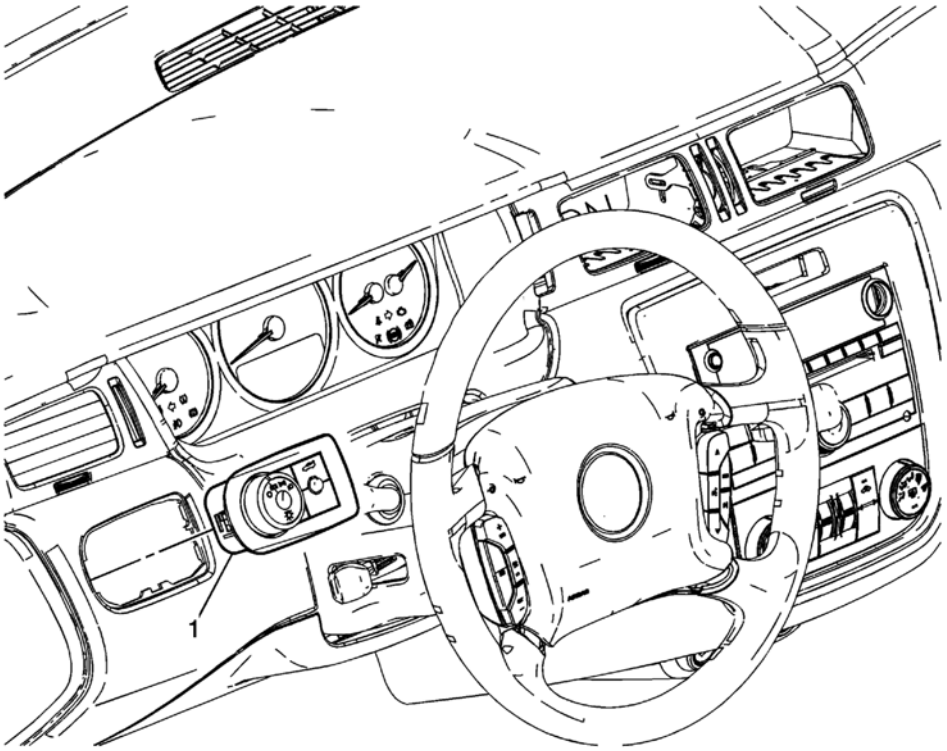

Fig. 29: View Of Traction Control Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** .	
1	Switch Assembly, Headlamp Instrument Panel Dimmer • The traction control switch is part of the headlamp switch and must be serviced as an assembly. • Disconnect the electrical connector.

VEHICLE YAW SENSOR LEARN

The yaw and lateral accelerometer sensor does not require calibration often. Calibration of the accelerometer sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module (EBCM) replacement
- Yaw and lateral accelerometer sensor replacement

The Yaw Rate Sensor Learn procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface
2. Apply the parking brake, or set the transmission in the P position.
3. Ignition ON, engine OFF
4. Install the scan tool to the data link connector.

5. Scroll to the EBCM, special functions menu on the scan tool.
6. Select Yaw Rate Sensor Recalibration.
7. Press the Reset.
8. Clear any DTCs that may be set.

VEHICLE YAW SENSOR WITH VEHICLE LATERAL ACCELEROMETER REPLACEMENT

Removal Procedure

1. Turn the ignition switch to the OFF position.
2. Remove the front floor center console. Refer to **Front Floor Console Replacement** .

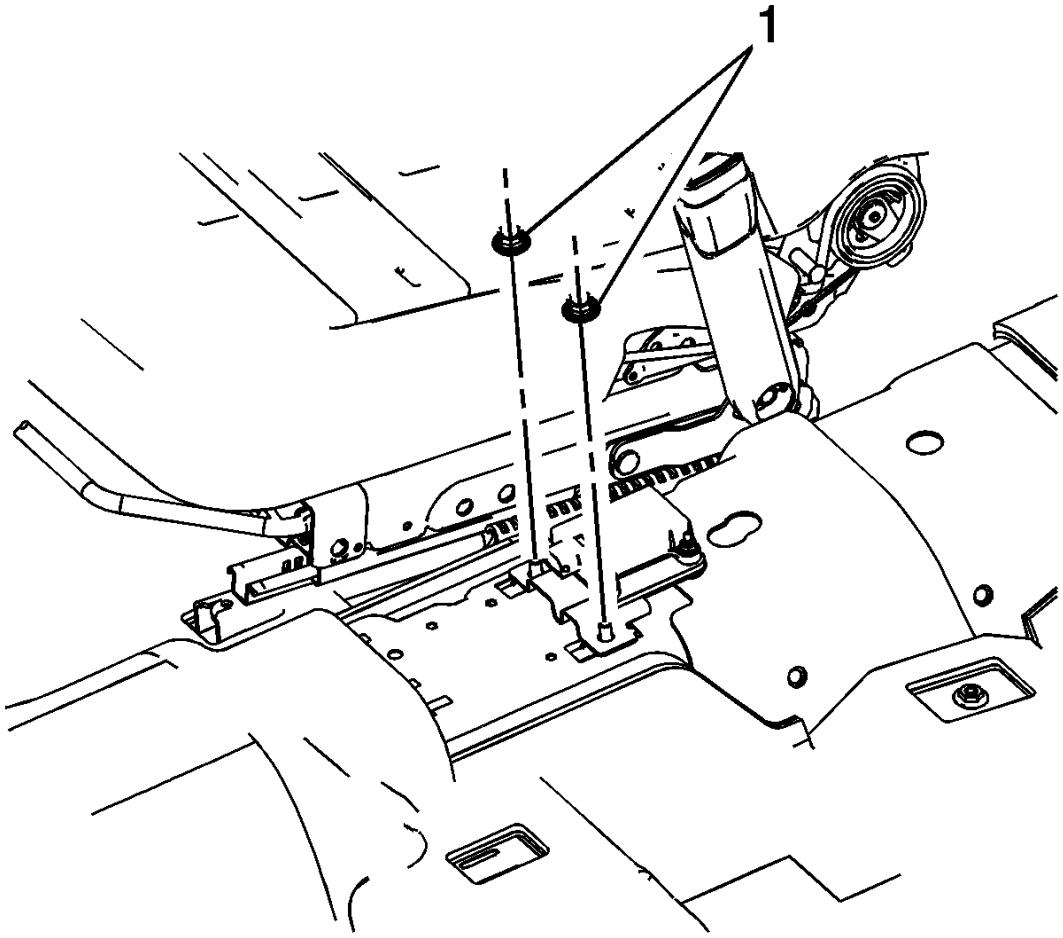

Fig. 30: Lateral Accelerometer Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the yaw sensor with lateral accelerometer electrical connector.
4. Remove the yaw sensor with lateral accelerometer nuts (1).

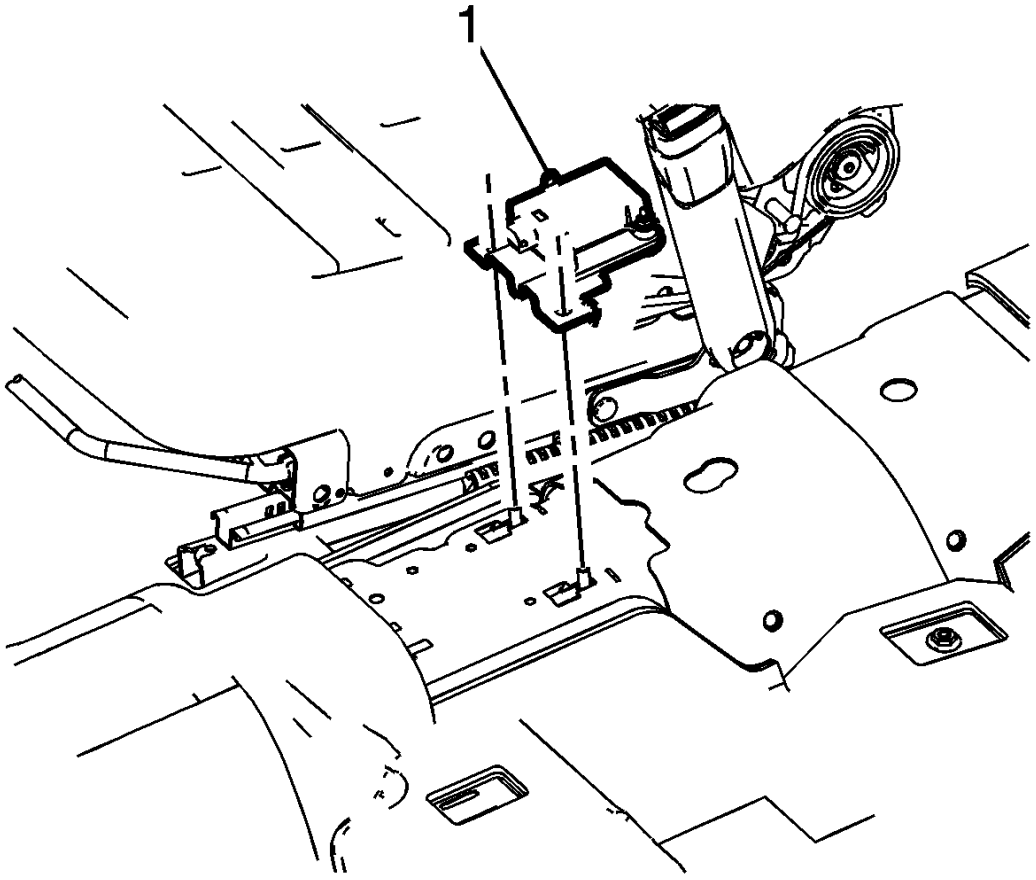

Fig. 31: Lateral Accelerometer
Courtesy of GENERAL MOTORS COMPANY

5. Remove the yaw sensor with lateral accelerometer (1).

Installation Procedure

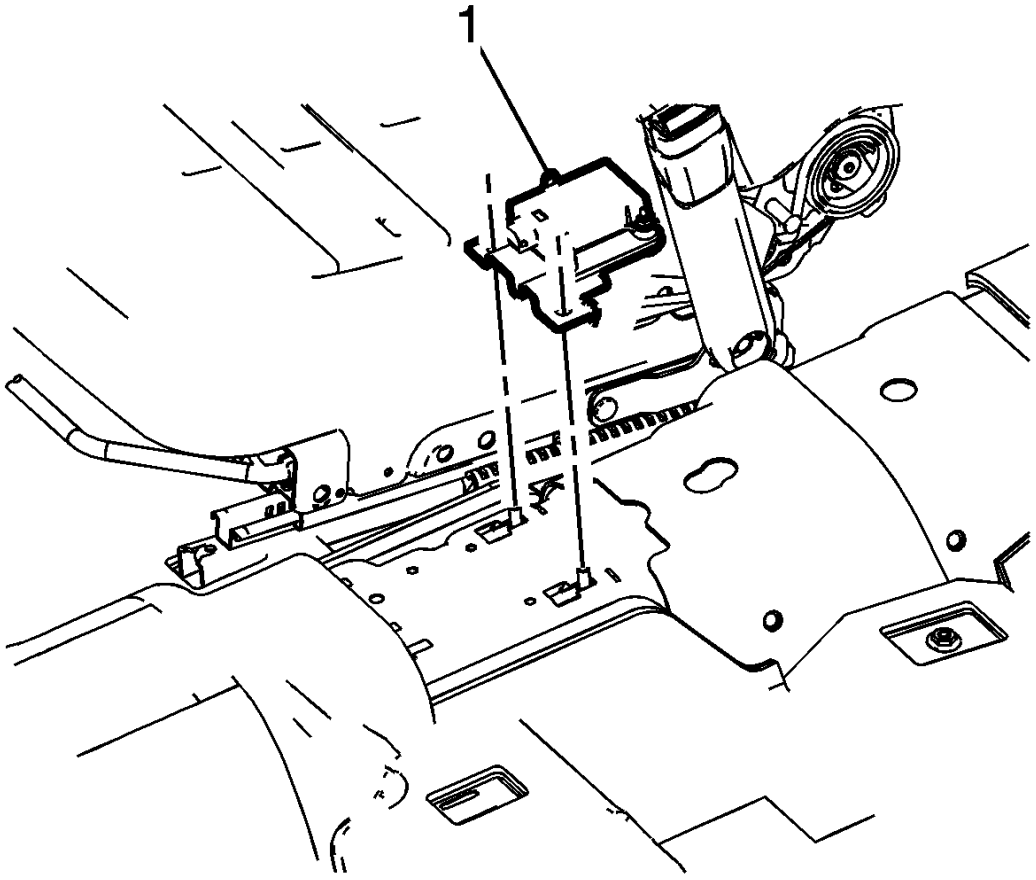

Fig. 32: Lateral Accelerometer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install the yaw sensor with lateral accelerometer with the electrical connection facing forward.**

1. Install the yaw sensor with lateral accelerometer (1).

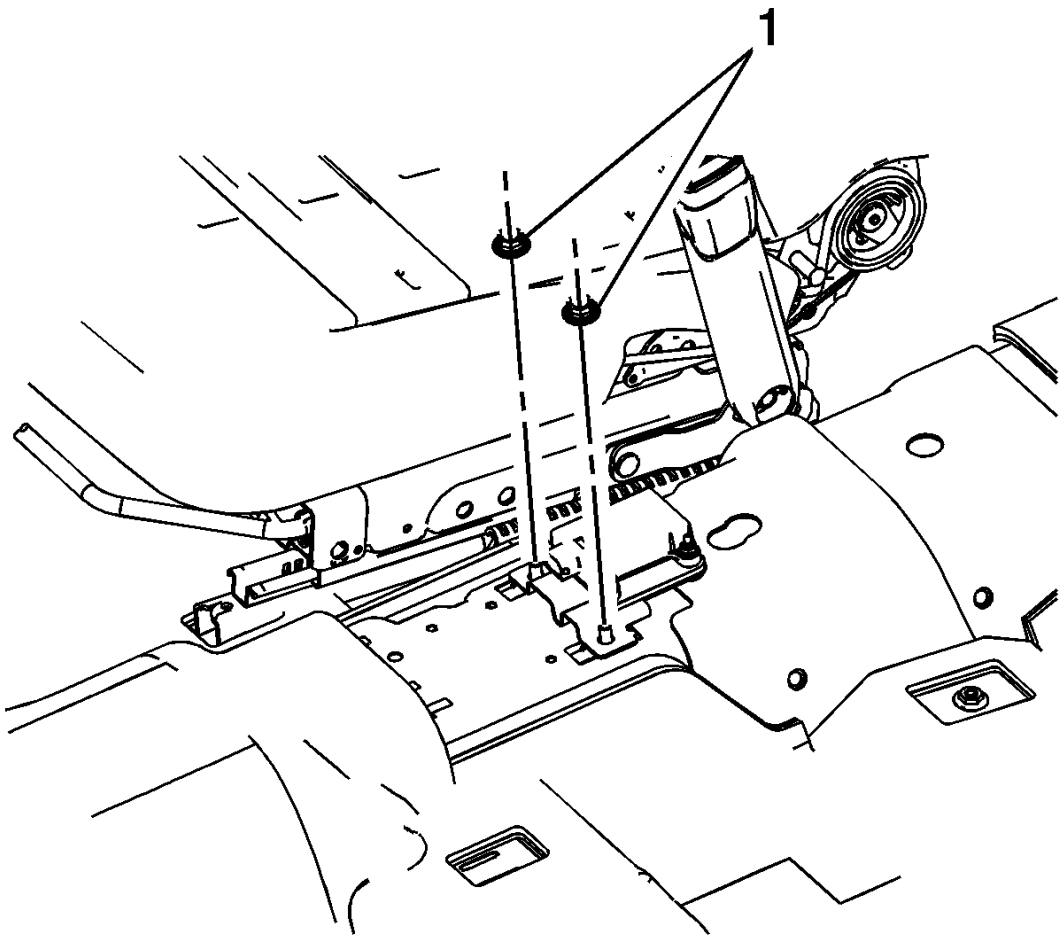

Fig. 33: Lateral Accelerometer Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the yaw sensor with lateral accelerometer nuts (1) and tighten to 26 N.m (19 lb ft).
3. Connect the yaw sensor with lateral accelerometer electrical connector.
4. Install the front floor center console. Refer to **Front Floor Console Replacement** .
5. Install a scan tool.
6. Using the special functions menu on the scan tool, reset the yaw rate sensor.
7. Perform the **Diagnostic System Check - Vehicle** .

DESCRIPTION AND OPERATION

ABS DESCRIPTION AND OPERATION

This vehicle is equipped with an TRW 440 brake master cylinder assembly. The electronic brake control module (EBCM) and the brake pressure modulator valve (BPMV) can be serviced separately. The BPMV uses a 4 circuit configuration to control hydraulic pressure to each wheel independently.

The following vehicle performance enhancement systems are provided.

- Antilock brake system (ABS)
- Dynamic rear proportioning (DRP)
- Traction control system (TCS) (w/NW9)

The following components are involved in the operation of the above systems:

- Brake pressure modulator valve (BPMV)-The BPMV contains the hydraulic valves and pump motor that are controlled electrically by the EBCM. The BPMV uses a 4 circuit configuration with a diagonal split. The BPMV directs fluid from the reservoir of the master cylinder to the left front and right rear wheels and fluid from the other reservoir to the right front and left rear wheels. The diagonal circuits are hydraulically isolated so that a leak or malfunction in one circuit will allow continued braking ability on the other.
- Solenoids-The solenoids are commanded ON and OFF by the EBCM to operate the appropriate valves in the BPMV.
- System relay-There are 2 system relays internal to the EBCM. The system relays are energized when the ignition is ON. The system relays supply battery positive voltage to the valve solenoids and to the ABS pump motor. This voltage is referred to as system voltage
- Traction control switch (w/NW9 and w/JL4)-TCS and vehicle stability enhancement system (VSES) is manually disabled or enabled using the traction control switch.
- Wheel speed sensors (WSS) - As the wheel spins, the wheel speed sensor produces an AC signal. The EBCM uses this AC signal to calculate wheel speed. The wheel speed sensors are replaceable only as part of the wheel hub and bearing assemblies.
- Brake pedal position (BPP) sensor-The EBCM receives a serial data message from the body control module (BCM) to indicate that the brake pedal is applied.

Initialization Sequence

The electronic brake control module (EBCM) performs 1 initialization test each ignition cycle. The initialization of the EBCM occurs when 1 set of the following conditions occur:

- The EBCM detects that there is a minimum of 500 RPM from the engine control module (ECM) via a serial data message.
- The brake pedal is not applied.

OR

- The vehicle speed is greater than 16 km/h (10 mph).
- The brake pedal is applied.

Antilock Brake System (ABS) Operation

When wheel slip is detected during a brake application, an ABS event occurs. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel. The ABS does not, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the electronic brake control module (EBCM) responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability. The typical ABS activation sequence is as follows:

Pressure Hold

The EBCM closes the isolation valve and keeps the dump valve closed in order to isolate the slipping wheel when wheel slip occurs. This holds the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

Pressure Decrease

If a pressure hold does not correct the wheel slip condition, a pressure decrease occurs. The isolation valve remains closed and the dump valve is opened. This allows a small amount of brake fluid to escape from the hydraulic circuit into the reservoir.

Pressure Increase

After the wheel slip is corrected, a pressure increase occurs. The isolation and dump valves are returned to their off states and brake pressure in the hydraulic circuit is once again dependant on the amount of force applied to the brake pedal by the driver. If the driver applies too much pressure causing wheel slip, the ABS activation sequence reoccurs.

Dynamic Rear Proportioning (DRP) Operation

The dynamic rear proportioning (DRP) is a control system that enhances the hydraulic proportioning function of the mechanical proportioning valve in the base brake system. The DRP control system is part of the operation software in the electronic brake control module (EBCM). The DRP uses active control with existing ABS in order to regulate the vehicle's rear brake pressure.

Traction Control System (TCS)

When drive wheel slip is noted while the brake is not applied, the electronic brake control module (EBCM) will enter traction control mode. The traction control system (TCS) controls vehicle traction by applying brakes and limiting engine torque to the drive wheels. The EBCM performs the fallowing TCS operations:

- The EBCM requests the engine control module (ECM) to reduce the amount of torque to the drive wheels via serial data messages.
- The ECM reduces torque to the drive wheels by retarding spark timing and throttle actuator control (TAC).
- The ECM reports the amount torque delivered to the drive wheels via serial data messages.

- The EBCM applies brake pressure to the slipping wheel in order to transfer torque to the gripping wheel.

Power-Up Self-Test

The electronic brake control module (EBCM) is able to detect many malfunctions whenever the ignition is ON. However, certain failures cannot be detected unless active diagnostic tests are performed on the components. Shorted solenoid coil or motor windings, for example, cannot be detected until the components are commanded ON by the EBCM. Therefore, a power-up self-test is required at the beginning of each ignition cycle to verify correct operation of components before the various control systems can be enabled. The EBCM performs the power-up self-test when the vehicle achieves a speed greater than 10 km/h (7 mph). The system relay, solenoids, and the ABS pump motor are commanded ON and OFF to verify proper operation and the EBCM verifies the ability to return the system to base braking in the event of a failure. The power-up self-test may sometimes be heard by the driver or passengers of the vehicle.

Vehicle Stability Enhancement System (VSES)

The vehicle stability enhancement system (VSES) adds an additional level of vehicle control to the electronic brake control module (EBCM).

Yaw rate is the rate of rotation about the vehicle's vertical axis. The lateral accelerometer measures the sideways acceleration of the vehicle. The VSES is activated when the EBCM determines that the desired yaw rate and lateral forces do not match the actual attitude of the vehicle.

The desired attitude of the vehicle are calculated from the following inputs:

- The position of the steering wheel
- The speed of the vehicle
- The lateral, or sideways acceleration of the vehicle
- Yaw rate of the vehicle
- Master cylinder brake pressure

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of oversteer or understeer. If the yaw rate error becomes too large, the EBCM attempts to correct the vehicle's yaw motion by applying differential braking to the appropriate wheel. The amount of differential braking applied to the left or right front wheel is based on both the yaw rate error and side slip rate error.

The VSES activations generally occur during aggressive driving, in turns, or on poor road conditions, without much use of the accelerator pedal. When braking during VSES activation, the pedal pulsations feel different than the ABS pedal pulsations. The brake pedal pulsates at a higher frequency during VSES activation.

Driver Information Indicators and Messages

The following indicators are used to inform the driver of several different conditions:

Brake System Warning Indicator

The instrument panel cluster (IPC) illuminates the brake warning indicator when any of the following instances occur.

- The body control module (BCM) detects that the park brake is engaged. The BCM sends a serial data

message to the IPC requesting illumination.

- The electronic brake control module (EBCM) detects a low brake fluid condition. The EBCM sends a serial data message to the IPC requesting illumination.
- The IPC performs the bulb check.
- The IPC detects a loss of serial data communication with the EBCM.
- The EBCM detects an ABS-disabling malfunction which also disables dynamic rear proportioning (DRP). The EBCM sends a serial data message to the IPC requesting illumination.

ABS Indicator

The IPC illuminates the ABS indicator when any of the following instances occur.

- The EBCM detects an ABS-disabling malfunction. The EBCM sends a serial data message to the IPC requesting illumination.
- The IPC performs the bulb check.
- The IPC detects a loss of serial data communication with the EBCM.

Usually, the ABS indicator is turned OFF during the following ignition cycle unless the fault is detected during that ignition cycle. However, the setting of certain DTCs will cause the ABS indicator to remain illuminated during the following ignition cycle until the vehicle is operated at a speed greater than 13 km/h (8 mph). This allows the EBCM to verify that no malfunction exists, before turning OFF the ABS indicator, in order to comply with the United Nations Economic Commission for Europe (ECE) regulation no. 13. This response occurs even if the ABS indicator turns OFF when the scan tool is used to clear the DTCs. When repairing these vehicles, it is important to ensure that the ECE 13 response has occurred and that the ABS indicator does not illuminate after returning the vehicle to the customer. It is also important to verify that ECE 13 is not the cause of an ABS indicator which is illuminated when no DTCs are set, before attempting to diagnose other possible causes.

Vehicle Dynamics Caution (VDC) Indicator

The IPC illuminates the VDC indicator when there is a traction event, or if the traction control system (TCS) has been disabled due to a malfunction.

SERVICE TRACTION Message

The IPC displays the SERVICE TRACTION message when either of the following instances occur:

- The EBCM detects a malfunction that requires traction control to be disabled. The EBCM sends a serial data message to the IPC requesting that the message be displayed.
- The IPC detects a loss of serial data communication with the EBCM.

TRACTION CONTROL OFF Message

The IPC displays this message when the traction control system (TCS) or vehicle stability enhancement system (VSES) has been turned off by the driver.

The IPC also displays this message momentarily on the DIC on an initial Key up after the power moding times out and is reset.

STABILITRAK NOT READY Message

The IPC may display this message and the ESC/TCS light on the instrument panel cluster may be on until the vehicle is driven above 19 mph (30 km/h) for 30 seconds. The ESC system is not functional until the light has turned off.

SERVICE STABILITRAK Message

The IPC displays this message and the ESC/TCS light on the instrument panel cluster will be on when EBCM detects a malfunction with the vehicle stability enhancement system (VSES) that requires the system to be disabled.

• Rotor Thickness- New	14.0 mm	0.551 in
*All brake rotors have a discard dimension cast into them. Replace any rotor that does not meet this specification. After refinishing the rotor, replace any rotor that does not meet the minimum thickness specification.		

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKE ROTOR THICKNESS MEASUREMENT

WARNING: Two different designs of the front brake rotors and front brake pads are used on this vehicle. Do NOT interchange first design and second design parts, or a loss of braking and personal injury could occur.

WARNING: Refer to Brake Dust Warning .

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

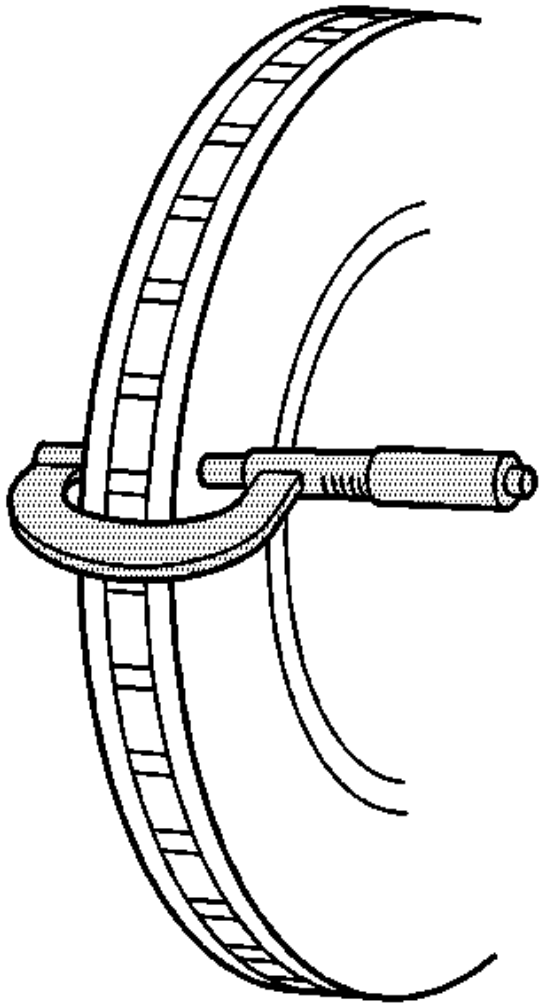

Fig. 1: Measuring Brake Rotor Thickness
Courtesy of GENERAL MOTORS COMPANY

3. Using a micrometer calibrated in thousanths-of-a-millimeter, or ten-thousanths-of-an-inch, measure and record the thickness of the brake rotor at four or more points, evenly spaced around the rotor.

   Ensure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the rotor, about 13 mm (1/2 in), for each measurement.

4. Compare the lowest thickness measurement recorded to the specifications listed in **Disc Brake Component Specifications**.
5. If the lowest thickness measurement of the brake rotor is above the minimum allowable thickness after refinishing specification, the rotor may be able to be refinished, depending upon surface and wear conditions which may be present.
6. If the lowest thickness measurement of the brake rotor is at or below the minimum allowable thickness after refinishing specification, the rotor may not be refinished.
7. If the lowest thickness measurement of the brake rotor is at or below the discard thickness specification, the rotor requires replacement.

BRAKE ROTOR THICKNESS VARIATION MEASUREMENT

WARNING: **Refer to Brake Dust Warning .**

NOTE: **Any disc brake rotor that exhibits thickness variation exceeding the maximum acceptable level must be refinished or replaced. Thickness variation exceeding the maximum acceptable level can cause brake pulsation.**

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

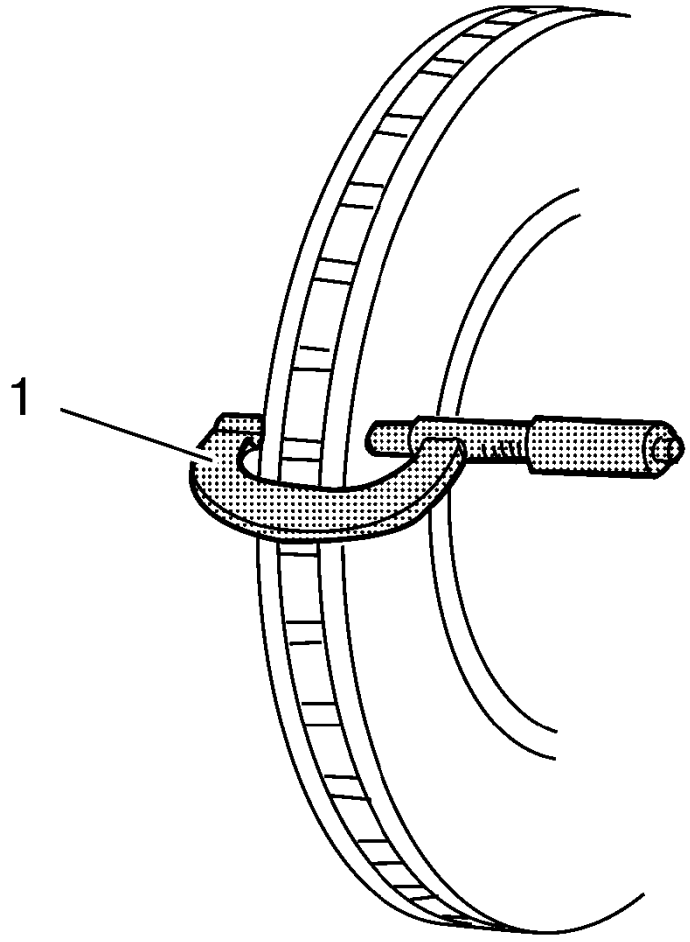

Fig. 2: Micrometer On Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

3. Using a micrometer (1) calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure

and record the thickness of the brake rotor at 4 or more points, evenly spaced around the rotor.

Ensure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the rotor, about 13 mm (1/2 in), for each measurement.

4. Calculate the difference between the highest and lowest thickness measurements recorded to obtain the amount of thickness variation.
5. Compare the thickness variation measurement to the following specification:

Specification

Brake rotor maximum allowable thickness variation: 0.025 mm (0.001 in)

NOTE: **Whenever a brake rotor is refinished or replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes.**

6. If the brake rotor thickness variation measurement exceeds the specification, the rotor requires refinishing or replacement.

BRAKE ROTOR SURFACE AND WEAR INSPECTION

WARNING: **Refer to Brake Dust Warning .**

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Inspect the friction surfaces of the brake rotor for the following Braking Surface Conditions:
    - Heavy rust and/or pitting

      Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the rotor.

    - Cracks and/or heat spots
    - Excessive blueing discoloration
4. If the friction surfaces of the brake rotor exhibit one or more of the Braking Surface Conditions, the rotor requires refinishing or replacement.

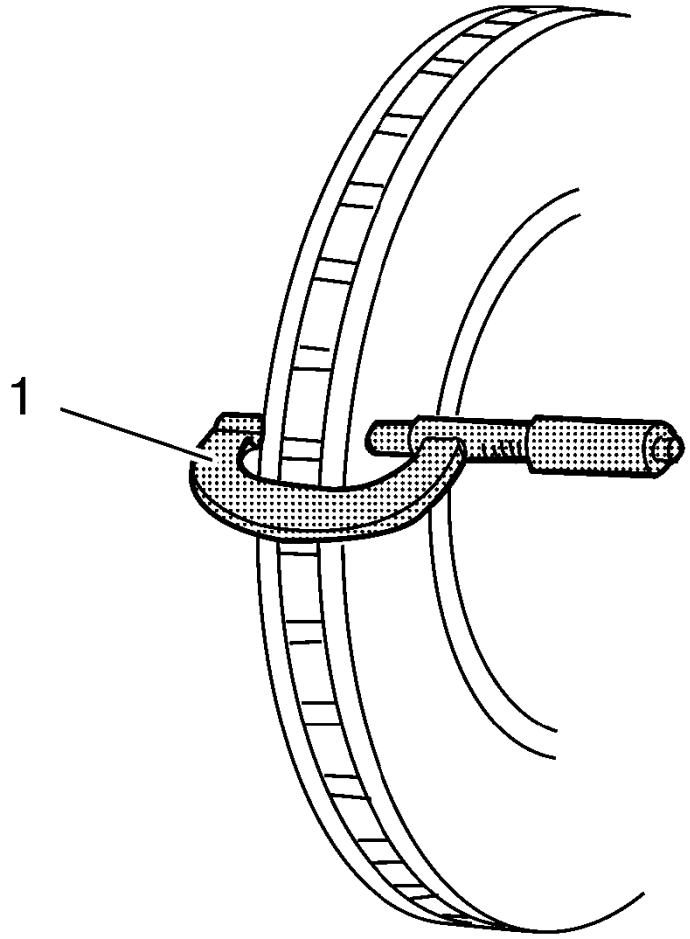

Fig. 3: Micrometer On Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

5. Using a micrometer (1) calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the scoring depth of any grooves present on the rotor friction surfaces.
6. Compare the groove scoring depth recorded to the following specification:

   Specification

   Brake rotor maximum allowable scoring: 1.50 mm (0.059 in)

7. If the brake rotor scoring depth exceeds the specification, or if an excessive amount of scoring is present, the rotor requires refinishing or replacement.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT MEASUREMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit

- **CH-42450-A** Wheel Hub Resurfacing Kit
- **CH-45101** Hub and Wheel Runout Gauge
- **CH-45101-100** Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Brake Dust Warning .

NOTE:

- **Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4,800-11,300 km (3,000-7,000 mi).**
- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**

1. Matchmark the position of the brake rotor to the wheel studs if this has not been done already.

NOTE: **Whenever the brake rotor has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.**

2. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles, corrosion, rust, or debris remaining. If the wheel hub/axle flange and/or if the brake rotor mating surfaces exhibit these conditions, perform the following steps:
    1. Remove the brake rotor from the vehicle. Refer to **Front Brake Rotor Replacement**, and/or **Rear Brake Rotor Replacement**.
    2. Using the **CH-42450-A** wheel hub resurfacing kit , thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
    3. Using the **CH-41013** rotor resurfacing kit , thoroughly clean any rust or corrosion from the mating surface of the brake rotor.
    4. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Install the rotor to the hub/axle flange using the matchmark made prior to removal.

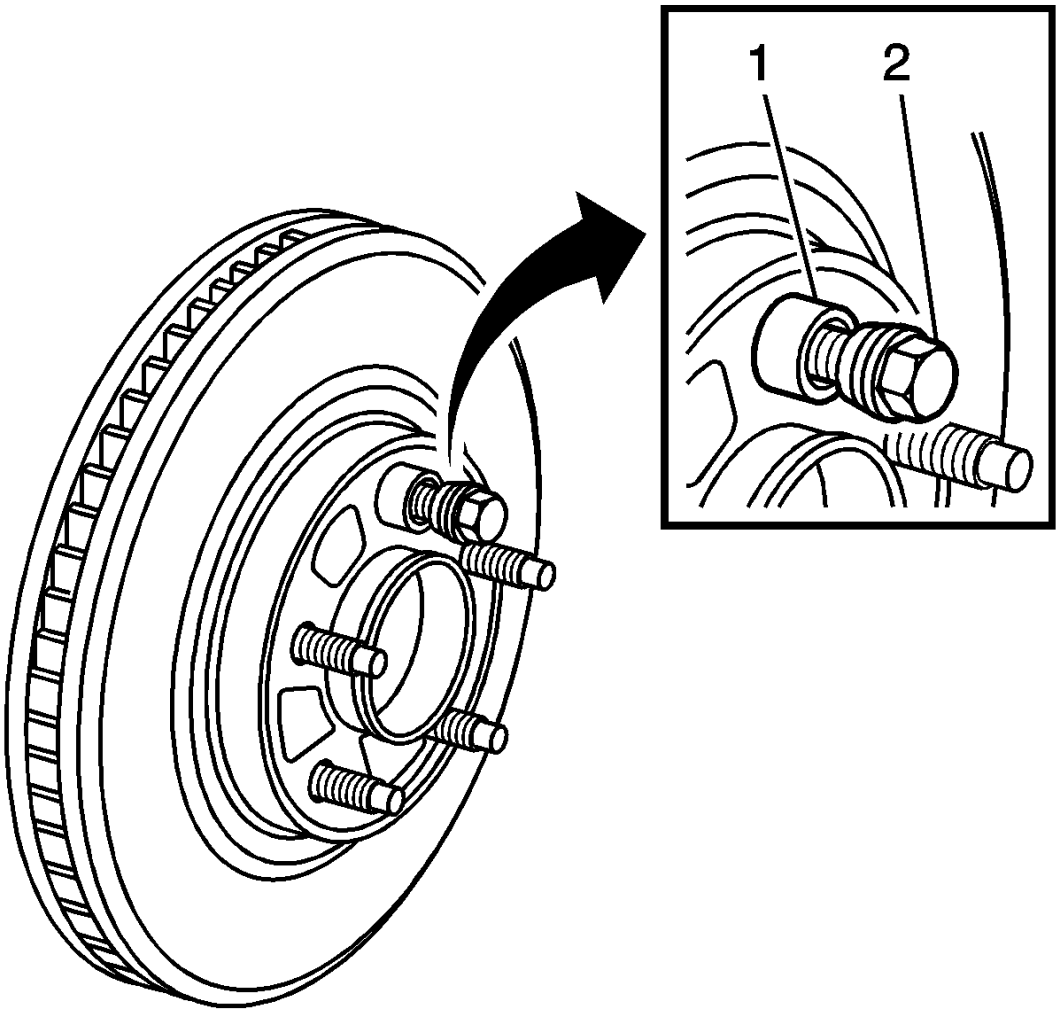

Fig. 4: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

4. Hold the rotor firmly in place against the hub/axle flange and install one of th **CH-45101-100** conical brake rotor washers (1), and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

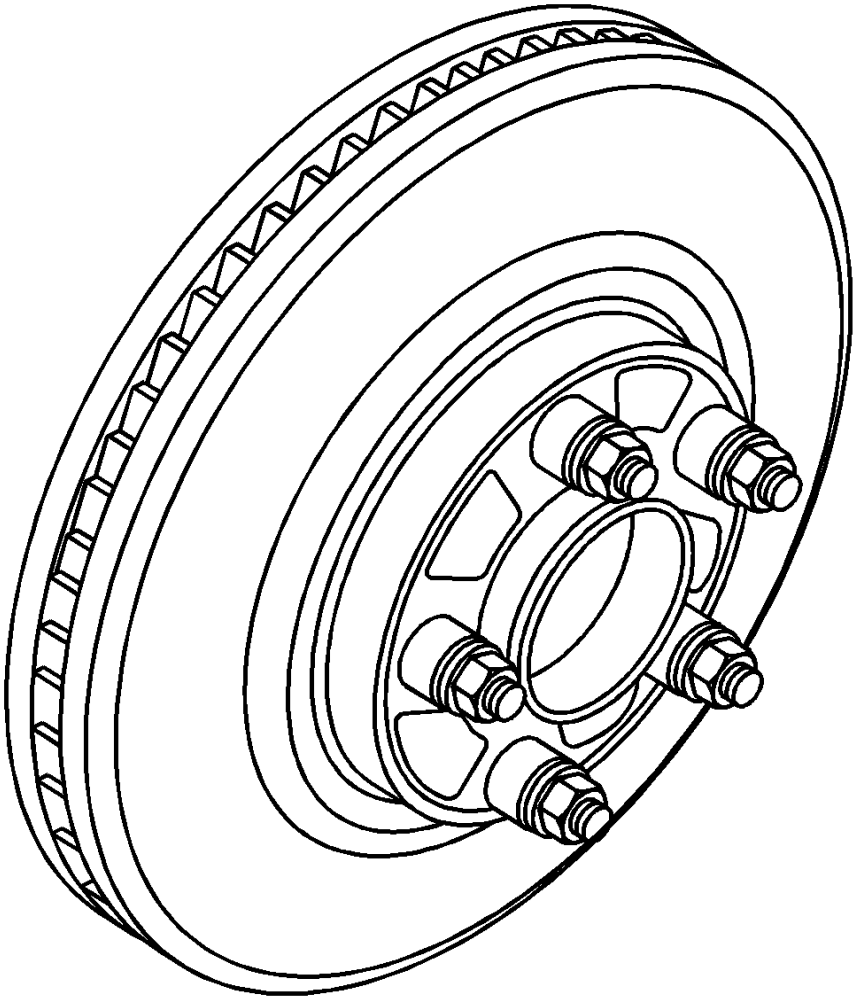

Fig. 5: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** conical brake rotor washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification. Refer to **Tire and Wheel Removal and Installation** .
8. If the brake rotor has been REFINISHED or REPLACED with a new rotor, proceed to step 14.
9. If the brake rotor meets the following criteria, proceed to step 10.
    - The rotor is within specifications and is being REUSED.
    - The rotor has NOT been refinished.
    - The rotor does NOT exhibit thickness variation exceeding the maximum allowable level.

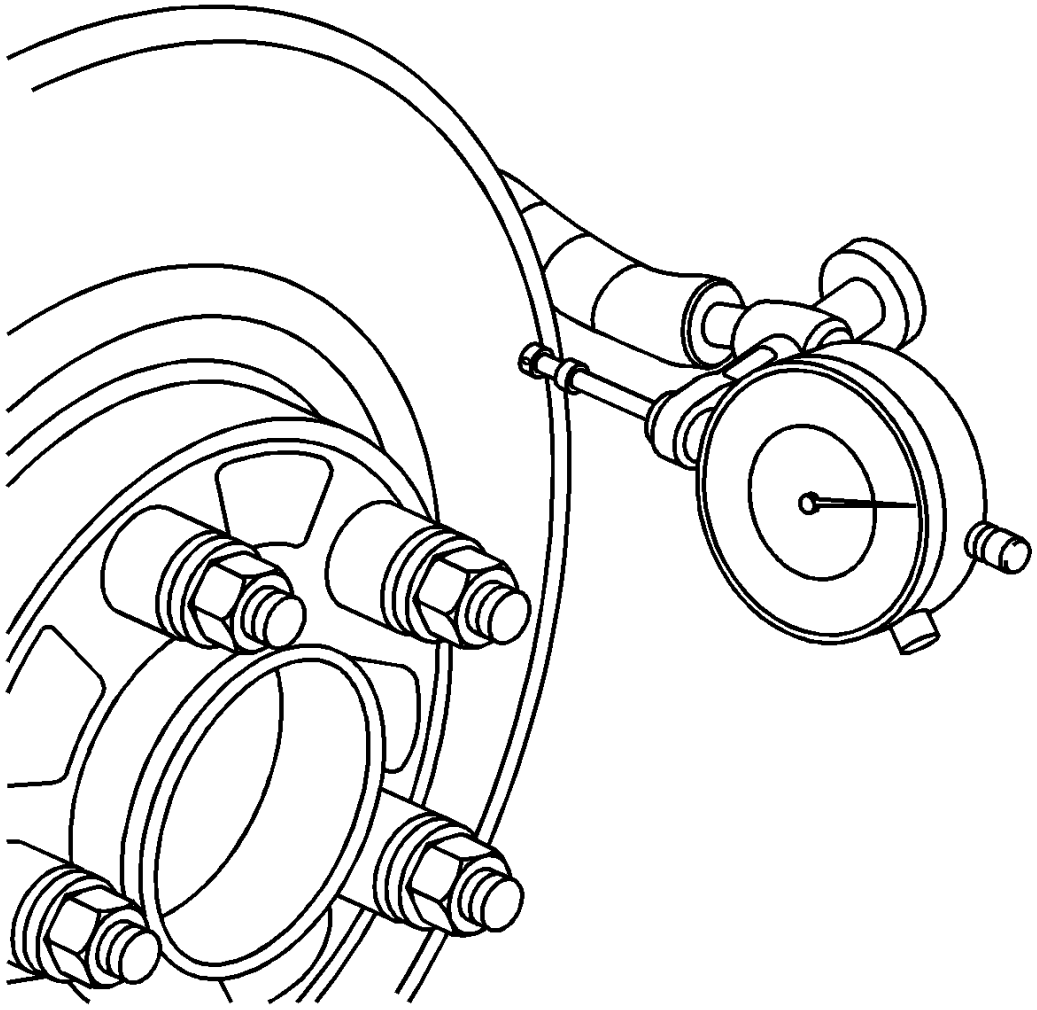

Fig. 6: Using Dial Indicator To Measure Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

10. Mount a dial indicator, **CH-45101** hub and wheel runout gauge , or equivalent, to the steering knuckle and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
11. Measure and record the assembled LRO of the brake rotor.
    1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
    2. Rotate the rotor until the highest reading is displayed on the dial.
    3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
    4. Measure and record the amount of LRO.
12. Compare the brake rotor assembled LRO to the following specification:

    Specification

    - Front brake rotor maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
    - Rear brake rotor maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
13. If the brake rotor assembled LRO is within specifications, proceed to step 18.

If the brake rotor assembled LRO exceeds the specification, refinish the rotor to ensure true parallelism. Refer to **Brake Rotor Refinishing**. After refinishing the rotor, proceed to step 14.

14. Mount a dial indicator, **CH-45101** hub and wheel runout gauge , or equivalent, to the steering knuckle and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
15. Measure and record the assembled LRO of the brake rotor.
    1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
    2. Rotate the rotor until the highest reading is displayed on the dial.
    3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
    4. Measure and record the amount of LRO.
16. Compare the brake rotor assembled LRO to the following specification:

    Specification

    - Front brake rotor maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
    - Rear brake rotor maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
17. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to **Brake Rotor Assembled Lateral Runout Correction**.
18. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** conical brake rotor washers and the lug nuts.

BRAKE PAD INSPECTION

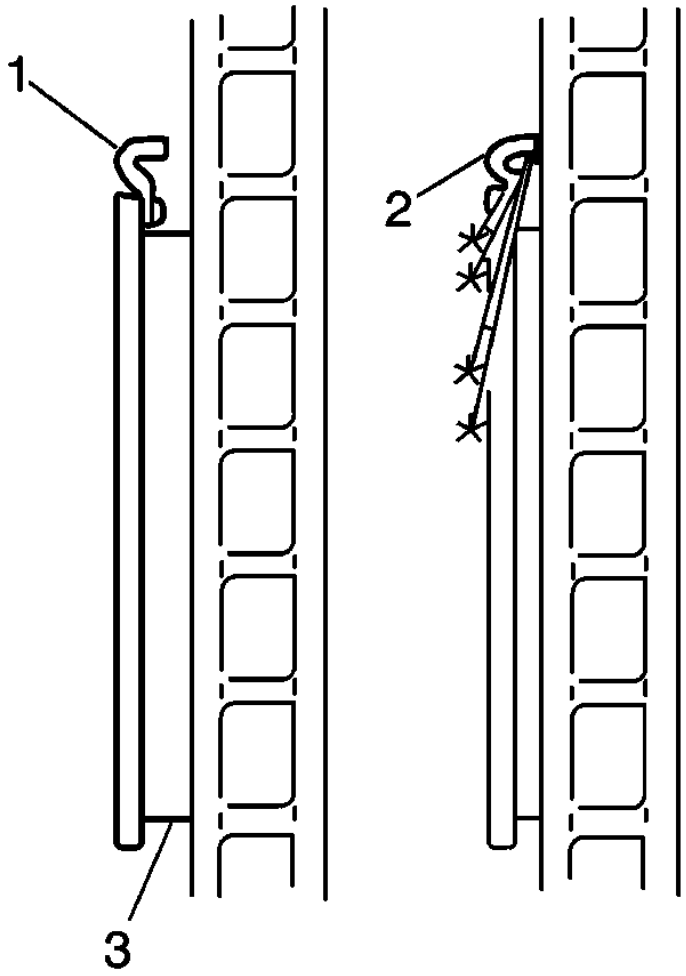

Fig. 7: View Of Brake Pads & Audible Wear Sensors
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Inspect the disc brake pads at regular intervals, or whenever the tire and wheel assemblies are removed from the vehicle.
2. If replacement is necessary, always replace disc brake pads in axle sets.
3. Inspect both edges of the disc brake pad friction surfaces (3). The highest rate of wear normally occurs at the trailing edge of the disc brake pads.
4. Inspect the thickness of the disc brake pads (3) in order to ensure that they have not worn prematurely. The disc brake pad wear should be approximately even per axle set.

NOTE: When replacing the disc brake pads, maintain the same disc brake pad wear sensor orientation.

5. Both front and rear disc brake pads have integral, audible wear sensors (1). When the disc brake pad wear reaches the minimum allowable thickness, the wear sensor contacts the disc brake rotor (2). The wear

indicator will then produce an audible, high-pitched warning noise during wheel rotation.

6. Replace the disc brake pads when the friction surface (3) is worn to within 0.76 mm (0.030 in) of the mounting plates.
7. Remove the brake calipers and inspect the friction surfaces of the inner and outer disc brake pads to ensure that they are level. Place the disc brake pad friction surfaces together and measure the gap between the surfaces. If more than 0.13 mm (0.005 in) gap exists midway between the length of the disc brake pads, replace the disc brake pads.
8. Verify that any disc brake pad shims that may be required are in place and not damaged or excessively corroded. Replace any missing or damaged shims in order to preserve proper disc brake performance.
9. Replace the disc brake pads if any have separated from the mounting plates.
10. Inspect the disc brake pads friction surfaces for cracks, fractures, or damage which may cause noise or otherwise impair disc brake performance.

BRAKE CALIPER INSPECTION

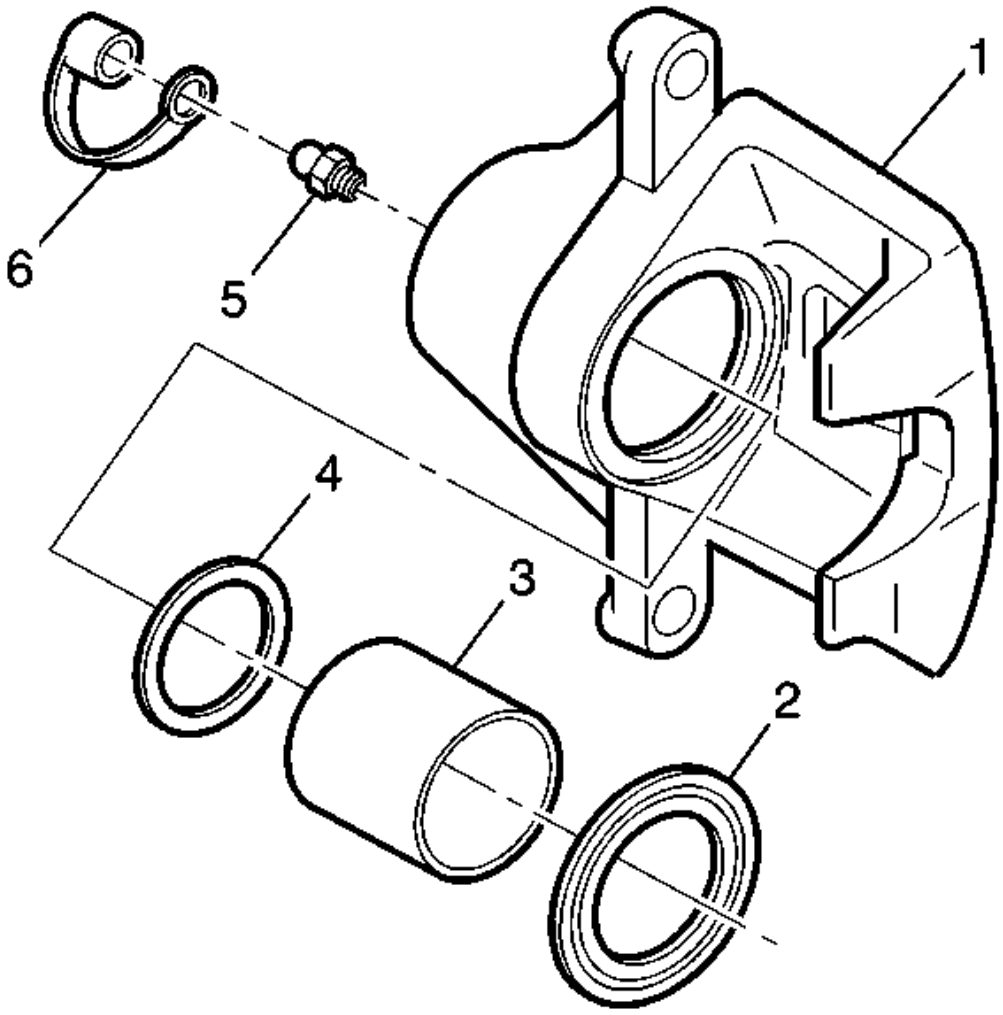

Fig. 8: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Dust Warning .**

1. Inspect the brake caliper housing (1) for cracks, excess wear, and/or damage. If any of these conditions are present, the brake caliper requires replacement.
2. Inspect the caliper piston dust boot seal (2) for cracks, tears, cuts, deterioration and/or improper seating in the caliper body. If any of these conditions are present, the brake caliper requires overhaul or replacement.
3. Inspect for brake fluid leakage around the caliper piston dust boot seal (2) and on the disc brake pads. If there is any evidence of brake fluid leakage, the brake caliper requires overhaul or replacement.

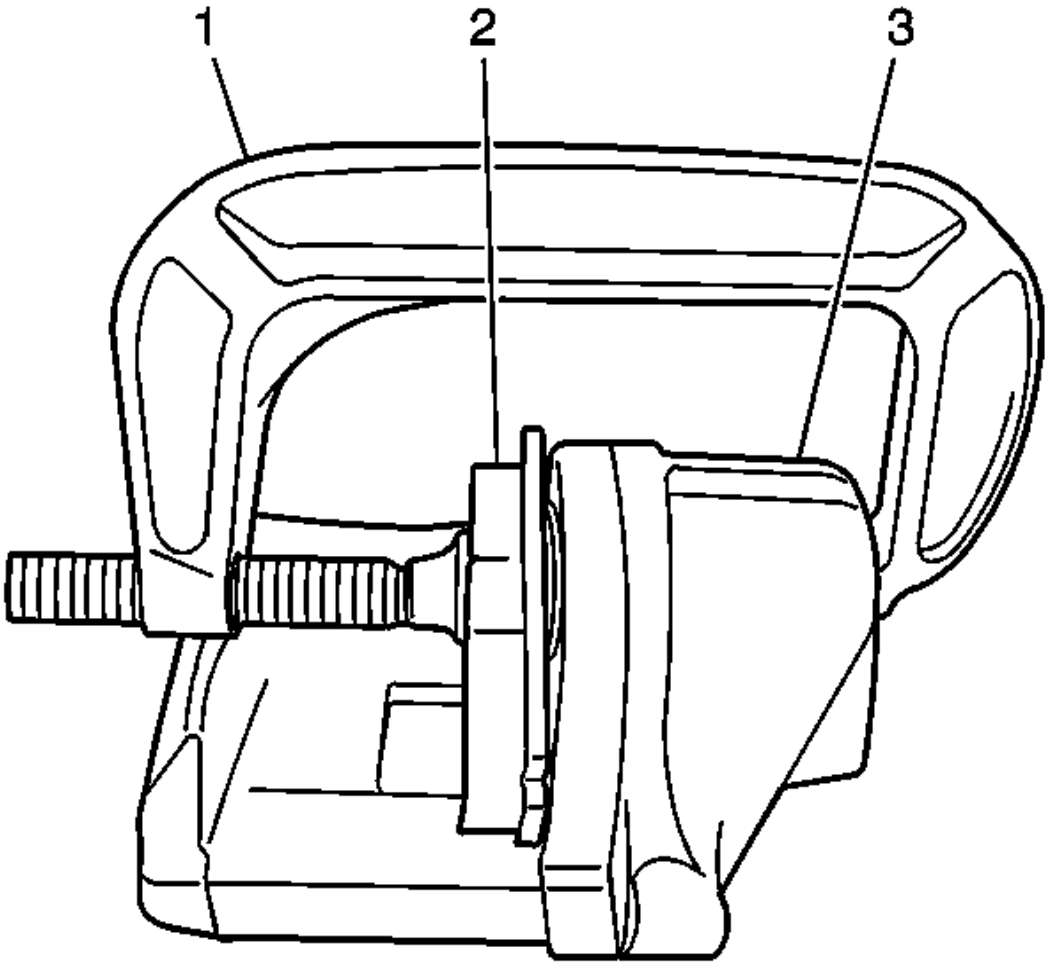

Fig. 9: Compressing Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

4. Inspect for smooth and complete travel of the caliper pistons into the caliper bores:

   The movement of the caliper pistons into the caliper bores should be smooth and even. If the caliper piston is frozen or difficult to bottom, the caliper requires overhaul or replacement.

   - For single piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the piston. Using a large C-clamp (1) installed over the body of the caliper (3) and against

the brake pad or block of wood, slowly bottom the piston in the bore.

- For dual piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the pistons. Using 2 large C-clamps (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the pistons evenly into the bores.

FRONT DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: Refer to Brake Dust Warning .

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level then no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level then remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer **Lifting and Jacking the Vehicle** .
5. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
6. Grasp the brake caliper housing and try to move the brake caliper housing up/down and forward/reverse in relation to the brake caliper mounting bracket. If excessive looseness is observed the brake caliper bracket bushings and/or the brake caliper mounting bolts may need to be replaced.
7. Compress the front caliper pistons.
   - Install a large C-clamp over the top of the caliper housing and against the back of the outboard pad.
   - Slowly tighten the C-clamp until the pistons are pushed completely into the caliper bores.
   - Remove the C-clamp from the caliper.
8. With the pistons compressed into the caliper bores, grasp the brake caliper housing and slide it back and forth on the brake caliper mounting bolts. Check for smooth operation. If the brake caliper housing slide force is high or the brake caliper housing does not slide smoothly, inspect the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings for wear or damage. If wear or damage conditions are found, replacement of the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings is necessary.
9. Remove the brake caliper mounting bolts from the brake caliper mounting bracket and support the brake caliper using heavy mechanics wire. Do Not remove the hydraulic brake hose from the caliper. Refer to **Front Brake Caliper Replacement**.

   NOTE: When replacing the disc brake pads, maintain the same disc brake pad wear sensor orientation.

10. Remove the disc brake pads from the brake caliper mounting bracket.
11. Inspect the disc brake pad mounting hardware for the following:
    - Missing mounting hardware
    - Excessive corrosion
    - Bent mounting tabs
    - Looseness at the brake caliper mounting bracket
    - Looseness at the disc brake pads

- Excessive contaminants in the brake caliper mounting bracket surface and threads.

12. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
13. Ensure the disc brake pads are held firmly in place on the brake caliper mounting bracket, yet slide easily on the mounting hardware without binding.

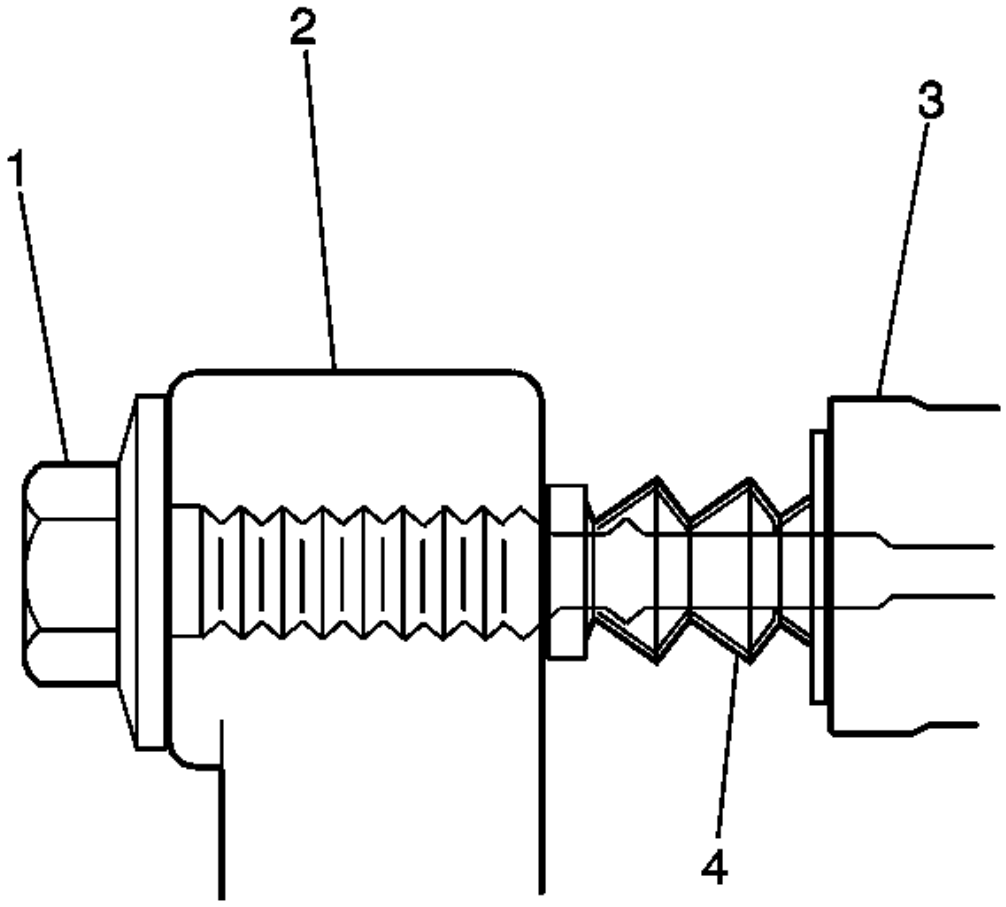

Fig. 10: View Of Caliper, Pin, Boots & Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

14. Inspect the brake caliper guide pin bolt (1), brake caliper (2), caliper bracket (3), and the guide pin seal (4) for the following:
    - Binding
    - Seizing
    - Looseness in the brake caliper mounting bracket
    - Bent or damaged brake caliper mounting bolts
    - Cracked or torn boots
    - Missing boots
    - Bent or damaged brake caliper mounting bracket

15. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.
16. Install the disc brake pads to the brake caliper mounting bracket.
17. Install the disc brake caliper to the brake caliper mounting bracket. Refer to **Front Brake Caliper Replacement**.

REAR DISC BRAKE MOUNTING AND HARDWARE INSPECTION

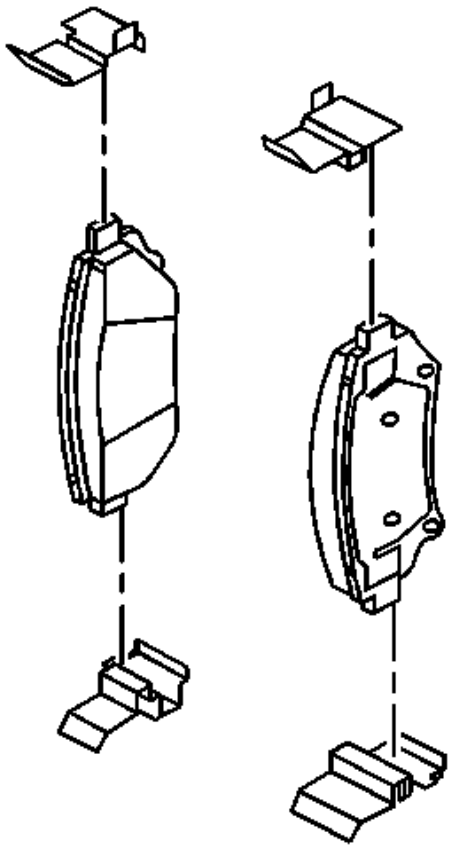

Fig. 11: Disc Brake Pad Mounting Hardware
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Inspect the disc brake pad mounting hardware for the following:
   - Missing mounting hardware
   - Excessive corrosion
   - Bent mounting tabs
   - Looseness at the caliper mounting bracket
   - Looseness at the disc brake pads

2. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
3. Ensure the disc brake pads are held firmly in place on the caliper mounting bracket, yet slide easily on the mounting hardware without binding.

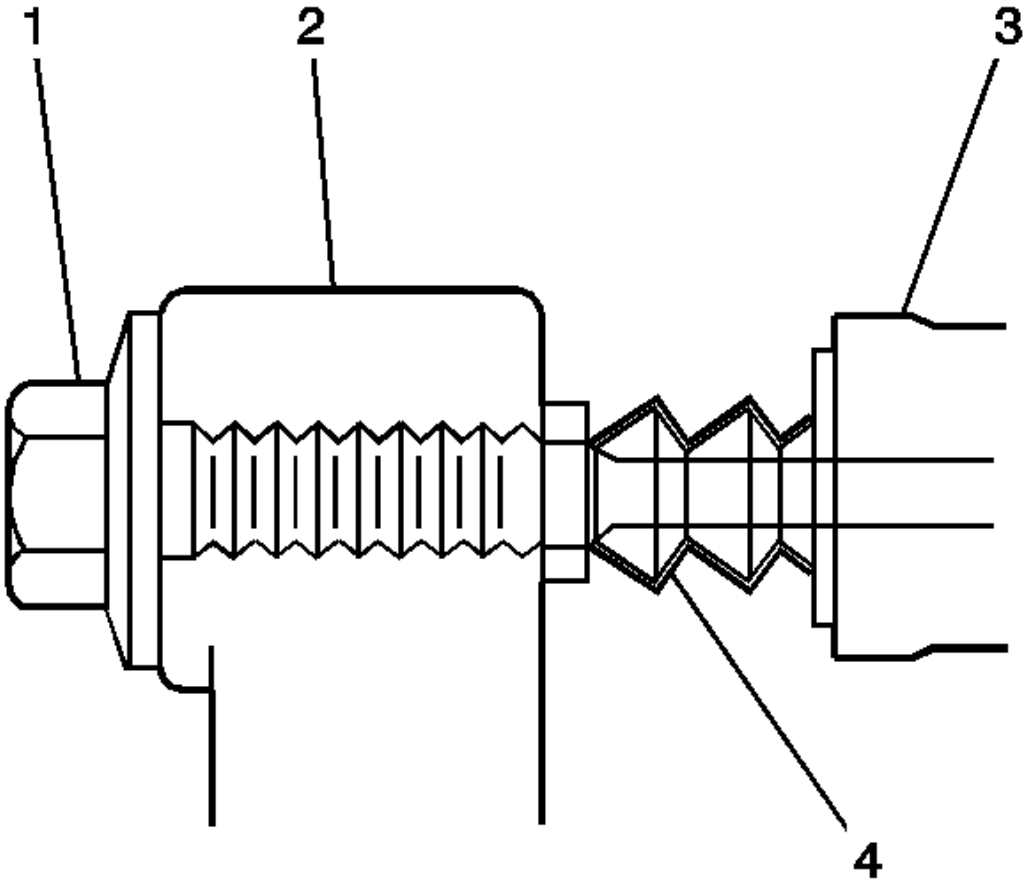

Fig. 12: Inspecting Caliper Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Inspect the caliper bolts (1) for the following:
    - Binding
    - Seizing
    - Looseness in the caliper mounting bracket (3)
    - Bent or damaged caliper bolts
    - Cracked or torn boots (4)
    - Missing boots
    - Bent or damaged caliper mounting bracket (3)
5. If any of the conditions listed are found, the caliper mounting hardware requires replacement.

REPAIR INSTRUCTIONS

FRONT DISC BRAKE PADS REPLACEMENT

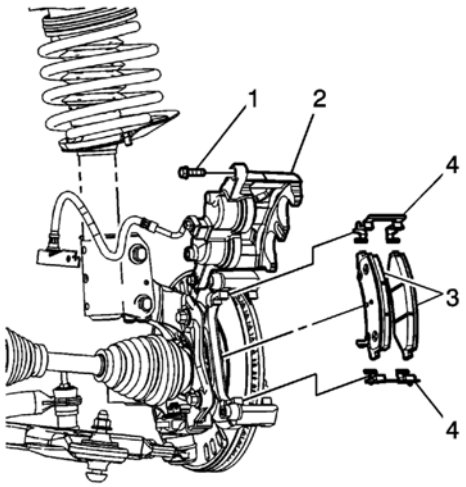

Fig. 13: Front Brake Pads
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Fluid Irritant Warning .** **WARNING:** **Refer to Brake Dust Warning .** **CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to**	

Callout	Component Name
support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **NOTE:** **Always replace disc brake pads in axle sets.** **Preliminary Procedures** 1. Inspect the fluid level in the brake master cylinder reservoir. 2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding. 3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding. 4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 5. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .	
1	Guide Pin Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 36 N.m (26 lb ft)

Callout	Component Name
2	Brake Caliper **Procedure** 1. Rotate the brake caliper up and to the rear until it rests on the mounting bracket and support with heavy mechanics wire or equivalent. 2. Place a block of wood or an old disc brake pad against the brake caliper pistons. 3. Using a brake pad spreader or equivalent tool, slowly compress the brake caliper pistons squarely into the caliper bores.
3	Brake Pad **Procedure** 1. If installing the original brake pads, note the brake pad location for proper installation. 2. When replacing the brake pads, ensure the brake pad with the wear indicator is positioned inboard of the brake rotor and the wear indicator is pointing down. 3. Clean the friction surfaces of the brake rotor with denatured alcohol.
4	Spring Retainer (Qty: 2) **Procedure** 1. If replacing the brake pads, DO NOT reuse the spring retainers. Install NEW spring retainers. 2. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance. 3. Slowly release the brake pedal. 4. Wait 15 seconds, then repeat steps 2-3 until a firm brake pedal is obtained. This will properly seat the brake caliper pistons and the brake pads. 5. Fill the master cylinder reservoir to the proper level. Refer to **Master Cylinder Reservoir Filling** . 6. Burnish the pads and rotors. Refer to **Brake Pad and Rotor Burnishing**.

REAR DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Dust Warning .

NOTE: Always replace disc brake pads in axle sets.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, then no brake fluid needs to be removed from the reservoir before proceeding. If the brake fluid level is

higher than midway between the maximum-full point and the minimum allowable level, then remove brake fluid to the midway point before proceeding.

3. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the rear tire and the wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
5. Install a hand tightened lug nut to retain the rotor to the hub.

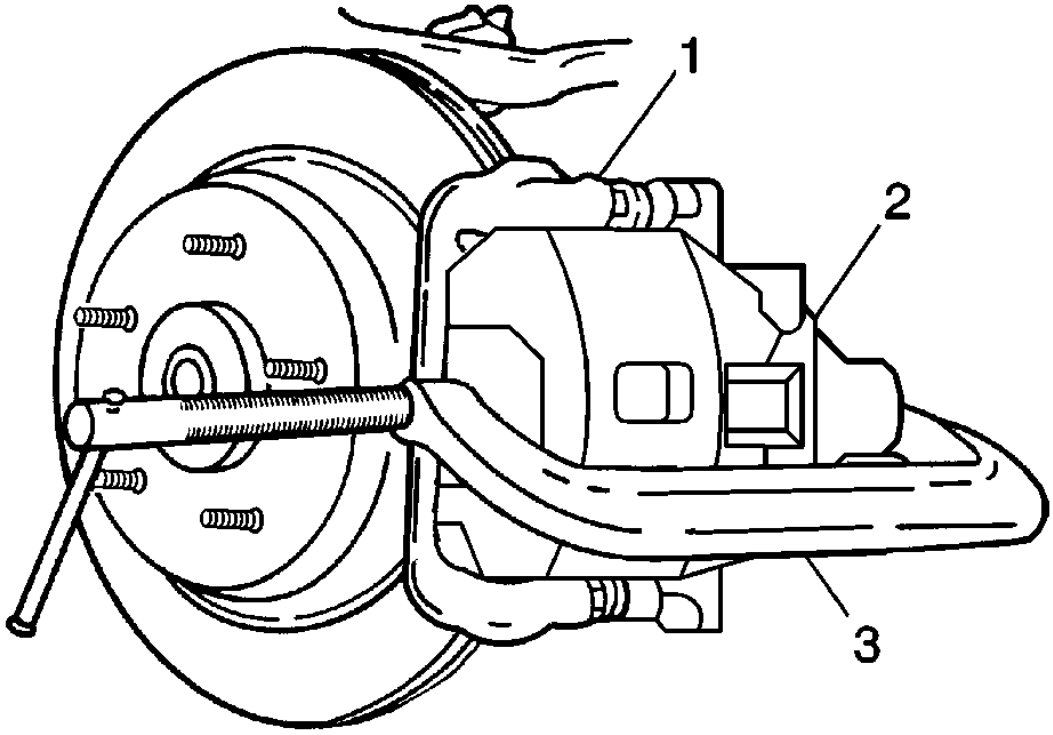

Fig. 14: Pushing In Brake Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

6. Compress the caliper piston enough for clearance. Use a C-clamp (3).

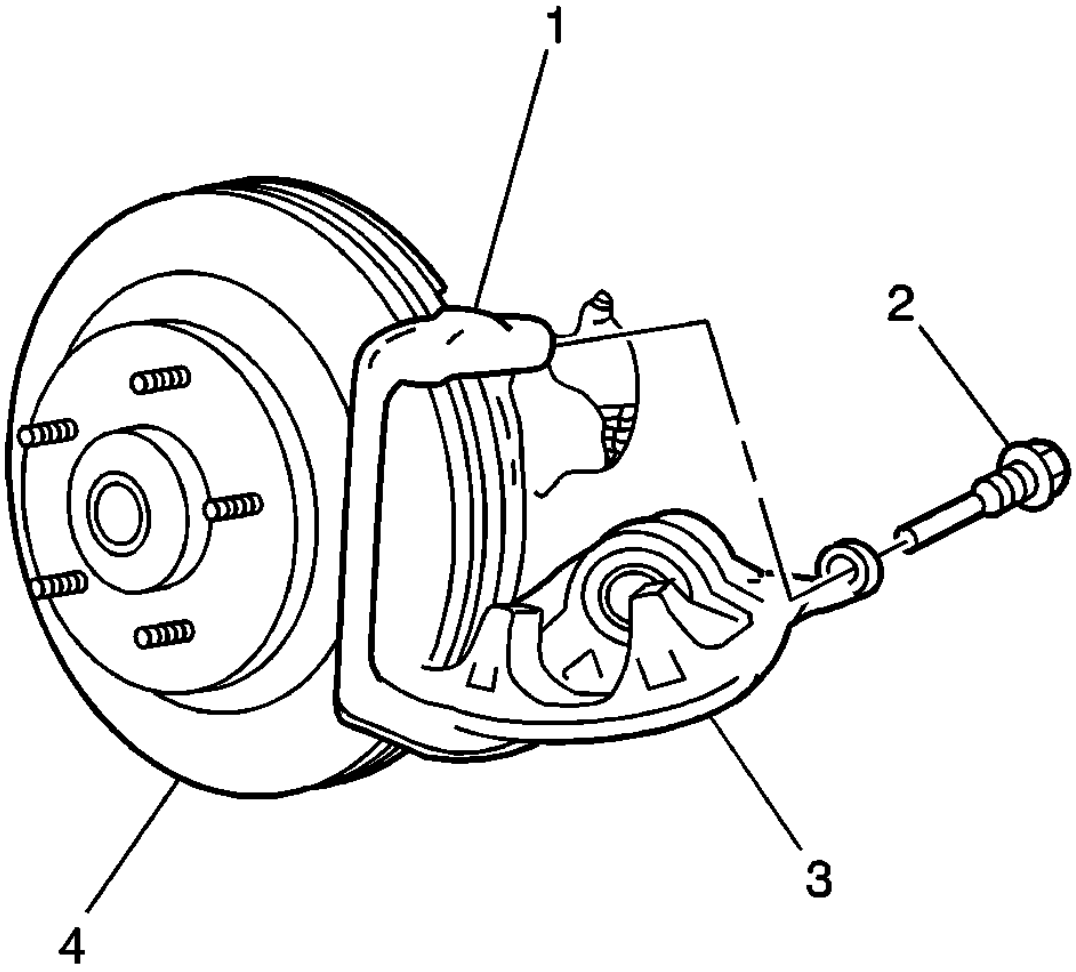

Fig. 15: View Of Upper Caliper Bolt - Rear
Courtesy of GENERAL MOTORS COMPANY

7. Remove the upper caliper bolt (2).

CAUTION: Use care to avoid damaging pin boot when rotating caliper.

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

8. Pivot the caliper down in order to access the pads. It is not necessary to remove the caliper.

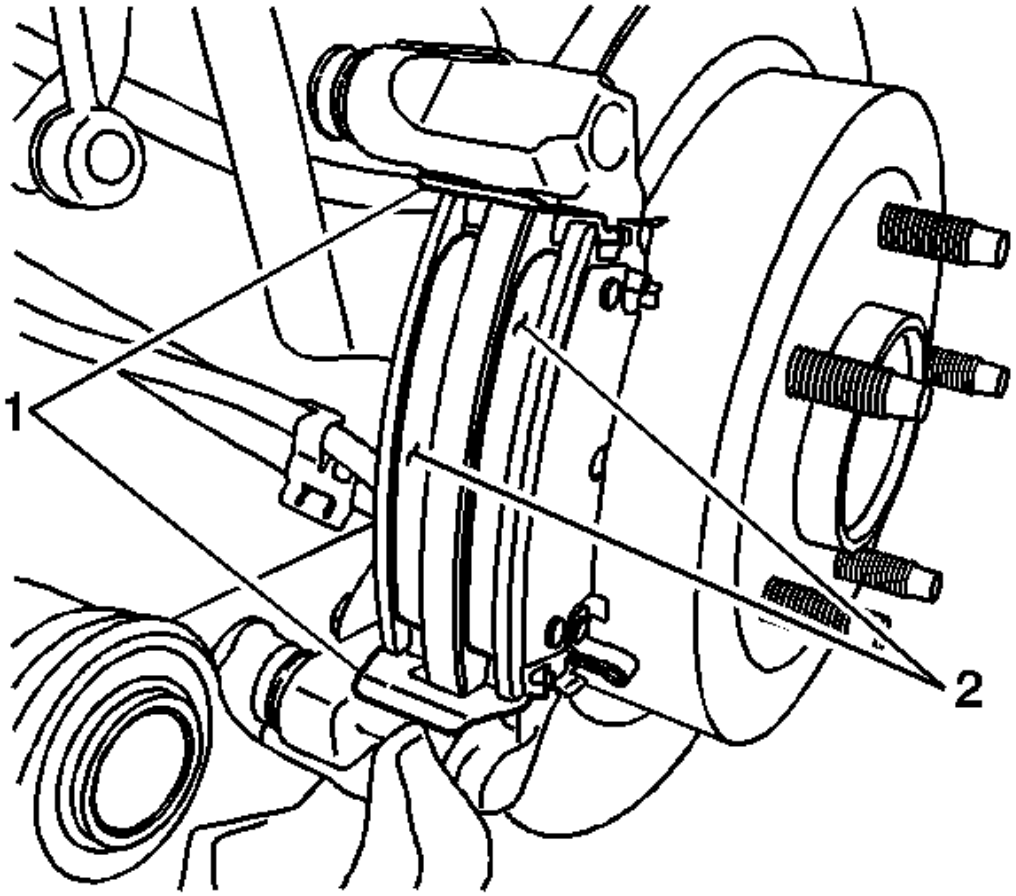

Fig. 16: Rear Brake Pads & Clips
Courtesy of GENERAL MOTORS COMPANY

9. Remove the brake pads (2) from the caliper bracket.
10. Remove the 2 pad clips (1) from the caliper bracket.
11. Inspect the caliper mounting hardware for the following conditions:
    - Cuts
    - Tears
    - Deterioration

    Replace any hardware if damage exists. Refer to **Rear Disc Brake Mounting and Hardware Inspection**.

12. Inspect the caliper dust boot for the following conditions:
    - Cuts
    - Tears
    - Deterioration

Replace the caliper dust boot if damage exists. Refer to **Brake Caliper Inspection**.

13. Inspect the caliper bolts for corrosion or damage. If corrosion exists, use new caliper bolts when installing the caliper.

Installation Procedure

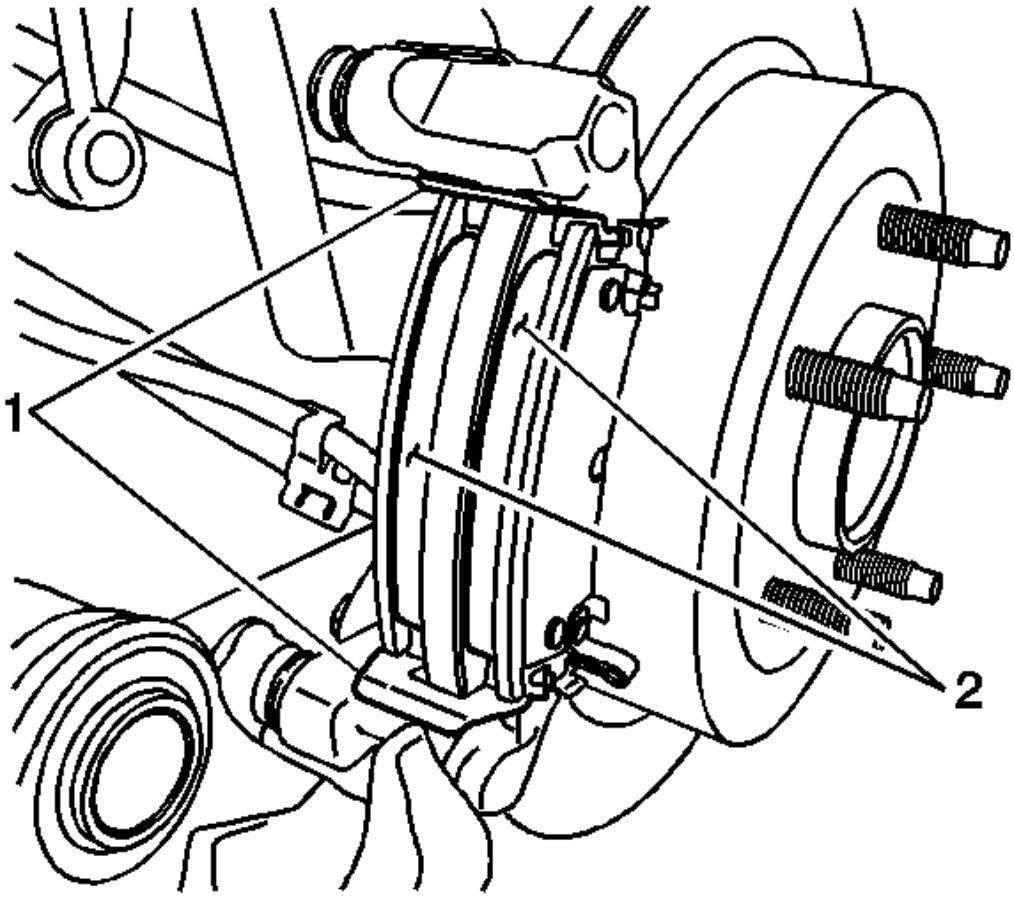

Fig. 17: Rear Brake Pads & Clips
Courtesy of GENERAL MOTORS COMPANY

1. Bottom the piston into the caliper bore.

   Use a C-clamp before installing new brake pads in order to compress the piston. Use an old brake pad or wooden block across the face of the piston to avoid damage to the piston or the caliper boot.

2. Install the 2 retainers (1) to the caliper bracket.

   NOTE: The wear sensor is on the outside pad. The sensor is positioned at the trailing or downward edge of the pad during forward wheel rotation.

3. Install the pads (2) to the caliper bracket.

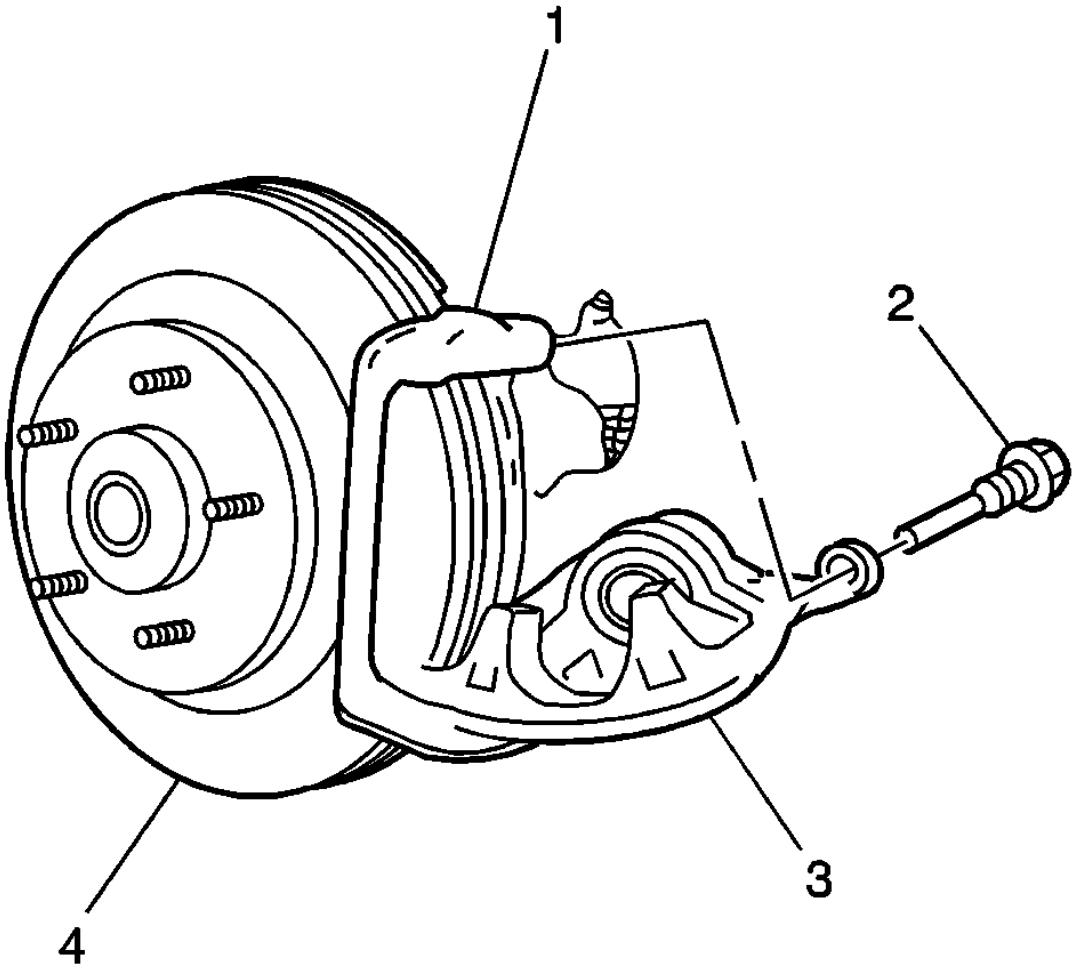

Fig. 18: View Of Upper Caliper Bolt - Rear
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use care to avoid damaging pin boot when rotating caliper.

4. Swing the caliper (3) upward in position around the pads.
5. Lubricate the bolt and the bolt boot. Use silicone grease.

CAUTION: Refer to Fastener Caution .

6. Install the upper caliper bolt (2).

Tighten

Tighten the caliper bolt to 44 N.m (32 lb ft).

7. Remove the wheel lug nut retaining the rotor to the hub.
8. Install the rear tire and the wheel assembly. Refer to **Tire and Wheel Removal and Installation** . Align the previous marks on the wheel, hub and bearing.

9. Lower the vehicle.
10. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then repeat steps 10 and 11 until a firm brake pedal is obtained. This will properly seat the brake caliper pistons and brake pads.
13. Fill the brake master cylinder reservoir to the proper level. Refer to **Master Cylinder Reservoir Filling** .
14. Burnish the pads and rotors. Refer to **Brake Pad and Rotor Burnishing**.

BRAKE PAD AND ROTOR BURNISHING

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

Burnishing the brake pads and brake rotors is necessary in order to ensure that the braking surfaces are properly prepared after service has been performed on the disc brake system.

This procedure should be performed whenever the disc brake rotors have been refinished or replaced, and/or whenever the disc brake pads have been replaced.

1. Select a smooth road with little or no traffic.
2. Accelerate the vehicle to 48 km/h (30 mph).

NOTE: Use care to avoid overheating the brakes while performing this step.

3. Using moderate to firm pressure, apply the brakes to bring the vehicle to a stop. Do not allow the brakes to lock.
4. Repeat steps 2 and 3 until approximately 20 stops have been completed. Allow sufficient cooling periods between stops in order to properly burnish the brake pads and rotors.

FRONT BRAKE CALIPER REPLACEMENT

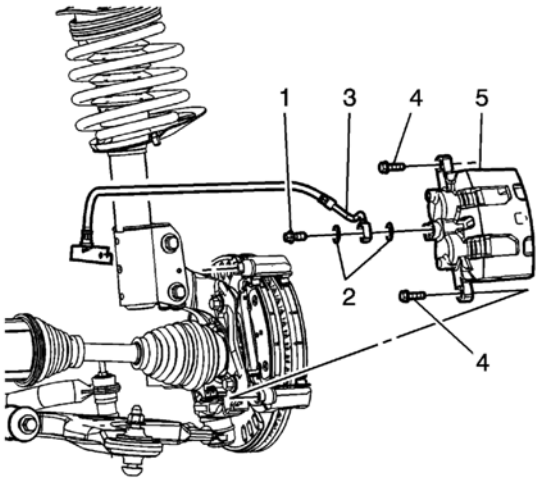

Fig. 19: Front Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Dust Warning .** **WARNING:** **Refer to Brake Fluid Irritant Warning .** **Preliminary Procedures** 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .	
1	Brake Hose Fitting Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 54 N.m (40 lb ft)
2	Brake Hose Fitting Gasket (Qty: 2) **TIP:** DO NOT reuse the brake hose fitting gaskets. Install NEW gaskets.
3	Brake Hose **TIP:** Cap the brake hose fitting to prevent brake fluid loss and contamination.
4	Guide Pin Bolt (Qty: 2) **Tighten** 36 N.m (26 lb ft)
5	Brake Caliper **Procedure** 1. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** **Hydraulic Brake System Bleeding (Pressure)** . 2. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance. 3. Slowly release the brake pedal.

Callout	Component Name
	4. Wait 15 seconds, then repeat steps 2-3 until a firm brake pedal is obtained. This will properly seat the brake caliper pistons and brake pads. 5. Fill the master cylinder reservoir to the proper level. Refer to **Master Cylinder Reservoir Filling** . 6. Burnish the pads and rotors. Refer to **Brake Pad and Rotor Burnishing**.

REAR BRAKE CALIPER REPLACEMENT

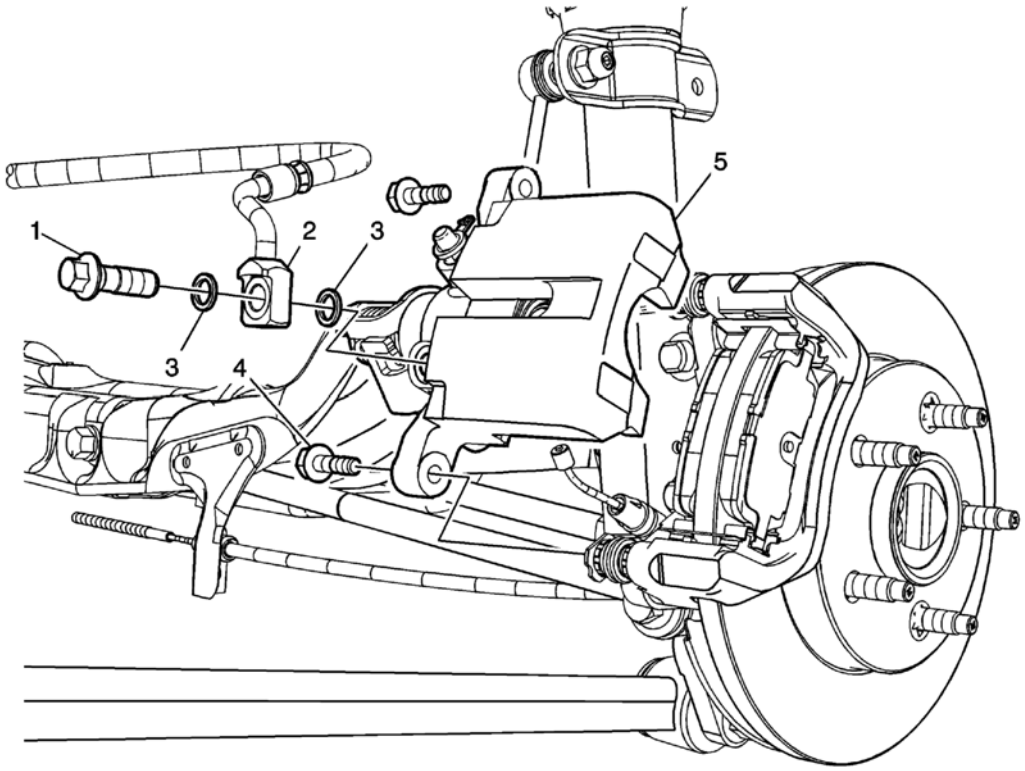

Fig. 20: Rear Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Dust Warning .** **WARNING:** **Refer to Brake Fluid Irritant Warning .** **Preliminary Procedures**	

Callout	Component Name
1. Inspect the brake fluid level in the master cylinder reservoir. 2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed from the reservoir before proceeding. 3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding. 4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 5. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .	
1	Brake Hose Fitting Bolt **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 54 N.m (40 lb ft)
2	Brake Hose Fitting **TIP:** Cap the brake hose fitting and plug the brake caliper inlet port to prevent brake fluid loss and contamination.
3	Brake Hose Fitting Gasket (Qty: 2) **Procedure** 1. Discard the brake hose fitting gaskets. 2. Install new brake hose fitting gaskets.
4	Brake Caliper Guide Pin Bolt (Qty: 2) **Tighten** 44 N.m (32 lb ft)
5	Brake Caliper **Procedure** 1. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** **Hydraulic Brake System Bleeding (Pressure)** . 2. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance. 3. Slowly release the brake pedal. 4. Wait 15 seconds, then repeat steps 2-3 until a firm brake pedal is obtained. This will properly seat the brake caliper pistons and the brake pads.

FRONT BRAKE CALIPER OVERHAUL

Special Tools

- **J-8092** Driver Handle 3/4 inch-10
- **J-45863** Dust Seal Installer

WARNING: Refer to Brake Fluid Irritant Warning .

Disassembly Procedure

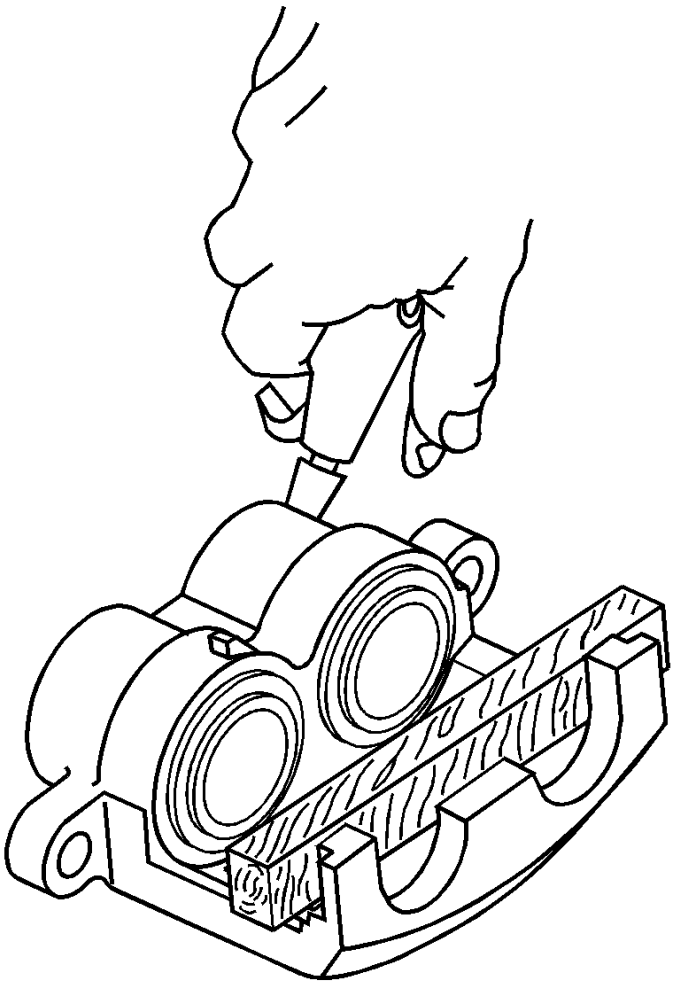

Fig. 21: Applying Air To Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

1. Drain all the brake fluid from the caliper.

WARNING: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

NOTE: In the following service procedure, the caliper piston may become damage when it is removed from the brake caliper assembly. If this happens, DO

NOT reuse the piston. Discard and replaced with new.

2. Install the brake caliper in a suitable holding devise.
3. Insert a piece of wood in the brake caliper.
4. Cover the brake caliper with a shop towel.
5. Using compressed filtered, non-lubricated air, apply the air to the remove the pistons from the brake caliper.

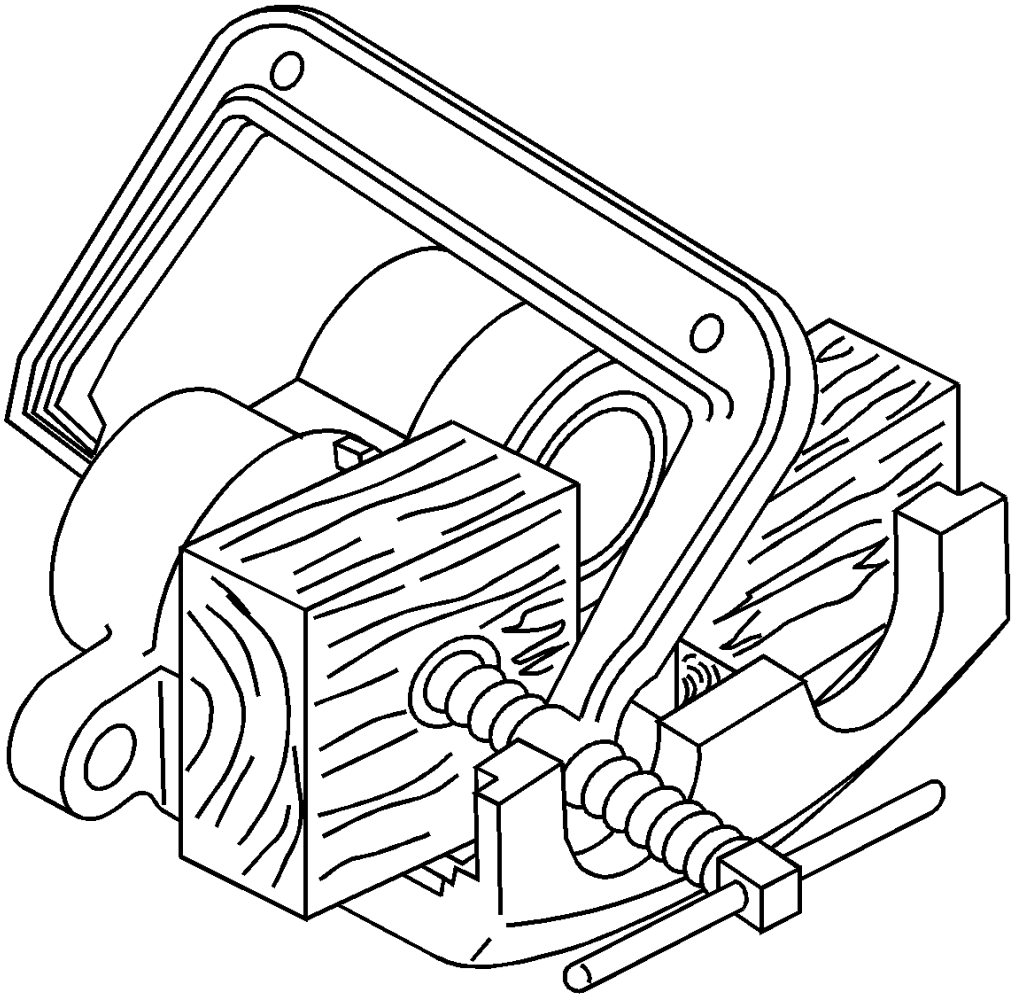

Fig. 22: Clamping Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

6. If one of the pistons fails to be removed from the brake caliper, perform the following steps.
    1. Reposition the piston that has been removed back in the brake caliper.
    2. Using a small block of wood and a C-clamp, slowly tighten the C-clamp until the piston it is half way in the brake caliper. It does not have to be fully seated.
    3. Position a second block of wood in front of the piston that remains in the brake caliper.
    4. Cover the brake caliper with a shop towel.
    5. Using compress filtered, non lubricated air, apply the air to the remove the pistons from the brake

caliper.

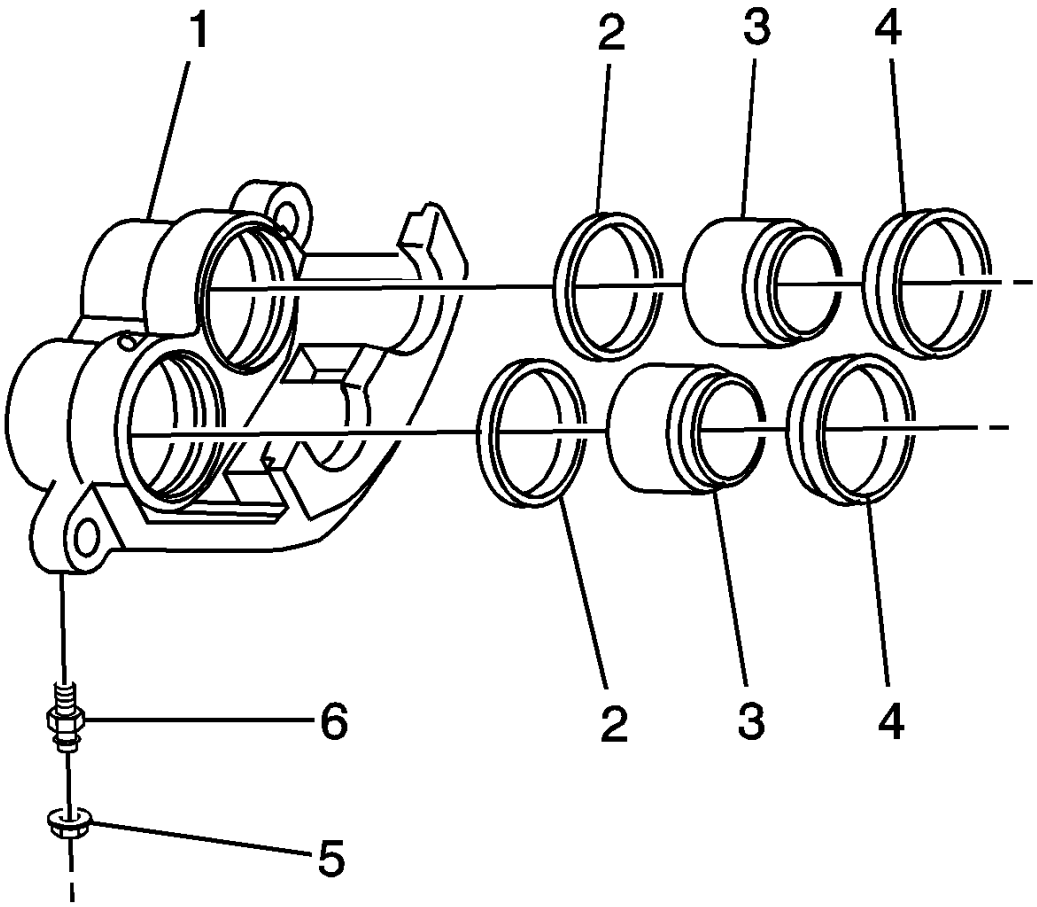

Fig. 23: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

7. Remove the pistons (3) from the caliper bores.
8. Remove the piston seals (2) from the caliper bores. Do not use a metal tool.
9. Remove the bleeder valve cap (5).
10. Remove the bleeder valve (6) from the caliper housing (1).
11. Clean the bleeder valve, the caliper bores, the caliper passages and the pistons with denatured alcohol. Dry the parts and blow out the brake fluid passages. Use dry and filtered compressed air.

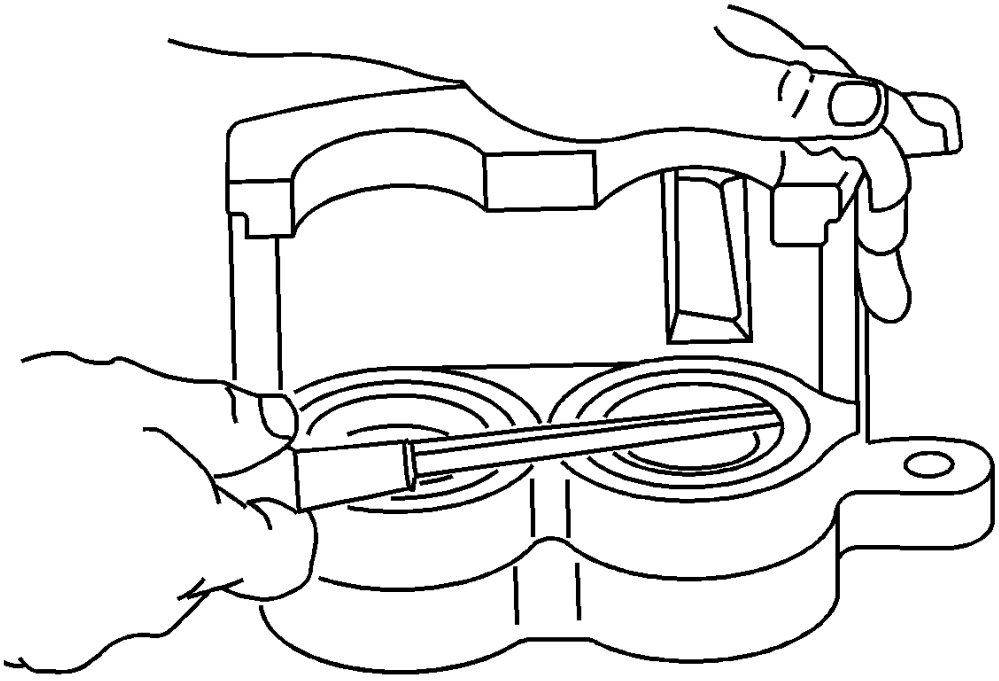

Fig. 24: Brake Caliper Boots
Courtesy of GENERAL MOTORS COMPANY

12. Remove the boots from the caliper bores. Do not scratch the caliper bores.
13. Replace the pistons or the caliper if any of the following conditions exist:
    - Scoring in the caliper bores
    - Corrosion in the caliper bores
    - Pitting in the caliper bores
    - Damage to the pistons (phenolic)
14. Clean the brake caliper assembly with denatured alcohol.
15. Dry with filtered , lubricated compressed air.

Assembly Procedure

NOTE: **When applying the clean brake fluid to the piston bores and pistons, only apply the brake fluid to one bore at a time. This is done to ensure that the brake caliper, seals and pistons DO NOT become contaminated with dirt or other foreign material.**

1. Apply a small amount of clean DOT-3 brake fluid to the piston, piston seal, and piston bore.

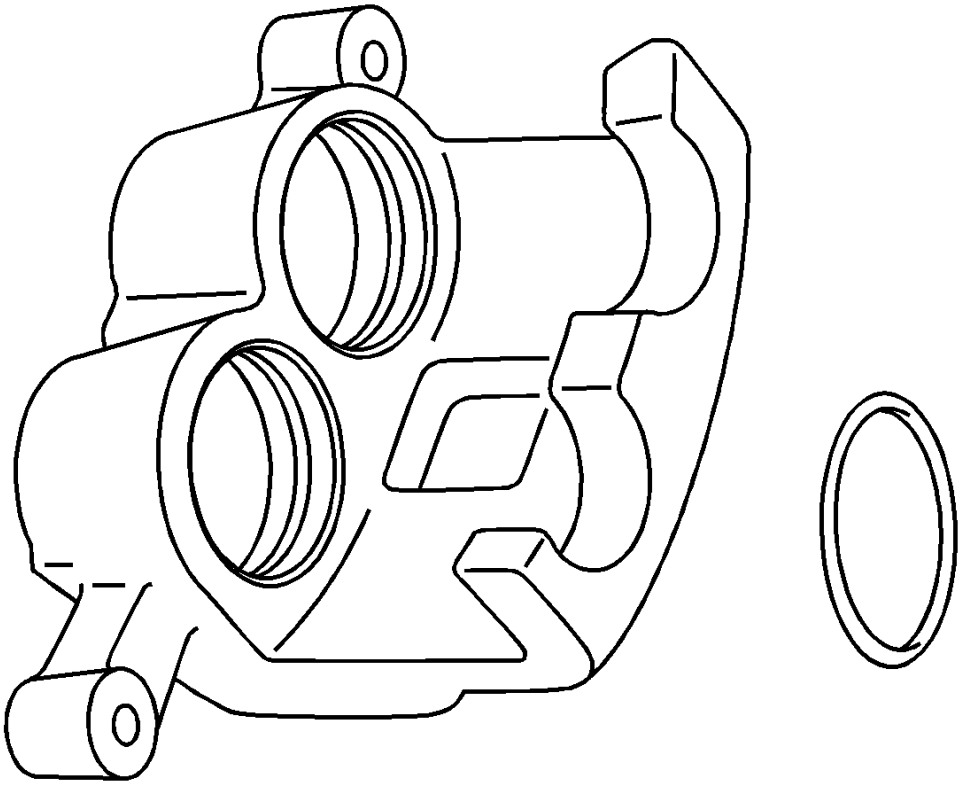

Fig. 25: View Of Brake Caliper Piston Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install the piston seal in the brake caliper.

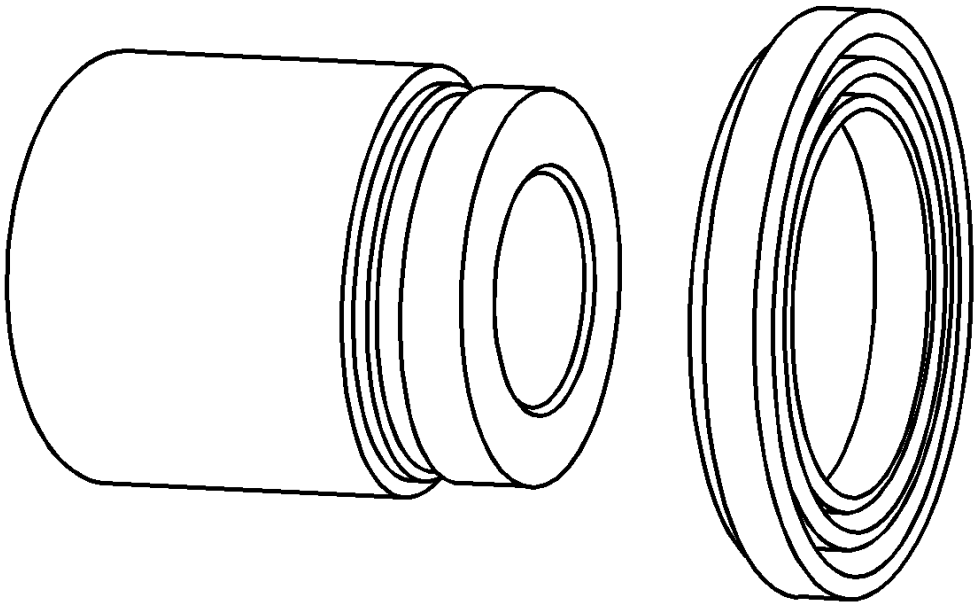

Fig. 26: View Of Piston Dust Seal
Courtesy of GENERAL MOTORS COMPANY

3. Install the dust seal on the piston.

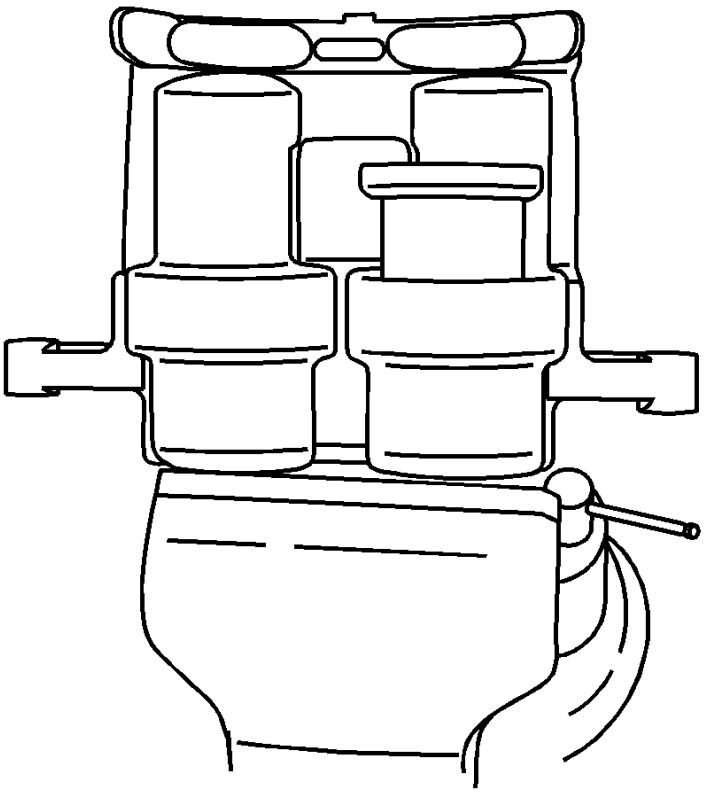

Fig. 27: Installing Piston To Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Position the piston in the bore so that it is straight and level.**

4. Install the piston in the brake caliper.

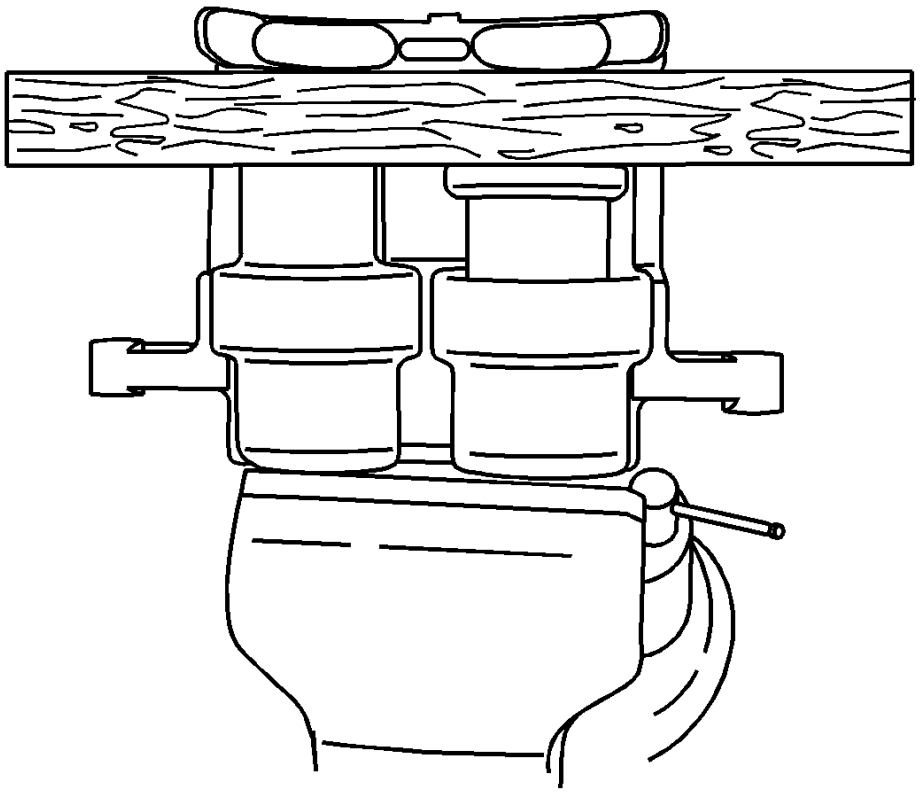

Fig. 28: Installing Piston Into Bore
Courtesy of GENERAL MOTORS COMPANY

5. Position a piece of wood across the piston to be installed.
6. Applying equal pressure by hand while pushing down, install the piston in the bore.
7. Remove the piece of wood.

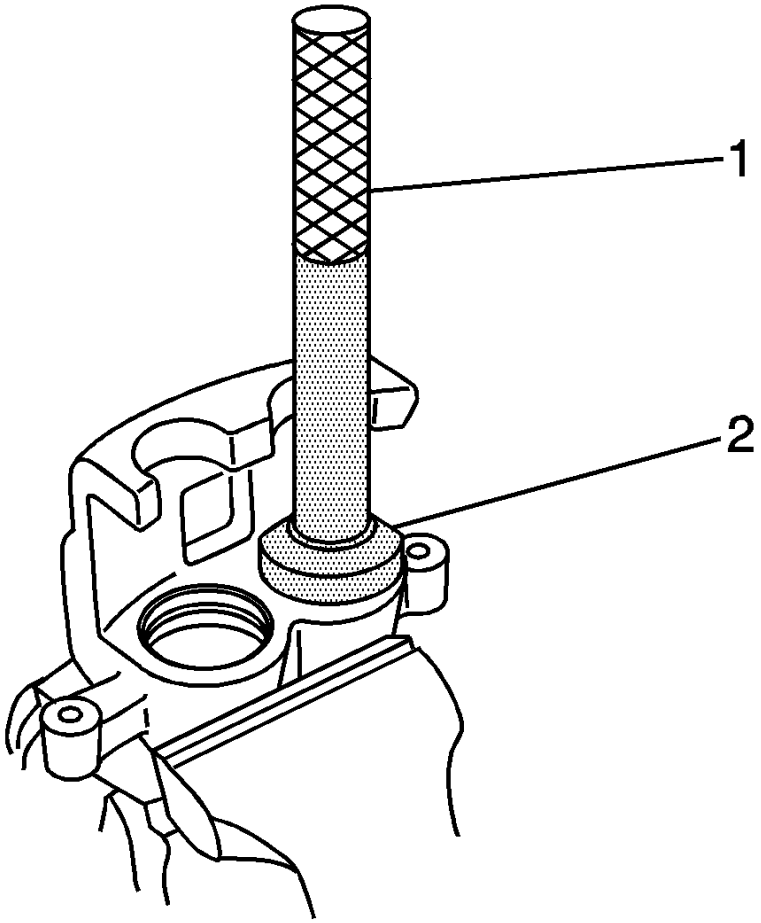

Fig. 29: Installing Piston Dust Seal
Courtesy of GENERAL MOTORS COMPANY

8. Using the **J-8092** Driver Handle 3/4 inch-10 (1) and the **J-45863** Dust Seal Installer (2) , install the piston dust seal in the brake caliper.

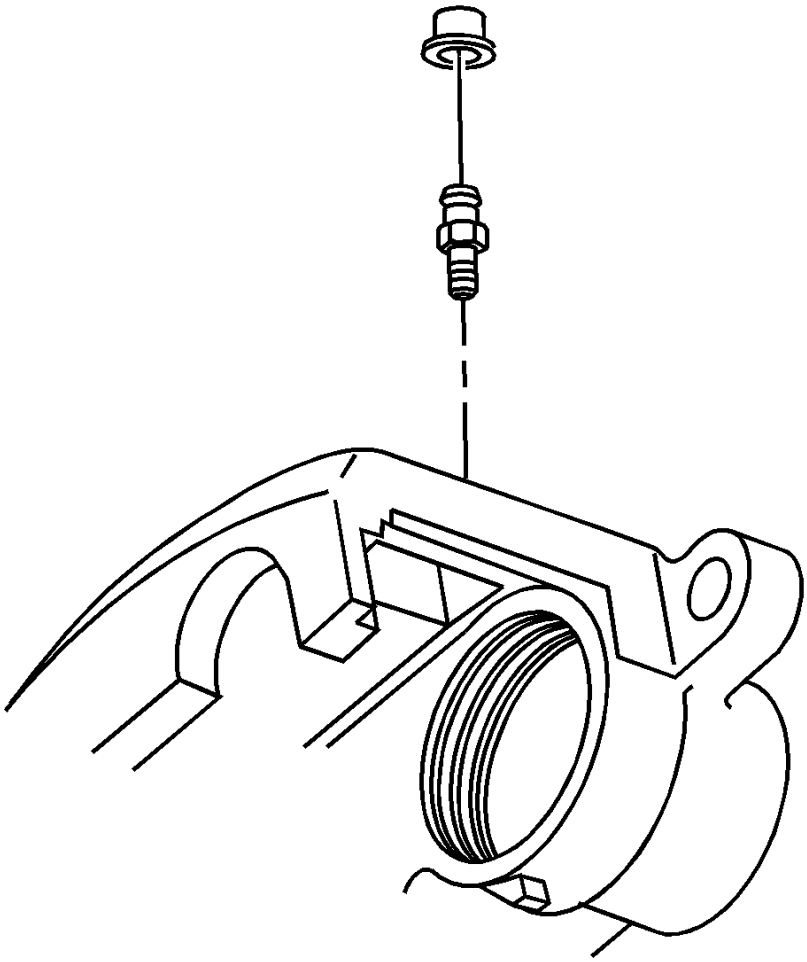

Fig. 30: View Of Bleeder Valve Cap
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

9. Install the bleeder valve in the brake caliper housing and tighten to 13 N.m (115 lb in).
10. Install bleeder valve cap.

REAR BRAKE CALIPER OVERHAUL

Removal Procedure

WARNING: Refer to Brake Dust Warning .

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Remove the rear brake caliper from the vehicle. Refer to **Rear Brake Caliper Replacement**.

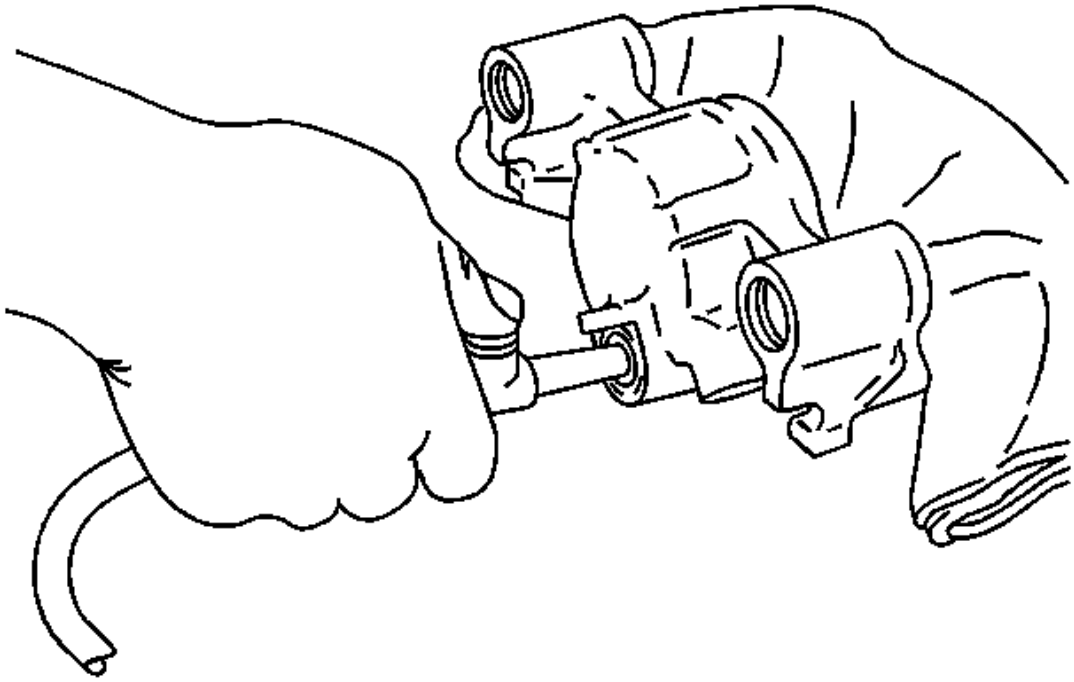

Fig. 31: Removing Brake Caliper Piston Using Low Pressure Compressed Air
Courtesy of GENERAL MOTORS COMPANY

WARNING: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

CAUTION: Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

2. Remove the brake caliper piston from the caliper bore by directing low pressure compressed air into the caliper bore through the fluid inlet hole.

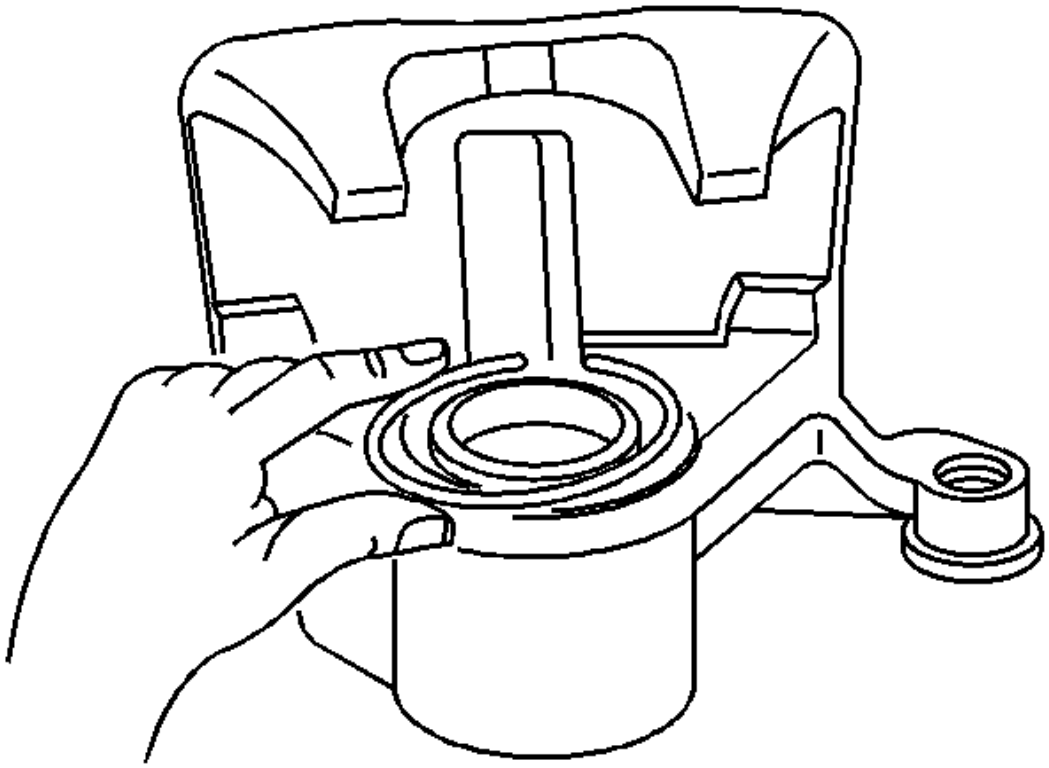

Fig. 32: View Of Dust Boot Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

3. Remove the retaining ring that secures the dust boot to the caliper housing.

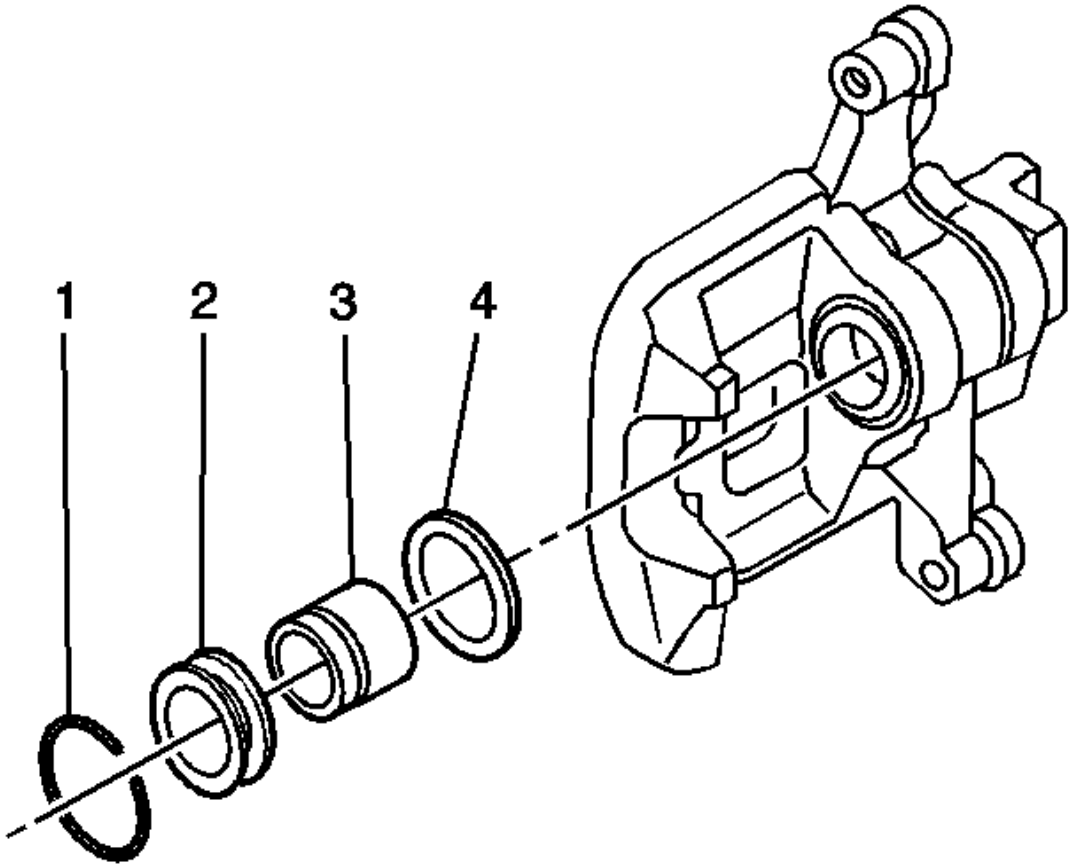

Fig. 33: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

4. Remove the piston dust boot seal (2) from the seal counterbore in the caliper. Discard the boot seal.
5. Using a small wooden or plastic tool, remove the piston seal (4) from the caliper bore . Discard the piston seal.

NOTE: **Do not use abrasives to clean the brake caliper piston.**

6. Clean the brake caliper piston bore and seal counterbore, and the caliper piston with denatured alcohol, or equivalent.
7. Dry the caliper piston bore and counterbore, and the piston with non-lubricated, filtered air.
8. Inspect the caliper bore for cracks, scoring, pitting, excessive rust, and/or excessive corrosion.
9. If light rust or light corrosion are present in the caliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the caliper assembly.
10. If cracks, scoring, pitting, excessive rust, and/or excessive corrosion are present in the caliper bore, replace the caliper assembly.
11. Inspect the caliper piston for cracks, scoring, and/or damage to the chrome plating. Replace the caliper piston if any of these conditions exist.

Installation Procedure

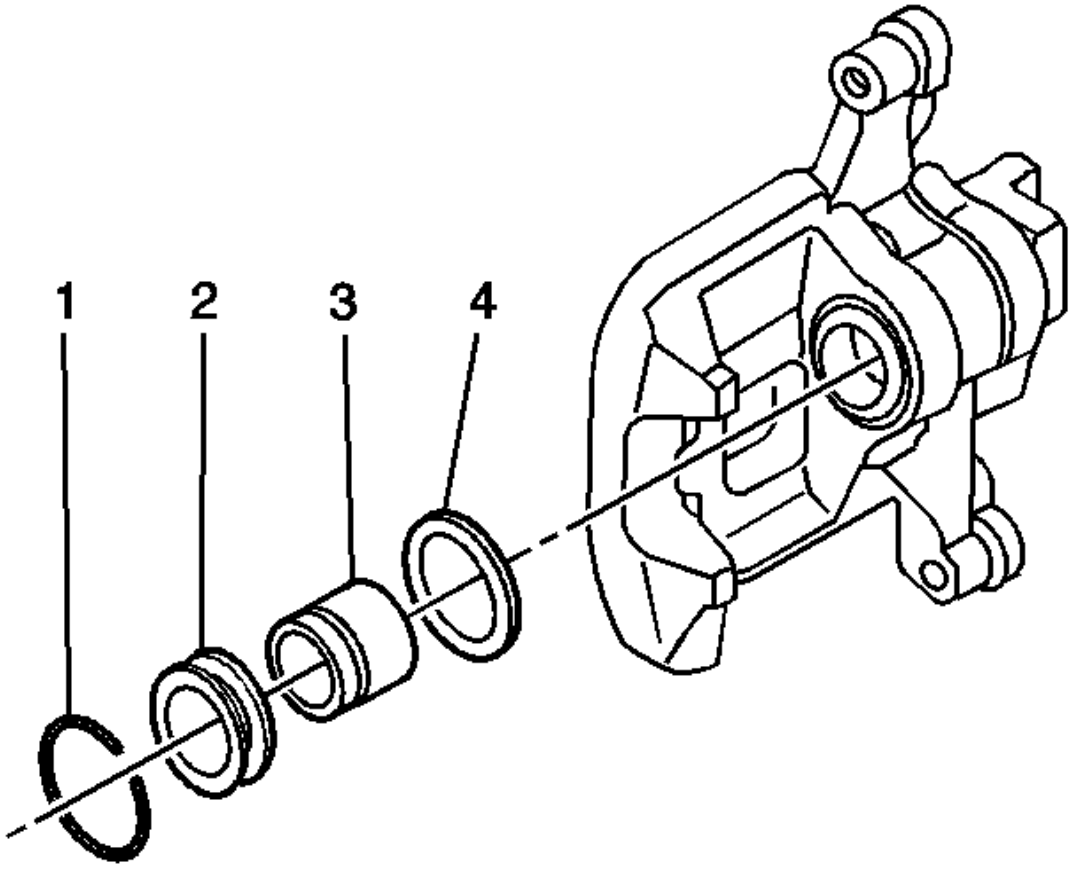

Fig. 34: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the new piston seal (4) with Delco Supreme 11Â®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.
2. Install the lubricated, new piston seal (4) into the caliper bore.
3. Apply a thin coat of Delco Supreme 11Â®, GM P/N 12377967 (Canadian P/N 992667) or equivalent, DOT-3 brake fluid from a clean, sealed brake fluid container onto the outer surface area of the caliper piston (3).

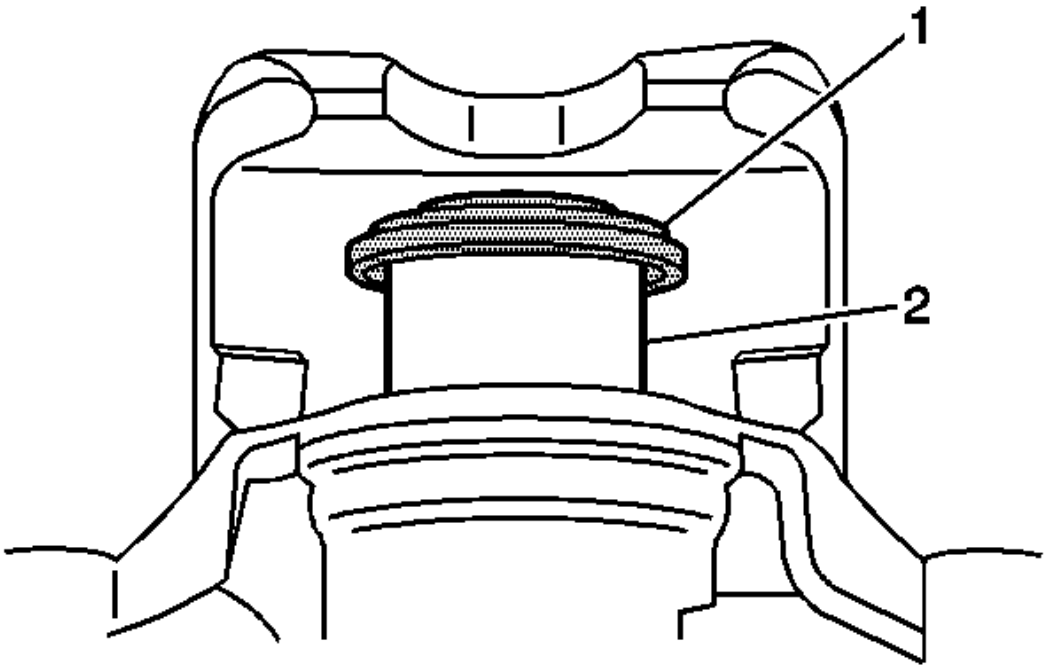

Fig. 35: Identifying Caliper Piston & Piston Dust Boot Seal
Courtesy of GENERAL MOTORS COMPANY

4. Install the bottom half of the caliper piston (2) into the caliper bore.
5. Install the new piston dust boot seal (1) over the caliper piston (2).
6. Compress the caliper piston (2) to the bottom of the caliper bore.
7. Fully seat the piston dust boot seal (1) into caliper counterbore.

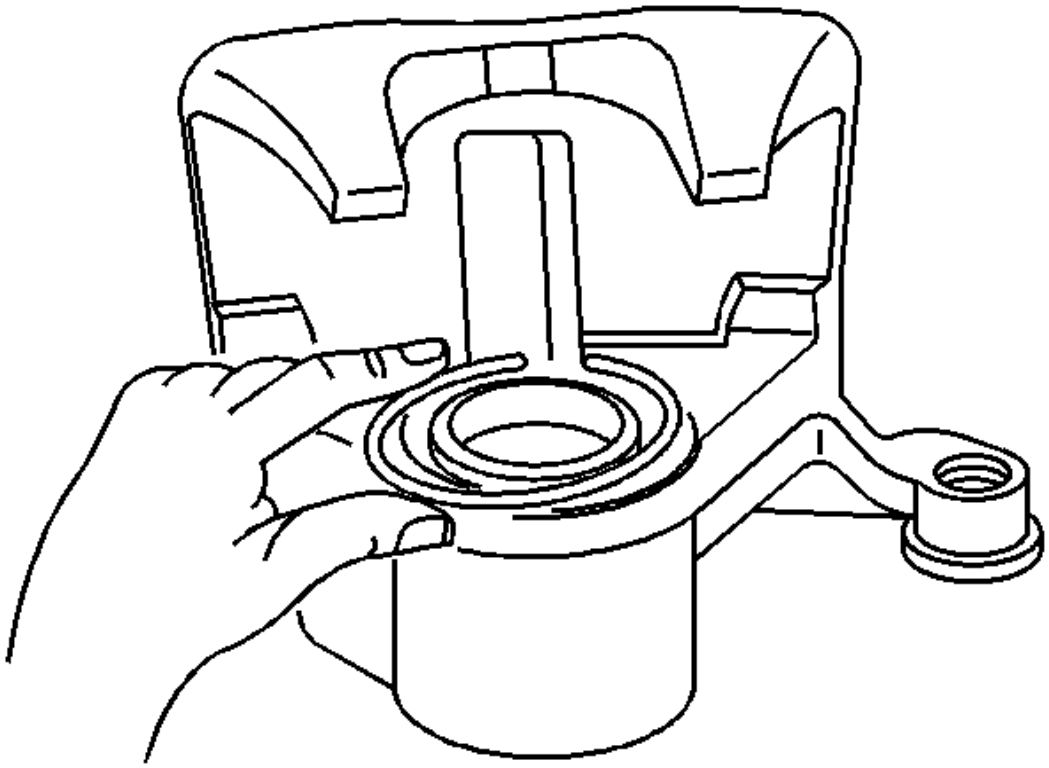

Fig. 36: View Of Dust Boot Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

8. Install the retaining ring that secures the dust boot to the caliper housing.
9. Install the bleeder valve and cap to the caliper and tighten the valve securely.
10. Install the rear brake caliper to the vehicle. Refer to **Rear Brake Caliper Replacement**.

FRONT BRAKE CALIPER HARDWARE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Dust Warning .**

CAUTION: **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.**

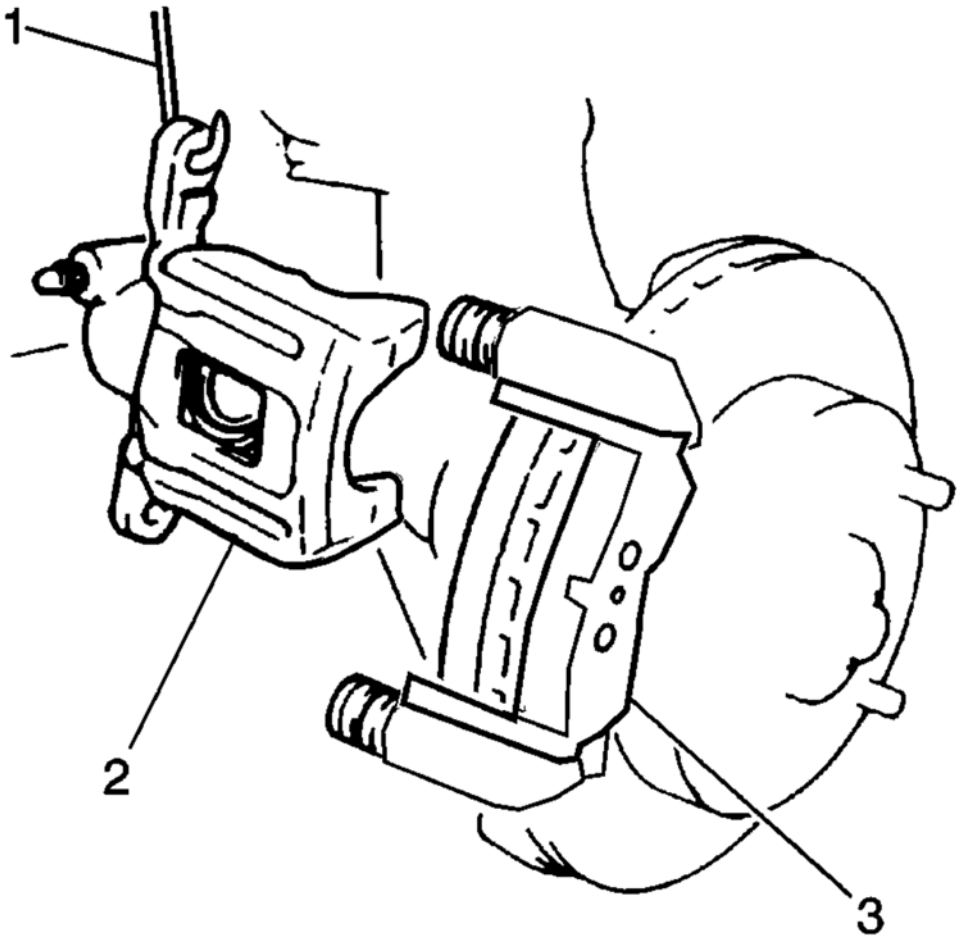

Fig. 37: View Of Brake Caliper And Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the brake caliper from the mounting bracket and support the brake caliper (2) with heavy mechanic's wire (1), or equivalent. Discard the old caliper pin bolts, new bolts are supplied in the hardware kit. It is not necessary to disconnect the hydraulic brake flexible hose from the caliper. Refer to **Front Brake Caliper Replacement**.

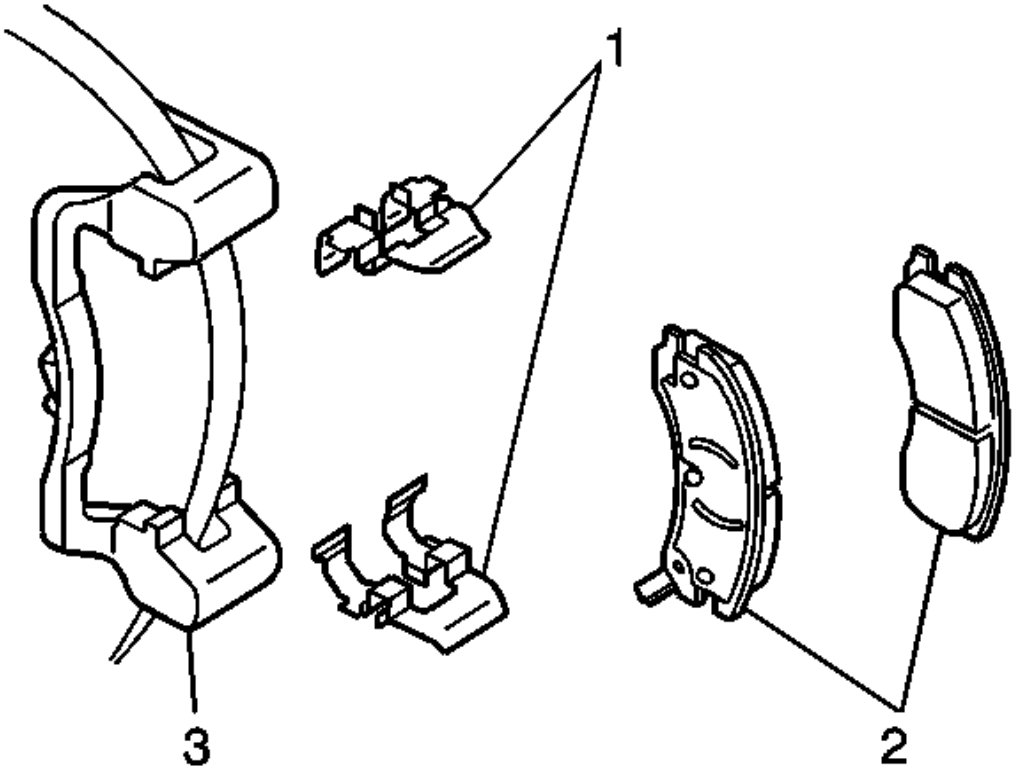

Fig. 38: View Of Brake Pads, Brake Pad Retainers, & Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Remove the brake pads (2) from the brake caliper bracket.
3. Remove the brake pad retainers (1) from the brake caliper bracket.

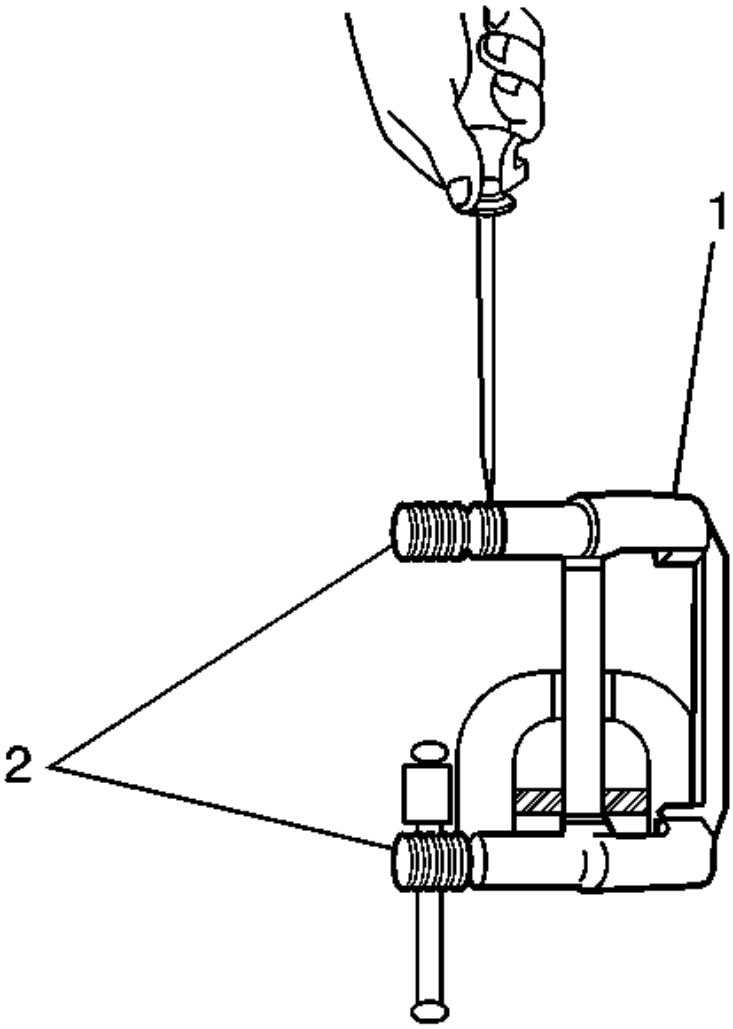

Fig. 39: Removing Front Caliper Pin Boots From Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Remove the brake caliper bracket. Refer to **Front Brake Caliper Bracket Replacement**.
5. Mount the brake caliper bracket (1) in a vise.
6. Using a flat bladed tool or punch carefully remove the caliper pin boots (2) from brake caliper bracket (1).

NOTE:

- **Clean the caliper bracket with denatured alcohol.**
- **Dry with low pressure, non-lubricated, filtered air.**
- **Inspect the brake caliper bracket for damage. If damaged, replace the bracket.**

7. Thoroughly clean the caliper bracket bores of all lubricant.

Installation Procedure

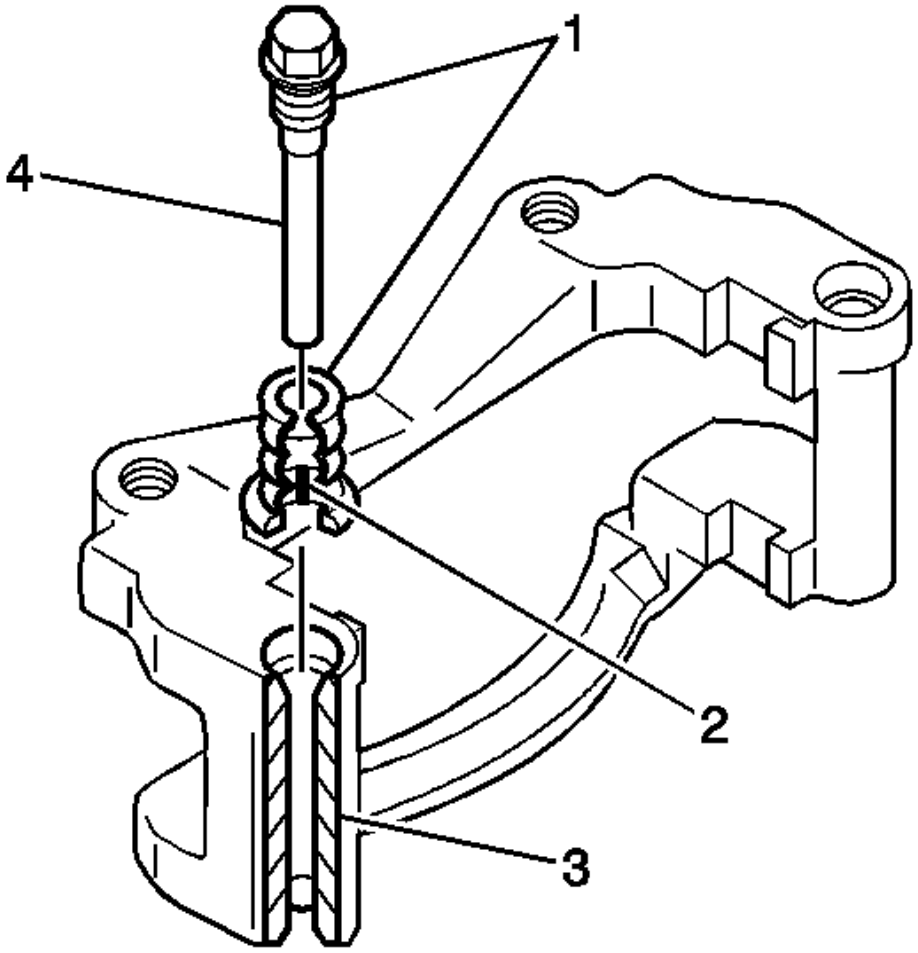

Fig. 40: Installing Pin Bolts & Boots
Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the bores (3), the inside part of the bolt boot (2) and the caliper pin bolts (4) with GM P/N 18047666, or equivalent.
2. Press the new caliper pin bolt boots into the caliper pin bores.
3. Install the brake caliper bracket. Refer to **Front Brake Caliper Bracket Replacement**.

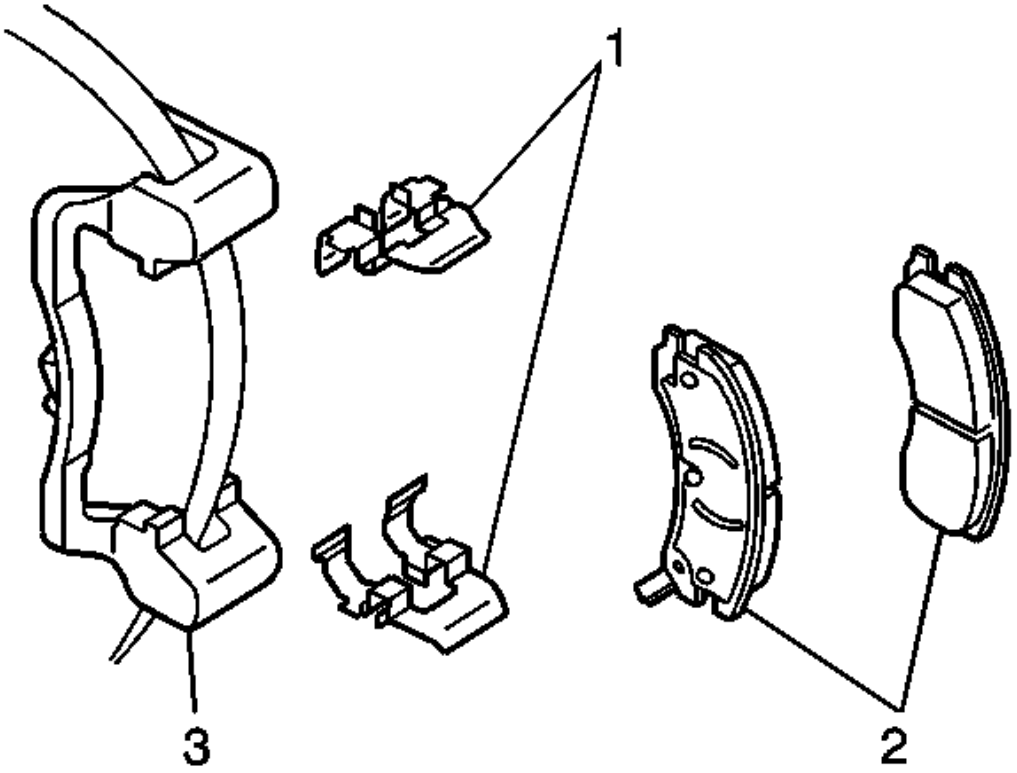

Fig. 41: View Of Brake Pads, Brake Pad Retainers, & Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Install the brake pad retainers (1) to the caliper bracket.
5. Install the brake pads (2) to the caliper bracket.

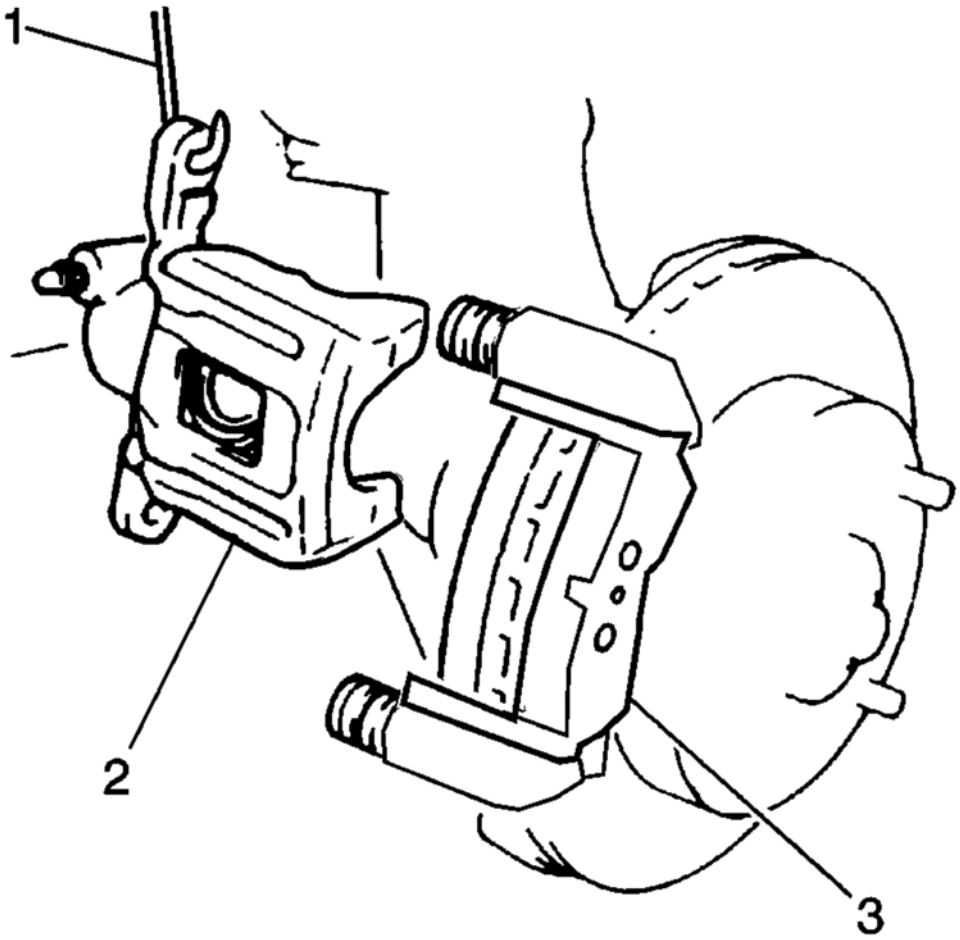

Fig. 42: View Of Brake Caliper And Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Remove the heavy mechanics wire (1) and install the brake caliper. Refer to **Front Brake Caliper Replacement**.

REAR BRAKE CALIPER HARDWARE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Dust Warning .**

CAUTION: **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.**

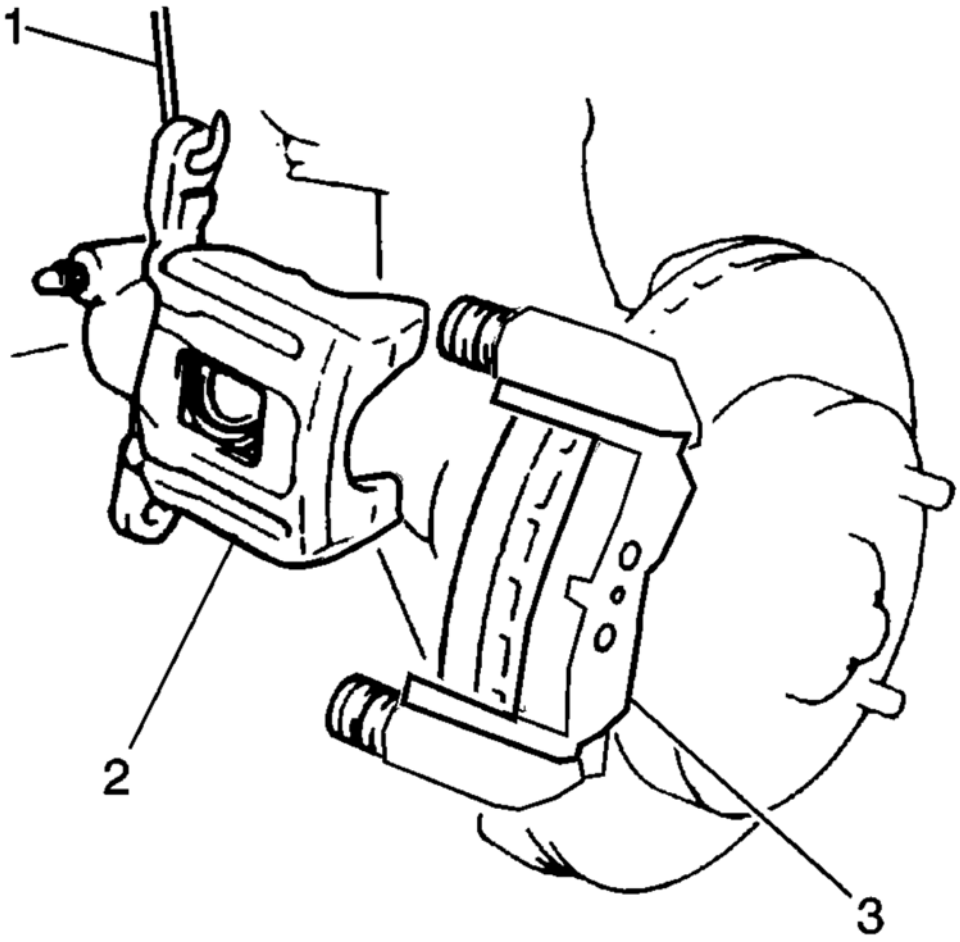

Fig. 43: View Of Brake Caliper And Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the brake caliper from the mounting bracket and support the brake caliper (2) with heavy mechanic's wire (1), or equivalent. It is not necessary to disconnect the hydraulic brake flexible hose from the caliper. Refer to **Rear Brake Caliper Replacement**.

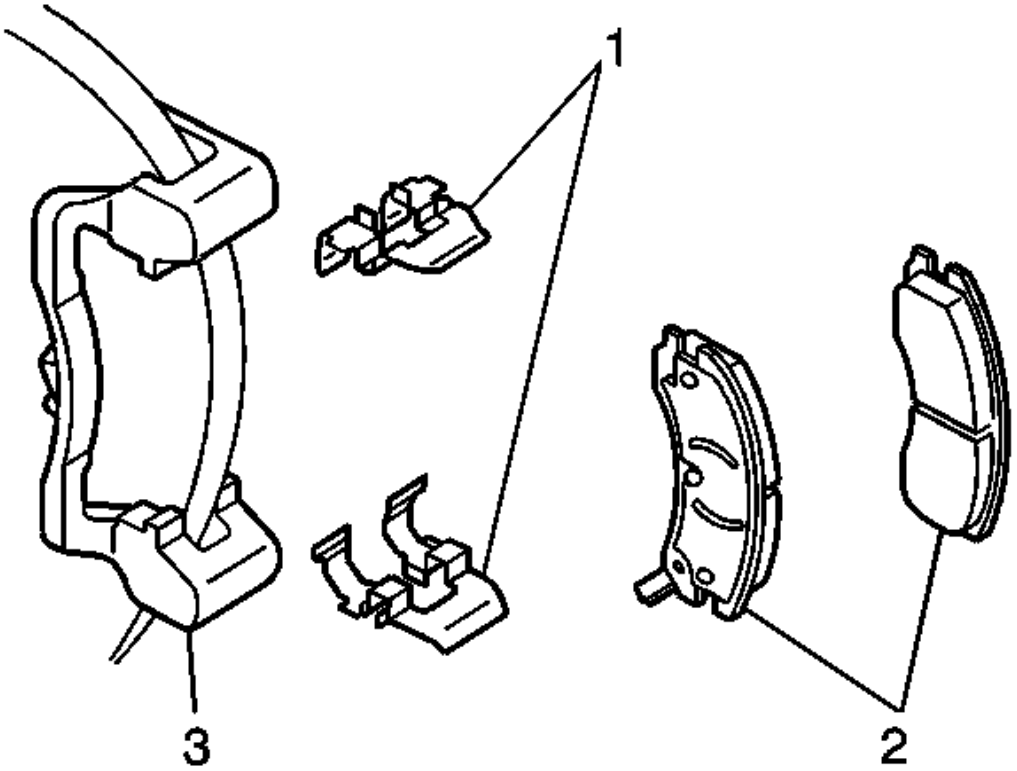

Fig. 44: View Of Brake Pads, Brake Pad Retainers, & Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Remove the brake pads (2) from the brake caliper bracket (1).
3. Remove the brake pad retainers (1) from the brake caliper bracket (3).
4. Remove the brake caliper bracket (3). Refer to **Rear Brake Caliper Bracket Replacement**.
5. Mount the brake caliper bracket (3) in a vise.

Installation Procedure

1. Clean all parts in clean, denatured alcohol.
2. Dry with low pressure, non-lubricated, filtered air.
3. Inspect the brake caliper bracket for cracks. If cracked, replace bracket.
4. Lubricate the brake caliper pin bolt sleeves with high temperature silicone lubricant.
5. Install the brake caliper bracket. Refer to **Rear Brake Caliper Bracket Replacement**.

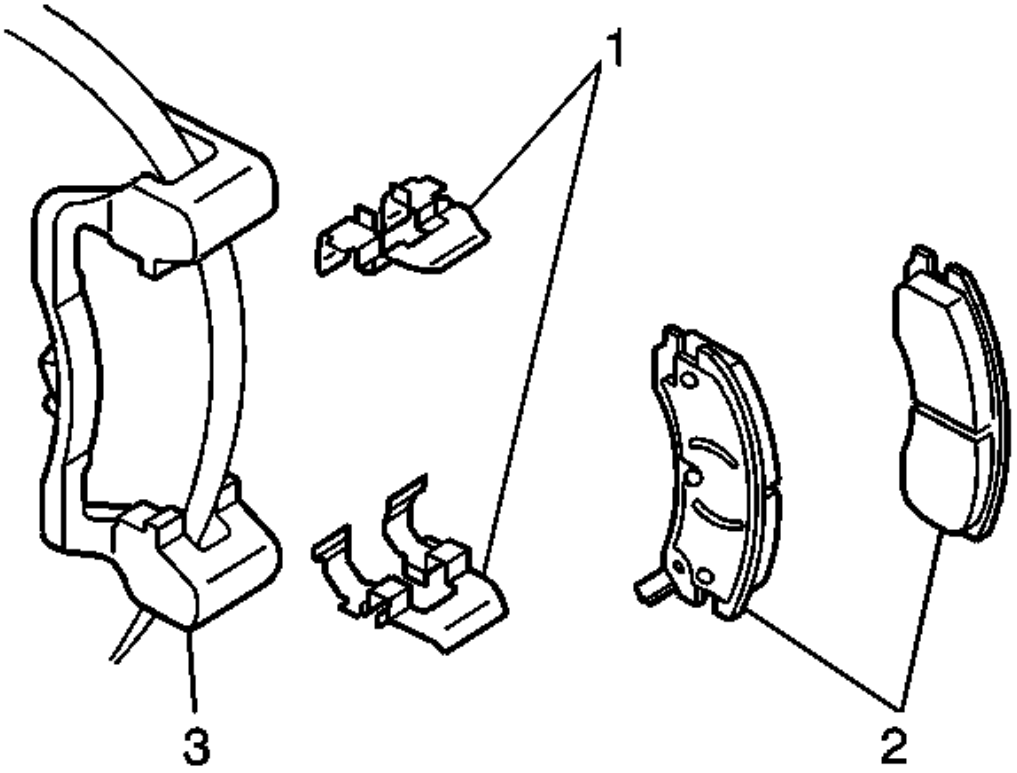

Fig. 45: View Of Brake Pads, Brake Pad Retainers, & Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Install the brake pad retainers (1) to the bracket caliper bracket (3).
7. Install the brake pads (2) to the bracket caliper bracket (3).
8. Install the brake caliper to the brake caliper bracket. Refer to **Rear Brake Caliper Replacement**.

FRONT BRAKE CALIPER BRACKET REPLACEMENT

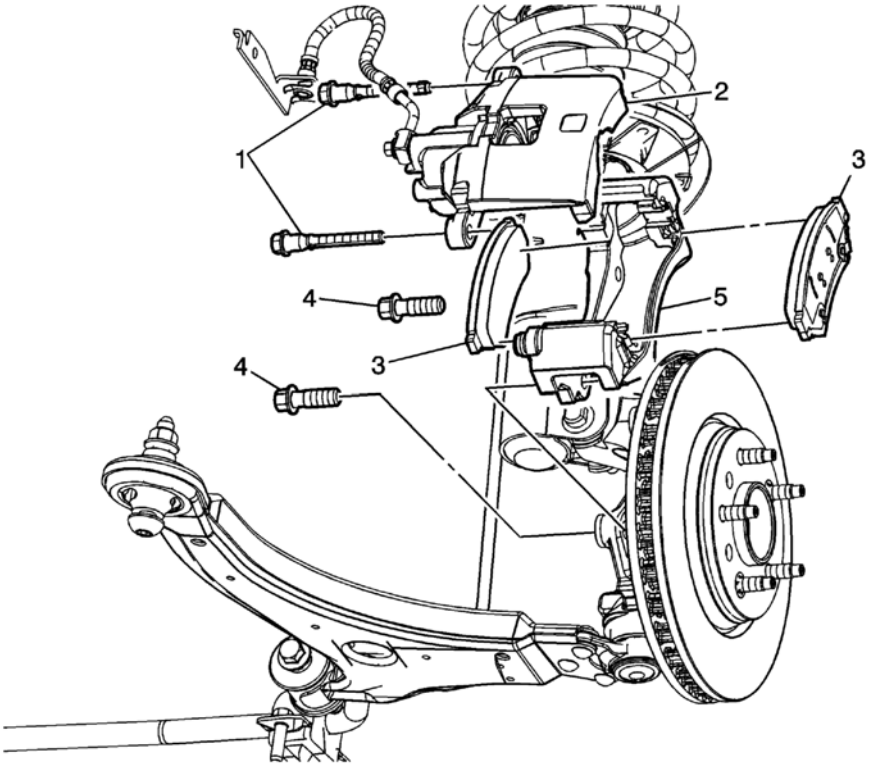

Fig. 46: Front Brake Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Dust Warning .** **CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to**	

Callout	Component Name
support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **Preliminary Procedures** 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .	
1	Brake Caliper Guide Pin Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Note the location of the brake caliper guide pin bolts. The upper guide pin bolt is equipped with a bushing and must be installed in the same location. 2. Clean the guide pin bolts with denatured alcohol and a clean cloth. 3. Apply a thin coat of high temperature silicone brake lubricant to the brake caliper guide pin bolt and the brake caliper bracket bore. **Tighten** 36 N.m (26 lb ft)
2	Brake Caliper **Procedure** Position the brake caliper aside and support with heavy mechanics wire or equivalent.
3	Disc Brake Pad

Callout	Component Name
4	Brake Caliper Bracket Bolt (Qty: 2) **Tighten** 180 N.m (133 lb ft)
5	Brake Caliper Bracket **Procedure** 1. Prepare the bolts and the threaded holes for assembly. 2. Thoroughly clean the residue from the fastener threads using denatured alcohol or equivalent and allow to dry. 3. Thoroughly clean the residue from the threaded holes using denatured alcohol or equivalent and allow to dry. 4. If reusing the old caliper bracket bolts, apply threadlocker GM P/N 12345493 (Canadian P/N 10953488), or equivalent to 2/3 of the threaded length of the fastener. Ensure that there are no gaps in the threadlocker along the length of the filled area of the fastener. 5. Allow the threadlocker to cure approximately 10 minutes before installation.

REAR BRAKE CALIPER BRACKET REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Dust Warning .

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

1. Remove the caliper from the mounting bracket and support the caliper with heavy mechanics wire or equivalent. It is not necessary to disconnect the hydraulic brake flexible hose from the caliper. Refer to **Rear Brake Caliper Replacement**.
2. Remove the rear brake pads.

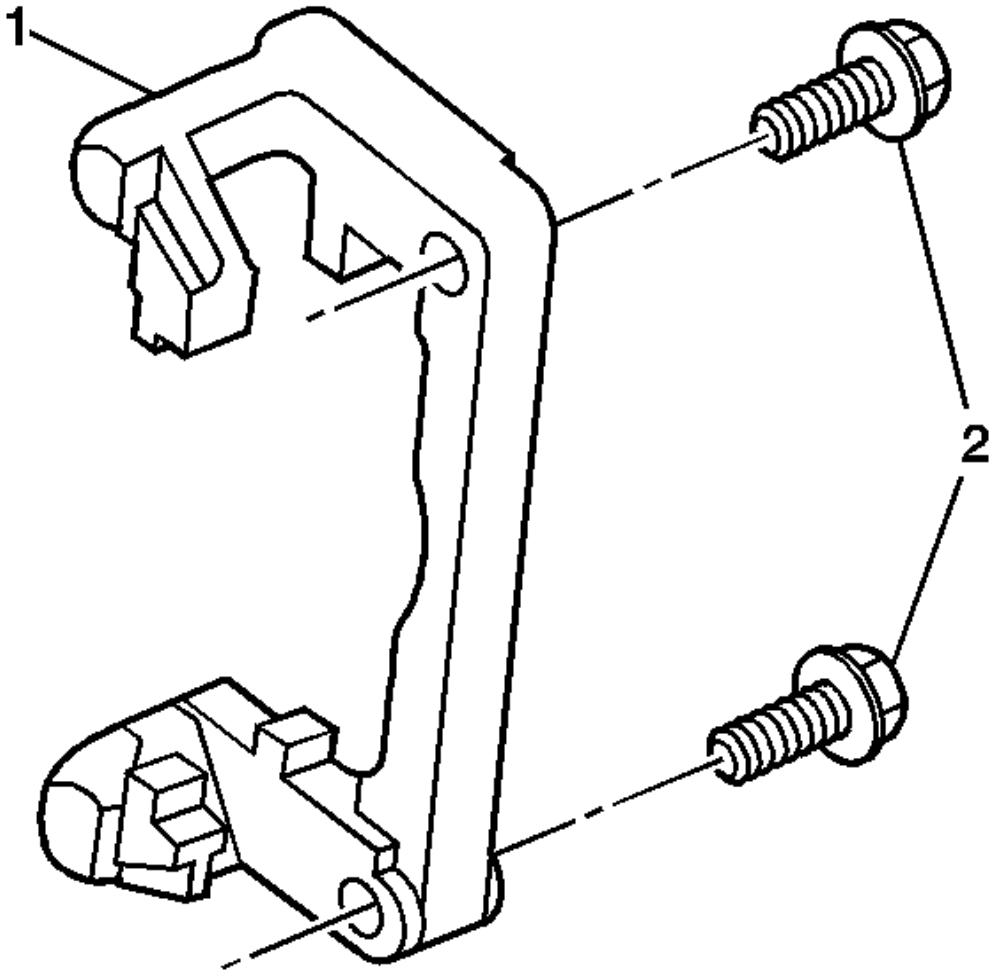

Fig. 47: View Of Caliper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the caliper bracket bolts (2).
4. Remove the caliper bracket (1).

Installation Procedure

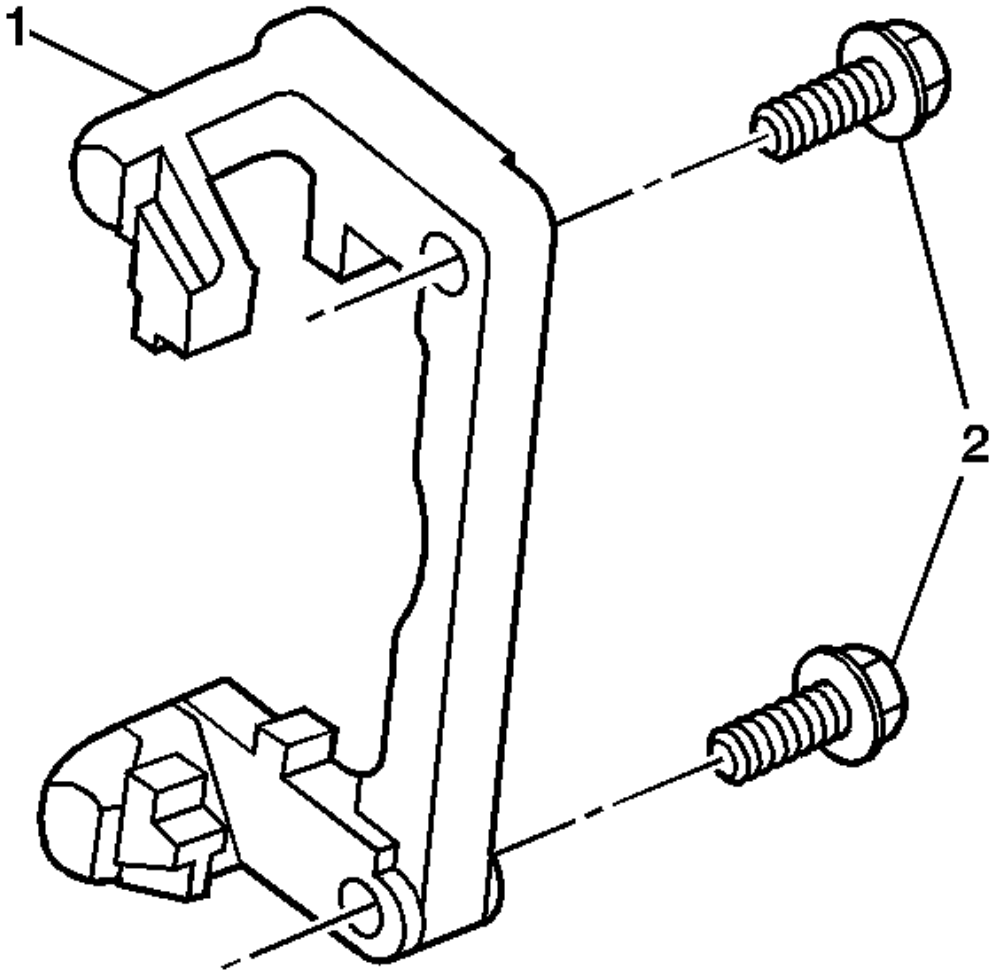

Fig. 48: View Of Caliper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **To ensure that the proper clamp load will be present when installed. It is imperative that the threads on the caliper bracket bolts, as well as the mounting holes in the knuckle, be cleaned of all debris and inspected before proceeding with installation.**

1. Clean and visually inspect threads of the caliper bracket bolts (2) and mounting holes in the knuckle.
2. Apply threadlocker, GM P/N 12345493 (Canadian P/N 10953488), or equivalent to the threads of the brake caliper bracket bolts (2).

CAUTION: **Refer to Fastener Caution .**

3. Install the caliper bracket (1) with the bracket bolts (2).

Tighten

Tighten the caliper bracket bolts to 120 N.m (88 lb ft).

4. Install the rear brake pads.
5. Install the caliper. Refer to **Rear Brake Caliper Replacement**.

FRONT BRAKE ROTOR REPLACEMENT

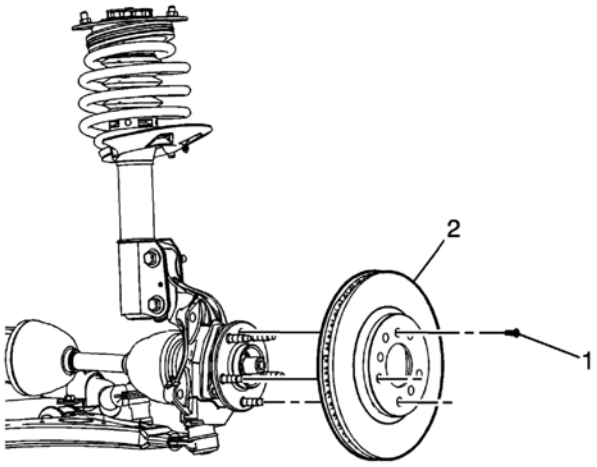

Fig. 49: Front Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Dust Warning .** **Preliminary Procedures** 1. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** . 2. Remove the brake caliper bracket. Refer to **Front Brake Caliper Bracket Replacement**.	
1	Retaining Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 14 N.m (124 lb in)
2	Brake Rotor **Procedure** 1. Using the **J 41013** rotor resurfacing kit , clean the contact area of the brake rotor and

Callout	Component Name
	the wheel bearing if the rotor is to be reused. 2. Using the **J 42450-A** wheel hub resurfacing kit , remove the rust and dirt from the contact area of the wheel bearing if replacing the rotor. 3. If the brake rotor has been refinished or replaced, burnish the brake pads and rotors. Refer to **Brake Pad and Rotor Burnishing**. **Special Tools** • **J 41013** Rotor Resurfacing Kit • **J 42450-A** Wheel Hub Resurfacing Kit

REAR BRAKE ROTOR REPLACEMENT

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to Brake Dust Warning .** **Preliminary Procedures** 1. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** . 3. Remove the rear brake caliper mounting bracket. Refer to **Rear Brake Caliper Bracket Replacement**.	
1	Rotor Retention Screw

Callout	Component Name
	CAUTION: **Refer to Fastener Caution .** **Tighten** 14 N.m (124 lb in)
2	Brake Rotor **Procedure** 1. If removing the rotor to service the brake system, mark the relationship of the rotor to the wheel stud for proper installation. 2. Using the **J 41013** rotor resurfacing kit , clean the contact area of the brake rotor and the wheel bearing if the rotor is to be reused. 3. Using the **J 42450-A** wheel hub resurfacing kit , remove the rust and dirt from the contact area of the wheel bearing if replacing the rotor. 4. After the installation is complete, inspect the parking brake operation and adjust, if necessary. Refer to **Parking Brake Adjustment** . 5. If the brake rotor has been refinished or replaced, burnish the brake pads and rotors. Refer to **Brake Pad and Rotor Burnishing**. **Special Tools** • **J 41013** Rotor Resurfacing Kit • **J 42450-A** Wheel Hub Resurfacing Kit

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**
- **Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4 800-11 300 km (3,000-7,000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.**

Review the following acceptable methods for bringing the brake rotor assembled LRO to within specifications. Determine which method to use for the specific vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025-0.127 mm (0.001-0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. Refer to **Brake Rotor Assembled Lateral Runout Correction - Indexing**.
- The correction plate method of correcting assembled LRO involves the addition of a tapered plate

between the brake rotor and the hub/axle flange. The correction plate method can be used to correct LRO that exceeds the specification by up to 0.23 mm (0.009 in). Refer to **Brake Rotor Assembled Lateral Runout Correction - Correction Plates**.

- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe**.

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - INDEXING

NOTE: **This Procedure is not used in Europe**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

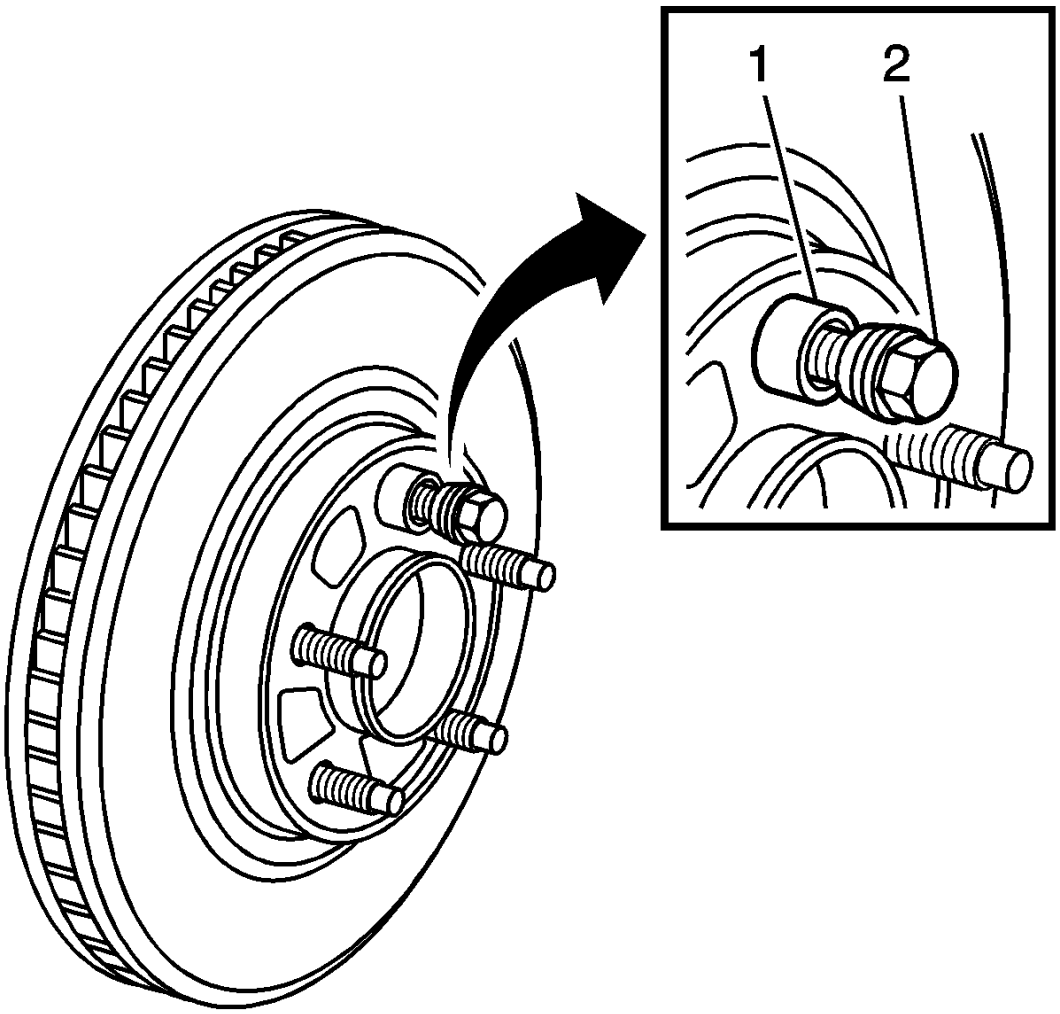

Fig. 51: Lug Nuts & Conical Washers

Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**
- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4,800-11, 300 km (3,000-7,000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.**

1. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure.
2. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
3. Index the brake rotor in a different orientation to the hub/axle flange.
4. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

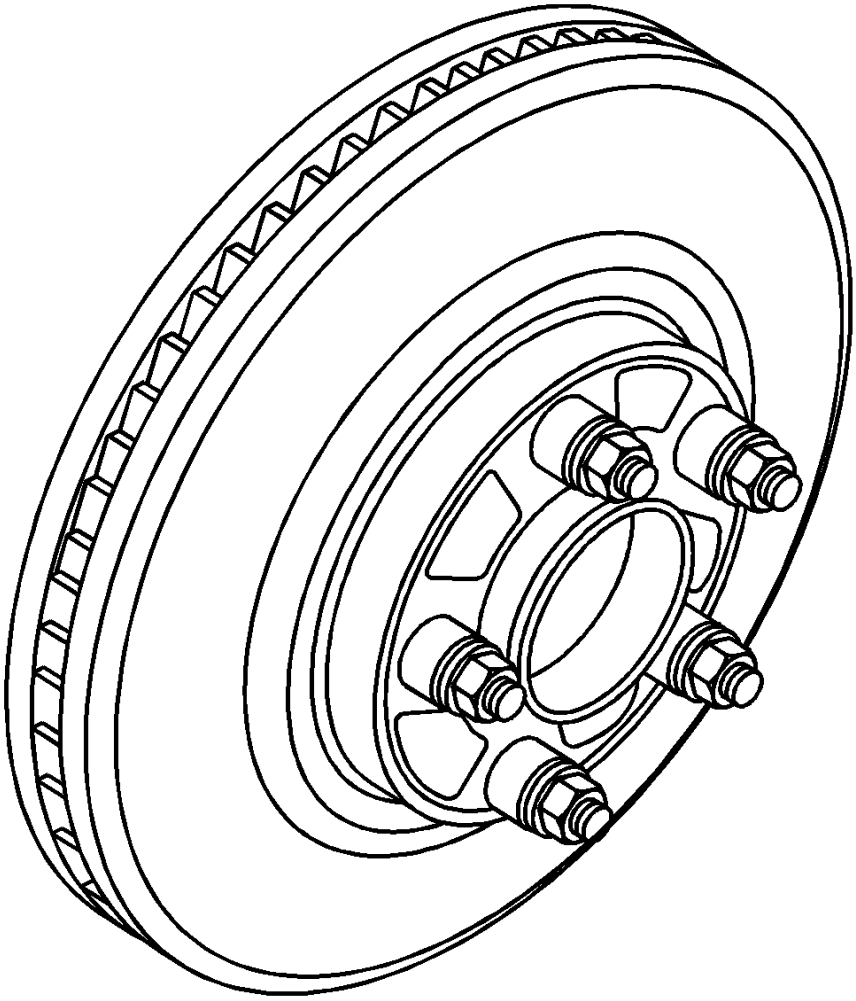

Fig. 52: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to **Tire and Wheel Removal and Installation** .
8. Measure the assembled LRO of the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
9. Compare the amount of change between this measurement and the original measurement.
10. If this measurement is within specifications, proceed to step 14.
11. If this measurement still exceeds specifications, repeat steps 1-9 until the best assembled LRO measurement is obtained.
12. Matchmark the final location of the rotor to the wheel studs if the orientation is different than it was originally.
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
14. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake

pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - CORRECTION PLATES

NOTE: **This procedure not used in Europe**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

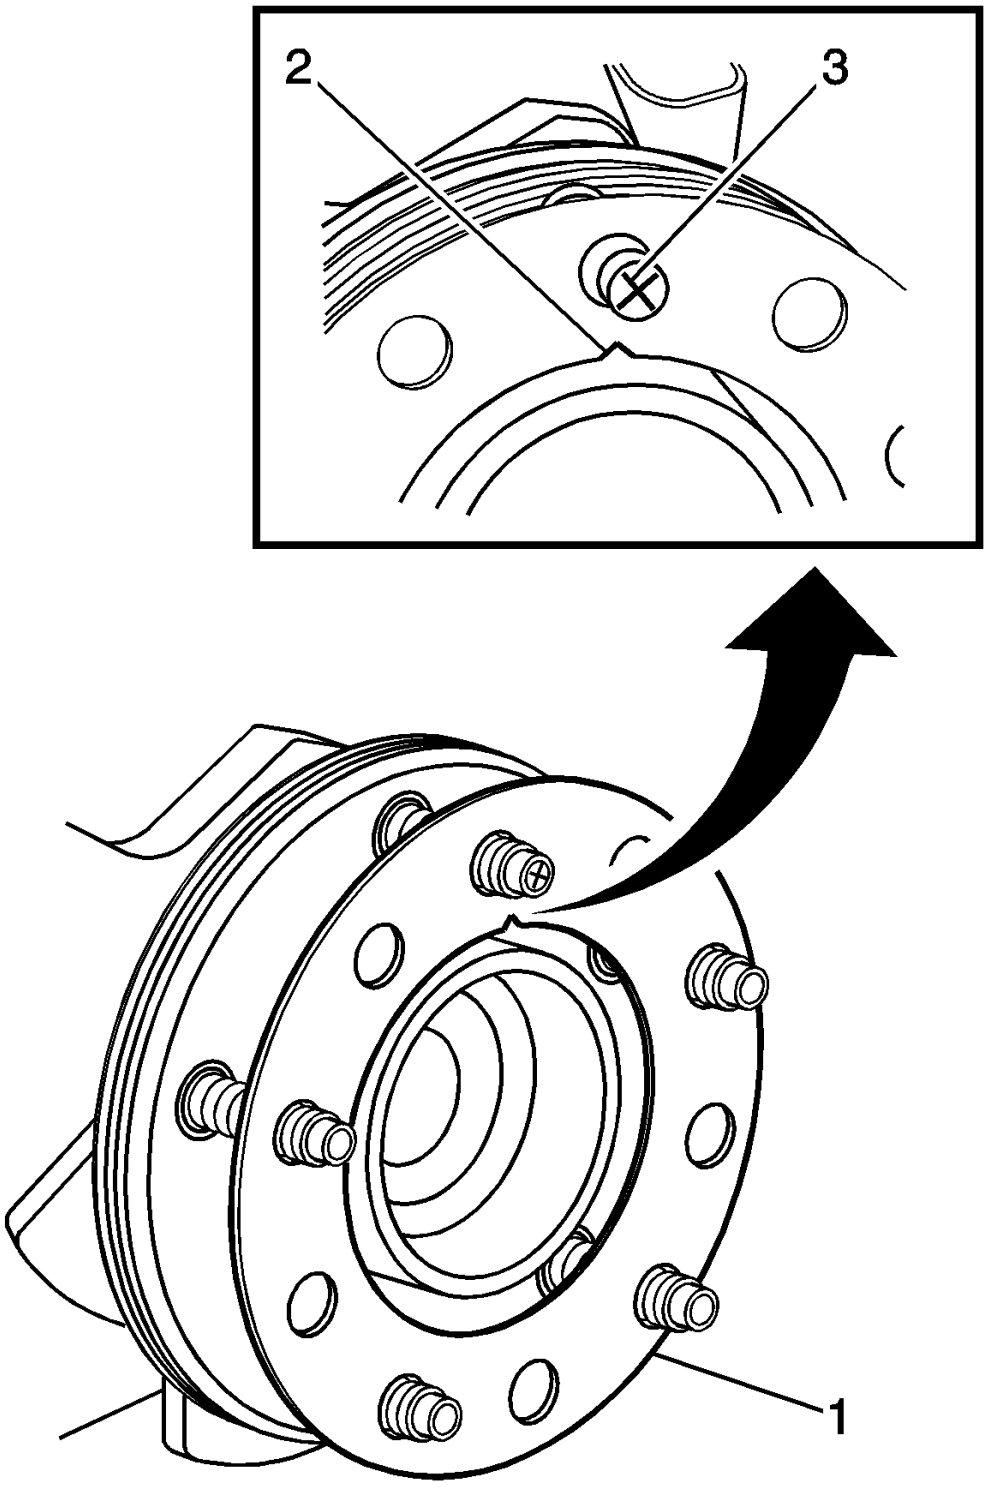

Fig. 53: Identifying Correction Plate, High Spot Mark & V-Shaped Notch
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking**

for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.

- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4,800-11,300 km (3,000-7,000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.**

1. Rotate the brake rotor to position the high spot, identified and marked during the brake rotor assembled LRO measurement procedure, to face upward.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Select the correction plate, following the manufacturer's instructions, which has a specification closest to the assembled LRO measurement.

   For example: If the assembled LRO measurement was 0.076 mm (0.003 in), the 0.076 mm (0.003 in) correction plate would be used. If the measurement was 0.127 mm (0.005 in), the 0.152 mm (0.006 in) correction plate would be used.

5. Determine the positioning for the correction plate (1) using the high spot mark (3) made during the brake rotor assembled LRO measurement procedure.

NOTE:

- **Do NOT install used correction plates in an attempt to correct brake rotor assembled LRO.**
- **Do NOT stack up, or install more than one correction plate onto one hub/axle flange location, in an attempt to correct brake rotor assembled LRO.**

6. Install the correction plate (1) onto the hub/axle flange, with the V-shaped notch (2) orientated to align with the high spot mark (3), that was positioned to face upward.

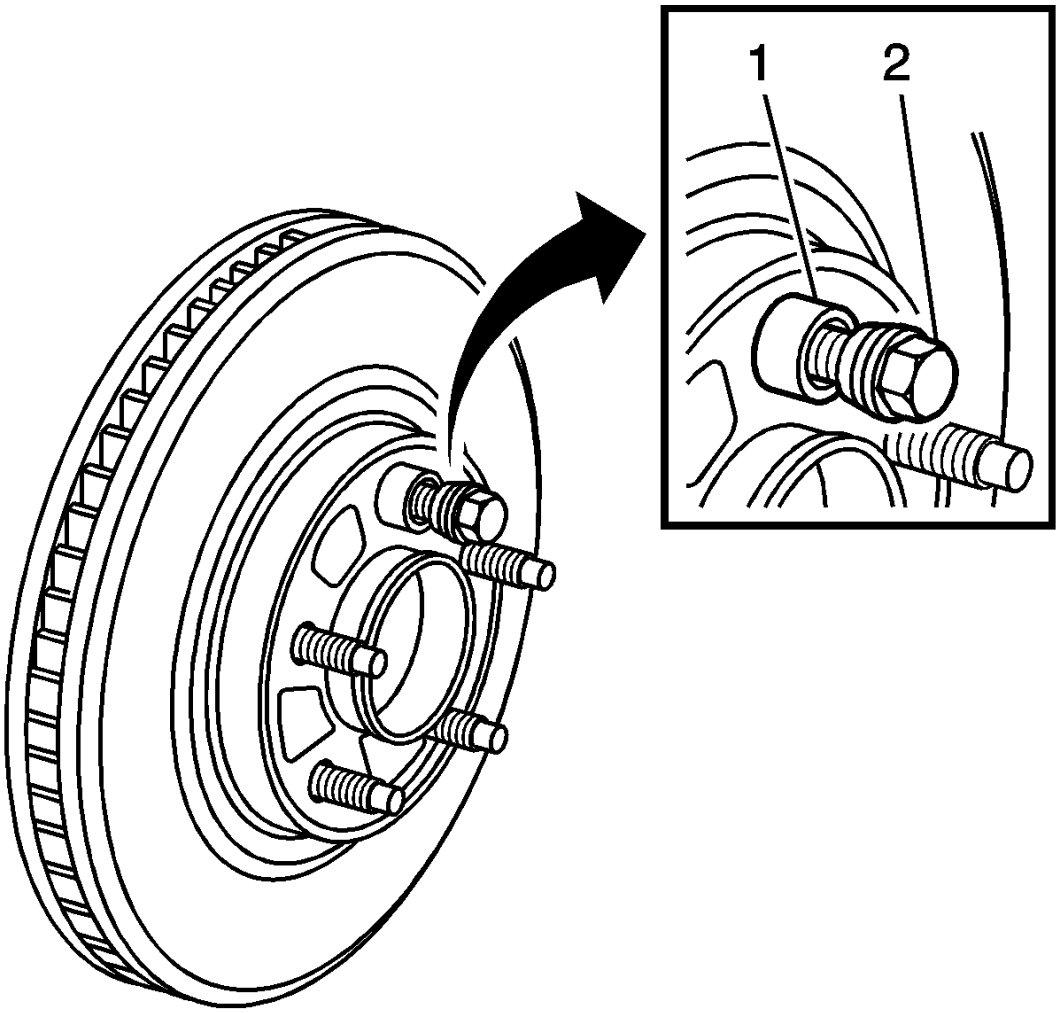

Fig. 54: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

7. Install the brake rotor to the hub/axle flange. Use the matchmark made prior to removal for proper orientation to the flange.
8. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
9. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

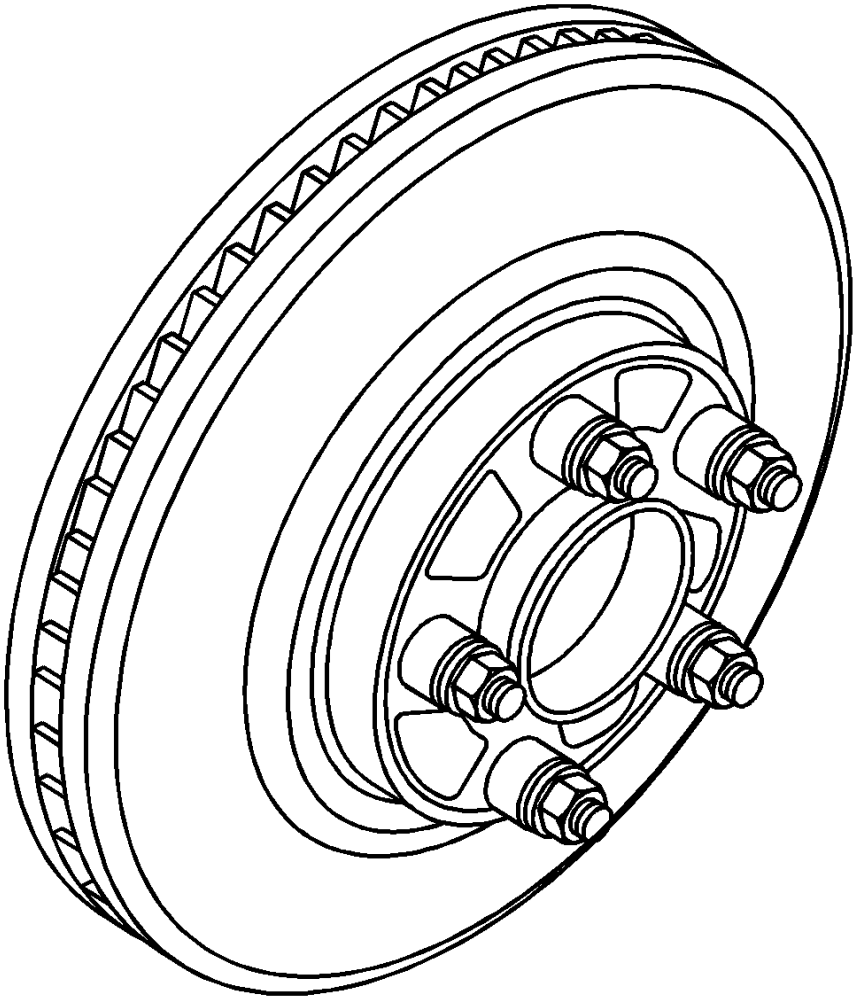

Fig. 55: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

10. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
11. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to **Tire and Wheel Removal and Installation** .
12. Measure the assembled LRO of the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
14. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - ON VEHICLE LATHE

NOTE: **This procedure is not used in Europe.**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Brake Dust Warning .

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**
- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4 800-11 300 km (3,000-7,000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.**

1. Ensure that the caliper and caliper bracket that are already being supported, are clear from contacting any rotating components, such as the brake rotor.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer's instructions.
5. Refinish the brake rotor, following the brake lathe manufacturer's instructions.
6. After each successive cut, inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement**.
7. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced. After replacing the rotor, proceed to step 10.
8. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
    1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
    2. Using moderate pressure, apply the non-directional finish:
        - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
        - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
    3. After applying a non-directional finish, clean each friction surface of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
11. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer

to **Brake Rotor Assembled Lateral Runout Correction**.

12. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR REFINISHING

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **The disc brake rotors do not require refinishing as part of routine brake system service. New disc brake rotors do not require refinishing.**

  Do not refinish disc brake rotors in an attempt to correct the following conditions:

  - **Brake system noise - squeal, growl, groan**
  - **Uneven and/or premature disc brake pad wear**
  - **Superficial or cosmetic corrosion/rust of the disc brake rotor friction surface**
  - **Scoring of the disc brake rotor friction surface less than the maximum allowable specification**
- **Before refinishing a brake rotor, the rotor MUST first be checked for adequate thickness to allow the rotor to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to Brake Rotor Thickness Measurement.**

  Disc brake rotors should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:

  - **Thickness variation in excess of the maximum allowable specification**
  - **Excessive corrosion/rust and/or pitting**
  - **Cracks and/or heat spots**
  - **Excessive blueing discoloration**
  - **Scoring of the disc brake rotor surface in excess of the maximum allowable specification**
- **Disc brake rotors may need to be refinished as part of the process for correcting brake rotor assembled lateral runout (LRO) that exceeds the maximum allowable specification.**

NOTE: **If the vehicle is equipped with cross-drilled rotors, use a lathe with positive rake tooling. This setup requires less cutting pressure, which will result in less vibration, and a better surface finish. Also, use a vibration dampener when cutting. Otherwise, refinish according to the following instructions.**

NOTE: **Whenever the brake rotor has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in increased assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.**

1. Using the **CH-42450-A** Wheel Hub Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
2. Using the **CH-41013** Rotor Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake rotor.
3. Inspect the mating surfaces of the hub/axle flange and the rotor to ensure that there are no foreign particles or debris remaining.
4. Mount the brake rotor to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Ensure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake rotor friction surfaces.
7. Observe the witness mark on the brake rotor. If the witness mark extends approximately three-quarters or more of the way around the brake rotor friction surface on each side, the brake rotor is properly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake rotor, re-mount the rotor to the lathe.
9. Following the brake lathe manufacturer's instructions, refinish the brake rotor.
10. After each successive cut, inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement**.
11. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced.
12. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
    1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
    2. Using moderate pressure, apply the non-directional finish:
        - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
        - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.

NOTE: **Thoroughly cleaning the brake rotor will prevent the possible transfer of finite metal dust left as a by-product of machining to the brake pad**

material during the burnishing process, thereby reducing the possibility for brake squeal or other brake noises to occur.

3. After applying a non-directional finish, clean each friction surface of the brake rotor with a solution of mild dish washing detergent and water, or a GM approved brake cleaner and a clean shop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.

13. Remove the brake rotor from the brake lathe.
14. Measure the assembled LRO of the brake rotor to ensure optimum performance of the disc brakes. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
15. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to **Brake Rotor Assembled Lateral Runout Correction**.

DESCRIPTION AND OPERATION

DISC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The disc brake system consists of the following components:

Disc Brake Pads

Applies mechanical output force from the hydraulic brake calipers to friction surfaces of brake rotors.

Disc Brake Rotors

Uses mechanical output force applied to friction surfaces from the disc brake pads to slow speed of tire and wheel assembly rotation.

Disc Brake Pad Hardware

Secures disc brake pads firmly in proper relationship to the hydraulic brake calipers. Enables a sliding motion of brake pads when mechanical output force is applied.

Disc Brake Caliper Hardware (Floating Caliper)

Provides mounting for hydraulic brake caliper and secures the caliper firmly in proper relationship to caliper bracket. Enables a sliding motion of the brake caliper to the brake pads when mechanical output force is applied.

System Operation (Floating Caliper)

Mechanical output force is applied from the hydraulic brake caliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the caliper housings draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake rotors, which slows the rotation of the tire and wheel assemblies. The correct function of both the brake pad and brake caliper hardware is essential for even distribution of braking force.

System Operation (Fixed Caliper)

Mechanical output force is applied from the hydraulic brake caliper inboard and outboard pistons to the inner and outer brake pads. The brake calipers are a fixed, opposed-piston design, allowing the output force to be equally distributed through the distribution of the pressurized brake fluid within the caliper. The brake pads apply the output force to the friction surfaces on both sides of the brake rotors, which slows the rotation of the tire and wheel assemblies. The correct function of the brake pad hardware and of the brake caliper inboard and outboard pistons is essential for even distribution of braking force.

System Characteristics

Brake Noise

Brake noise can occur and to a degree, some brake noise is normal. Variations in driving conditions such as the weather, environment, driving patterns, differences in vehicle loading, and type or style of driving, can affect brake wear. Any one of these variations can cause brake noise to become apparent. Inspect and verify that all metal-to-metal contact areas of the brake pads, brake pad guides or springs, brake caliper housing, caliper bracket and/or suspension knuckle, as applicable, are clean and free of corrosion and scale.

Brake noise is a "slip-stick" vibration of disc brake components and, if it occurs intermittently, can be considered normal. Most brake noise may be eliminated or temporarily reduced by performing 3 or 4 aggressive brake applications. If the brake noise persists or consistently recurs, application of a damping compound to the brake pad mounting plate where it contacts the caliper can lessen the vibration as the components move relative to each other. Refer to Adhesives, Fluids, Lubricants, and Sealers in this section for recommended compounds.

The following brake noises are characteristic of all brake systems. These noises cannot be avoided, and may not indicate improper operation of the brake system.

Squeak/Squeal Noise

A squeak or squeal noise can occur on vehicles with front semi-mettalic brake pads during light to medium brake pedal application at low to moderate vehicle speeds. Occasionally this noise may appear from the front or rear brakes after a period of non-use such as overnight, or cold brakes and/or in high humidity conditions.

Grinding Noise

Common occurrence for rear brakes and some front disc brakes during initial brake applications after the vehicle has been parked overnight. Caused by light corrosion forming on the metal brake component friction surfaces during vehicle non-use. Typically disappears after the first few brake applications.

Groan Noise

A groan type noise may be heard during a quick stop, or when slowly moving forward from a complete stop. On vehicles equipped with antilock brake systems (ABS), a groan or moan noise may occur during heavy brake application or on road surfaces with compromised traction such as loose gravel, or on wet or icy roads. This is a normal function of ABS activation.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0267: LOW BRAKE FLUID

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0267 00

Low Brake Fluid Indicated

DTC C0267 71

Low Brake Fluid Indicated Invalid Serial Data

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal

	Ground	Resistance	Voltage	Performance
Brake Fluid Level Signal	C0267 00	1	1	-
Park Brake Signal	1	1	1	-
Ground	-	1	-	-
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The brake fluid level switch monitors the level of brake fluid in the master cylinder. When the instrument panel cluster (IPC) sees the brake fluid level switch input closed, it turns ON the Red Brake Warning indicator and sends a serial data message to the electronic brake control module (EBCM) that the brake fluid level is low.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

- Low brake fluid is detected.
- A short to ground exists on the signal circuit.

Action Taken When the DTC Sets

- The EBCM disables the antilock brake system (ABS)/traction control system (TCS) dynamic rear proportion (DRP) and vehicle stability enhancement system (VSES).
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Control Module References for scan tool information

Circuit/System Verification

1. Inspect for proper brake fluid level, the fluid level should be at or above the proper level.
    - If low, refer to **Brake Fluid Loss**.
2. Ignition ON, observe the scan tool IPC Brake Fluid parameter. The reading should be OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the brake fluid level switch.
2. Test for less than 10 ohm between the ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool IPC Brake Fluid parameter is Ok.
    - If not the specified value, test the signal circuit for a short to ground. If the circuit tests normal, replace the IPC.
4. Install a 3A fused jumper wire between the signal circuit terminal B and ground. Verify the scan tool IPC Brake Fluid parameter is Low.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
5. If all circuits test normal, remove the brake fluid level switch.
6. Connect the harness connector to the brake fluid level switch, verify the scan tool IPC Brake Fluid parameter is OK.
    - If not the specified value, replace the brake fluid level switch.
    - If at the specified value, replace the brake fluid reservoir.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Auxilary Brake Booster Pump Control	1	1	1	-
Auxiliary Brake Booster Pump Ground	-	1	-	-
1. Auxiliary Brake Booster Pump Motor Malfunction				

Circuit/System Description

The brake booster vacuum sensor measures the vacuum in the brake booster assembly. When the vacuum within the system drops, the EBCM turns ON the auxiliary brake booster pump by providing ground to the brake booster pump relay. The relay activates and supplies voltage to the auxiliary brake booster pump motor.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

A short to ground, open/high resistance is detected on the brake booster pump relay control circuit.

Action Taken When the DTC Sets

The brake warning indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The EBCM will turn OFF the indicator in the next ignition cycle.

Circuit/System Verification

1. Ignition OFF, apply and release the brake pedal several times to ventilate the brake booster.
2. Engine running, the auxiliary brake booster pump motor should turn ON for a short time.

Circuit/System Testing

1. Ignition OFF, remove the brake booster pump relay.
2. Ignition ON, verify that a test lamp does not illuminate between the auxiliary brake booster pump control circuit terminal 87 and ground.
    - If the test lamp illuminates, test the auxiliary brake booster pump control circuit for a short to voltage.
3. Test for more than 10 Ω between the auxiliary brake booster pump control circuit terminal 87 and ground.
    - If less than the specified range, test the auxiliary brake booster pump control circuit for a short to ground.
4. Verify that a test lamp illuminates between the brake booster pump relay switch B+ circuit terminal 30 and ground.
    - If the test lamp does not illuminate, test the brake booster pump relay switch B+ circuit for a short to ground or an open/high resistance.
5. Verify that a test lamp illuminates between the brake booster pump relay coil B+ circuit terminal 85 and ground.
    - If the test lamp does not illuminate, test the brake booster pump relay coil B+ circuit for a short to ground or an open/high resistance.
6. Disconnect the harness connector at the auxiliary brake booster pump.
7. Test for less than 10 Ω between the auxiliary brake booster pump ground circuit terminal 2 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
8. Connect the harness connector at the auxiliary brake booster pump.
9. Connect a 20 A fused jumper wire between the brake booster pump relay switch B+ circuit terminal 30 and the auxiliary brake booster pump control circuit terminal 87. Verify the auxiliary brake booster pump is activated.

- If the auxiliary brake booster pump does not activate, test the auxiliary brake booster pump control circuit for an open/high resistance. If the circuit tests normal, test or replace the auxiliary brake booster pump.

10. Connect a test lamp between the brake booster pump relay coil B+ circuit terminal 85 and the brake booster pump relay control circuit terminal 86.
11. Command the auxiliary brake booster pump ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the brake booster pump relay control circuit for a short to ground. If the circuit tests normal, replace the electronic brake control module.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the electronic brake control module.
12. If all circuits test normal, test or replace the brake booster pump relay.

Component Testing

Auxiliary Brake Booster Pump Test

1. Ignition OFF, disconnect the harness connector at the auxiliary brake booster pump.
2. Connect a 20 A fused jumper wire between the control circuit terminal 1 and B+.
3. Connect a jumper wire between the ground circuit terminal 2 and ground, verify the auxiliary brake booster pump activates.
    - If the auxiliary brake booster pump does not activate, replace the auxiliary brake booster pump.

Relay Test

1. Ignition OFF, disconnect the brake booster pump relay.
2. Test for 60-100 Ω between terminals 85 and 86 of the relay.
    - If not within the specified range, replace the brake booster pump relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 85
    - 30 and 86
    - 30 and 87
    - If less than the specified value, replace the brake booster pump relay.
4. Install a fused jumper wire between relay terminal 86 and B+. Install a jumper wire between relay terminal 85 and ground.
5. Test for less than 5 Ω between terminals 30 and 87.
    - If greater than the specified value, replace the brake booster pump relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Power Brake Booster Auxiliary Pump Replacement**
- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**

- **Control Module References** for EBCM replacement, setup, and programming

DTC C1100: BRAKE BOOSTER VACUUM SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C1100 01

Brake Booster Vacuum Sensor Circuit Short to Voltage

DTC C1100 06

Brake Booster Vacuum Sensor Circuit Short to Ground or Open

DTC C1100 5A

Brake Booster Vacuum Sensor Circuit Plausible Failure

DTC C1100 75

Brake Booster Vacuum Sensor Circuit Signal Above Allowable Range

Circuit/System Description

The brake booster vacuum sensor measures the vacuum in the brake booster assembly. The electronic brake control module (EBCM) supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the EBCM.

Conditions for Running the DTC

Engine Running.

Conditions for Setting the DTC

C1100 01

The EBCM detects a voltage greater than 4.9 V for more than 100 m/sec on the vacuum sensor 5 V reference circuit.

C1100 06

The EBCM detects a voltage less than 0.2 V for more than 100 m/sec on the vacuum sensor 5 V reference circuit.

C1100 5A

The vacuum sensor signal is not plausible (erractic).

C1100 75

The vacuum sensor is out of range.

Action Taken When the DTC Sets

The DIC displays Service Brake System Soon.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The EBCM will turn OFF the indicator in the next ignition cycle.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the brake booster vacuum sensor.
2. Ignition OFF, test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the EBCM.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the EBCM.
    - If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit

tests normal, replace the EBCM.

4. Ignition ON, test for 4.5-5.2 V between the 5 V reference circuit terminal 3 and the signal circuit terminal 1.
    - If less than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the EBCM.
    - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the EBCM.
5. Ignition OFF, disconnect the X1 harness connector at the EBCM.
6. Ignition OFF, test for infinite resistance between the signal circuit terminal 8 and ground.
    - If not the specified value, test the signal circuit for a short to ground.
7. If all circuits test normal, replace the power brake booster vacuum sensor.

Brake Booster Pump Control	1	1	1	-
Brake Booster Pump Ground	1	1	-	-
1. Brake Booster Pump Malfunction				

Circuit/System Description

The engine control module (ECM) monitors the control circuit of the brake booster pump relay. The ECM supplies ground through the pump relay control circuit which then supplies B+ voltage to actuate the brake booster pump. B+ voltage is supplied at all times to the coil side of the pump relay.

Conditions for Running the DTC

P258A, P258C, P258D

Ignition ON.

P258B

- Engine Running
- Vacuum pump is activated for greater than 1.6 seconds.

Conditions for Setting the DTC

P258A, P258C

The ECM detects an open/high resistance on the relay coil control circuit.

P258B

The ECM detects an excessive difference in vacuum levels between the power brake booster and the manifold absolute pressure (MAP).

P258D

The ECM detects a short to voltage on the relay control circuit.

Action Taken When the DTC Sets

DTC P258A, P258B, P258C, P258D are Type B DTCs.

Conditions for Clearing the DTC

DTC P258A, P258B, P258C, P258D are Type B DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that a vacuum leak is not present, refer to **Brake System Vacuum Source Test**
2. Ignition ON, command the relay ON and OFF with a scan tool. Observe to verify that the vacuum relay and motor turns ON and OFF with each command.

Circuit/System Testing

1. Ignition OFF, disconnect the vacuum pump relay.
2. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 87 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
3. Verify that a test lamp illuminates between the B+ circuit terminals listed below and ground.
    - Terminal 30
    - Terminal 86
        - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test or replace the relay.
4. Verify that a test lamp does not illuminate between the control circuit terminal 85 and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
5. Disconnect the harness connector at the vacuum pump.
6. Test for less than 2 ohms between the vacuum pump ground circuit terminal 2 and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.

7. Connect the harness connector at the vacuum pump.
8. Connect a 20A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87. Verify the vacuum pump is activated.
    - If the vacuum pump does not activate, test the control circuit for a short ground or an open/high resistance. If the circuit tests normal, test or replace the vacuum pump.
9. Ignition OFF, test for infinite resistance between the control circuit terminal 85 and ground.
    - If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
10. Disconnect the X1 harness connector at the ECM.
11. Test for less than 2 ohms between the control circuit terminal 85 at the relay cavity and terminal 18 at the ECM harness connector.
    - If greater than the specified range, test the control circuit for an open/high resistance.
12. If all circuits test normal, replace the brake booster pump relay. If the DTC resets, replace the power brake booster vacuum pump.

Component Testing

1. Ignition OFF, disconnect the vacuum pump relay.
2. Test for 60-180 ohms between terminals 85 and 86.
    - If the resistance is not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 85
    - 30 and 87
    - 30 and 86
    - 86 and 87
        - If not the specified value, replace the relay.
4. Install a 30A fused jumper wire between relay terminal 86 and B+. Install a jumper wire between relay terminal 85 and ground.
5. Test for less than 2 ohms between terminals 30 and 87.
    - If greater than the specified range, replace the relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Power Brake Booster Auxiliary Pump Replacement**
- **Control Module References** for ECM replacement, setup, and programming

SYMPTOMS - HYDRAULIC BRAKES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** before using the brake indicator symptom tables in order to

verify that all of the following are true:

- There are no DTCs set.
- The control module(s) can communicate via the serial data link.

2. Perform the **Brake System Vehicle Road Test** before using the hydraulic brake symptom tables in order to duplicate the customer's concern.
3. Review the system operation in order to familiarize yourself with the system functions. Refer to the following:
   - **Brake Warning System Description and Operation**
   - **Hydraulic Brake System Description and Operation**
   - **Brake Assist System Description and Operation**
   - **Disc Brake System Description and Operation**
   - **Brake Booster Vacuum Assist Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the brake warning system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Brake Warning Indicator Malfunction (Without UJ1)**
- **Brake Pulsation**
- **Brake System Noise**
- **Braking Action Uneven - Pulls to One Side**
- **Braking Action Uneven - Front to Rear**
- **Brake Pedal Excessive Travel**
- **Brake Pedal Excessive Effort**
- **DTC C027B - Auxiliary Brake Booster Pump Malfunction**
- **Brakes Drag**
- **Brake System Slow Release**
- **Brake Fluid Loss**

BRAKE WARNING INDICATOR MALFUNCTION (WITHOUT UJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Fluid Level Signal	C0267 00	1	1	-
Park Brake Signal	1	1	1	-
Ground	-	1	-	-
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The instrument panel cluster (IPC) sees the brake fluid level switch input opens and illuminates the Red Brake Warning indicator. The body control module (BCM) sees the park brake switch input grounded, it sends a serial data message to the IPC requesting illumination of the Red Brake Warning indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the park brake is released and the brake fluid is at or above the proper level.
   - If low, refer to **Brake Fluid Loss**.
2. Command the IPC display test with a scan tool, the warning indicator should turn ON.

- If the red brake warning indicator does not illuminate, replace the IPC.

3. Ignition ON, observe the scan tool BCM Park Brake Switch parameter while applying and releasing the park brake. The parameter should cycle between Applied and Release.
    - If the parameter does not cycle between the specified values, refer to Park Brake Switch Malfunction.
4. Observe the scan tool IPC Brake Fluid parameter. The reading should be OK.
    - If not the specified value, refer to Brake Fluid Level Switch Malfunction.

Circuit/System Testing

Park Brake Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the park brake switch.
2. Ignition ON, verify the scan tool BCM Park Brake Switch parameter is Released.
    - If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the BCM.
3. Install a 3A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool BCM Park Brake Switch parameter is Applied.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance.
4. If all circuits test normal, test or replace the park brake switch.

Brake Fluid Level Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the brake fluid level switch.
2. Test for less than 1 ohm between the ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool IPC Brake Fluid parameter is Ok.
    - If not the specified value, test the signal circuit for a short to ground. If the circuit tests normal, replace the IPC.
4. Install a 3A fused jumper wire between the signal circuit terminal B and ground. Verify the scan tool IPC Brake Fluid parameter is Low.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the IPC.
5. If all circuits test normal, test or replace the brake fluid level switch.

Component Testing

Park Brake Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the park brake switch.
2. Test for infinite resistance between the signal terminal A and ground with the park brake released.
    - If less than the specified value, replace the park brake switch.
3. Test for less than 1 ohm between the signal terminal A and ground with the park brake applied.
    - If greater than the specified range, replace the park brake switch.

Brake Fluid Level Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the brake fluid level switch.
2. Test for infinite resistance between the ground terminal A and the signal terminal B.
    - If less than the specified value, replace the brake fluid level switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Brake Fluid Level Indicator Switch Replacement**
- **Parking Brake Indicator Switch Replacement**
- **Control Module References** for BCM and IPC replacement, setup, and programming

BRAKE PULSATION

Step	Action	Yes	No
DEFINITION: Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the disc brake system for the following conditions. • Excessive thickness variation of rotor friction surfaces • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Hard spots, heat checks, bluing discoloration of rotor friction surfaces; possibly due to brake drag • Excessive corrosion of rotor friction surfaces; including red, gray or black oxidation • Loose, damaged or missing caliper or lining hardware • Bent or damaged caliper or mounting component • Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 3**	Go to **Symptoms - Hydraulic Brakes**

Step	Action	Yes	No
3	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKE SYSTEM NOISE

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the disc brake system for the following conditions. • Lining wear indicator contact with rotor • Debris trapped between rotor and splash shield or backing plate; and/or debris trapped between rotor and linings • Contaminated linings • Aftermarket linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Damaged or excessively worn caliper hardware and/or lining hardware • Incorrectly installed, loose or missing caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged splash shield or backing plate • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**.	Go to **Step 9**	Go to **Step 3**

Step	Action	Yes	No
	Did you find and correct a condition?		
3	1. Inspect the brake assist system for the following conditions. • Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating vacuum booster and/or check valve, if equipped • Low power steering fluid level, if equipped with hydraulic boost • Improperly tensioned, excessively worn or damaged power steering belt, if equipped with hydraulic boost • Restricted return hose from hydraulic booster, if equipped • Improperly operating hydraulic booster, if equipped • Improperly functioning power steering system, if equipped with a hydraulic booster assembly • Contaminated power steering fluid, if equipped with hydraulic boost 2. Adjust, repair or replace components as necessary. Refer to **Brake Assist System Diagnosis**. Did you find and correct a condition?	Go to **Step 9**	Go to **Step 4**
4	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 9**	Go to **Step 5**
5	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to **Step 6**	Go to **Step 9**
6	Ensure the park brake shoes are not adjusted too tightly, possibly causing a noise under certain conditions. Are the park brake shoes adjusted too tightly?	Go to **Step 7**	Go to **Step 9**
7	1. Clean and inspect the park brake shoes for excessive wear and/or damage.	Go to **Step 9**	Go to **Step 8**

Step	Action	Yes	No
	2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration, heat spots, and excessive radial runout. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system. Did you find and correct a condition?		
8	Inspect the park brake system for proper operation. Refer to **Park Brake System Diagnosis** . Did you find and correct a condition?	Go to **Step 9**	Go to **Symptoms - Hydraulic Brakes**
9	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKING ACTION UNEVEN - PULLS TO ONE SIDE

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

5

Steering components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the hydraulic brake system for the following conditions. • Kinked, pinched or damaged brake pipe or flexible brake hose • Sticking or improperly operating caliper piston	Go to **Step 6**	Go to **Step 3**

Step	Action	Yes	No
	• Brake fluid leak 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?		
3	1. Inspect the disc brake system for the following conditions. • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings on one side • Loose, damaged or missing caliper hardware and/or lining hardware • Incorrect linings on one side • Hard spots, heat checks, blueing discoloration of rotor friction surfaces; possibly due to brake drag • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 6**	Go to **Step 4**
4	1. Inspect the suspension system for the following conditions. • Incorrect tire pressures • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to **Symptoms - Suspension General Diagnosis** . Did you find and correct a condition?	Go to **Step 6**	Go to **Step 5**
5	1. Inspect the steering system for the following conditions. • Loose steering component connections • Excessively worn or damaged steering components 2. Adjust, repair or replace components as necessary.	Go to **Step 6**	Go to **Symptoms - Hydraulic Brakes**

Step	Action	Yes	No
	Did you find and correct a condition?		
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKING ACTION UNEVEN - FRONT TO REAR

Test Descriptions

The number below refers to the step number on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of caliper pistons • Kinked, pinched or damaged brake pipe or flexible brake hose • Brake fluid leak • Improperly functioning proportion valve, if equipped • Improper operation of dynamic rear proportion (DRP) system, if equipped 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 6**	Go to **Step 3**
3	1. Inspect the disc brake system for the following conditions: • Contaminated linings • Glazed linings	Go to **Step 6**	Go to **Step 4**

Step	Action	Yes	No
	• Distorted, cracked or damaged linings • Excessively worn linings • Aftermarket linings • Damaged or excessively worn caliper hardware and/or lining hardware • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?		
4	1. Inspect the suspension system for the following conditions: • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to **Symptoms - Suspension General Diagnosis** . Did you find and correct a condition?	Go to **Step 6**	Go to **Step 5**
5	1. Inspect the brake assist system for the following conditions: • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating vacuum booster, if equipped • Damaged or improperly operating hydraulic booster, if equipped 2. Adjust, repair or replace components as necessary. Refer to **Brake Assist System Diagnosis**. Did you find and correct a condition?	Go to **Step 6**	Go to **Symptoms - Hydraulic Brakes**
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKE PEDAL EXCESSIVE TRAVEL

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away, or pedal is spongy.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	Inspect the travel and feel of brake pedal applies. Perform the following: 1. Apply the brake pedal several times to fully deplete the power reserve. 2. With power reserve depleted, apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. 3. Apply the brake pedal with light, steady pressure, then without pumping the pedal, reduce pressure and reapply pressure several times. Observe pedal travel and feel for each apply. 4. Apply the brake pedal slowly, then release and apply the pedal quickly. Observe pedal travel and feel for each apply. Did you complete the brake pedal travel and feel inspections?	Go to **Step 3**	-

3	1. Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections:
	• Pedal feel was spongy
	  • Air in hydraulic system
	  • External brake fluid leaks
	  • Soft, weak or damaged hydraulic hoses; expanding under pressure
	• Pedal fell away and/or traveled to or almost to floor
	  • External brake fluid leaks
	  • Poor brake fluid quality; low boiling point
	  • Internal brake fluid leaks; improperly functioning master cylinder
	• Pedal was somewhat firm then dropped slightly, or pedal rose with successive
		Go to **Step 8**	Go to **Step 4**

Step	Action	Yes	No
	applies, or pedal travel was different between slow and quick applies • Internal brake fluid leaks; improperly functioning master cylinder • Poor brake fluid quality; low boiling point • Pedal returned to rest slowly after any of the applies • Internally damaged flexible brake hoses; hindering fluid return • Binding caliper pistons • Internal brake fluid leaks; improperly functioning master cylinder 2. Repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?		
4	1. Inspect the disc brake system for the following conditions: • Cracked, excessively worn or damaged linings • Cracked, excessively worn or damaged rotors • Improperly operating, binding or damaged caliper hardware and/or lining hardware • Loose or missing caliper hardware and/or lining hardware • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?	Go to **Step 8**	Go to **Step 5**
5	Inspect for proper brake pedal travel. Refer to **Brake Pedal Travel Measurement and Inspection**. Is the brake pedal travel distance within the acceptable limits?	Go to **Step 7**	Go to **Step 6**

Step	Action	Yes	No
6	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. • For the brake pedal pushrod component inspection, refer to **Brake Pedal Pushrod Inspection**. • Inspect the brake pedal bushings for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to **Step 8**	Go to **Step 7**
7	1. Inspect the brake assist system for the following conditions: • Vacuum leaks and/or improperly operating check valve, if equipped with vacuum assist • Power steering fluid leaks, if equipped with hydraulic power assist • Damaged or improperly operating brake booster assembly 2. Adjust, repair or replace components as necessary. Refer to **Brake Assist System Diagnosis**. Did you find and correct a condition?	Go to **Step 8**	Go to **Symptoms - Hydraulic Brakes**
8	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKE PEDAL EXCESSIVE EFFORT

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the brake assist system for the following conditions:	Go to **Step 5**	Go to **Step 3**

Step	Action	Yes	No
	• Vacuum leaks, if equipped with vacuum power assist • Power steering fluid leaks, if equipped with hydraulic power assist • Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating brake booster assembly 2. Adjust, repair or replace components as necessary. Refer to **Brake Assist System Diagnosis**. Did you find and correct a condition?		
3	1. Inspect the hydraulic brake system for the following conditions: • Binding caliper pistons • Internally damaged flexible brake hoses; hindering fluid flow • External brake fluid leaks • Kinked or damaged flexible brake hoses and/or pipes • Internal brake fluid leaks; improperly operating master cylinder • Poor brake fluid quality; low boiling point 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 5**	Go to **Step 4**
4	1. Inspect the disc brake system for the following conditions: • Excessively worn linings • Glazed linings • Cracked, distorted or damaged linings • Contaminated linings • Binding, damaged or excessively worn caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Excessively worn or corroded rotor friction	Go to **Step 5**	Go to **Symptoms - Hydraulic Brakes**

Step	Action	Yes	No
	surfaces • Glazed rotor friction surfaces • Hard spots, heat checks, blueing discoloration of rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?		
5	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKES DRAG

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to **Step 3**	Go to **Step 4**
3	1. Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing. Did you find and correct a condition?	Go to **Step 14**	Go to **Step 4**
4	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to **Step 5**	Go to **Step 7**
5	Ensure the park brake shoes are not adjusted too tightly, possibly causing drag under certain conditions. Are the park brake shoes adjusted too tightly?	Go to **Step 6**	Go to **Step 7**
6	1. Clean and inspect the park brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration and heat spots.	Go to **Step 14**	Go to **Step 7**

Step	Action	Yes	No
	3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system. Did you find and correct a condition?		
7	Inspect the park brake system for proper operation. Refer to **Park Brake System Diagnosis** . Did you find and correct a condition?	Go to **Step 14**	Go to **Step 8**
8	1. Inspect the disc brake system for the following conditions: • Binding, incorrectly installed or missing caliper hardware and/or lining hardware- Ensure free movement of linings and of caliper, if equipped with sliding type caliper • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn caliper hardware and/or lining hardware • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 14**	Go to **Step 9**
9	1. Separate the brake booster pushrod from the brake pedal. 2. Inspect the brake corners to determine if the brake drag condition is still present. Do the brake corners still exhibit the brake drag condition?	Go to **Step 11**	Go to **Step 10**
10	1. Inspect the pushrod for improper positioning and/or damage. Correctly position or replace the pushrod if necessary. 2. Inspect the brake pedal assembly for damage and replace if necessary. Did you complete the repair or replacement?	Go to **Step 14**	-
11	1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the brake	Go to **Step 13**	Go to **Step 12**

Step	Action	Yes	No
	booster. Do not disconnect any brake pipes. 3. Inspect the brake corners to determine if the brake drag condition is still present. Do the brake corners still exhibit the brake drag condition?		
12	Replace the brake booster assembly. Did you complete the replacement?	Go to **Step 14**	-
13	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid • Internally damaged flexible brake hoses; hindering brake release • Damaged or improperly operating master cylinder 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 14**	Go to **Symptoms - Hydraulic Brakes**
14	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKE SYSTEM SLOW RELEASE

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of caliper pistons • Internally damaged flexible brake hoses; hindering brake release • Contaminated brake fluid • Damaged or improperly operating master cylinder	Go to **Step 5**	Go to **Step 3**

Step	Action	Yes	No
	2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?		
3	1. Inspect the brake assist system for the following conditions: • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating vacuum booster, if equipped • Restricted return hose from hydraulic booster, if equipped • Damaged or improperly operating hydraulic booster, if equipped 2. Adjust, repair or replace components as necessary. Refer to **Brake Assist System Diagnosis**. Did you find and correct a condition?	Go to **Step 5**	Go to **Step 4**
4	1. Inspect the disc brake system for the following conditions: • Damaged or excessively worn caliper hardware and/or lining hardware • Distorted or damaged linings • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 5**	Go to **Symptoms - Hydraulic Brakes**
5	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

BRAKE FLUID LOSS

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the following hydraulic brake system components for brake fluid leaks: • Flexible brake hose connections; threaded and bolted • Flexible brake hose crimp joints • Brake pipe fittings • Caliper piston seals • Wheel cylinder piston seals, if equipped • Master cylinder reservoir • Master cylinder reservoir low pressure hose, if equipped • Brake pressure modulator valve (BPMV) assembly, if equipped 2. Repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 8**	Go to **Step 3**
3	Is the vehicle equipped with a vacuum brake booster?	Go to **Step 4**	Go to **Step 6**
4	1. Disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. 4. Inspect for brake fluid in the vacuum brake booster. Did you find a brake fluid leak?	Go to **Step 5**	Go to **Symptoms - Hydraulic Brakes**
5	Replace the brake master cylinder and the vacuum brake booster. Did you complete the replacement?	Go to **Step 8**	-
6	1. Wipe clean the external surface of the master cylinder to hydraulic brake booster area, if equipped. 2. Separate the master cylinder from the hydraulic brake booster, if equipped. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak.	Go to **Step 7**	Go to **Symptoms - Hydraulic Brakes**

Step	Action	Yes	No
	Did you find a brake fluid leak?		
7	Replace the brake master cylinder. Did you complete the replacement?	Go to **Step 8**	-
8	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm proper operation. Refer to **Brake System Vehicle Road Test**. Is the condition still present?	Go to **Step 2**	System OK

DISC BRAKE SYSTEM DIAGNOSIS

Test Description

The numbers below refer to the step numbers on the diagnostic table.

9

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12

Disc brake rotor shields/backing plates that come in contact with disc brake rotors may cause brake system noise.

15

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

22

Disc brake rotor assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating properly. You will be directed by the			

Step	Action	Yes	No
appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	Visually inspect the disc brake pads for the following conditions: Refer to **Brake Pad Inspection** . • Lining thickness below specifications • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness or damage - including pad hardware • Evidence of contamination from an external substance Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?	Go to **Step 3**	Go to **Step 12**
3	Are any of the front and/or rear disc brake pads contaminated?	Go to **Step 8**	Go to **Step 4**
4	Are any of the front and/or rear disc brake pads worn unevenly?	Go to **Step 7**	Go to **Step 5**
5	Are any of the front and/or rear disc brake pads and/or pad hardware loose or damaged?	Go to **Step 7**	Go to **Step 6**
6	1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** . Did you complete the inspection and replacement?	Go to **Step 12**	-
7	**CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible**	Go to **Step 12**	-

Step	Action	Yes	No
	brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **NOTE:** **Do NOT disconnect the hydraulic brake flex hoses from the calipers.** 1. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets and support the calipers. Refer to **Front Brake Caliper Replacement** , and/or **Rear Brake Caliper Replacement** . 2. Inspect the disc brake caliper mounting bracket and the mounting/sliding hardware for the following conditions: Refer to **Front Disc Brake Mounting and Hardware Inspection** , and/or **Rear Disc Brake Mounting and Hardware Inspection** . • Binding or seized hardware • Worn, damaged or missing hardware components		

Step	Action	Yes	No
	• Loose, bent, cracked, or damaged caliper mounting bracket 3. Replace components as required. Refer to the following procedures, as required: • **Front Brake Caliper Bracket Replacement** • **Rear Brake Caliper Bracket Replacement** • **Front Brake Caliper Hardware Replacement** • **Rear Brake Caliper Hardware Replacement** 4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** . Did you complete the inspection and replacement?		
8	1. Inspect the disc brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required: • **Front Brake Caliper Overhaul** , or **Front Brake Caliper Replacement** • **Rear Brake Caliper Overhaul** , or **Rear Brake Caliper Replacement** • **Front Brake Hose Replacement** • **Rear Brake Hose Replacement** • **Brake Pipe Replacement** Did you find and correct the source of the leak causing contamination of the pads?	Go to **Step 11**	Go to **Step 9**
9	1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the pads. Refer to **Wheel Drive Shaft Outer Joint and Boot Replacement (Without WL9)** **Wheel Drive Shaft Outer Joint and Boot Replacement**	Go to **Step 11**	Go to **Step 10**

Step	Action	Yes	No
	(With WL9) . Did you find and correct the source of the leak causing contamination of the pads?		
10	1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Inspect the power steering system hoses for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 3. Replace any components found to be leaking fluid which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to **Step 11**	-
11	1. Clean the remaining disc brake system components to remove any traces of the contaminant. **CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the**	Go to **Step 12**	-

Step	Action	Yes	No
	weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **NOTE:** **Do NOT disconnect the hydraulic brake flex hoses from the calipers.** 2. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets and support the calipers. Refer to **Front Brake Caliper Replacement** , and/or **Rear Brake Caliper Replacement** . 3. Inspect the disc brake caliper mounting/sliding hardware for the following conditions: Refer to **Front Disc Brake Mounting and Hardware Inspection** , and/or **Rear Disc Brake Mounting and Hardware Inspection** . • Binding or seized hardware • Distorted, worn, damaged or missing hardware components 4. Replace the caliper mounting/sliding hardware components as required. Refer to **Front Brake Caliper Hardware Replacement** , and/or **Rear Brake Caliper Hardware Replacement** . 5. Replace the contaminated disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** . Did you complete the cleaning, inspection and replacement?		

Step	Action	Yes	No
12	Visually inspect each of the rear disc brake rotor shields/backing plates, if equipped, for evidence of contact with the brake rotors. Are any of the brake rotor shields/backing plates contacting the brake rotors?	Go to **Step 13**	Go to **Step 14**
13	Repair or replace the disc brake rotor shields/backing plates as required. Did you complete the repair or replacement?	Go to **Step 14**	-
14	1. Check the thickness of each of the disc brake rotors. **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor can be REFINISHED and REMAIN ABOVE the minimum requirements. Refer to **Brake Rotor Thickness Measurement** .Does the disc brake rotor meet the minimum requirements for REFINISHING?	Go to **Step 15**	Go to **Step 18**
15	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.** Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to **Brake Rotor Thickness Variation Measurement** .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to **Step 17**	Go to **Step 16**
16	1. Inspect each of the disc brake rotors for the following surface and wear conditions:	Go to **Step 17**	Go to **Step 22**

Step	Action	Yes	No
	Refer to **Brake Rotor Surface and Wear Inspection** . • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor requires refinishing based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires refinishing. Does the brake rotor require REFINISHING?		
17	1. Refinish the brake rotor. Refer to **Brake Rotor Refinishing** . 2. Inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement** . Were you able to REFINISH the brake rotor within the minimum requirements?	Go to **Step 22**	Go to **Step 21**
18	Is the brake rotor at or below the DISCARD requirements (J55), or below the MINIMUM THICKNESS requirements, (JL9)?	Go to **Step 21**	Go to **Step 19**
19	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH**	Go to **Step 21**	Go to **Step 20**

Step	Action	Yes	No
	rotor. Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to **Brake Rotor Thickness Variation Measurement** .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?		
20	1. Inspect each of the disc brake rotors for the following surface and wear conditions: Refer to **Brake Rotor Surface and Wear Inspection** . • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor requires replacement based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires replacement. Does the brake rotor require REPLACEMENT?	Go to **Step 21**	Go to **Step 22**
21	**NOTE:** **Whenever a brake rotor is replaced, the assembled lateral runout (LRO) of the rotor**	Go to **Step 24**	-

Step	Action	Yes	No
	must be measured to ensure optimum performance of the disc brakes. Replace the brake rotor. Refer to **Front Brake Rotor Replacement** , or **Rear Brake Rotor Replacement** .Did you complete the replacement?		
22	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.** Inspect each of the disc brake rotors for assembled lateral runout (LRO) that exceeds the maximum acceptable level. Refer to **Brake Rotor Assembled Lateral Runout Measurement** .Does the brake rotor exhibit assembled LRO that exceeds the maximum acceptable level?	Go to **Step 23**	Go to **Step 24**
23	Correct the LRO for each brake rotor that was determined to have LRO exceeding the maximum acceptable level. Refer to **Brake Rotor Assembled Lateral Runout Correction** . Did you complete the operation?	Go to **Step 24**	-
24	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	-

HYDRAULIC BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the HYDRAULIC brake system in order to determine if the HYDRAULIC brake system is operating properly. You will be directed by the appropriate Symptom Table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom Table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**

Step	Action	Yes	No
2	Inspect and adjust the brake fluid level in the brake master cylinder. Refer to **Master Cylinder Reservoir Filling**. Was the brake fluid level low?	Go to **Step 3**	Go to **Step 4**
3	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: • Fluid separation (indicating 2 types of fluid are present) • Swirled appearance - oil-based substance • Layered appearance - silicone-based substance • Fluid discoloration • Cloudy appearance - moisture • Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to **Step 5**	Go to **Step 6**
4	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: • Fluid separation (indicating 2 types of fluid are present) • Swirled appearance - oil-based substance • Layered appearance - silicone-based substance • Fluid discoloration • Cloudy appearance - moisture • Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to **Step 5**	Go to **Step 12**
5	1. Flush the hydraulic brake system. Refer to **Hydraulic Brake System Flushing**. 2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid (indicated by fluid separation and/or a swollen master cylinder reservoir	Go to **Step 9**	-

Step	Action	Yes	No
	cap diaphragm and/or swollen reservoir-to-master cylinder grommets), perform the following: 1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. 2. Clean out the hydraulic brake pipes using denatured alcohol (or equivalent). 3. Dry the brake pipes using non-lubricated, filtered air. 4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. • **Master Cylinder Overhaul**, or **Master Cylinder Replacement** ; also perform the following: Clean the brake master cylinder reservoir using denatured alcohol (or equivalent), then dry the reservoir using non-lubricated, filtered air, or if necessary, replace the brake master cylinder reservoir. Replace the brake master cylinder reservoir cap diaphragm. • **Front Brake Hose Replacement** • **Rear Brake Hose Replacement** • **Front Brake Caliper Overhaul** , or **Front Brake Caliper Replacement** . • **Rear Brake Caliper Overhaul** , or **Rear Brake Caliper Replacement** . • **Brake Pressure Modulator Valve Replacement** , if equipped. 3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system. 4. Refill and bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding**		

Step	Action	Yes	No
	(Manual)Hydraulic Brake System Bleeding (Pressure). Did you complete the operation and any required repairs and/or replacements?		
6	1. Inspect the following hydraulic brake system components for external fluid leaks; repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures: • **Master Cylinder Overhaul**, or **Master Cylinder Replacement** Brake master cylinder reservoir cap diaphragm • **Front Brake Hose Replacement** • **Rear Brake Hose Replacement** • **Brake Pipe Replacement** • **Front Brake Caliper Overhaul** , or **Front Brake Caliper Replacement** . • **Rear Brake Caliper Overhaul** , or **Rear Brake Caliper Replacement** . • **Brake Pressure Modulator Valve Replacement** , if equipped. 2. If you repaired or replaced any of the brake system components listed, bleed the hydraulic brake system. While bleeding the hydraulic brake system, observe for the following: Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**. • The presence of air in the system at a bleeder valve location other than at the repair location (except if the brake master cylinder and/or the proportioning valves, if equipped [non-ABS], were replaced) • An unrestricted and even flow of brake fluid per axle (during the bleeding procedure) Did you find and correct a condition?	Go to **Step 7**	Go to **Step 12**

Step	Action	Yes	No
7	Was there air in the system at a bleeder valve location other than at the repair location, (except if the brake master cylinder and/or the proportioning valves, if equipped [non-ABS], were replaced)?	Go to **Step 19**	Go to **Step 8**
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to **Step 9**	Go to **Step 10**
9	Inspect the hydraulic function of the brake calipers for proper operation. Refer to **Hydraulic Brake Component Operation Visual Inspection**. Was the hydraulic function of the brake calipers operating properly?	Go to **Step 21**	Go to **Step 14**
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to **Step 13**	Go to **Step 11**
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to **Step 17**	-
12	Inspect the hydraulic function of the brake calipers for proper operation. Refer to **Hydraulic Brake Component Operation Visual Inspection**. Was the hydraulic function of the brake calipers operating properly?	Go to **Step 15**	Go to **Step 13**
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating properly: 1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** . 3. Open the suspected caliper bleeder valve. 4. Using a large C-clamp, compress the caliper piston and observe for an unrestricted flow of brake fluid and for free movement of the caliper piston. 5. Close the caliper bleeder valve. Was the flow of brake fluid unrestricted and did the caliper piston move freely?	Go to **Step 17**	Go to **Step 14**

Step	Action	Yes	No
14	Repair or replace any brake caliper that was not operating properly. Refer to the appropriate procedures. • **Front Brake Caliper Overhaul** , or **Front Brake Caliper Replacement** . • **Rear Brake Caliper Overhaul** , or **Rear Brake Caliper Replacement** . Did you complete the repair and/or replacement?	Go to **Step 21**	-
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle (during the bleeding procedure). Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**. Was there air in the system?	Go to **Step 19**	Go to **Step 16**
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to **Step 21**	Go to **Step 17**
17	1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Refer to **Brake Pipe and Hose Inspection**. 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched or damaged. Refer to the following procedures as necessary: • **Front Brake Hose Replacement** • **Rear Brake Hose Replacement** • **Brake Pipe Replacement** 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched, or damaged, replace the hydraulic brake flex hoses at the restricted location. Did you find and correct a condition?	Go to **Step 21**	Go to **Step 18**
18	If equipped with Antilock Brakes, replace the brake pressure modulator valve (BPMV), in order to correct the hydraulic brake dynamic rear proportioning mechanical operation. Refer to **Brake Pressure Modulator Valve Replacement** . Did you complete the replacement?	Go to **Step 21**	-
19	1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location,	Go to **Step 21**	Go to **Step 20**

Step	Action	Yes	No
	which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?		
20	1. Inspect the brake master cylinder for internal fluid leaks. Refer to **Brake System Internal Leak Test**. 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. Refer to **Master Cylinder Overhaul**, or **Master Cylinder Replacement**. Did you find and correct a condition?	Go to **Step 21**	Return to Symptom Table
21	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	-

BRAKE ASSIST SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the brake ASSIST system in order to determine if the brake ASSIST system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to **Step 3**	Go to **Step 2**
2	Were you sent here directly from an electrical diagnostic to investigate vacuum as a possible concern?	Go to **Step 5**	Go to **Diagnostic Starting Point - Vehicle**
3	Inspect for proper brake pedal travel. Refer to **Brake Pedal Travel Measurement and Inspection**. Is the brake pedal travel distance within the acceptable limits?	Go to **Step 5**	Go to **Step 4**
4	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. • For the brake pedal pushrod component inspection, refer to **Brake Pedal Pushrod Inspection**. • Inspect the brake pedal bushings for excessive wear and/or damage and inspect the brake pedal for a misaligned, bent and/or damaged condition.	Go to **Step 5**	Go to **Hydraulic Brake System Diagnosis** to check for internal and external fluid leaks and air in the hydraulic brake system

Step	Action	Yes	No
	2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?		
5	Check the engine vacuum source that supplies vacuum to the vacuum brake booster. Refer to **Brake System Vacuum Source Test**. Is the vacuum reading within the acceptable limits?	Go to **Step 6**	Go to Engine Controls Diagnostics Information to check for vacuum issues, including vacuum pump operation, if equipped
6	Does the condition occur during cold start-up conditions?	Go to **Step 7**	Go to **Step 8**
7	Check engine vacuum, and vacuum pump operation, if equipped, under the same cold start-up conditions. Refer to **Auxiliary Brake Booster Pump Malfunction - DTC C027B**. Did you find and correct a condition?	Go to **Step 22**	Go to **Step 9**
8	During the vacuum source test, did the vacuum booster check valve operate properly?	Go to **Step 10**	Go to **Step 9**
9	Replace the vacuum booster check valve. Refer to **Power Brake Booster Vacuum Check Valve and Hose Replacement**. Did you complete the replacement?	Go to **Step 10**	-
10	If equipped with a booster mounted separate vacuum sensor, inspect the vacuum sensor grommet for cracks, cuts, dry-rot, or damage. Does the vacuum sensor grommet exhibit any of the conditions listed?	Go to **Step 11**	Go to **Step 12**
11	Replace the vacuum sensor grommet. Did you complete the replacement?	Go to **Step 12**	-
12	1. If the vehicle is equipped with a vacuum sensor, install a scan tool. 2. Using the Data Display function, determine if brake booster vacuum sensor data is available within either the chassis brake controls area or the powertrain engine controls area. Is vacuum sensor data available through the scan tool?	Go to **Step 13**	Go to **Step 16**
13	Perform the vacuum booster leak-down test using a scan tool: 1. Release the brake pedal.	Go to **Step 18**	Go to **Step 14**

Step	Action	Yes	No
	2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. **NOTE:** **Vacuum readings will decrease by approximately 2.7 kPa (0.8 Hg) for every 305 m (1000 ft) of elevation above sea level.** 6. Determine the rate of vacuum leak. **Specification** Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds Was the rate of vacuum leak within the specified allowable range?		
14	1. Deplete the vacuum reserve by pressing the brake pedal several times, or by removing the vacuum booster check valve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Refer to **Master Cylinder Replacement**. 3. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder. Replace the vacuum seal as necessary. 4. Carefully reinstall the master cylinder to the brake booster. Refer to **Master Cylinder Replacement**.	Go to **Step 15**	-

Step	Action	Yes	No
	Did you complete the operation?		
15	Perform the vacuum booster leak-down test using a scan tool: 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. **NOTE:** **Vacuum readings will decrease by approximately 2.7 kPa (0.8 Hg) for every 305 m (1000 ft) of elevation above sea level.** 6. Determine the rate of vacuum leak. **Specification** Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds Was the rate of vacuum leak within the specified allowable range?	Go to **Step 22**	Go to **Step 21**
16	1. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Before removing the master cylinder, first deplete the vacuum by removing the check valve or applying the brake pedal several times. Refer to **Master Cylinder Replacement**. 2. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder.	Go to **Step 17**	Go to **Step 18**

Step	Action	Yes	No
	3. If equipped with a vacuum seal that is part of the booster, inspect the seal for damage. Does the vacuum seal exhibit any of the conditions listed?		
17	1. If equipped with a vacuum seal on the rear of the master cylinder, replace the vacuum seal as necessary. Ensure the seal is positioned correctly during installation. 2. If equipped with a vacuum seal that requires replacement and which is part of the booster, the booster assembly must be replaced. 3. Carefully reinstall the master cylinder to the brake booster. Refer to **Master Cylinder Replacement**. Did you complete the replacement?	Go to **Step 18**	-
18	Perform the vacuum boost functional test: 1. If still separated, reinstall the master cylinder to the booster. Refer to **Master Cylinder Replacement**. 2. If the engine was started after reinstalling the master cylinder to the booster, perform the following: With the engine OFF, depress the brake pedal several times to deplete the vacuum reserve. 3. Depress and maintain moderate foot pressure on the brake pedal. 4. Start the engine and observe pedal operation. 5. Observe for audible vacuum leaks. The brake pedal should fall slightly, then hold. Is there an audible vacuum leak coming from the brake pedal area?	Go to **Step 21**	Go to **Step 19**
19	Did the brake pedal fall slightly after the engine was started, then hold?	Go to **Step 20**	Go to **Step 21**
20	Perform the vacuum booster leak-down test: 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000	Go to **Step 22**	Go to **Step 21**

Step	Action	Yes	No
	RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Wait 60 seconds. 5. Depress the brake pedal 2 times to check for vacuum booster available vacuum reserve. Observe pedal effort. • Both pedal applies should be assisted • The amount of assist could diminish slightly with the second apply Were both pedal applies power assisted?		
21	Replace the vacuum brake booster. Refer to **Power Vacuum Brake Booster Replacement**. Did you complete the replacement?	Go to **Step 22**	-
22	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Brake Assist System OK Return to Symptom Table	-

BRAKE SYSTEM VEHICLE ROAD TEST

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing. Refer to **Master Cylinder Reservoir Filling**.
3. Inspect the tire inflation pressures and adjust as necessary.
4. Inspect the tire tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

1. Start the engine and allow it to idle.
2. Check to see if the brake system warning lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to **Symptoms - Hydraulic Brakes**.
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for

brake system low speed road testing.

5. With the transmission in PARK, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
6. If the brake pedal apply felt spongy, or the pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
7. If the brake pedal apply did not feel spongy and the pedal travel was not excessive, proceed to step 8.
8. Release and apply the brakes.
9. While continuing to apply the brakes, shift the transmission into DRIVE, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
10. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
11. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
12. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 13.
13. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to him.
14. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
15. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
16. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
17. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
18. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
19. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 20.
20. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side, or front to rear.

    A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

21. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.

BRAKE PEDAL TRAVEL MEASUREMENT AND INSPECTION

Tools Required

J 28662 Brake Pedal Effort Gage Brake Pedal Effort Gauge

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the brake booster power reserve.
2. Install the **J 28662** brake pedal effort gage to the brake pedal.

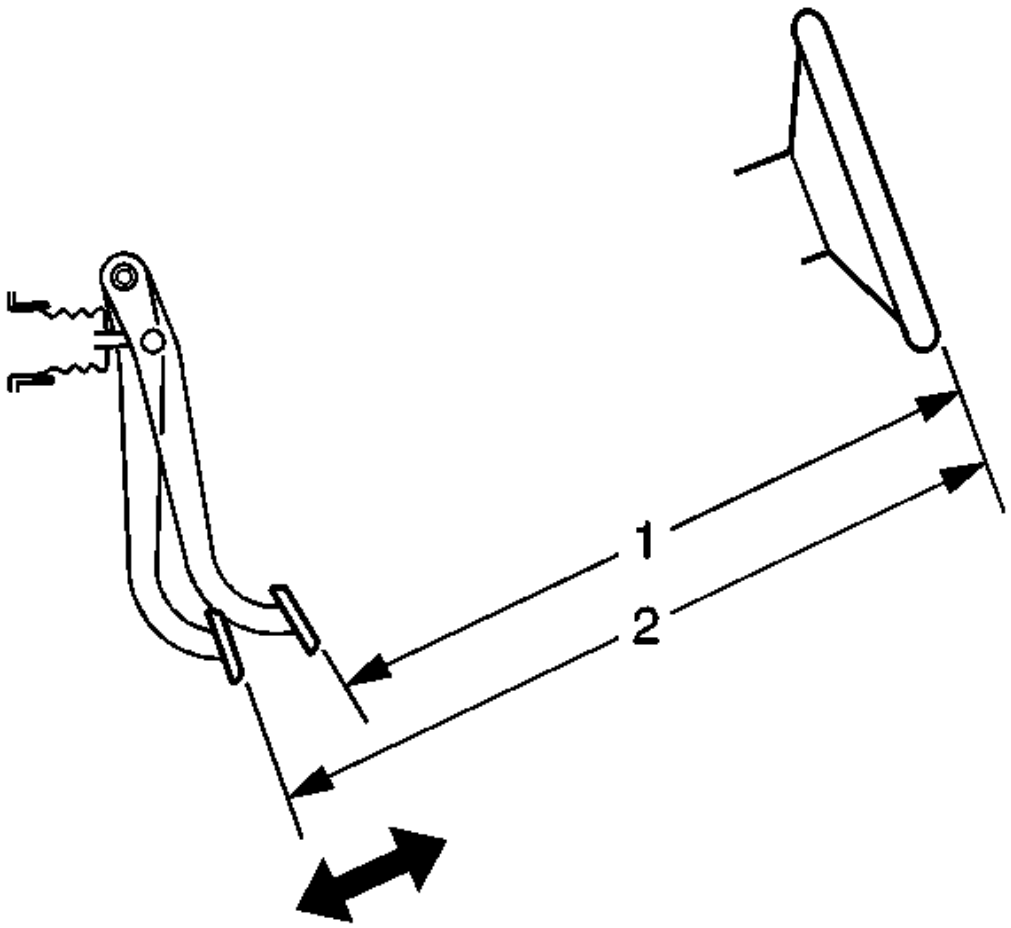

Fig. 2: Measuring Brake Pedal Travel
Courtesy of GENERAL MOTORS COMPANY

3. Measure and record the distance (1) from the brake pedal to the rim of the steering wheel; note the points of measurement.
4. Apply and maintain the brakes with 445 N (100 lb) of force to the brake pedal, as indicated on the **J 28662** brake pedal effort gage.
5. While maintaining 445 N (100 lb) of force to the brake pedal, measure and record the distance (2) from the same point on the brake pedal to the same point on the rim of the steering wheel.
6. Release the brakes and repeat steps 4 and 5 to obtain a second measurement. After obtaining a second measurement, proceed to step 7.
7. Average the first and second measurements recorded during the two applies of the brakes.
8. Subtract the initial measurement, unapplied (1), from the averaged, applied measurement (2) to obtain the

brake pedal travel distance.

Specification

Maximum brake pedal travel (measured with the ignition OFF, brake booster power assist depleted, and the brakes cool): 74 mm (2.91 in).

BRAKE SYSTEM VACUUM SOURCE TEST

NOTE:

- **Engine temperature, accessory load, and elevation level will affect engine vacuum.**
- **Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above sea level.**

1. Disconnect the engine vacuum hose from the vacuum brake booster check valve.
2. Install a vacuum gauge to the engine vacuum hose.
3. Start the engine and allow the engine to idle until normal operating temperatures are reached.
4. With the vehicle in PARK, the engine idling, and the air conditioning (A/C) system OFF, check to see if the engine vacuum reading is within the specified normal engine vacuum range.

   Specification

   47-68 kPa (14-20 in Hg)

5. Turn the ignition OFF.
6. If the engine vacuum reading was within the specified normal range, proceed to step 10.
7. If the engine vacuum reading was NOT within the specified normal range, inspect the engine vacuum hose for the following conditions:
   - Loose connection to the engine
   - Collapse, deformation or contamination
   - Cracks, cuts, dry-rot
8. If any of these conditions were found with the engine vacuum hose, replace the hose, then repeat steps 2-4.
9. If none of these conditions were found with the engine vacuum hose, then there is an engine vacuum source problem, check the engine vacuum system.
10. Remove the vacuum brake booster check valve from the booster.
11. Install the check valve to the engine vacuum hose.
12. Install the vacuum gauge to the check valve.
13. Start the engine and allow the engine to idle in PARK with the A/C system OFF, until normal operating temperatures are reached.
14. Turn the ignition OFF.
15. Check to see if the engine vacuum reading is maintained within the specified normal engine vacuum range.

Specification

47-68 kPa (14-20 in Hg)

16. If the engine vacuum reading is maintained within the specified normal range, proceed to step 18.
17. If the engine vacuum reading is NOT maintained within the specified normal range, replace the brake booster check valve, then repeat steps 11-15.
18. Inspect the brake booster check valve grommet for the following conditions:
    - Loose connection to the vacuum brake booster
    - Deformation or contamination
    - Cracks, cuts, dry-rot
19. If any of these conditions were found with the check valve grommet, replace the grommet.

BRAKE SYSTEM EXTERNAL LEAK INSPECTION

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. In order to inspect for external brake fluid leaks, first check the fluid level in the master cylinder.

   While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

2. If the fluid level is abnormally low, adjust the brake fluid level. Refer to **Master Cylinder Reservoir Filling**.
3. Start the engine and allow it to idle.
4. Apply constant, moderate foot pressure to the brake pedal.

   If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

5. Turn OFF the ignition.
6. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
   - Master cylinder brake pipe fittings
   - All brake pipe connections
   - Brake pipes
   - Brake hoses and connections
   - Brake calipers and/or wheel cylinders, if equipped
7. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

BRAKE SYSTEM INTERNAL LEAK TEST

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Start the engine and allow it to idle.
2. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
3. Release the brakes and turn OFF the ignition.
4. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
    1. Inspect the brake system for external leaks. Refer to **Brake System External Leak Inspection**.
    2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.

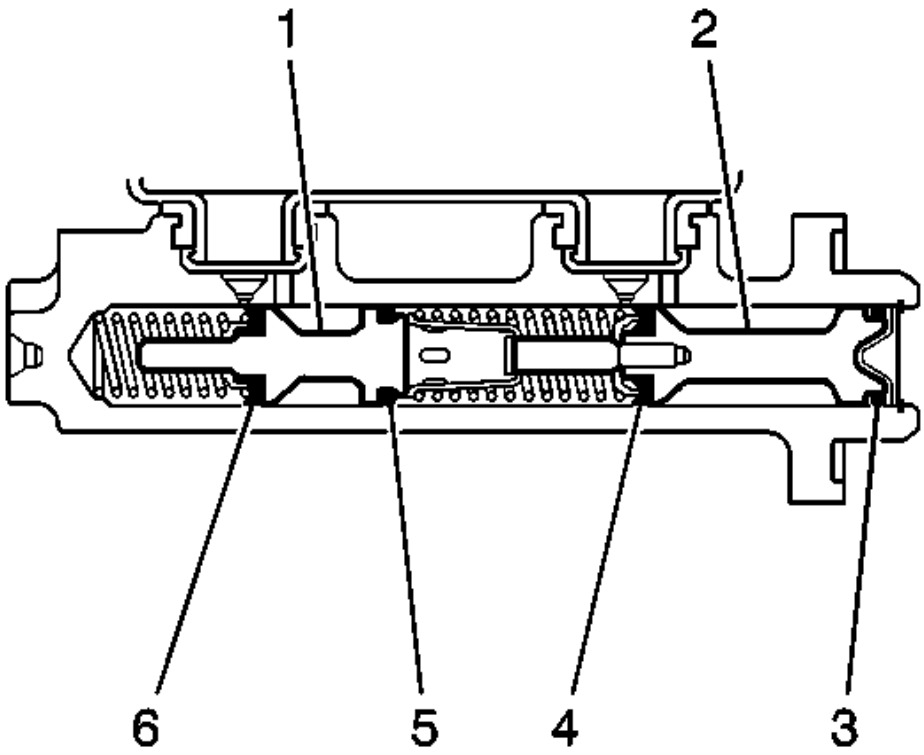

Fig. 3: Identifying Brake Master Cylinder (Cross Sectional View)
Courtesy of GENERAL MOTORS COMPANY

5. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the

following steps:

1. Loosen the master cylinder-to-brake power booster mounting nuts.
2. Carefully pull the master cylinder away from the brake power booster just enough to inspect the mounting surface of the master cylinder.
3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.

6. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires overhaul or replacement.
7. If the master cylinder primary piston (2) does not exhibit any leakage, pressure bleed the brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.
8. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires overhaul or replacement due to an internal leak past the secondary piston (1) from the secondary piston primary seal (6) or secondary seal (5).
9. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV) may be leaking internally, and may require replacement.

HYDRAULIC BRAKE COMPONENT OPERATION VISUAL INSPECTION

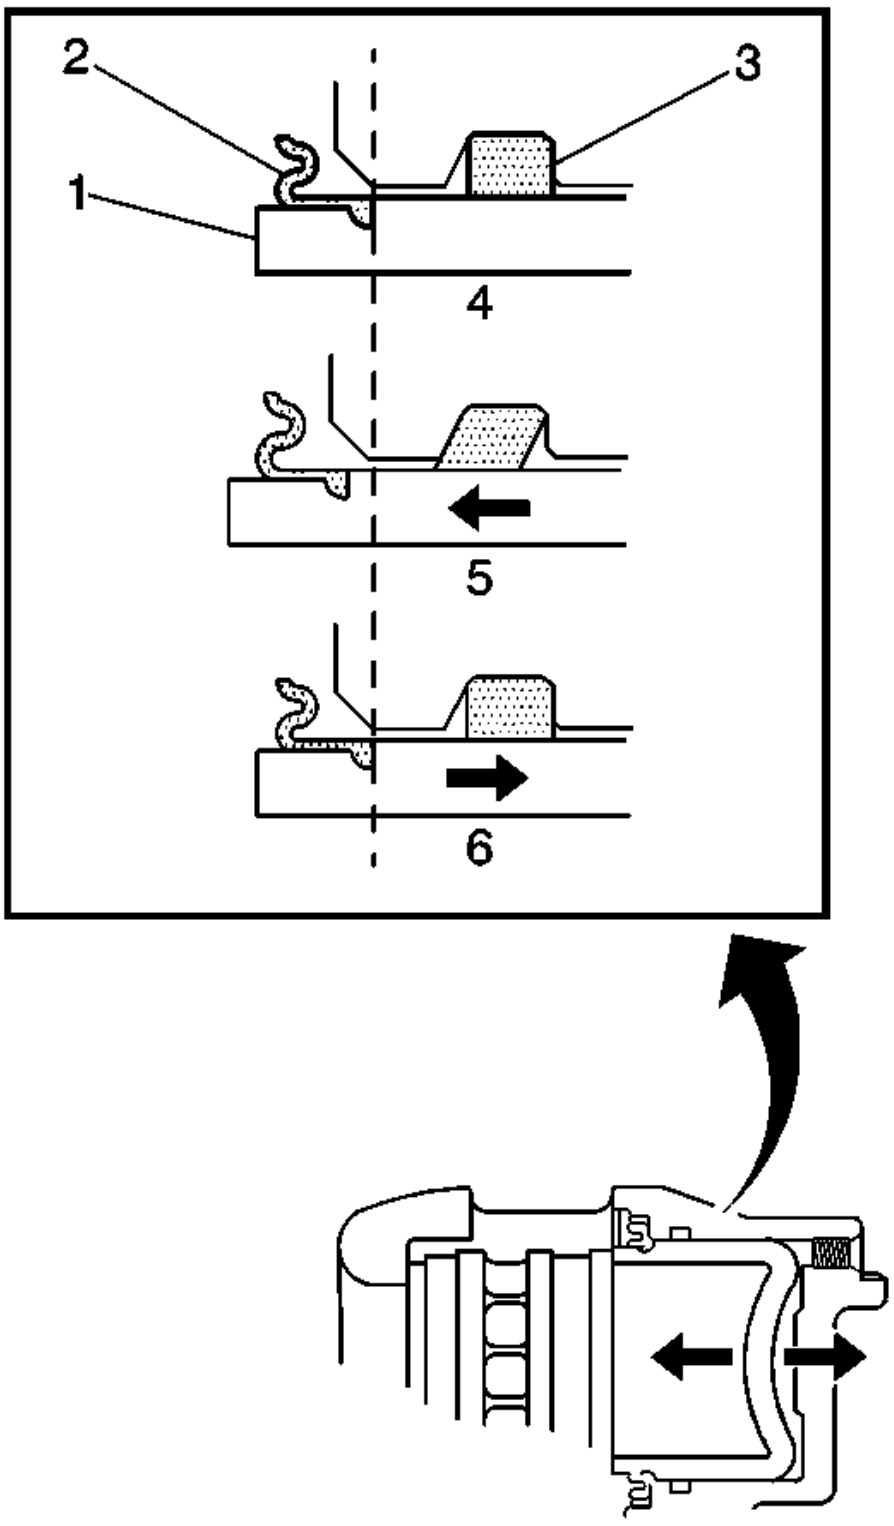

Fig. 4: Identifying Brake Caliper/Pad Inspection Areas
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. With the tire and wheel assemblies removed and the brake rotors retained by wheel lug nuts, visually inspect the caliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the caliper piston (1) in relation to the caliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
    1. Observe the caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
    2. Observe the caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the caliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the caliper may require overhaul or replacement.

BRAKE PIPE AND HOSE INSPECTION

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Visually inspect all of the brake pipes for the following conditions:
    - Kinks, improper routing, missing or damaged retainers
    - Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Ensure that the vehicle axles are properly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

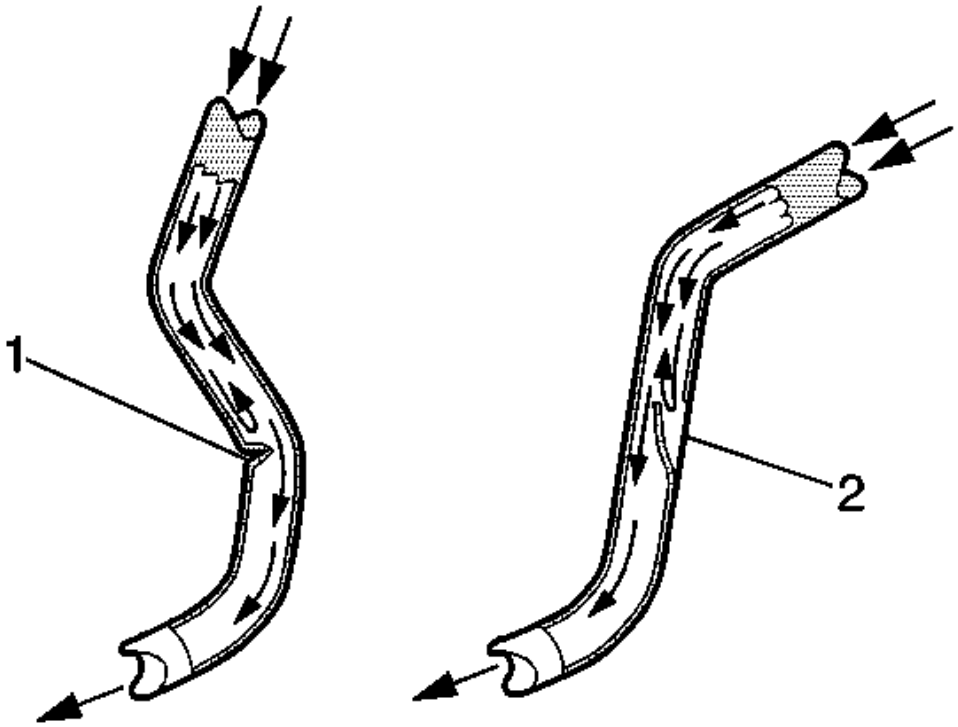

Fig. 5: Identifying Flexible Brake Hose Failure Conditions
Courtesy of GENERAL MOTORS COMPANY

4. Visually inspect all of the flexible brake hoses for the following conditions:
    - Kinks (1), improper routing, twists, chafing, missing or damaged retainers
    - Leaking connections, cracking, dry-rot, blisters, bulges
5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Squeeze the flexible brake hoses with firm finger pressure to check for soft spots (2), indicating an internal restriction. Check the entire length of each flexible brake hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

BRAKE PEDAL PUSHROD INSPECTION

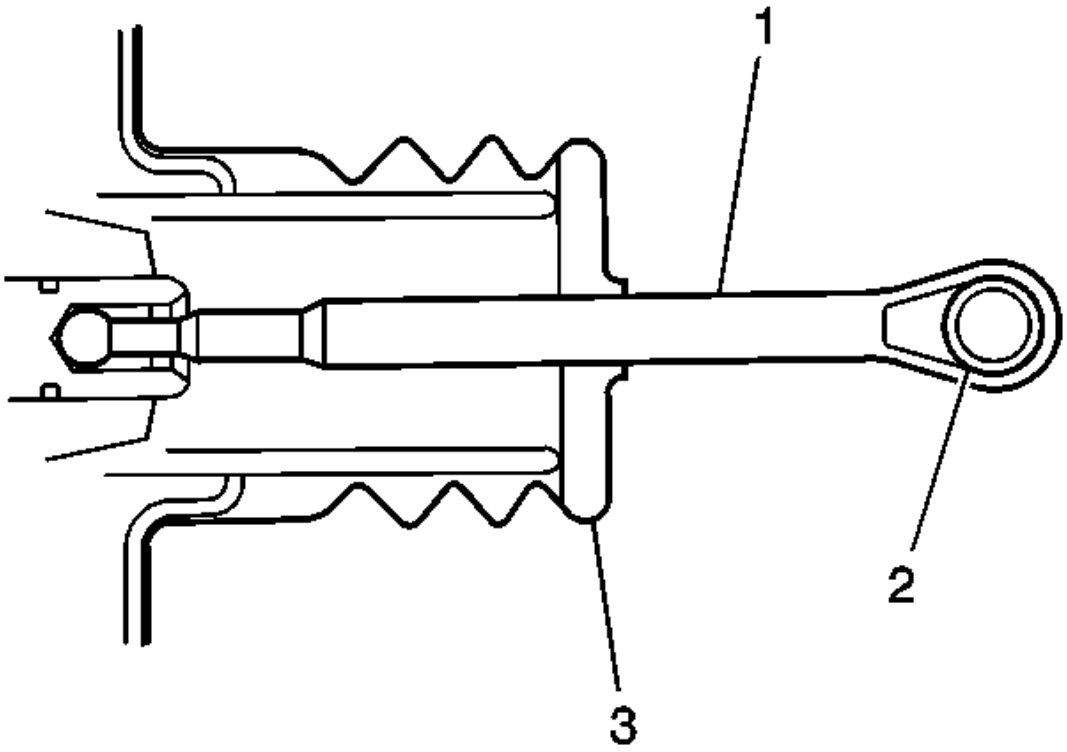

Fig. 6: View of Brake Pedal Pushrod
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the brake pedal pushrod (1) from the brake pedal.
2. Inspect the brake pedal pushrod eyelet bushing (2), if equipped, for cracks and/or excessive wear.
3. Reposition the pedal pushrod boot (3) toward the front of the vehicle to expose as much of the pedal pushrod (1) as possible.
4. Inspect the brake pedal pushrod (1) for straightness.
5. If the brake pedal pushrod eyelet bushing (2) exhibited cracks and/or excessive wear, then the bushing requires replacement.
6. If the brake pedal pushrod (1) is not straight, then the pushrod requires replacement.
7. Return the pedal pushrod boot (3) to its original position on the pedal pushrod (1).
8. Connect the brake pedal pushrod (1) to the brake pedal.

REPAIR INSTRUCTIONS

MASTER CYLINDER RESERVOIR FILLING

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Visually inspect the brake fluid level through the brake master cylinder reservoir.
2. If the brake fluid level is at or below the half-full point during routine fluid checks, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is at or below the half-full point during routine fluid checks, and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped-off up to the maximum-fill level.
4. If brake system service was just completed, the brake fluid may be topped-off up to the maximum-fill level.
5. If the brake fluid level is above the half-full point, adding brake fluid is not recommended under normal conditions.
6. If brake fluid is to be added to the master cylinder reservoir, clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm. Use only GM approved brake fluid from a clean, sealed brake fluid container.

MASTER CYLINDER RESERVOIR REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Remove and properly dispose of the fluid in the brake master cylinder reservoir.
2. Disconnect the brake fluid level indicator switch electrical connector.

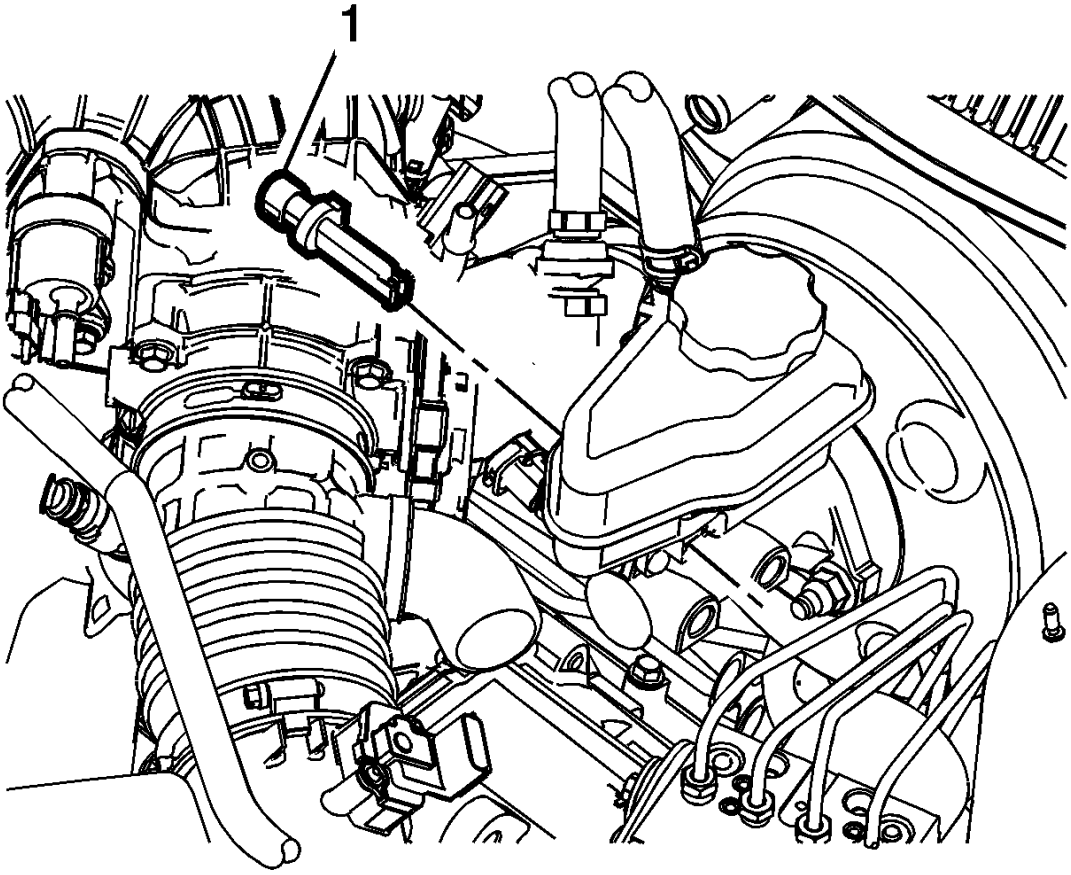

Fig. 7: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

3. Compress the locking tabs and remove the brake fluid level indicator switch (1).

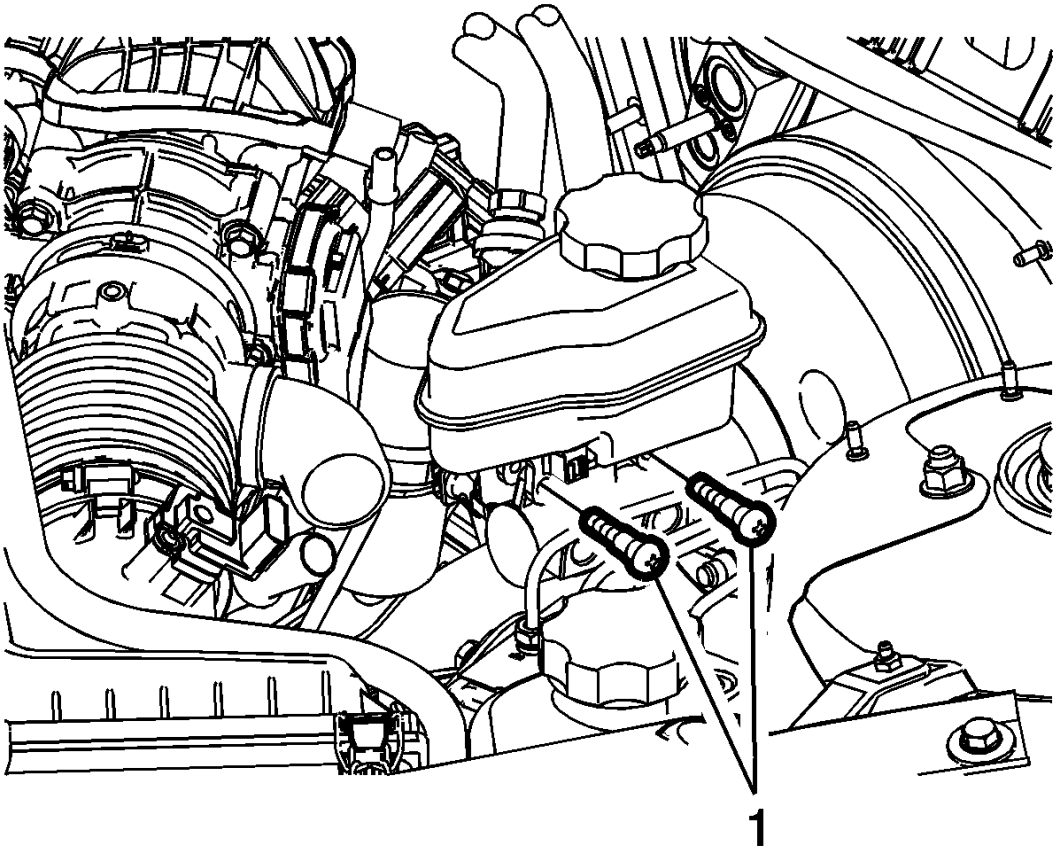

Fig. 8: Master Cylinder Reservoir Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the master cylinder reservoir bolts (1).

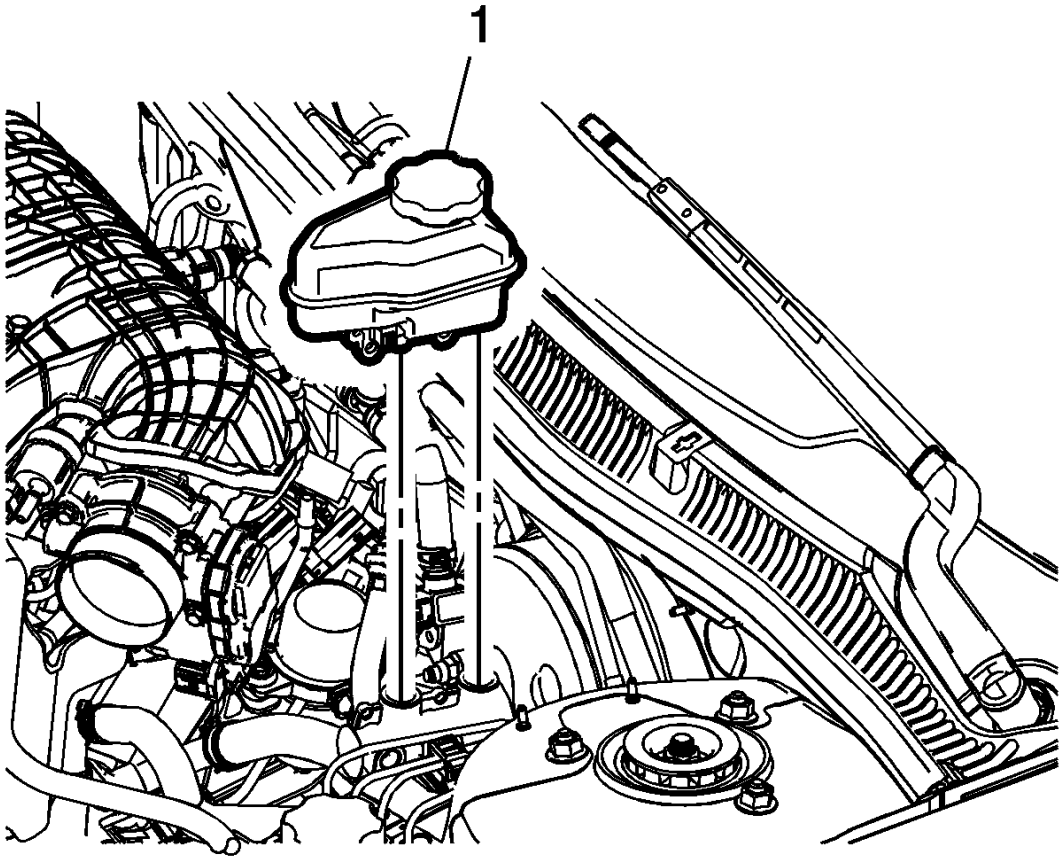

Fig. 9: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

5. Remove the master cylinder reservoir (1) by lifting the reservoir straight upward.

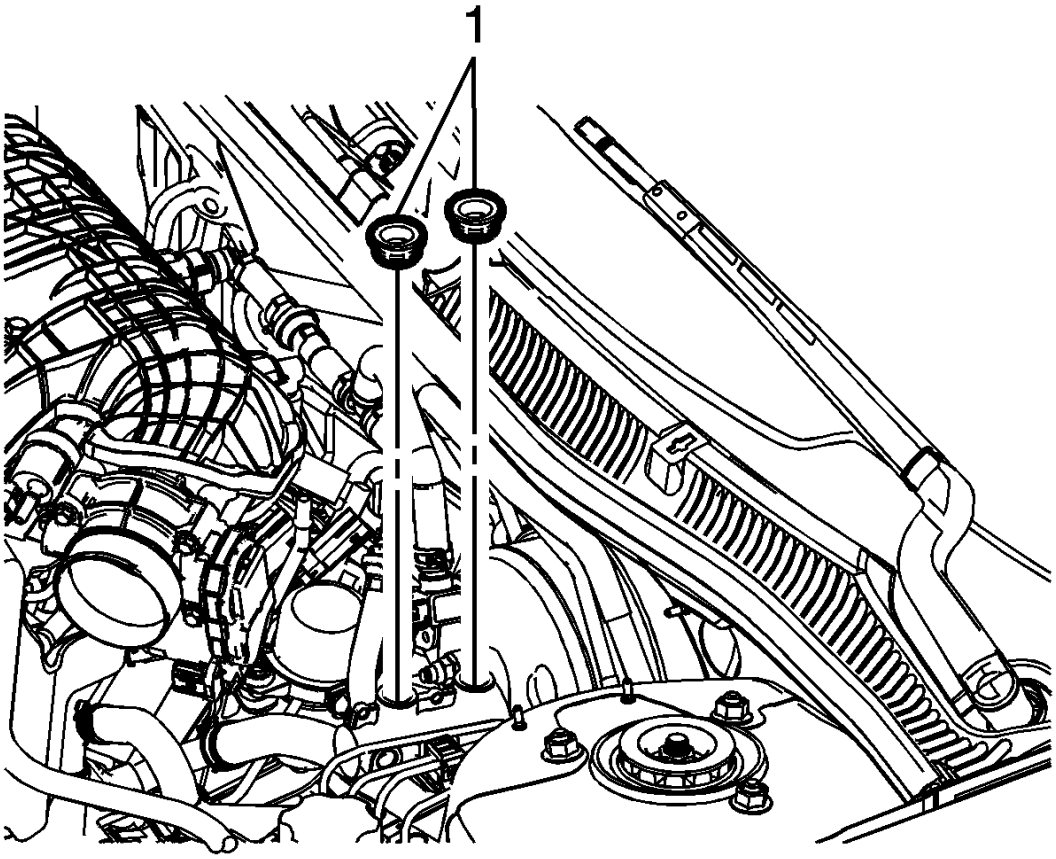

Fig. 10: Master Cylinder Reservoir Seals
Courtesy of GENERAL MOTORS COMPANY

6. Remove the master cylinder reservoir seals (1).

Installation Procedure

1. Lightly lubricate the master cylinder reservoir seals with GM approved brake fluid from a clean, sealed, brake fluid container.

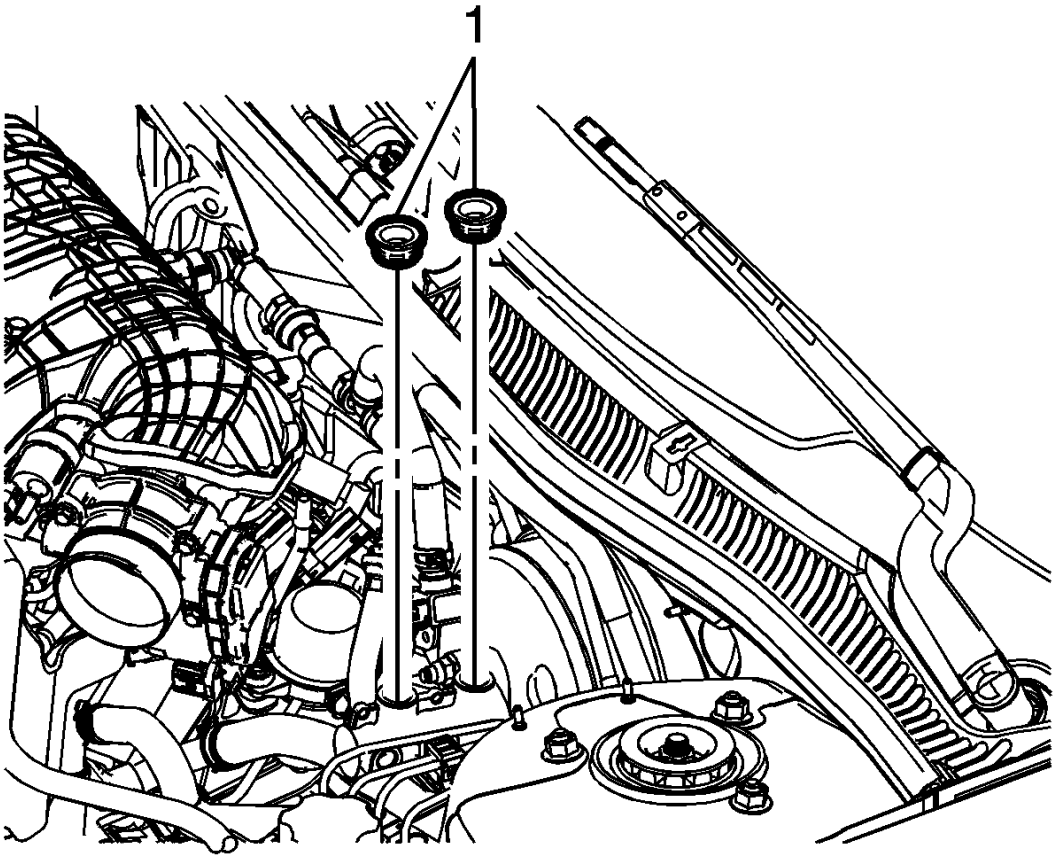

Fig. 11: Master Cylinder Reservoir Seals
Courtesy of GENERAL MOTORS COMPANY

2. Install the master cylinder reservoir seals (1).

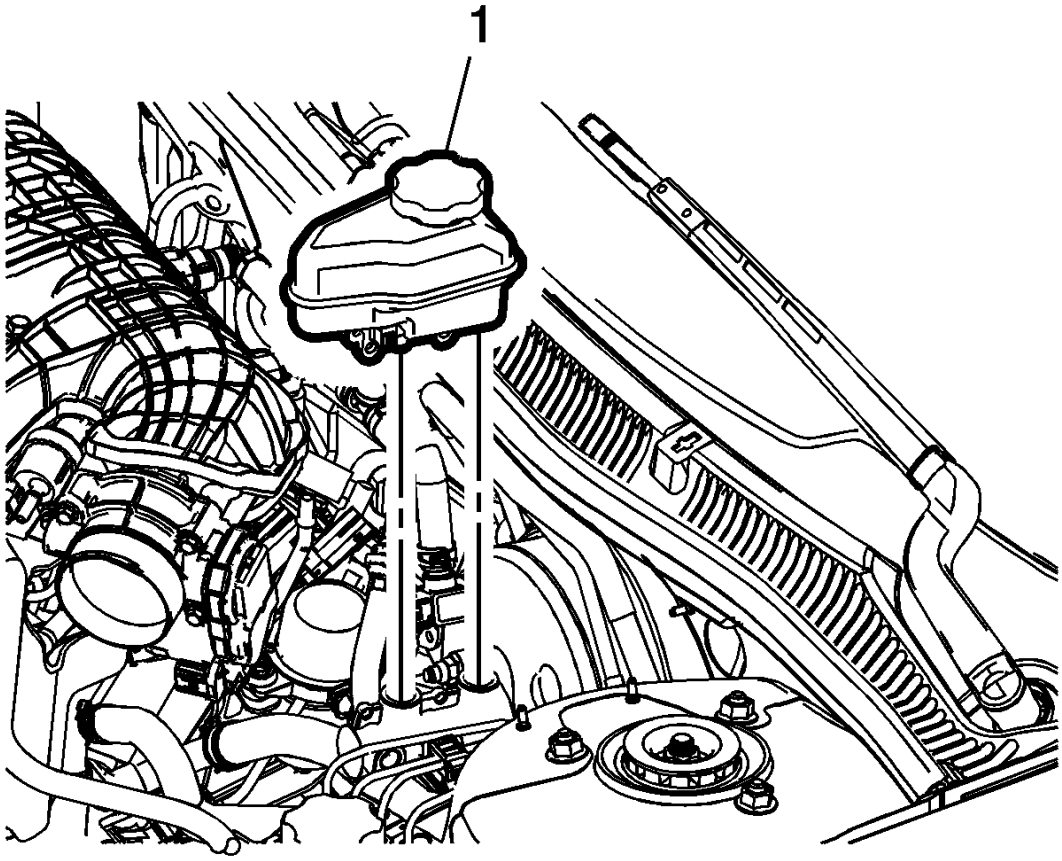

Fig. 12: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure the master cylinder reservoir is fully seated in the master cylinder reservoir seals.**

3. Install the master cylinder reservoir (1) by aligning the reservoir bayonets with the master cylinder ports and pressing the reservoir straight downward.

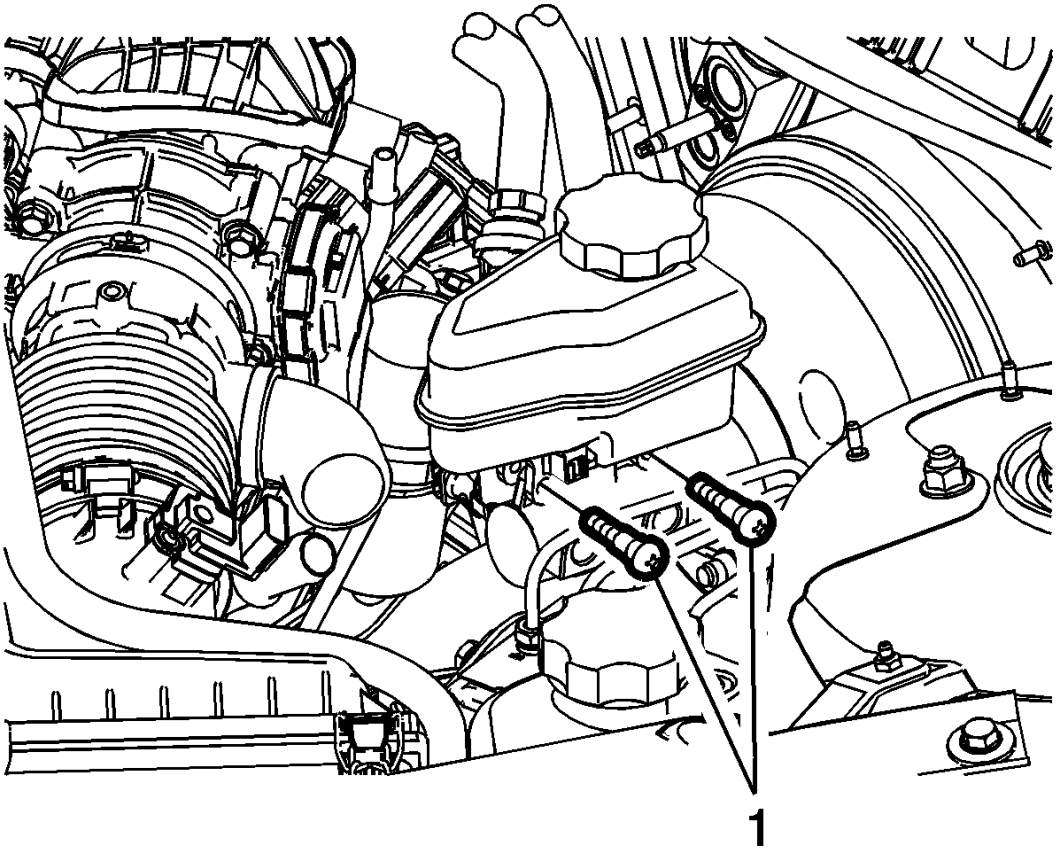

Fig. 13: Master Cylinder Reservoir Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the master cylinder reservoir bolts (1).

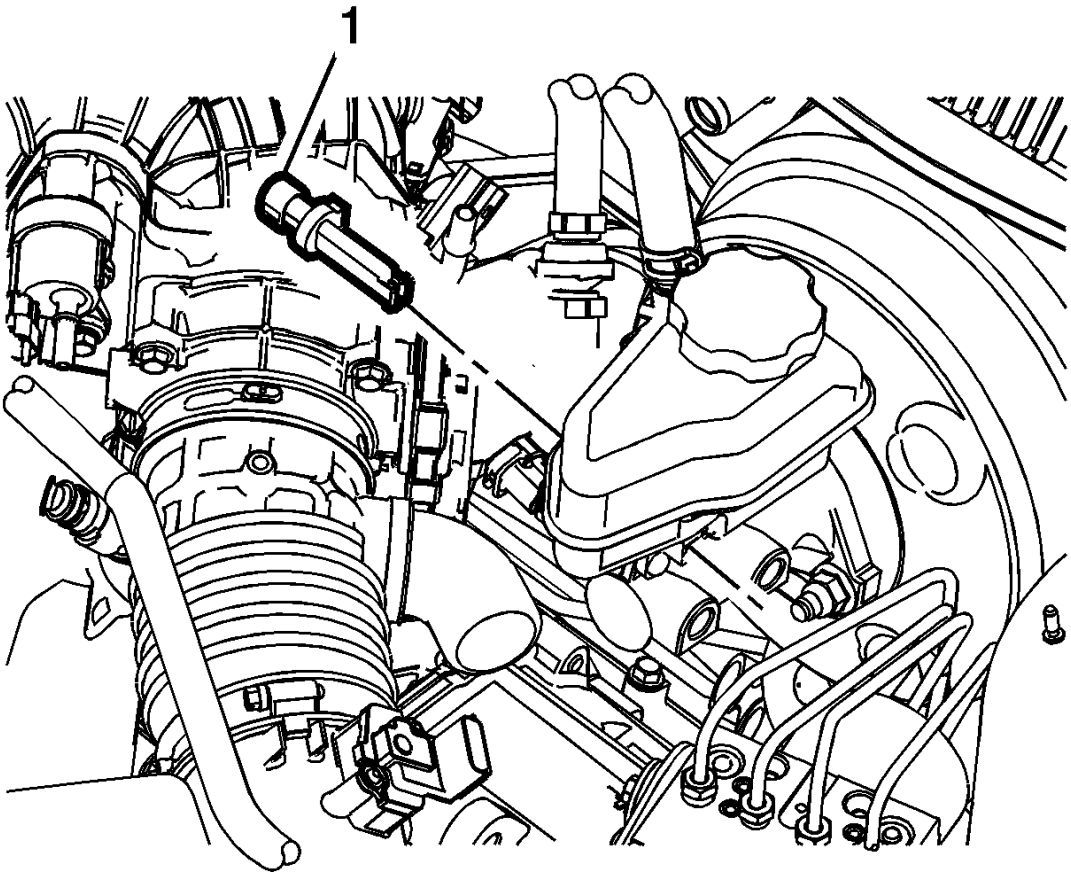

Fig. 14: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure the locking tabs are fully engaged in the master cylinder reservoir.**

5. Install the brake fluid level indicator switch (1).
6. Connect the brake fluid level indicator switch electrical connector.
7. Fill the master cylinder reservoir. Refer to **Master Cylinder Reservoir Filling**.

MASTER CYLINDER REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Remove and properly dispose of the brake fluid in the master cylinder reservoir.
2. Disconnect the brake fluid level indicator switch electrical connector.

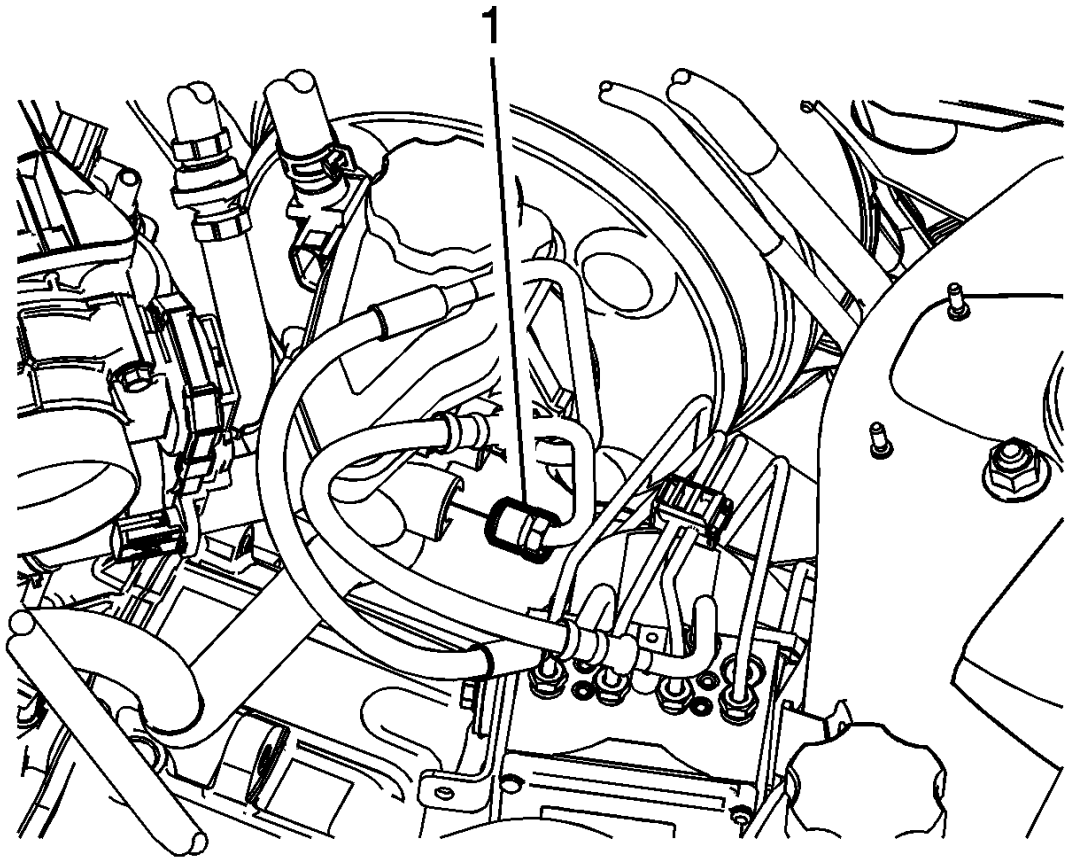

Fig. 15: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the master cylinder secondary brake pipe fitting (1).
4. Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

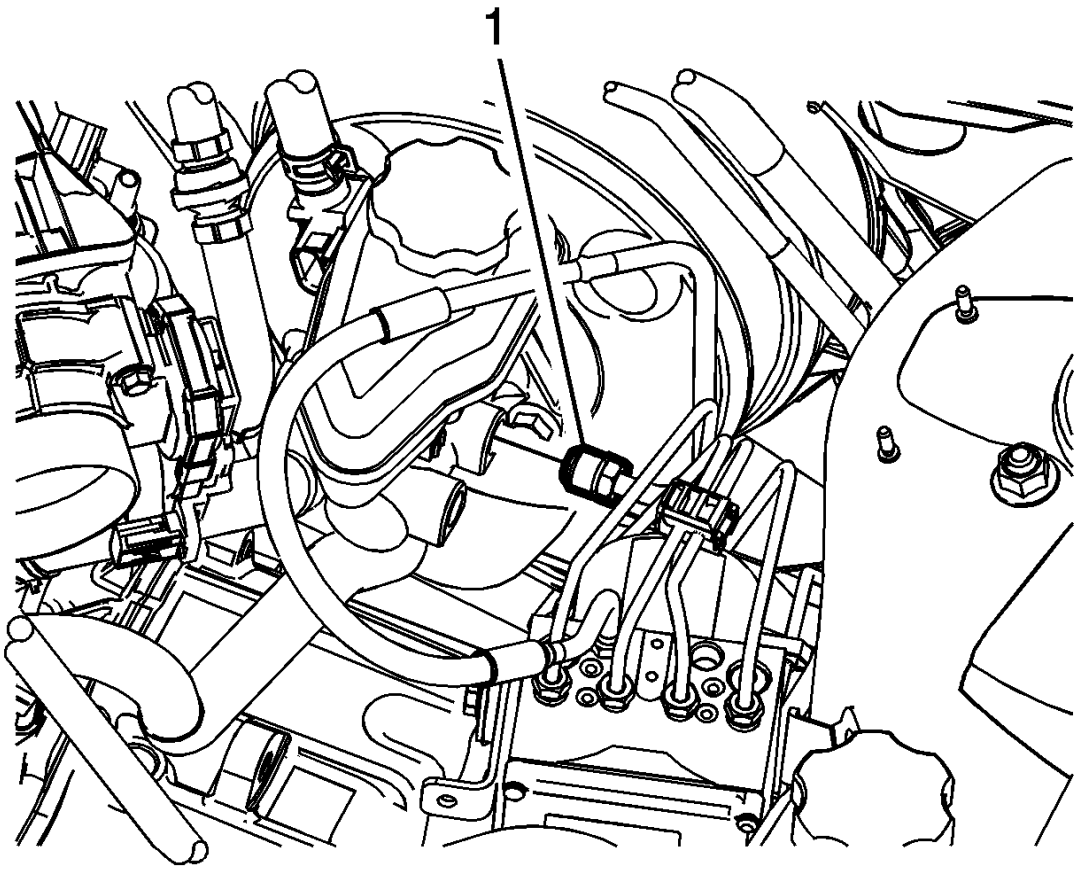

Fig. 16: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the master cylinder primary brake pipe fitting (1).
6. Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

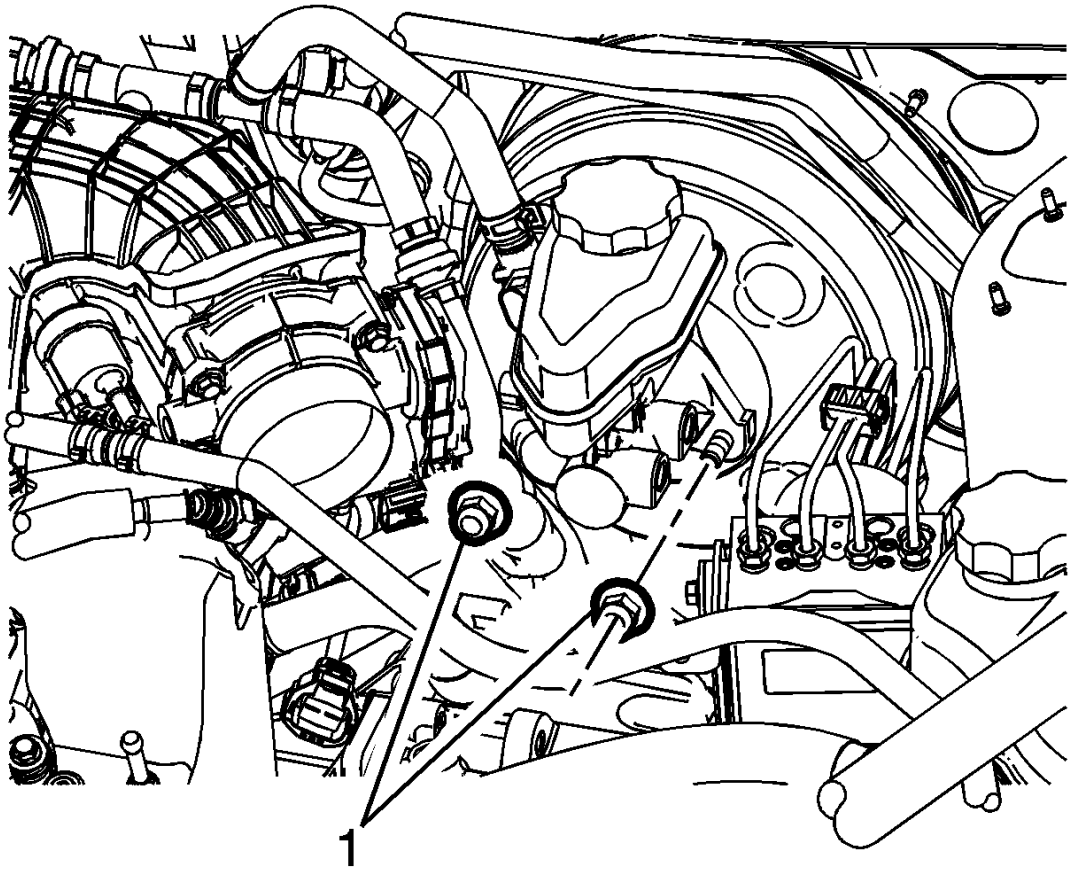

Fig. 17: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the master cylinder nuts (1).

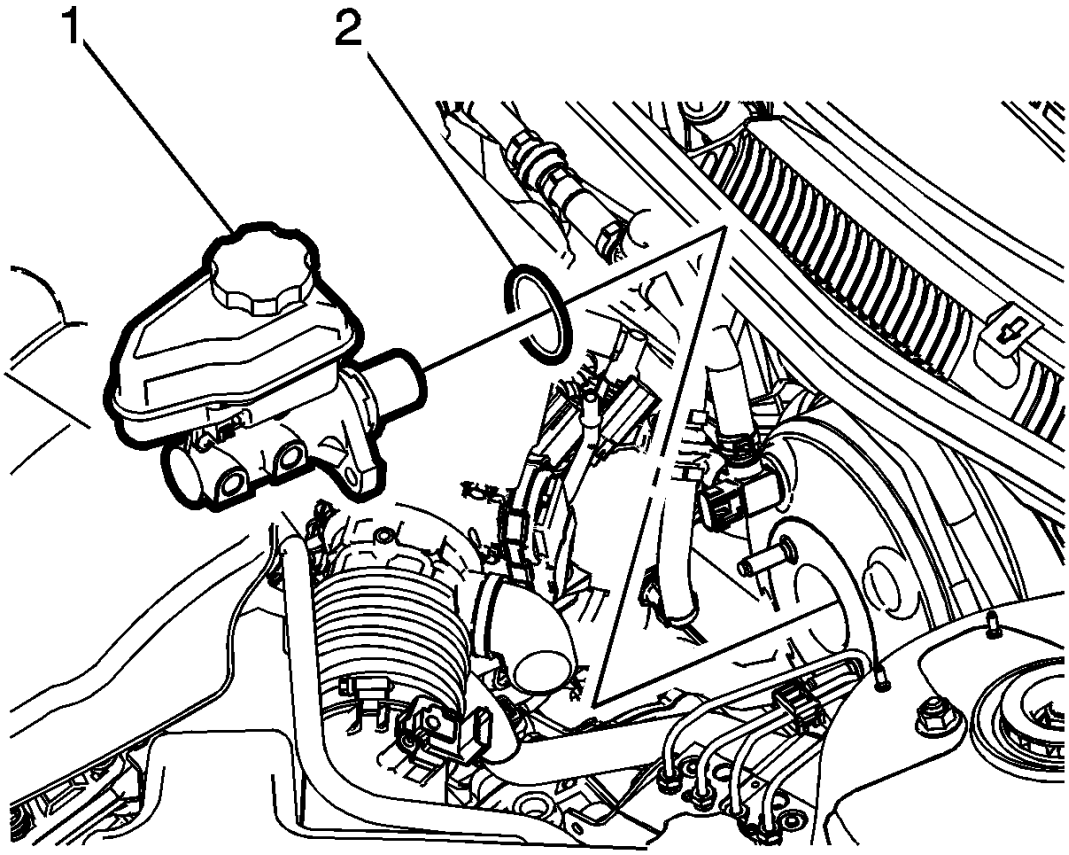

Fig. 18: Master Cylinder And Master Cylinder Seal
Courtesy of GENERAL MOTORS COMPANY

8. Remove the master cylinder (1) and the master cylinder seal (2).
9. Inspect the master cylinder seal for damage and replace, if necessary.

Installation Procedure

1. Bench bleed the master cylinder. Refer to **Master Cylinder Bench Bleeding**.

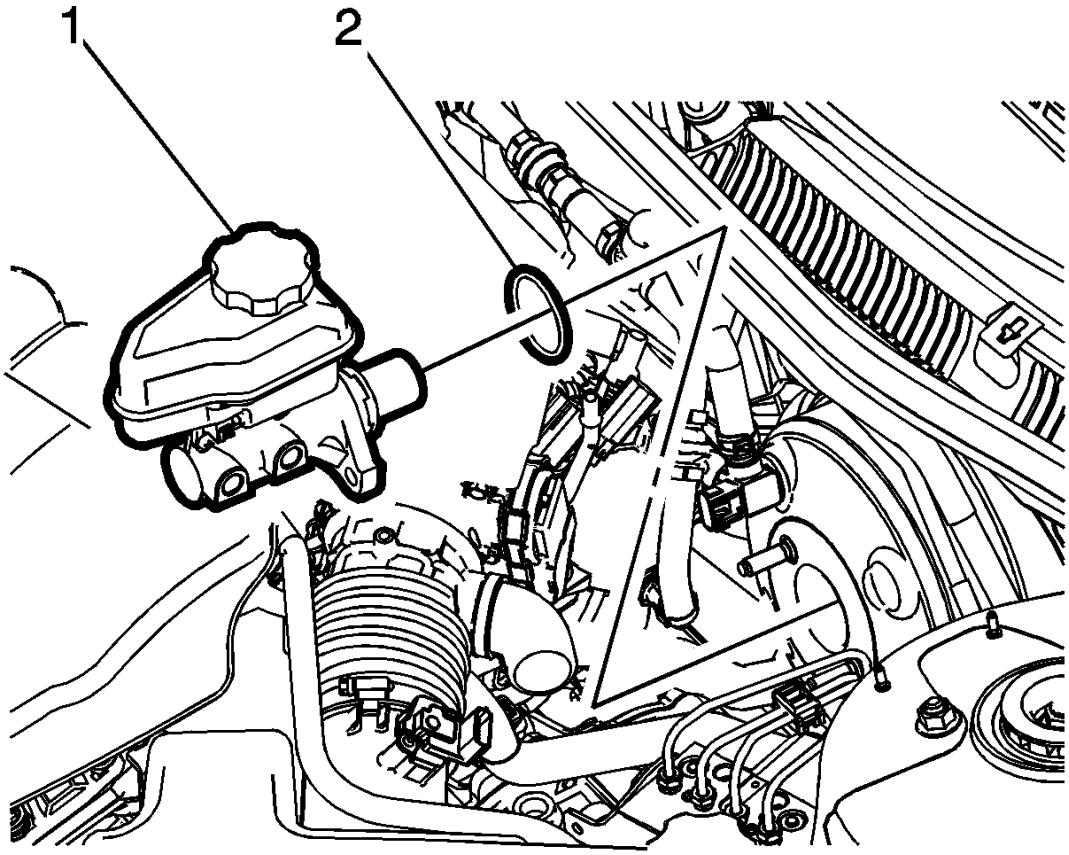

Fig. 19: Master Cylinder And Master Cylinder Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install the master cylinder (1) and the master cylinder seal (2).

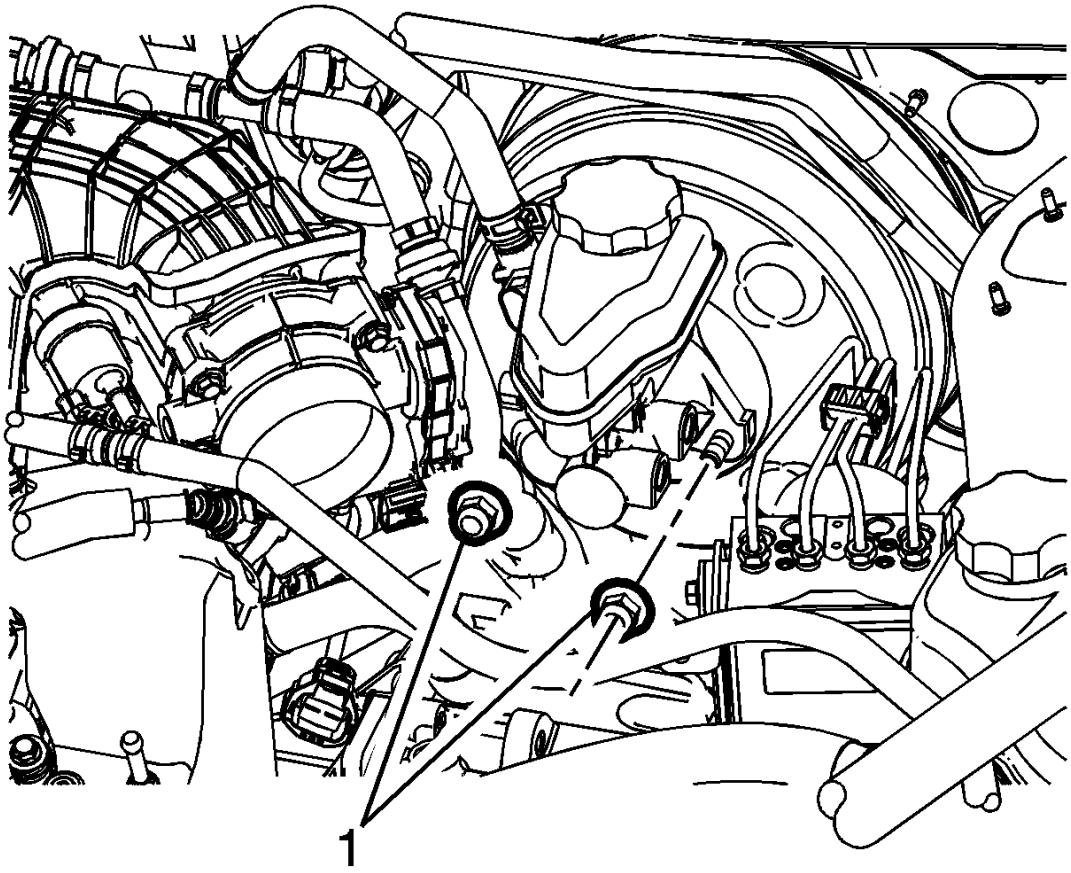

Fig. 20: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the master cylinder nuts (1) and tighten to 33 N.m (24 lb ft).

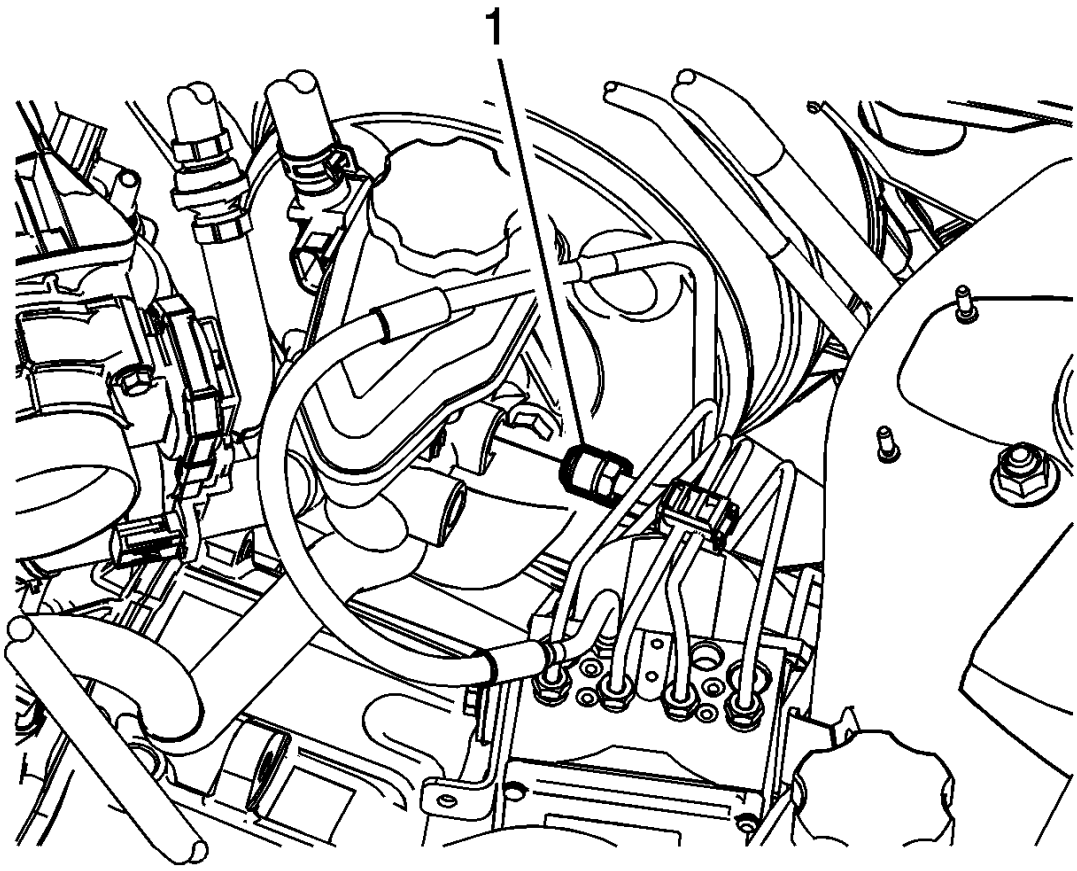

Fig. 21: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

4. Install the master cylinder primary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).

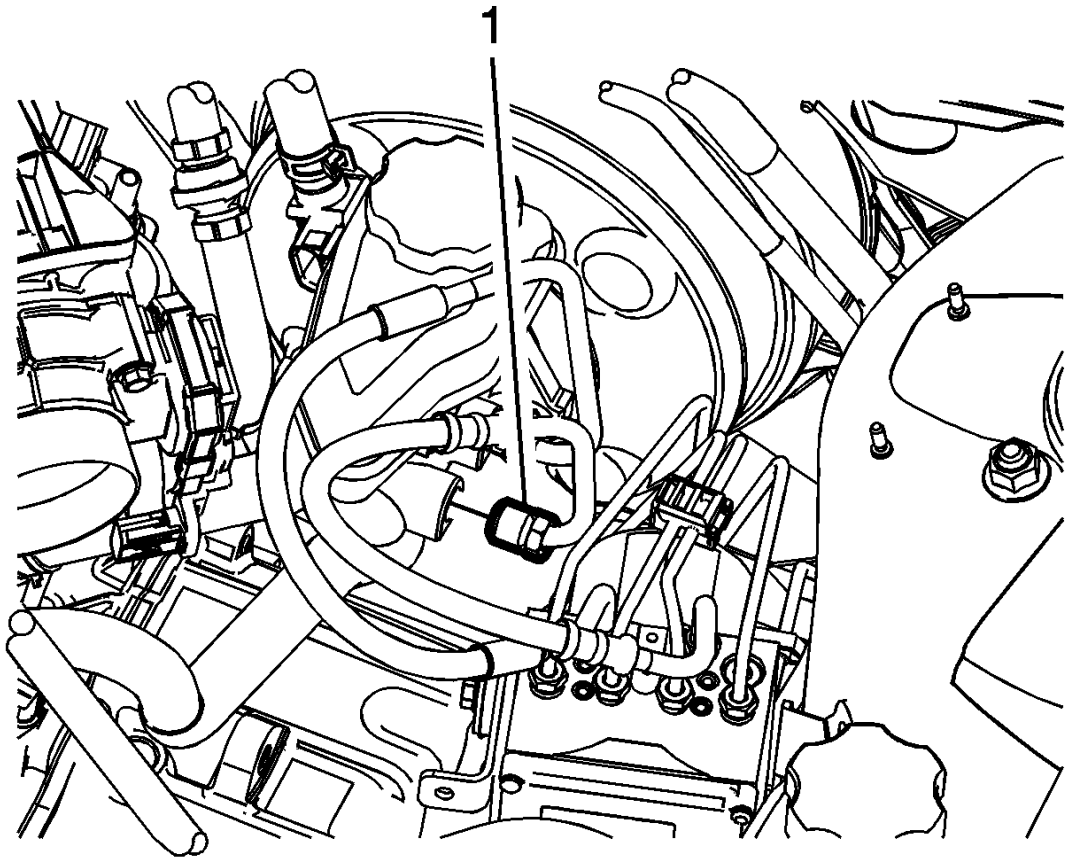

Fig. 22: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Install the master cylinder secondary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
6. Connect the brake fluid level indicator switch electrical connector.
7. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.

MASTER CYLINDER OVERHAUL

Disassembly Procedure

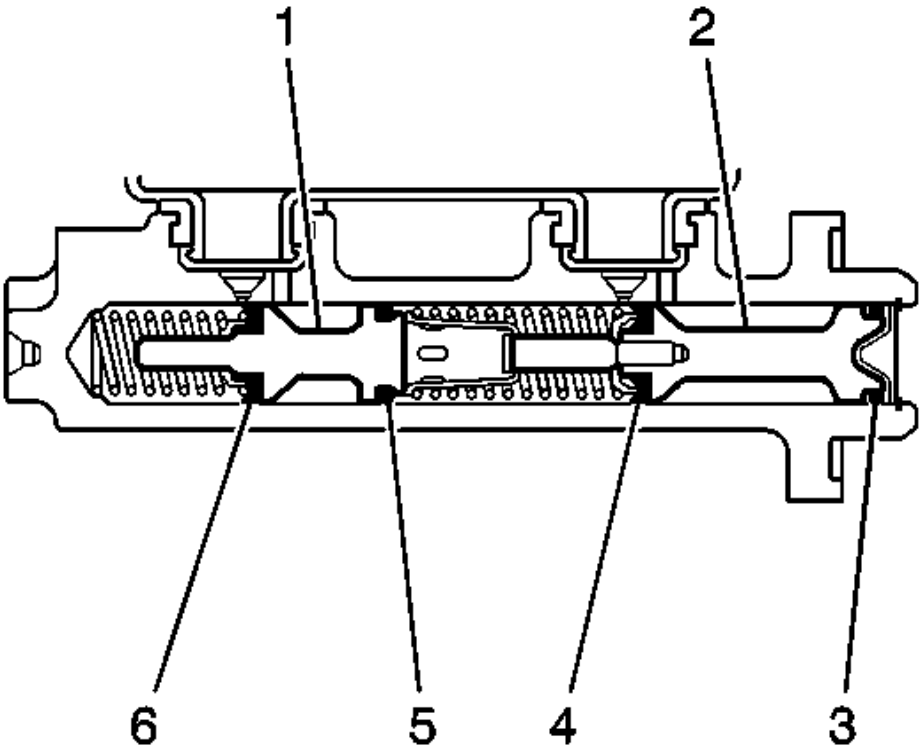

Fig. 23: Identifying Brake Master Cylinder (Cross Sectional View)
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Remove the brake master cylinder from the vehicle. Refer to **Master Cylinder Replacement**.
2. Secure the mounting flange of the brake master cylinder in a bench vise so that the rear of the primary piston is accessible.
3. Clean the outside of the master cylinder reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Remove the reservoir cap and diaphragm from the reservoir.
5. Inspect the reservoir cap and diaphragm for the following conditions. If any of these conditions are present, replace the affected components.
    - Cuts or cracks
    - Nicks or deformation
6. Remove the master cylinder reservoir from the master cylinder. Refer to **Master Cylinder Reservoir**

Replacement.

7. Using a smooth, round-ended tool, depress the primary piston (2) and remove the piston retainer.
8. Remove the primary piston assembly from the cylinder bore.
9. Plug the cylinder inlet ports and the rear outlet port. Apply low pressure, non-lubricated, filtered air into the front outlet port, in order the remove the secondary piston (1) with the primary (6) and secondary (5) seals, and the return spring.
10. Discard the primary piston assembly, the piston retainer, and the seals and seal retainer from the secondary piston.

Assembly Procedure

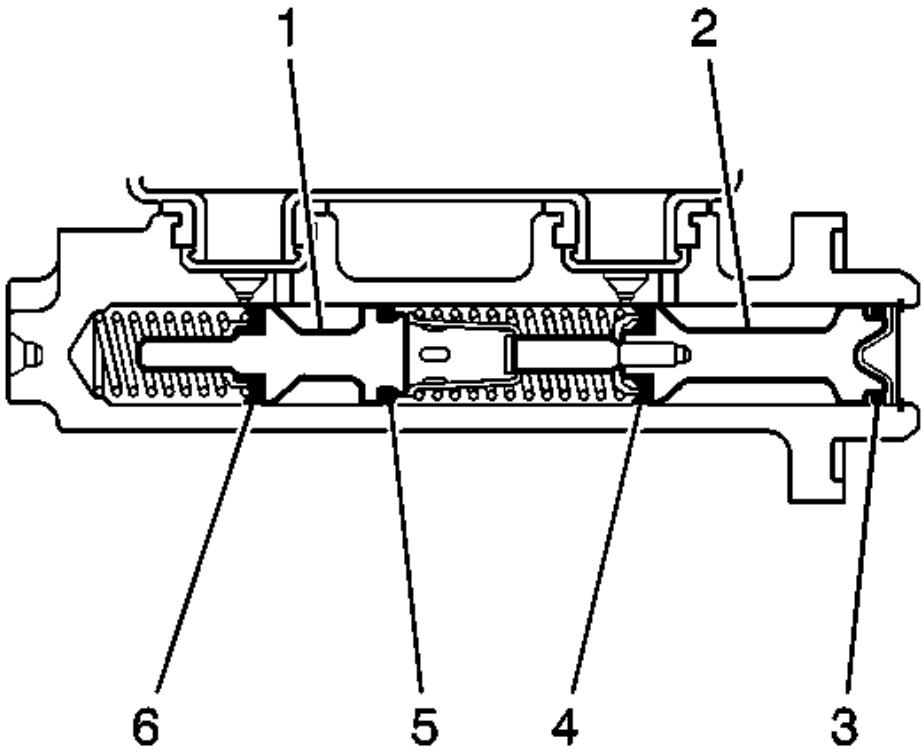

Fig. 24: Identifying Brake Master Cylinder (Cross Sectional View)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not use abrasives to clean the brake master cylinder bore.**

1. Clean the interior and exterior of the master cylinder, the secondary piston (1), and the return spring in denatured alcohol, or equivalent.
2. Inspect the master cylinder bore, inlet and outlet ports, the secondary piston (1), and the return spring for

cracks, scoring, pitting, and/or corrosion. Replace the master cylinder if any of these conditions exist.

3. Dry the master cylinder and the individual components with non-lubricated, filtered air.
4. Lubricate the master cylinder bore, the secondary piston (1), the return spring, and all of the individual overhaul components with Delco Supreme 11Â®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.
5. Assemble the lubricated, new primary seal (6) and retainer, and new secondary seal (5) onto the secondary piston.
6. Install the lubricated return spring and secondary piston assembly (1) into the cylinder bore.
7. Install the lubricated, new primary piston assembly (2) into the cylinder bore.
8. Using a smooth, round-ended tool, depress the primary piston (2) and install the new piston retainer.
9. Install the master cylinder reservoir to the master cylinder. Refer to **Master Cylinder Reservoir Replacement**.
10. Install the reservoir cap and diaphragm to the reservoir.
11. Install the master cylinder to the vehicle. Refer to **Master Cylinder Replacement**.

MASTER CYLINDER BENCH BLEEDING

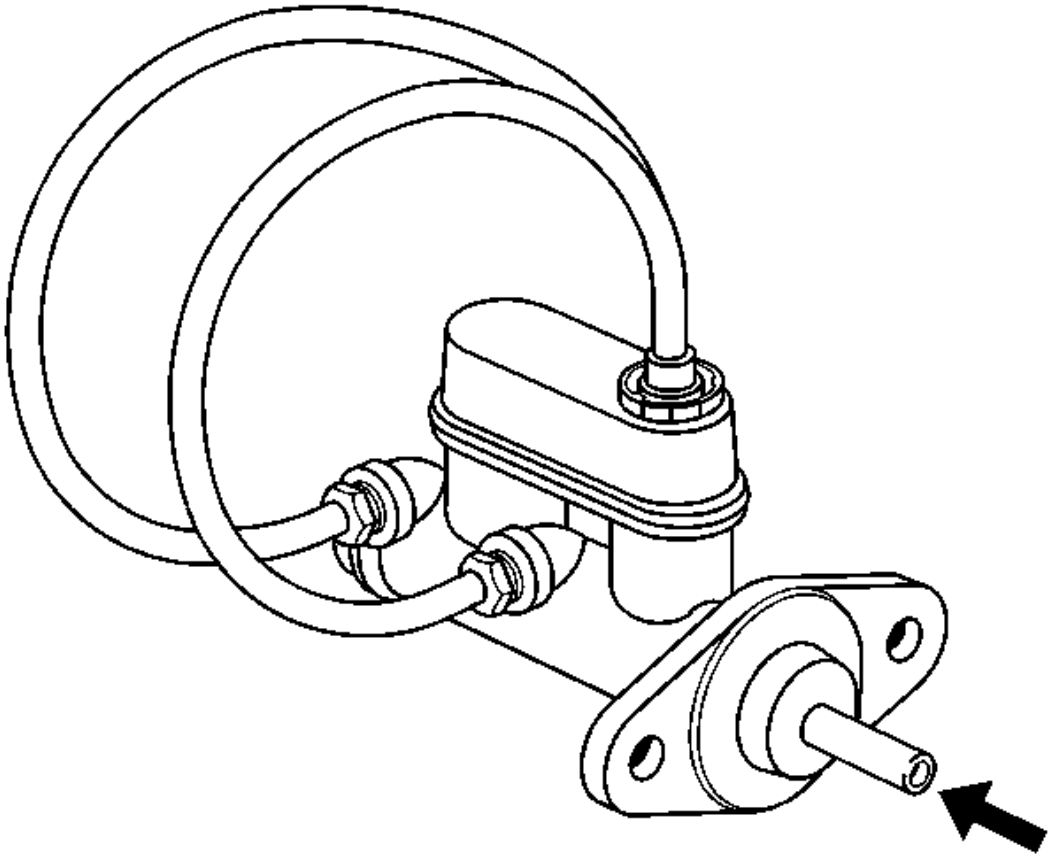

Fig. 25: Bleeding Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Secure the mounting flange of the brake master cylinder in a bench vise so that the rear of the primary piston is accessible.
2. Remove the master cylinder reservoir cap and diaphragm.
3. Install suitable fittings to the master cylinder ports that match the type of flare seat required and also provide for hose attachment.
4. Install transparent hoses to the fittings installed to the master cylinder ports, then route the hoses into the master cylinder reservoir.
5. Fill the master cylinder reservoir to at least the half-way point with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Master Cylinder Reservoir Filling**.
6. Ensure that the ends of the transparent hoses running into the master cylinder reservoir are fully submerged in the brake fluid.
7. Using a smooth, round-ended tool, depress and release the primary piston as far as it will travel, a depth of about 25 mm (1 in), several times. Observe the flow of fluid coming from the ports.

   As air is bled from the primary and secondary pistons, the effort required to depress the primary piston will increase and the amount of travel will decrease.

8. Continue to depress and release the primary piston until fluid flows freely from the ports with no evidence of air bubbles.
9. Remove the transparent hoses from the master cylinder reservoir.
10. Install the master cylinder reservoir cap and diaphragm.
11. Remove the fittings with the transparent hoses from the master cylinder ports. Wrap the master cylinder with a clean shop cloth to prevent brake fluid spills.
12. Remove the master cylinder from the vise.

BRAKE FLUID LEVEL INDICATOR SWITCH REPLACEMENT

Removal Procedure

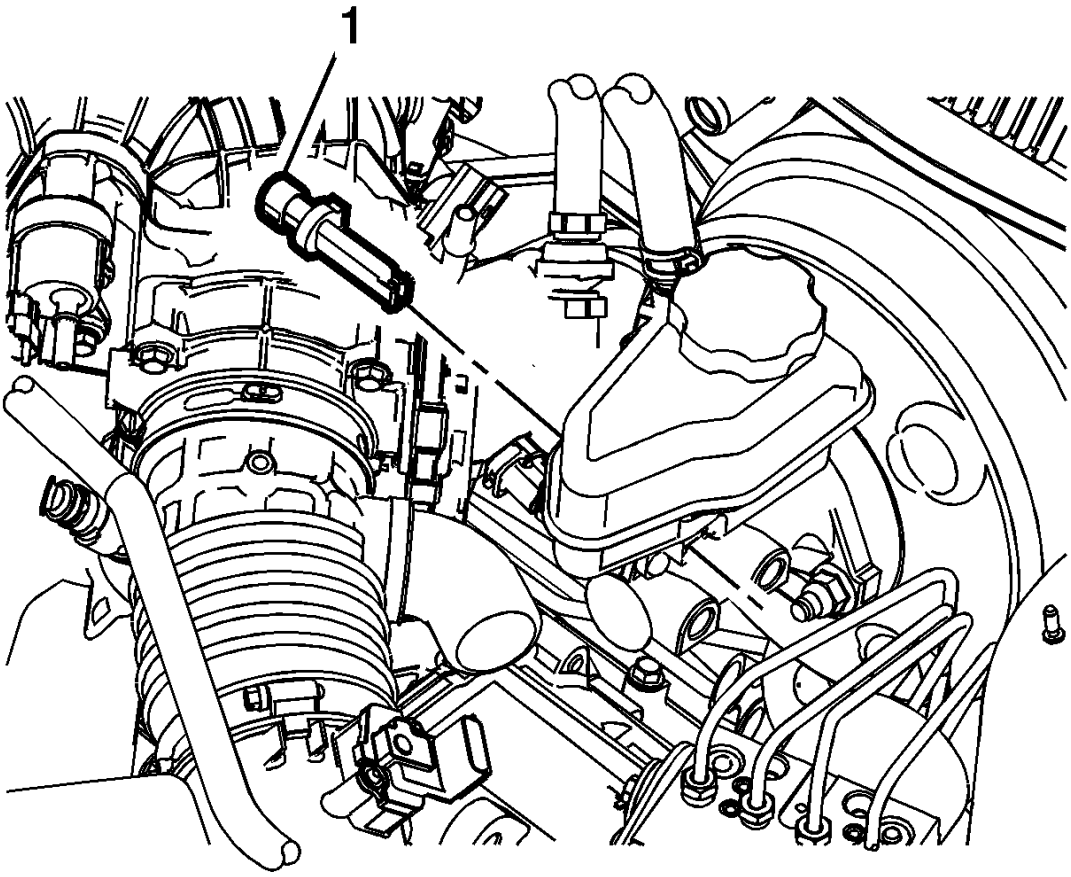

Fig. 26: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the brake fluid level indicator switch electrical connector.
2. Compress the locking tabs and remove the brake fluid level indicator switch (1).

Installation Procedure

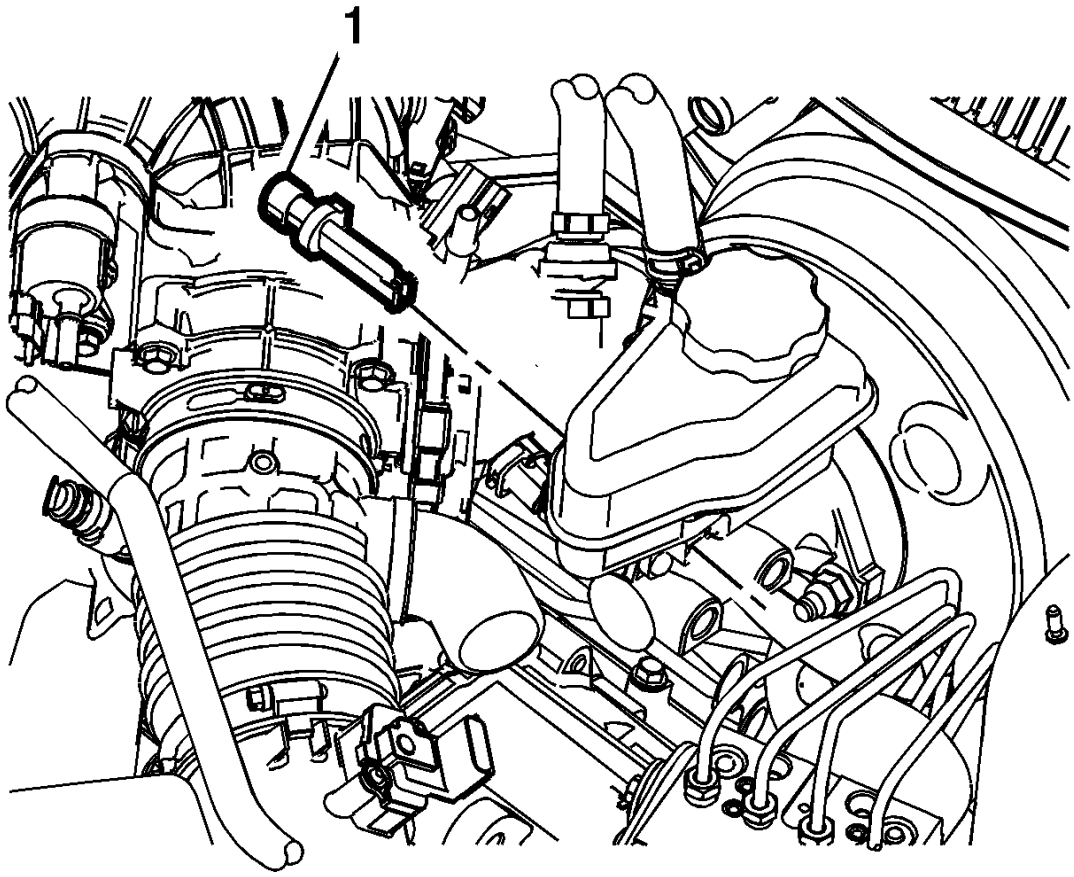

Fig. 27: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure the locking tabs are fully engaged in the master cylinder reservoir.**

1. Compress the locking tabs and install the brake fluid level indicator switch (1).
2. Connect the brake fluid level indicator switch electrical connector.

BRAKE PEDAL ASSEMBLY REPLACEMENT

Removal Procedure

1. Remove the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .
2. Push the body control module (BCM) up and move the bottom of the BCM away from and out of the mounting bracket slot. Position the BCM aside.
3. Disconnect the brake pedal position sensor electrical connector.
4. Release the wiring harness clips from the bracket.

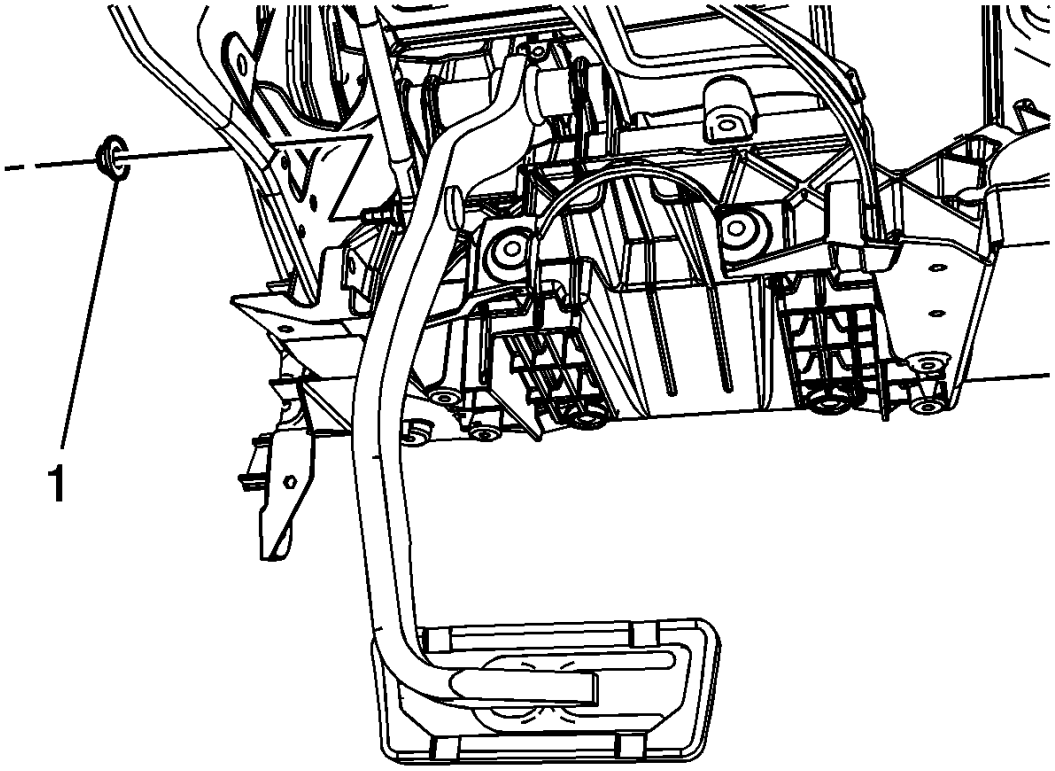

Fig. 28: Identifying Brake Pedal Pushrod Nut
Courtesy of GENERAL MOTORS COMPANY

5. Remove the brake pedal pushrod nut (1).

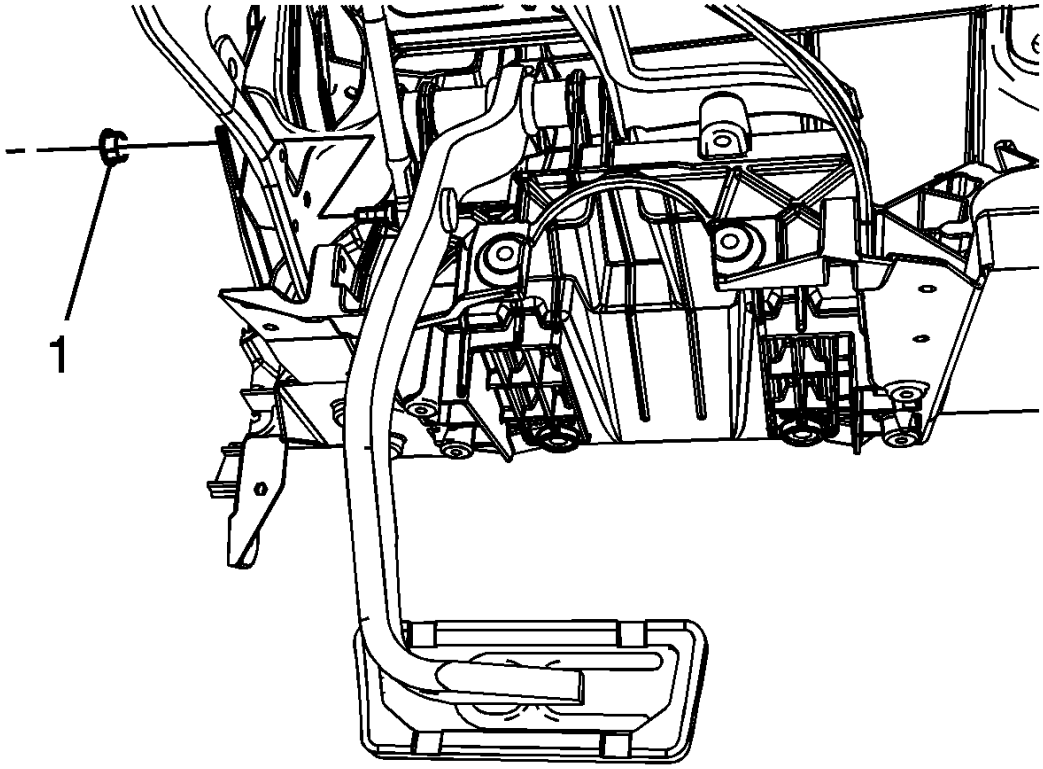

Fig. 29: Identifying Brake Pedal Pushrod Bushing
Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake pedal pushrod bushing (1).

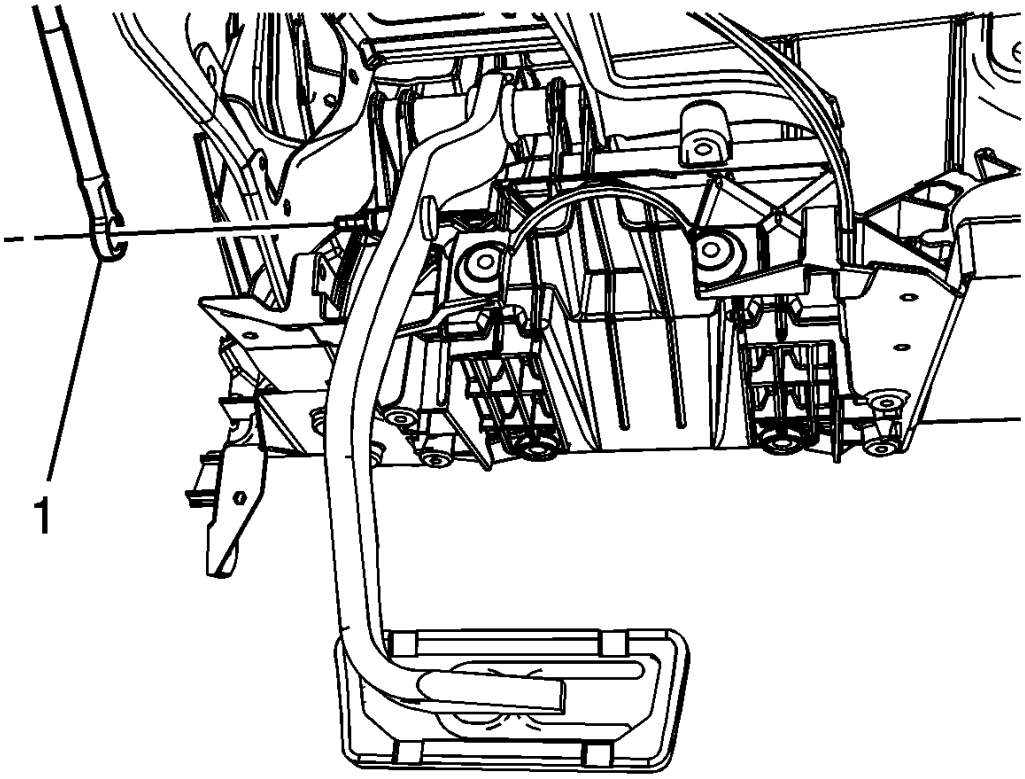

Fig. 30: View Of Brake Pedal Pushrod Nut
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the brake pedal pushrod (1) from the brake pedal.

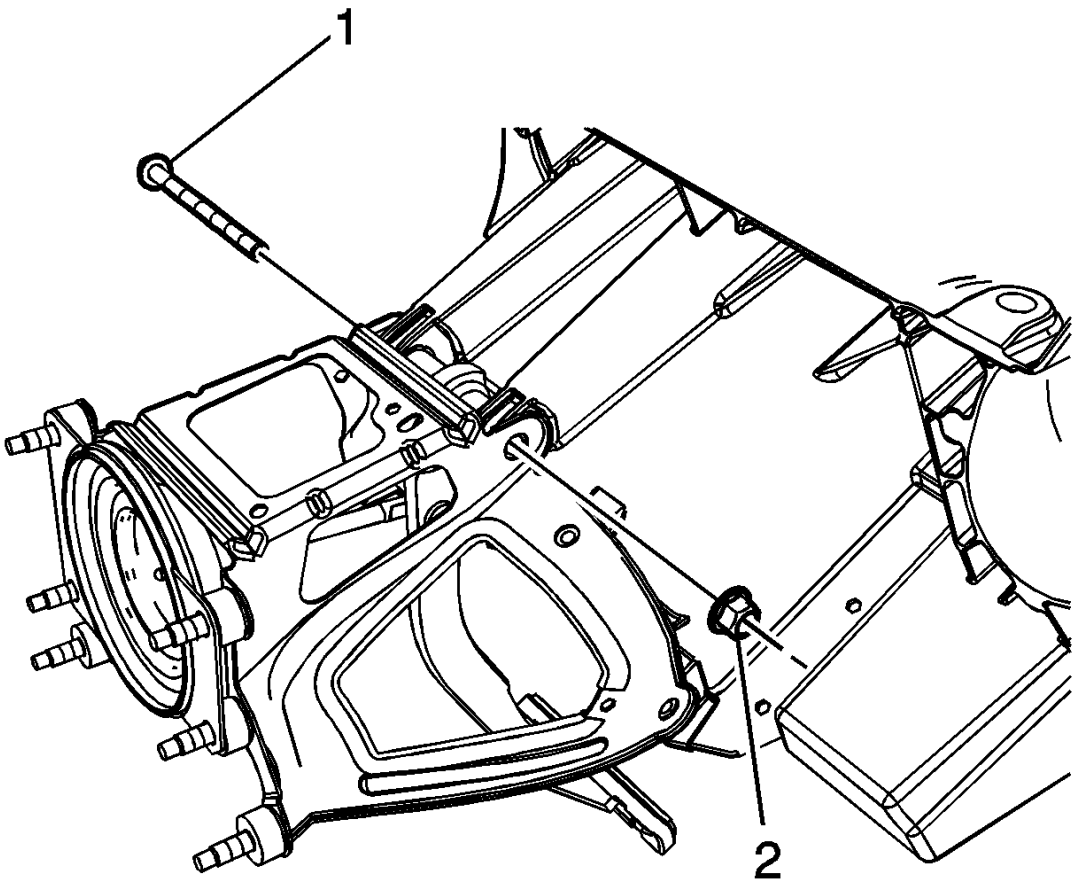

Fig. 31: View Of Brake Pedal Assembly, Bolt & Nut
Courtesy of GENERAL MOTORS COMPANY

8. Remove the brake pedal bolt (1) and nut (2).

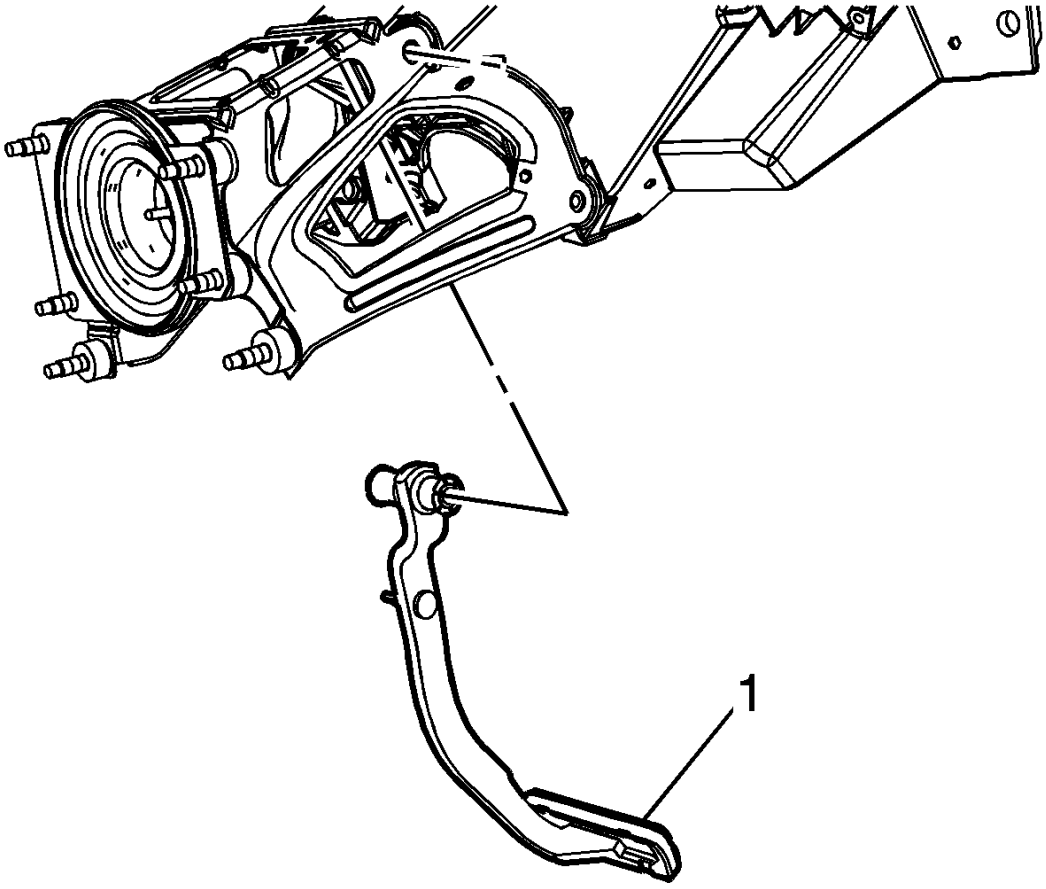

Fig. 32: View Of Brake Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Remove the brake pedal (1).

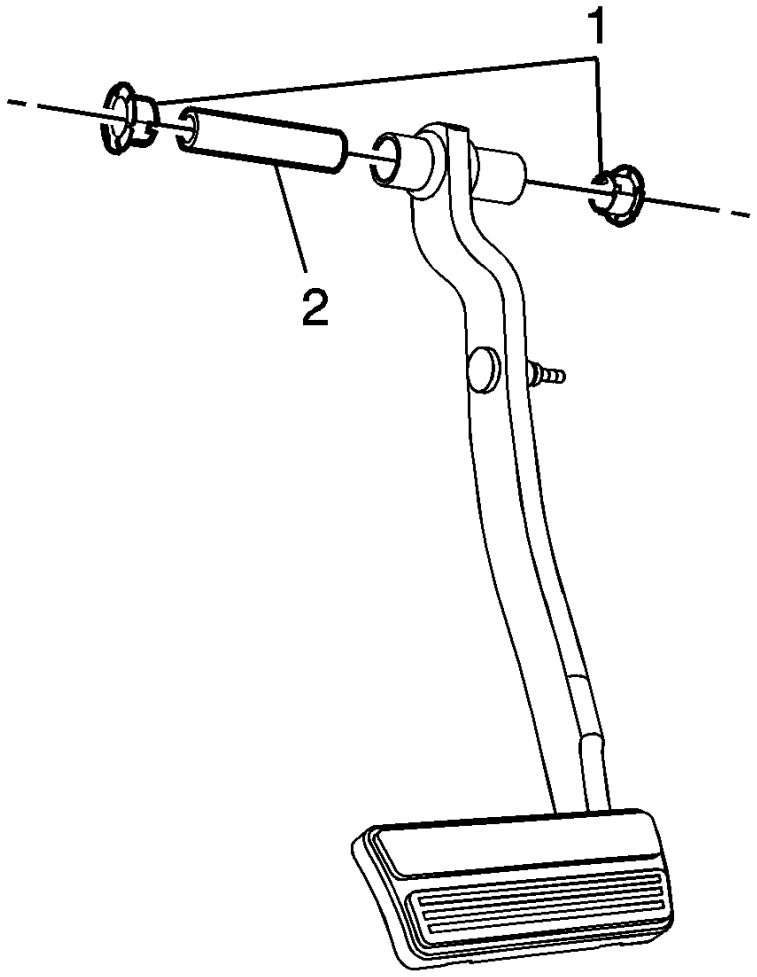

Fig. 33: View Of Brake Pedal Pivot Bushing & Spacer
Courtesy of GENERAL MOTORS COMPANY

10. Remove the brake pedal pivot bushings (1) and spacer (2).

Installation Procedure

1. Apply a light coating of silicone lubricant to the brake pedal pivot spacer.

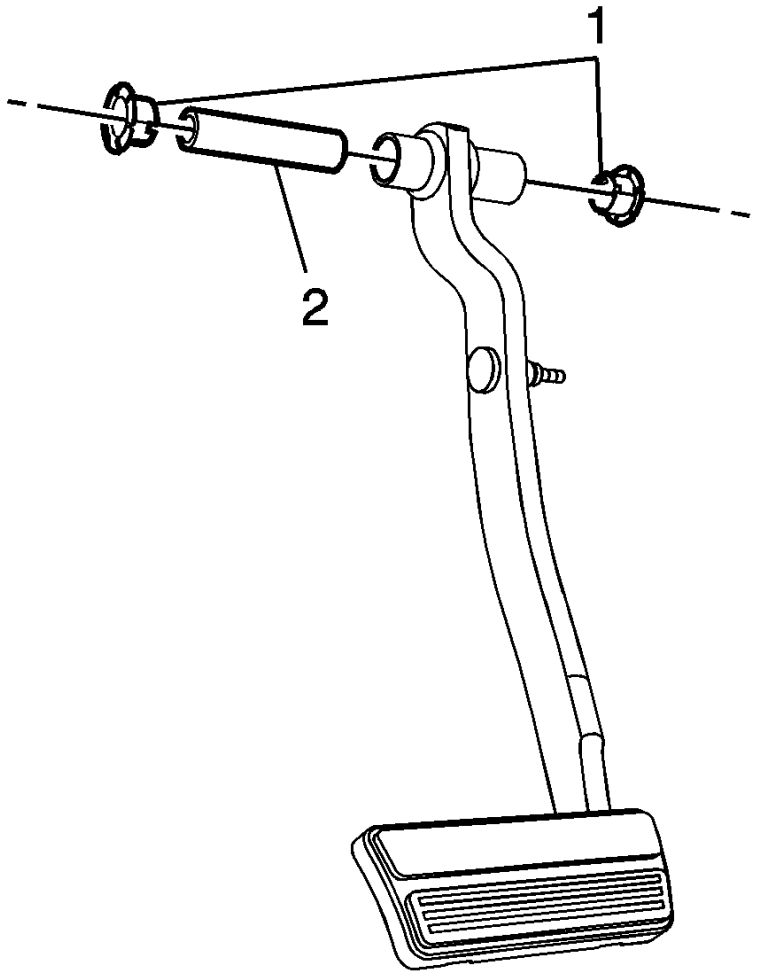

Fig. 34: View Of Brake Pedal Pivot Bushing & Spacer
Courtesy of GENERAL MOTORS COMPANY

2. Install the brake pedal pivot bushings (1) and spacer (2).

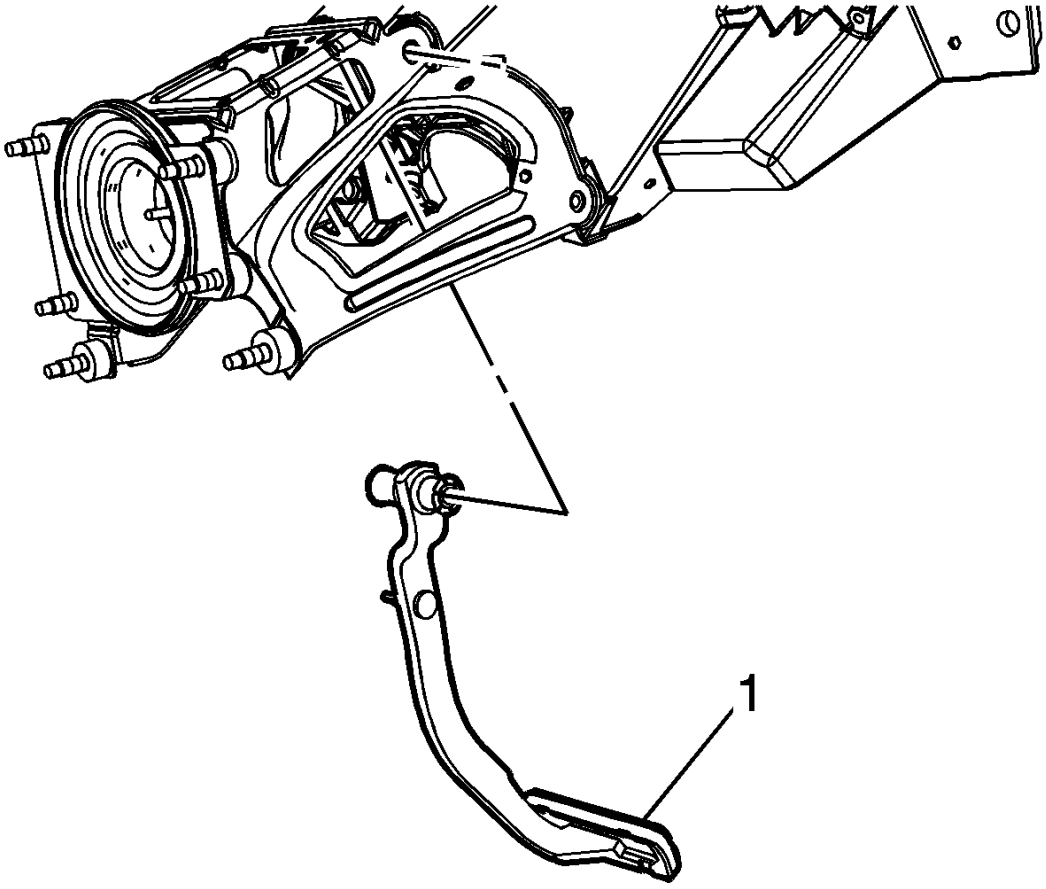

Fig. 35: View Of Brake Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install the brake pedal (1).

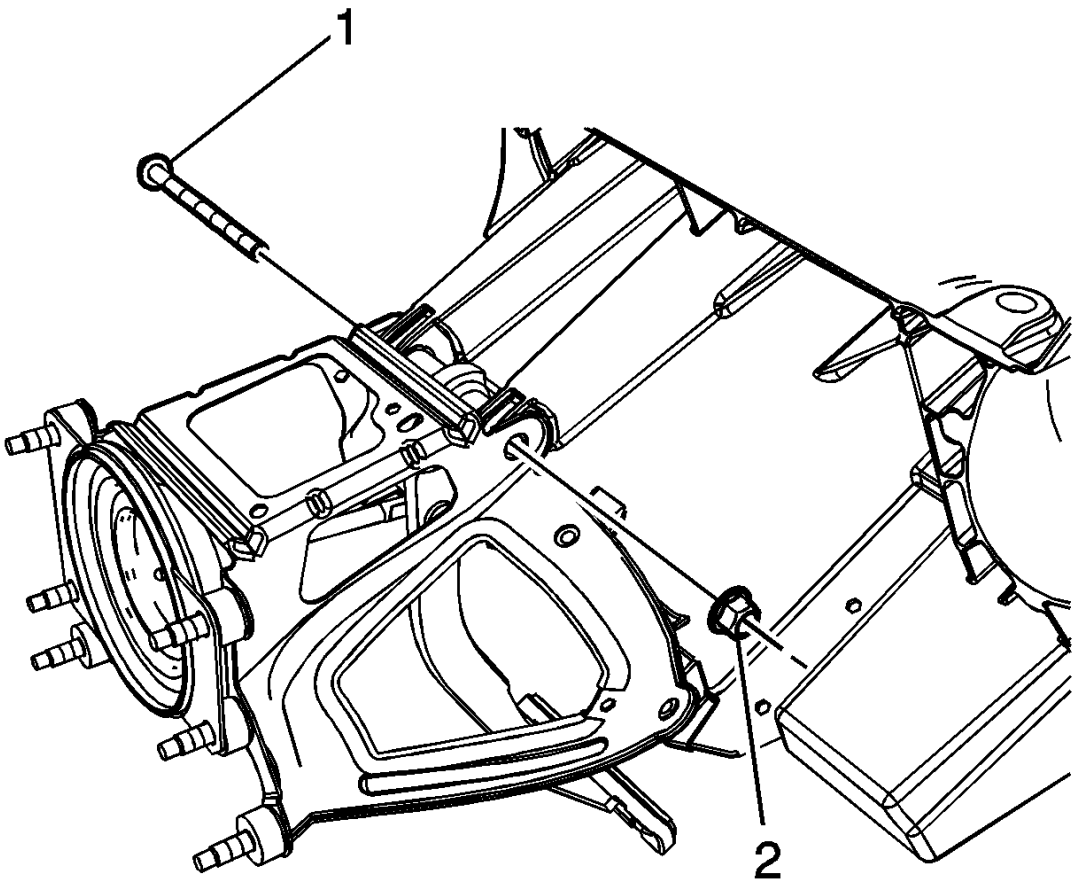

Fig. 36: View Of Brake Pedal Assembly, Bolt & Nut
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the brake pedal bolt (1) and nut (2) and tighten to 40 N.m (30 lb ft).

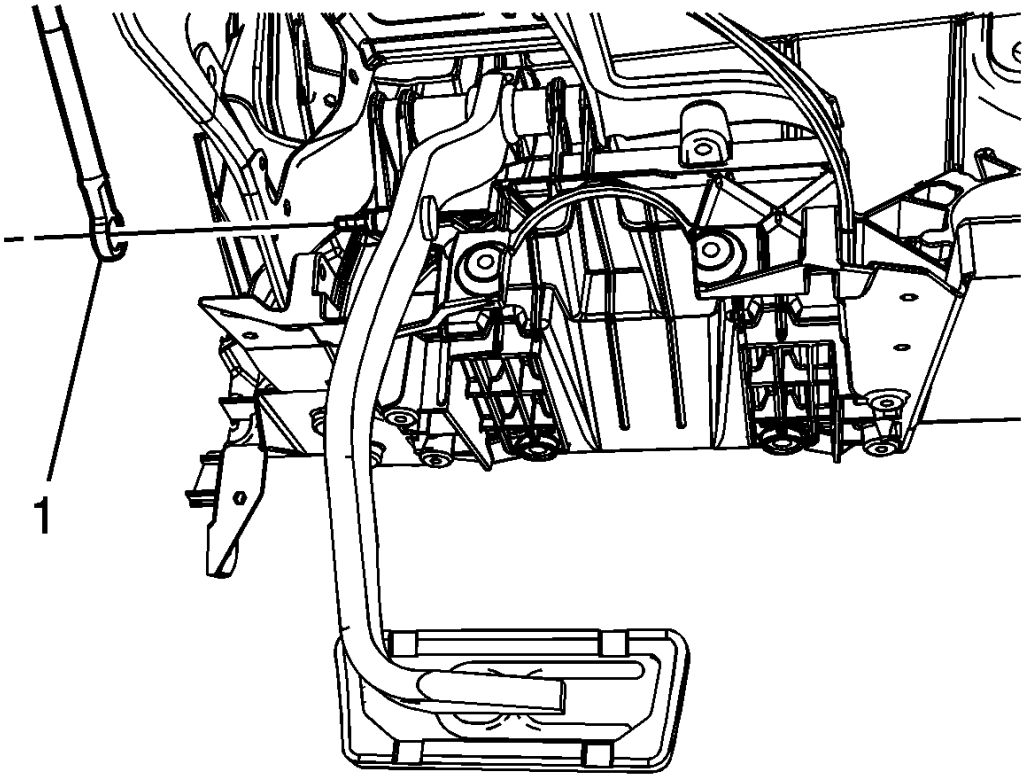

Fig. 37: View Of Brake Pedal Pushrod Nut
Courtesy of GENERAL MOTORS COMPANY

5. Connect the brake pedal pushrod (1) to the brake pedal.

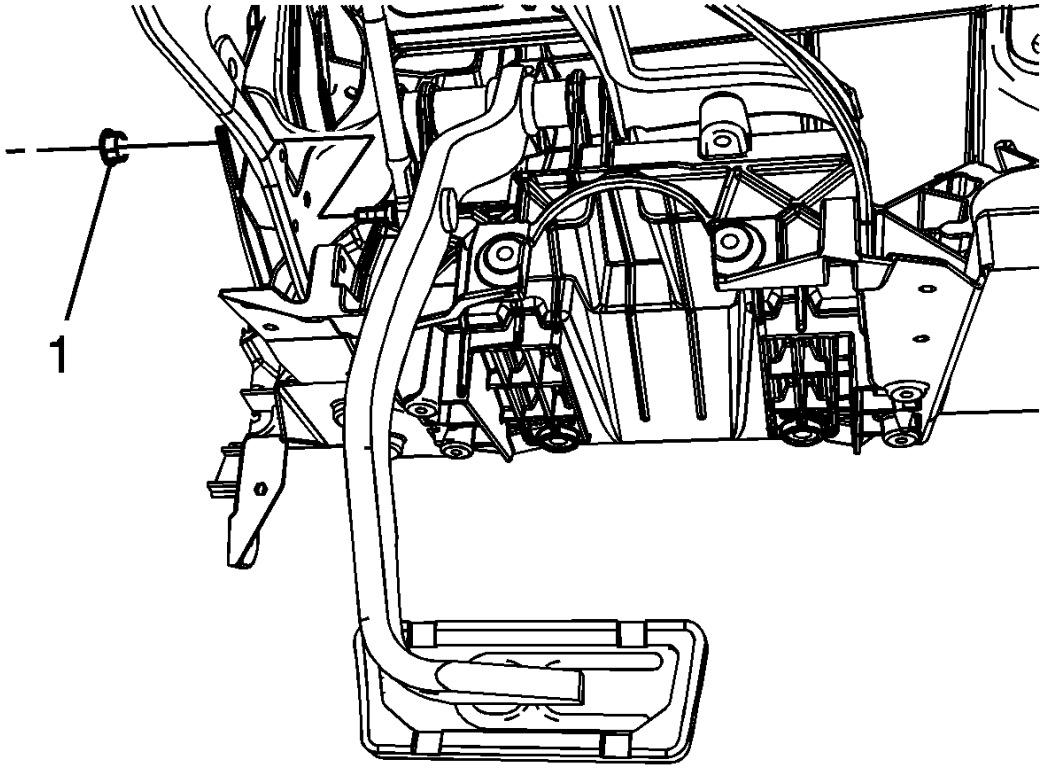

Fig. 38: Identifying Brake Pedal Pushrod Bushing
Courtesy of GENERAL MOTORS COMPANY

6. Install the brake pedal pushrod bushing (1).

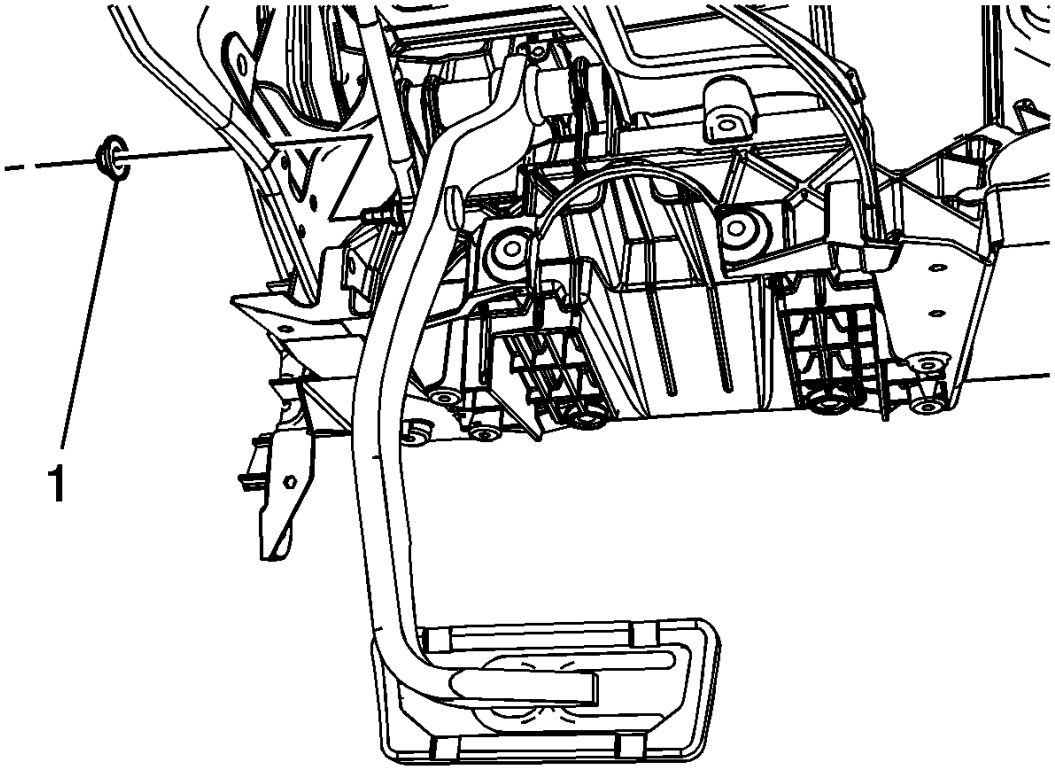

Fig. 39: Identifying Brake Pedal Pushrod Nut
Courtesy of GENERAL MOTORS COMPANY

7. Install the brake pedal pushrod nut (1) and tighten to 13 N.m (115 lb in).
8. Secure the wiring harness clips to the bracket.
9. Connect the brake pedal position sensor electrical connector.
10. Insert the top of the BCM up into the mounting bracket, then engage the bottom of the BCM into the mounting bracket slot.
11. Install the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .

BRAKE PIPE REPLACEMENT

Special Tools

J 45405 Pipe Flaring Tool Kit

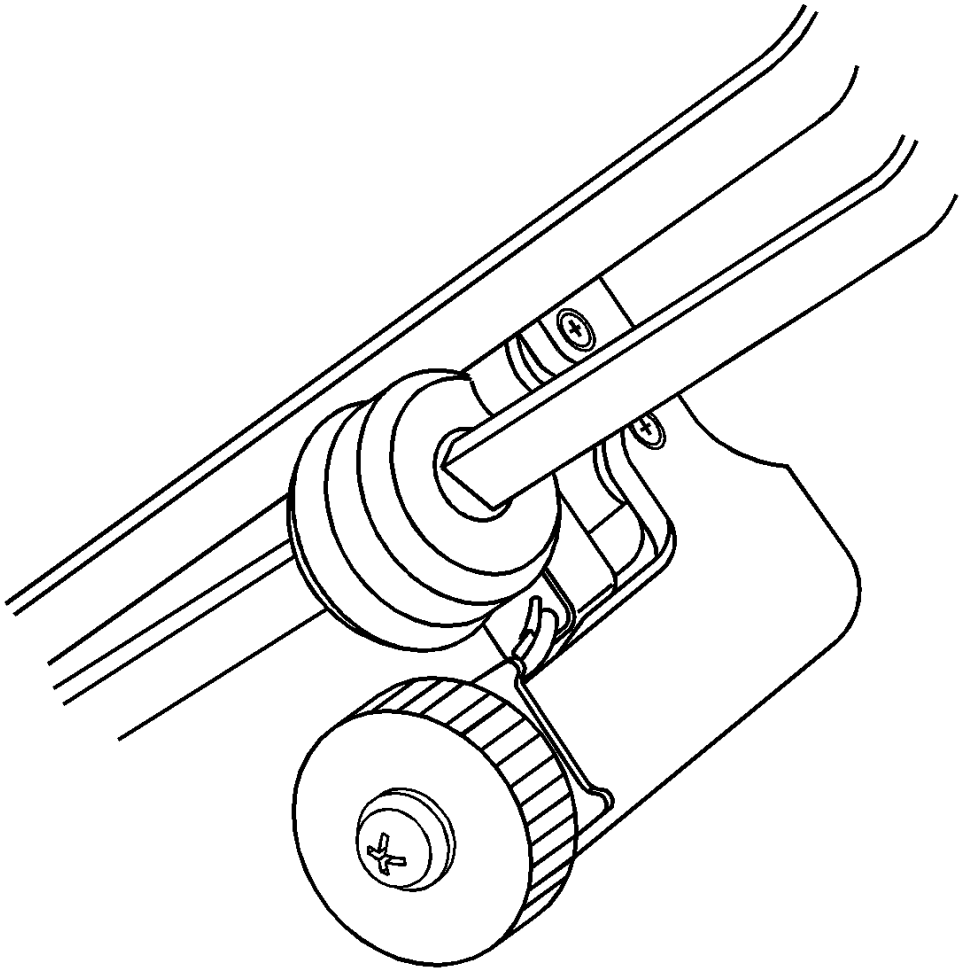

Fig. 40: Sectioning Brake Pipe Using Pipe Cutter
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Always use double walled steel brake pipe when replacing brake pipes. The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and retain brake pipes may cause damage to the brake pipes and cause brake system failure.**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

NOTE: **When servicing brake pipes, note the following:**

- **If sectioning brake pipe, use replacement pipe of the same type and outside diameter.**
- **Use fittings of the appropriate size and type.**

- **Only create flares of the same type or design as originally equipped on the vehicle.**

1. Inspect the section of brake pipe to be replaced.
2. Release the brake pipe to be replaced from the retainers, as required.
3. Select an appropriate location to section the brake pipe, if necessary.
   - Allow adequate clearance in order to maneuver the **J 45405** pipe flaring tool kit.
   - Avoid sectioning the brake pipe at bends or mounting points.
4. Using a string or wire, measure the length of the pipe to be replaced including all pipe bends.
5. Add to the measurement taken the appropriate additional length required for each flare to be created.

   Specification

   6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe

   NOTE: **Ensure that the brake pipe end to be flared is cut at a square, 90 degree angle to the pipe length.**

6. Using the pipe cutter included in the **J 45405** pipe flaring tool kit carefully cut the brake pipe squarely to the measured length.
7. Remove the sectioned brake pipe from the vehicle.
8. Select the appropriate size of brake pipe and tube nuts, as necessary. The brake pipe outside diameter determines brake pipe size.

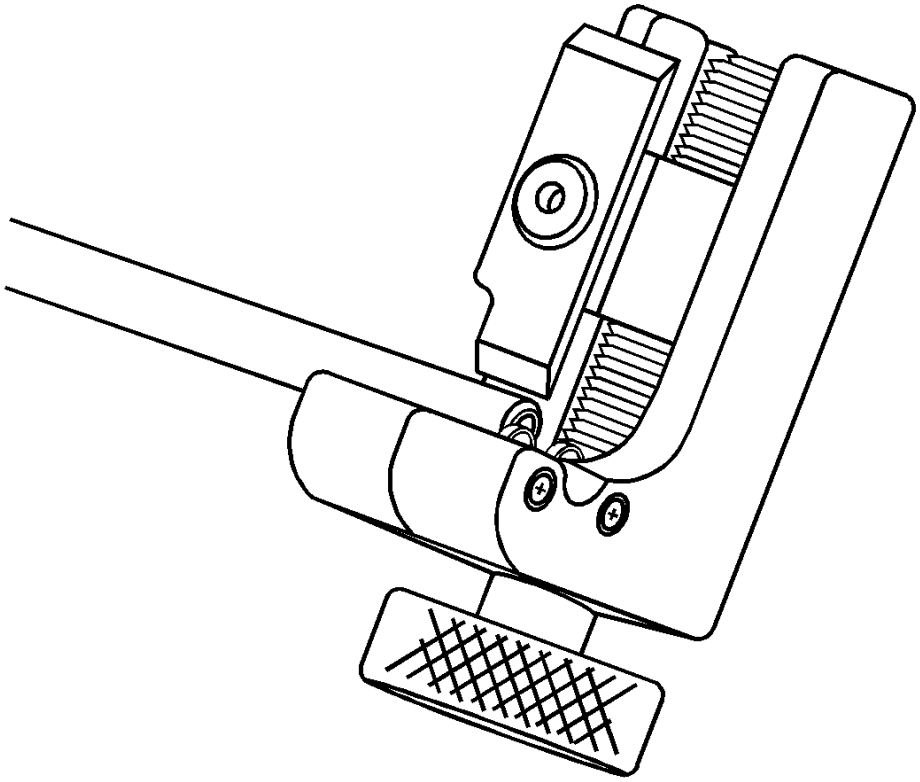

Fig. 41: Stripping Nylon Coating From Brake Pipe Ends
Courtesy of GENERAL MOTORS COMPANY

9. Strip the nylon coating from the brake pipe ends to be flared, if necessary.
    - Select the appropriate blade on the coating stripping tool included in the **J 45405** pipe flaring tool kit by unthreading the blade block from the stripping tool and installing the block with the desired blade facing the tool rollers.

      Specification

      6.35 mm (0.250 in) blade for 4.76 mm (3/16 in) diameter pipe

    - Insert the brake pipe end to be flared into the stripping tool to the depth of the ledge on the tool rollers.
    - While holding the brake pipe firmly against the stripping tool roller ledges, rotate the thumbwheel of the tool until the blade contacts the brake pipe coated surface.

      NOTE: Do not gouge the metal surface of the brake pipe.

    - Rotate the stripping tool in a clockwise direction, ensuring that the brake pipe end remains against

the tool roller ledges.

- After each successive revolution of the stripping tool, carefully rotate the thumbwheel of the tool clockwise, in order to continue stripping the coating from the brake pipe until the metal pipe surface is exposed.
- Loosen the thumbwheel of the tool and remove the brake pipe.

NOTE: **Ensure that all loose remnants of the nylon coating have been removed from the brake pipe.**

- Inspect the stripped end of the brake pipe to ensure that the proper amount of coating has been removed.

Specification

6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe

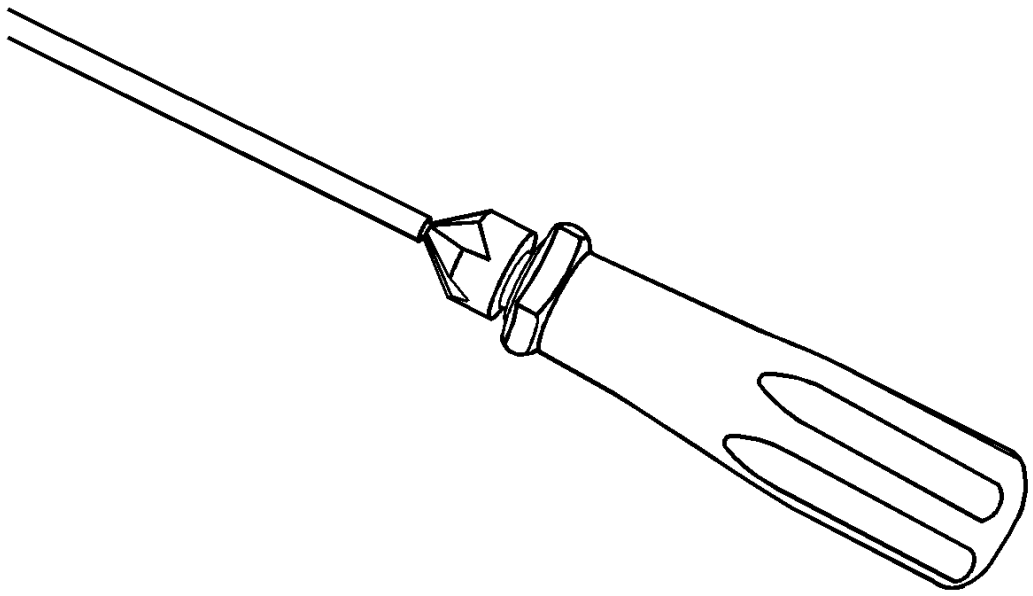

Fig. 42: Chamfering Pipe Using De-Burring Tool
Courtesy of GENERAL MOTORS COMPANY

10. Chamfer the inside and outside diameter of the pipe with the de-burring tool included in the **J 45405** pipe

flaring tool kit .

11. Install the tube nuts on the brake pipe, noting their orientation.
12. Clean the brake pipe and the **J 45405** pipe flaring tool kit of lubricant, contaminants, and debris.

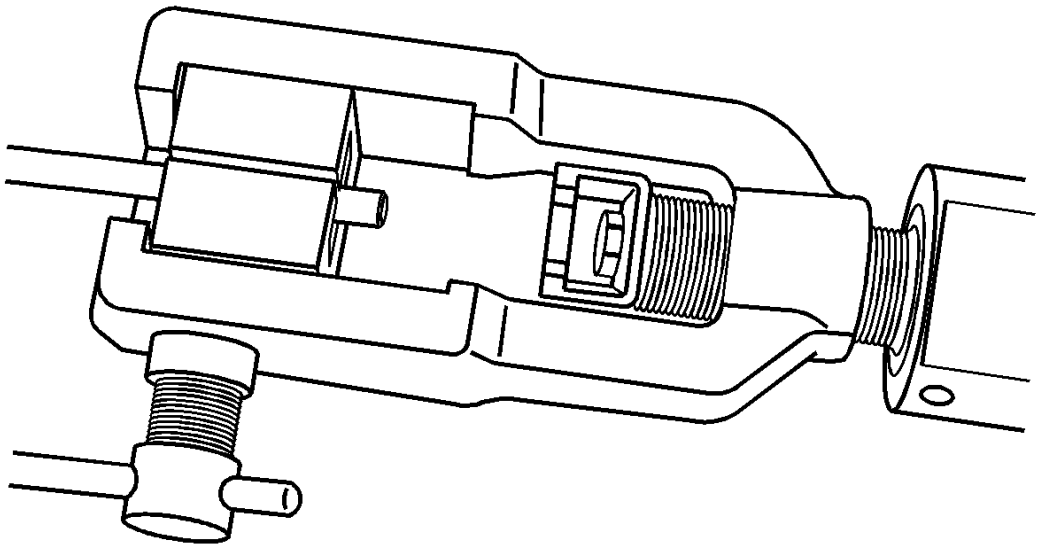

Fig. 43: Installing Die Halves Into Die Cage
Courtesy of GENERAL MOTORS COMPANY

13. Loosen the die clamping screw of the **J 45405** pipe flaring tool kit.
14. Select the corresponding die set and install the die halves into the die cage with the full, flat face of one die facing the clamping screw, and the counterbores of both dies facing the forming ram.

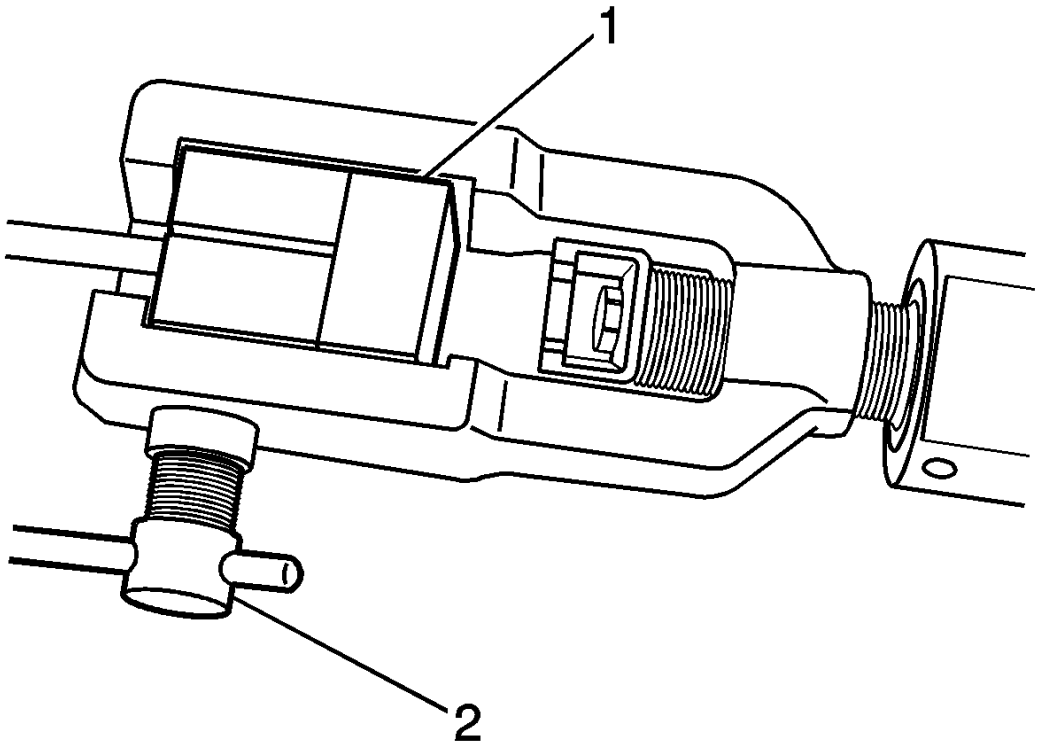

Fig. 44: View Of Clamping Screw & Unused Die
Courtesy of GENERAL MOTORS COMPANY

15. Place the flat face of an unused die (1) against the die halves in the clamping cage and hold firmly against the counterbored face of the dies.
16. Insert the prepared end of the pipe to be flared through the back of the dies until the pipe is seated against the flat surface of the unused die (1).
17. Remove the unused die (1).
18. Ensure that the rear of both dies are seated firmly against the enclosed end of the die cage.
19. Firmly hand tighten the clamping screw (2) against the dies.

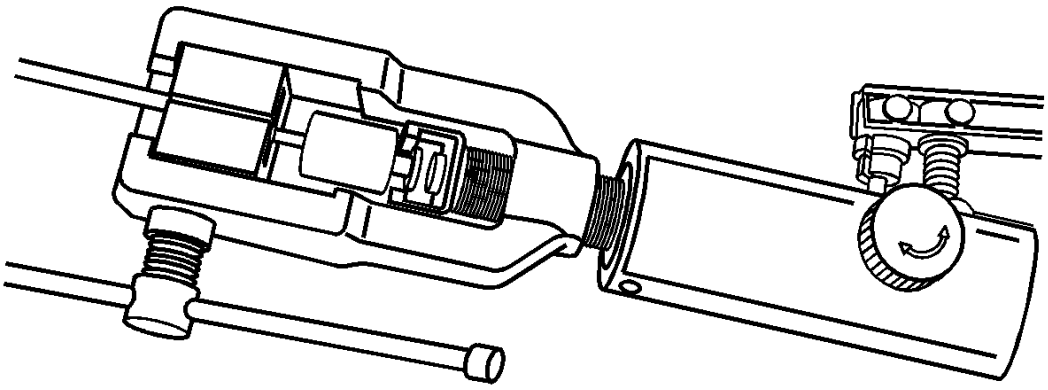

Fig. 45: Rotating J 45405 To Bottom Against Die Cage
Courtesy of GENERAL MOTORS COMPANY

20. Select the appropriate forming mandrel and place into the forming ram.
21. Rotate the hydraulic fluid control valve clockwise to the closed position.
22. Rotate the body of the **J 45405** pipe flaring tool kit until it bottoms against the die cage.

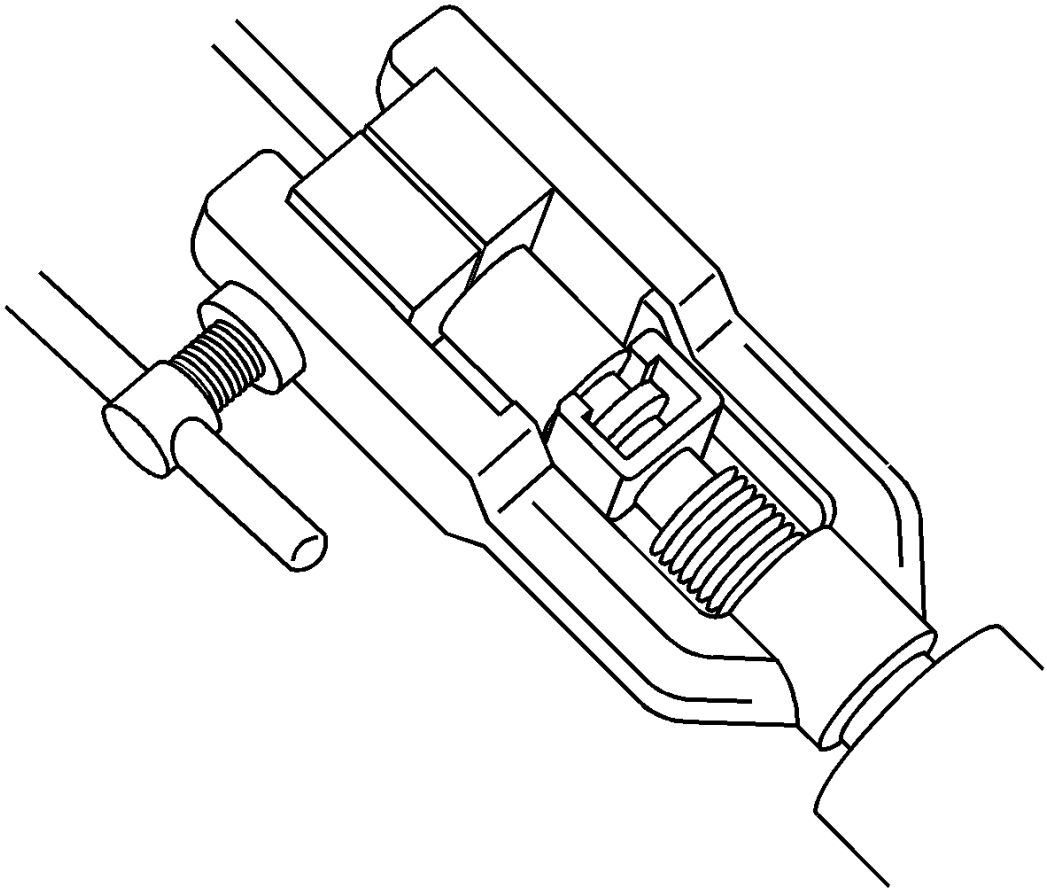

Fig. 46: Bottoming Forming Mandrel Against Clamping Dies Using Pipe Flaring Tool
Courtesy of GENERAL MOTORS COMPANY

23. While guiding the forming mandrel into the exposed end of pipe to be flared, operate the lever of the **J 45405** pipe flaring tool kit until the forming mandrel bottoms against the clamping dies.
24. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.
25. Loosen the die clamping screw and remove the dies and pipe.
26. If necessary, lightly tap the dies until the die halves separate.

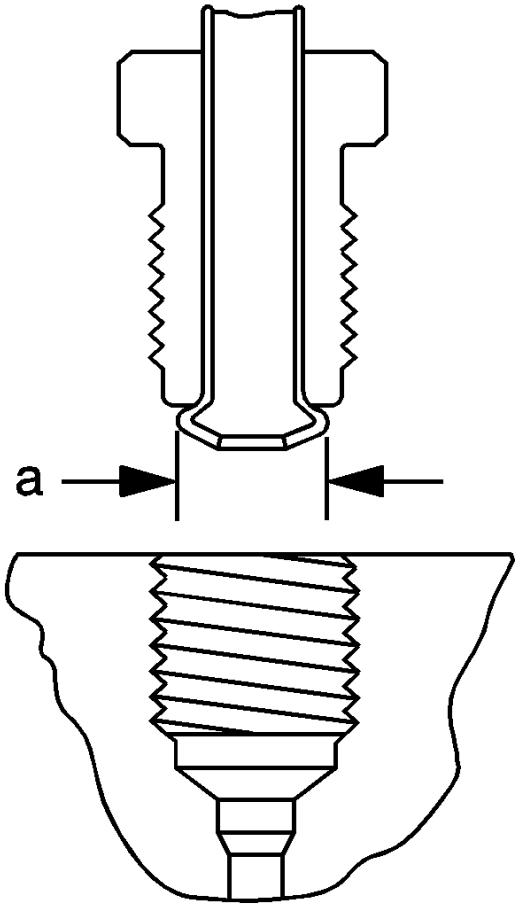

Fig. 47: Inspecting Brake Pipe Flare Diameter
Courtesy of GENERAL MOTORS COMPANY

27. Inspect the brake pipe flare for correct shape and diameter (a).

    Specification

    7.10 mm (0.279 in) +/- 0.18 mm (0.007 in) flare diameter for 4.76 mm (3/16 in) diameter pipe

28. If necessary, using the removed section of pipe as a template, shape the new pipe with a suitable brake pipe bending tool.

    NOTE: When installing the pipe, maintain a clearance of 19 mm (3/4 in) from all moving or vibrating components.

29. Install the pipe to the vehicle with the appropriate brake pipe unions as required.
30. If previously released, secure the brake pipe to the retainers.
31. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.
32. With the aid of an assistant, inspect the brake pipe flares for leaks by starting the engine and applying the

brakes.

FRONT BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Clean all dirt and foreign material from the brake hoses and brake pipe fitting.

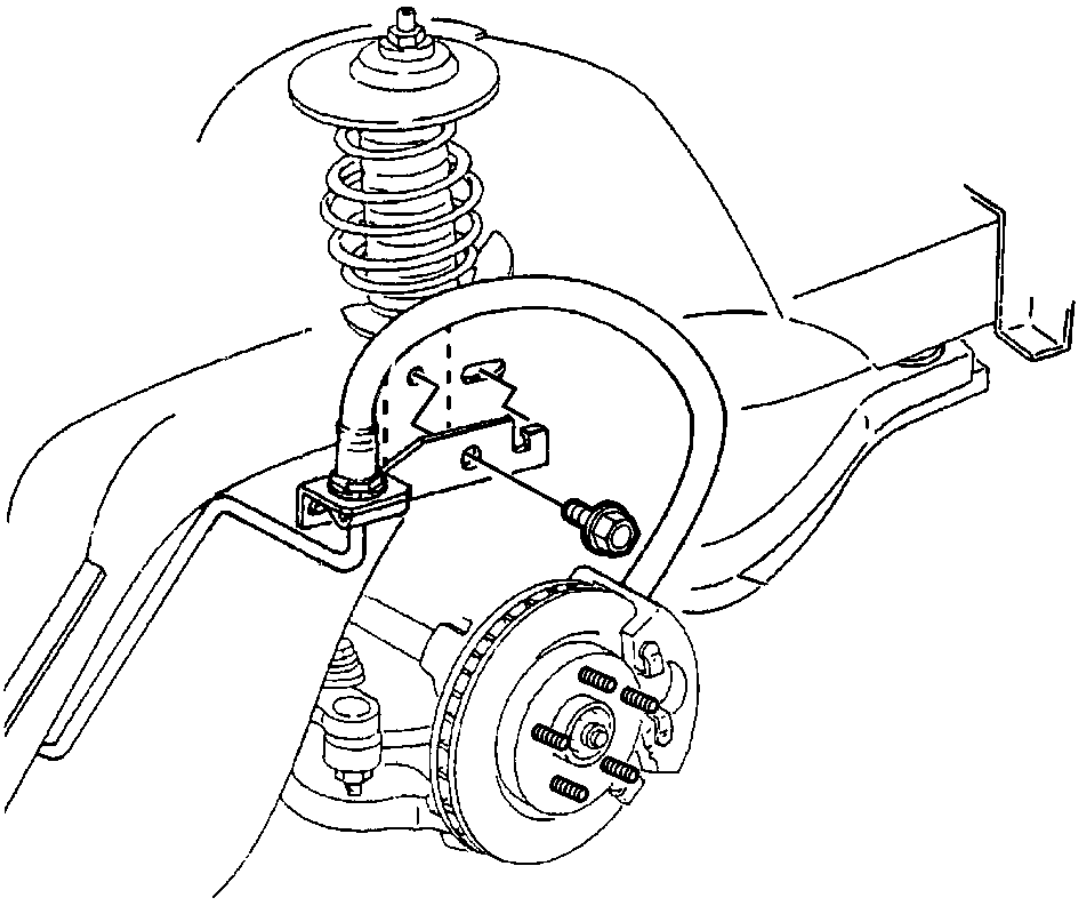

Fig. 48: Front Brake Hose & Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

NOTE: Install a rubber cap or plug to the exposed brake pipe fitting end to prevent brake fluid loss and contamination.

4. Use a backup wrench on the hose fitting, disconnect the brake pipe fitting from the brake hose, then cap or plug the brake pipe fitting end.

   Do not bend the brake pipe or the bracket.

5. Remove the brake hose retaining clip from the hose mounting bracket.
6. Remove the hose from the bracket.

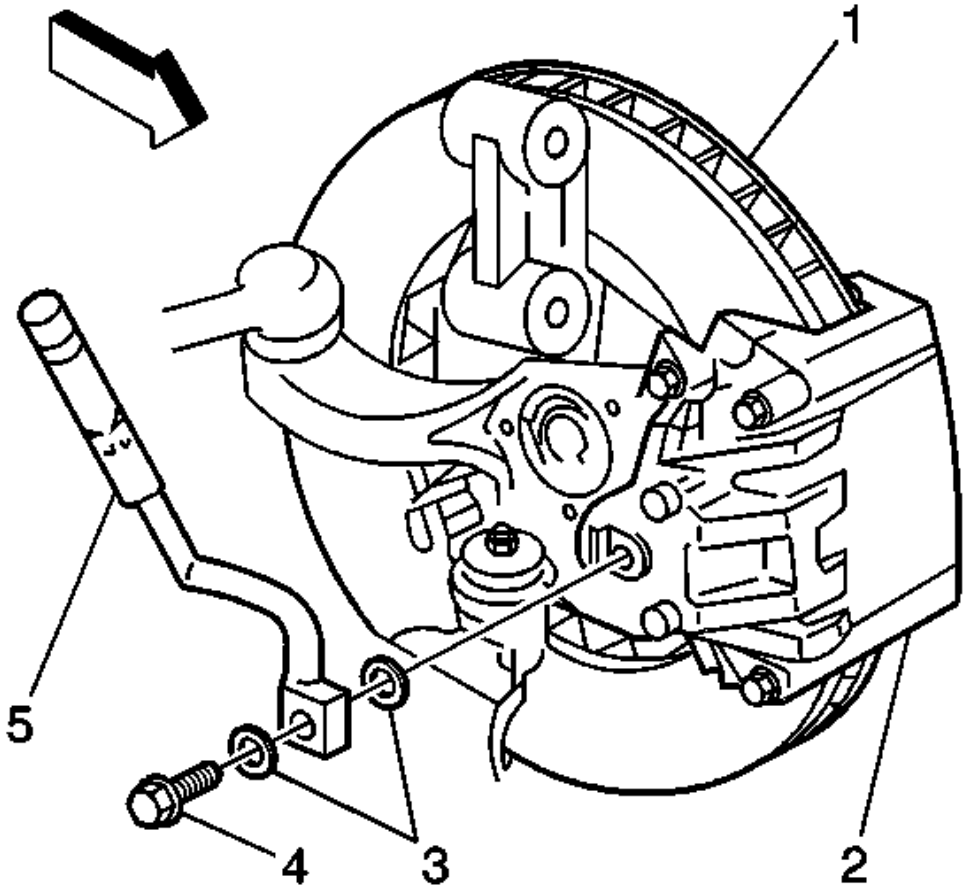

Fig. 49: Identifying Brake Hose At Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake hose to caliper bolt (4) from the brake caliper (2).
8. Remove the brake hose (5) from the brake caliper (2).
9. Remove and discard the two copper brake hose gaskets (3). These gaskets may be stuck to the brake caliper and/or the brake hose end.

Installation Procedure

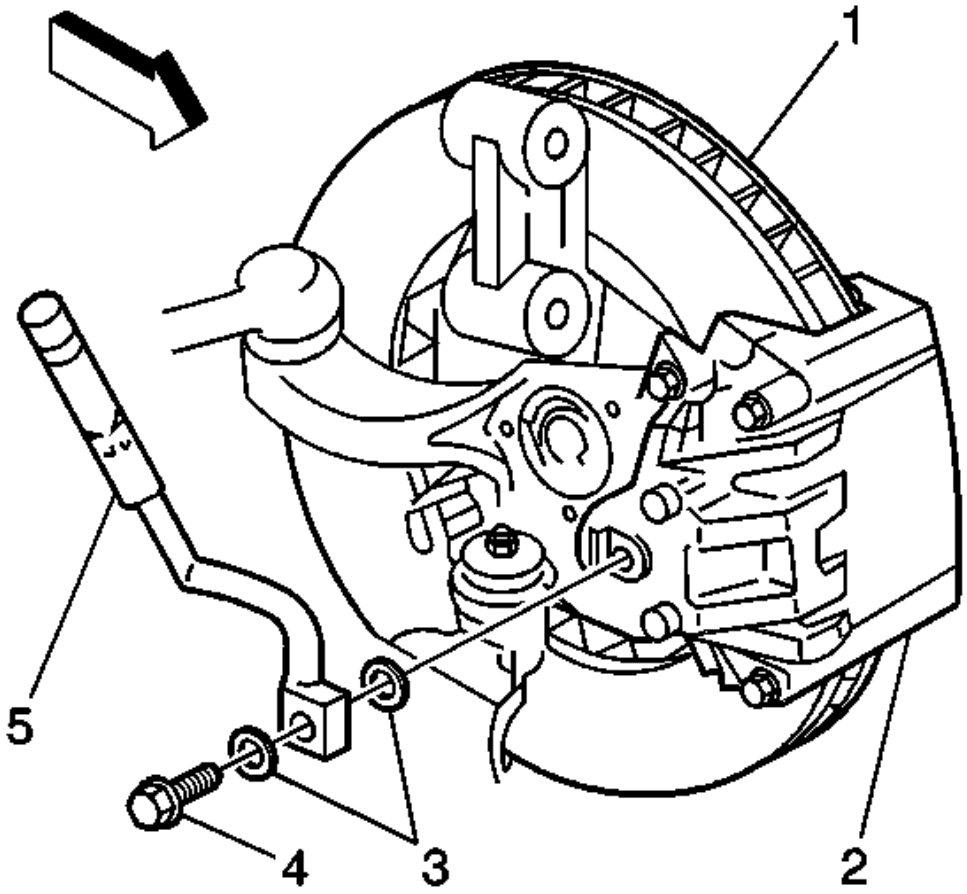

Fig. 50: Identifying Brake Hose At Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install NEW copper brake hose gaskets (3).**

1. Assemble the NEW copper brake hose gaskets (3), and the brake hose bolt (4) to the brake hose.

CAUTION: **Refer to Fastener Caution .**

2. Install the brake hose to caliper bolt to the brake caliper.

Tighten

Tighten the brake hose to brake caliper bolt to 54 N.m (40 lb ft).

3. With the weight of the vehicle on the suspension, install the brake hose into the bracket.

There should not be any kinks in the hose.

Align the hose fitting with the notch in the bracket. Use the hose paint stripe as a visual aid.

4. Install the retainer onto the hose fitting at the bracket.
5. Remove the rubber cap or plug from the exposed brake pipe fitting end.

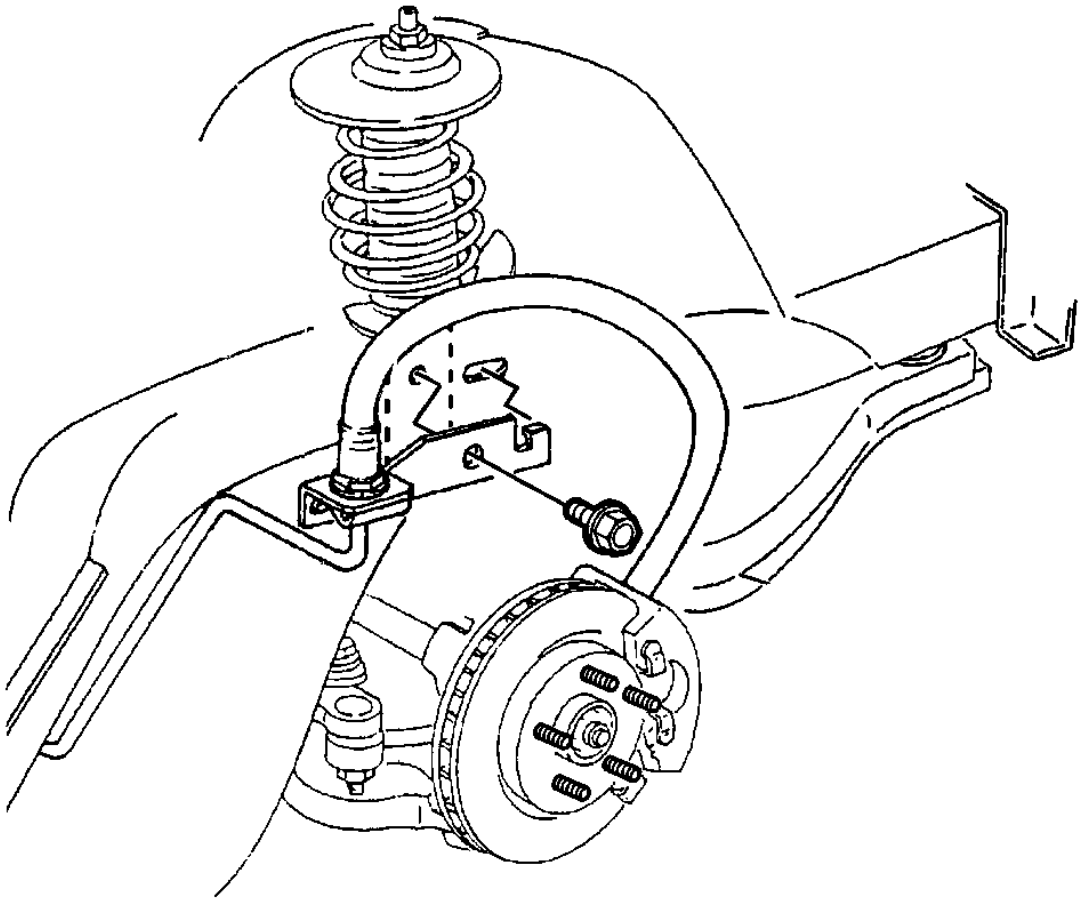

Fig. 51: Front Brake Hose & Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Connect the brake pipe fitting to the brake hose:
    - Use a backup wrench on the hose fitting.
    - Do not bend the bracket or pipe.

    Tighten

    Tighten the brake pipe fitting to 18 N.m (13 lb ft).

7. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Ensure that the hose does not make contact with any part of the suspension. Check the hose in extreme right and extreme left turn conditions. If the hose makes contact, remove the hose and correct the condition.

9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.
10. Lower the vehicle.

REAR BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Clean all dirt and foreign material from the brake hoses and brake pipe fitting.

   NOTE: Install a rubber cap or plug to the exposed brake pipe fitting end to prevent brake fluid loss and contamination.

4. Use a backup wrench on the hose fitting, disconnect the brake pipe fitting from the brake hose, then cap or plug the brake pipe fitting end.

   Do not bend the brake pipe or the bracket.

5. Remove the brake hose retaining clip from the hose mounting bracket.
6. Remove the hose from the bracket.

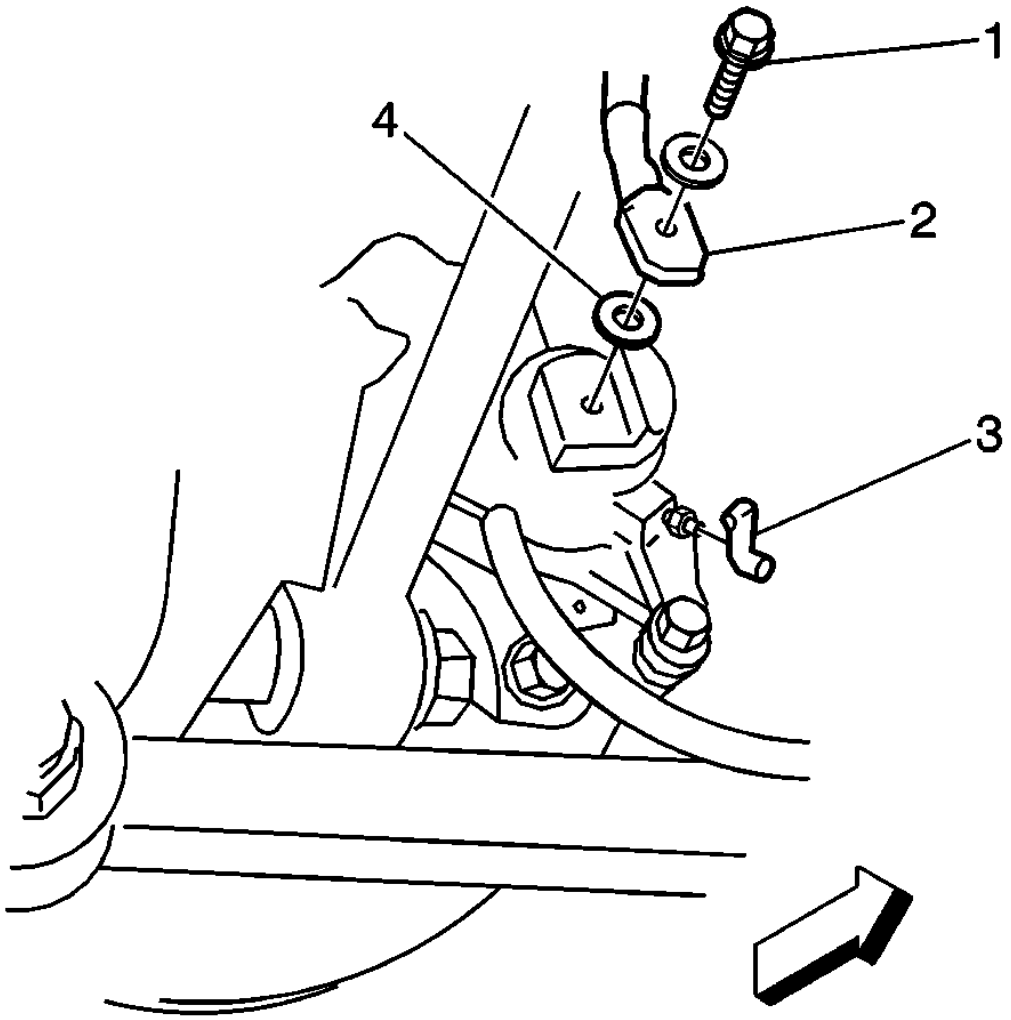

Fig. 52: Rear Brake Hose At Caliper
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake hose to caliper bolt (1) from the brake caliper.
8. Remove the brake hose (2) from the brake caliper.
9. Remove and discard the two copper brake hose gaskets (4). These gaskets may be stuck to the brake caliper and/or the brake hose end.

Installation Procedure

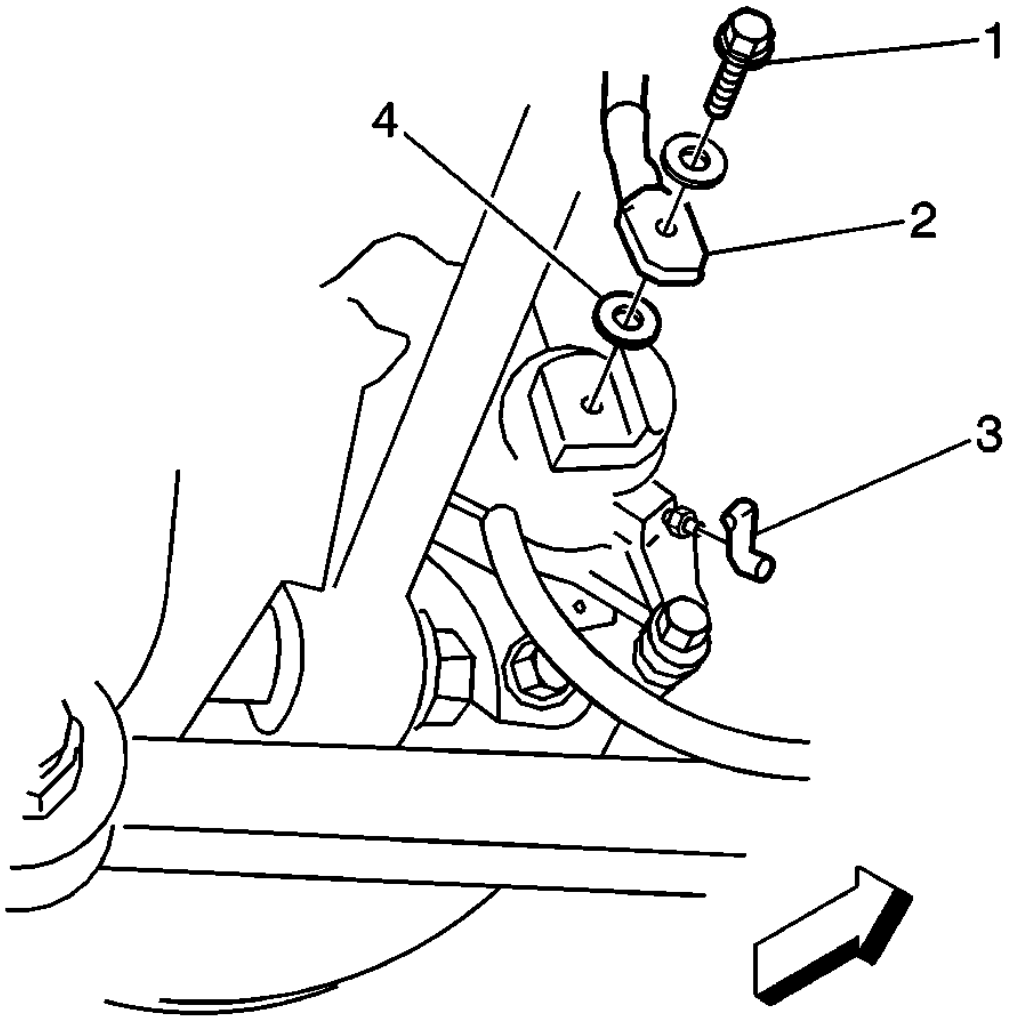

Fig. 53: Rear Brake Hose At Caliper
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install NEW copper brake hose gaskets (4).**

1. Assemble the NEW copper brake hose gaskets (4), and the brake hose bolt (1) to the brake hose (2).

CAUTION: **Refer to Fastener Caution .**

2. Install the brake hose to caliper bolt (1) to the brake caliper.

Tighten

Tighten the brake hose to brake caliper bolt to 54 N.m (40 lb ft).

3. With the weight of the vehicle on the suspension, install the brake hose into the bracket.

There should not be any kinks in the hose.

Align the hose fitting with the notch in the bracket. Use the hose paint stripe as a visual aid.

4. Install the retainer onto the hose fitting at the bracket.
5. Remove the rubber cap or plug from the exposed brake pipe fitting end.
6. Connect the brake pipe fitting to the brake hose:
    - Use a backup wrench on the hose fitting.
    - Do not bend the bracket or pipe.

    Tighten

    Tighten the brake pipe fitting to 18 N.m (13 lb ft).
7. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Ensure that the hose does not make contact with any part of the suspension. If the hose makes contact, remove the hose and correct the condition.
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.
10. Lower the vehicle.

HYDRAULIC BRAKE SYSTEM BLEEDING (MANUAL)

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Add brake fluid as needed to ensure that the brake master cylinder reservoir remains at least half-full throughout the bleed procedure. The reservoir cap must be installed at all times except when filling the reservoir. Refer to **Fluid and Lubricant Recommendations** .
5. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
6. Install a transparent hose over the end of the bleeder valve.
7. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid

from a clean, sealed brake fluid container.

8. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
9. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
10. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
11. Wait 15 seconds, then repeat steps 8-10 until all air is purged from the wheel hydraulic circuit.
12. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.
13. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
14. Slowly press and release the brake pedal. Observe the brake pedal feel.
15. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:
16. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until it is diagnosed and repaired.**

17. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

Bleeding the Complete Brake Hydraulic System

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Add brake fluid as needed to ensure that the brake master cylinder reservoir remains at least half-full throughout the bleed procedure. The reservoir cap must be installed at all times except when filling the reservoir. Refer to **Fluid and Lubricant Recommendations** .
5. If the master cylinder was replaced, the master cylinder must be bench bled. Refer to **Master Cylinder Bench Bleeding**.
6. If the brake pipes have been removed from the master cylinder, the following steps must be performed.
    1. With the rear brake pipe installed securely to the master cylinder, loosen and separate the front brake pipe fitting from the front port of the brake master cylinder.
    2. Allow a small amount of brake fluid to gravity bleed from the open port of the master cylinder. Capture and properly dispose of the brake fluid in an approved container.
    3. Install the front brake pipe fitting to the front port of the brake master cylinder and tighten the fitting. Refer to **Fastener Specifications**.
    4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
    5. Loosen the front brake pipe fitting from the front port of the brake master cylinder to purge air from the master cylinder port.
    6. Tighten the front brake pipe fitting, then have the assistant slowly release the brake pedal.
    7. Wait 15 seconds, then repeat steps 6.4-6.6 until all air is purged from the front brake pipe fitting of the front port of the master cylinder.

8. After all air is purged from the front port of the brake master cylinder, tighten the front master cylinder brake pipe fitting. Refer to **Fastener Specifications**.
9. With the front brake pipe fitting installed securely to the front port of the brake master cylinder, loosen and separate the rear brake pipe fitting from the rear port of the brake master cylinder.
10. Repeat steps 6.2-6.7 for the rear port of the brake master cylinder.
11. After all air is purged from the rear port of the brake master cylinder, tighten the rear master cylinder brake pipe fitting. Refer to **Fastener Specifications**.
12. Slowly press and release the brake pedal. Observe the brake pedal feel.
13. If the brake pedal feels spongy, proceed to step 7.
14. If the brake pedal feels firm, proceed to step 24.

7. If the brake pipes have been removed from the brake pressure modulator valve (BPMV) assembly, if equipped, or the brake proportion valve assembly, if equipped, air must be purged from each port of the respective assembly beginning with the feed pipes from the master cylinder.
    1. Loosen and separate one of the master cylinder brake pipe fittings from the inlet port of the assembly to be bled.
    2. Allow a small amount of brake fluid to gravity bleed from the open port of the assembly. Capture and properly dispose of the brake fluid in an approved container.
    3. Install the brake pipe fitting and to the inlet port of the assembly and tighten securely.
    4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
    5. Loosen the same brake pipe fitting to purge air from the open port of the assembly.
    6. Tighten the brake pipe fitting, then have the assistant slowly release the brake pedal.
    7. Wait 15 seconds, then repeat steps 7.4-7.6 until all air is purged from the brake pipe fitting of the assembly.
    8. Repeat steps 7.1-7.7 for all of the remaining ports of the assembly.
    9. After bleeding each port of the assembly, tighten all of the brake pipe fittings on the assembly. Refer to **Fastener Specifications**.
    10. Fill the master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container.
    11. Slowly press and release the brake pedal. Observe the brake pedal feel.
    12. If the brake pedal feels spongy, proceed to step 8.
    13. If the brake pedal feels firm, proceed to step 24.
8. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
9. Install a transparent hose over the end of the bleeder valve.
10. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
11. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the brake pedal.
12. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
13. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
14. Wait 15 seconds, then repeat steps 11-13 until all air is purged from the wheel hydraulic circuit.
15. Tighten the RIGHT REAR hydraulic wheel circuit bleeder valve securely.

16. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
17. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
18. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
19. After completing the final wheel hydraulic circuit bleeding procedure, tighten all of the wheel hydraulic circuit bleeder valves and install the bleeder valve dust caps.
20. Fill the master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container.
21. Slowly press and release the brake pedal. Observe the brake pedal feel.
22. If the brake pedal feels spongy, perform the following procedure.
    1. If equipped with antilock brakes, install a scan tool and perform the **Antilock Brake System Automated Bleed** to remove air which may be trapped in the BPMV.
    2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**.
    3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
23. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**
24. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

25. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM BLEEDING (PRESSURE)

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.

2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

5. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
6. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
7. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
8. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
10. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
11. Install a transparent hose over the end of the bleeder valve.
12. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid from a clean, sealed brake fluid container.
13. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
14. Allow fluid to flow until air bubbles stop flowing from the bleeder.
15. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.**

16. Close the brake pressure bleeder fluid tank valve then disconnect the brake pressure bleeder from the master cylinder reservoir bleeder adapter.
17. Remove the master cylinder reservoir bleeder adapter from the master cylinder reservoir.
18. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
19. Slowly press and release the brake pedal. Observe the brake pedal feel.
20. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:

21. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until it is diagnosed and repaired.**

22. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

Bleeding the Complete Brake Hydraulic System

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .
5. If the master cylinder was replaced, the master cylinder must be bench bled. Refer to **Master Cylinder Bench Bleeding**.

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

6. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
7. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
8. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
9. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

10. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
11. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
12. Install a transparent hose over the end of the bleeder valve.
13. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
14. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
15. Allow fluid to flow until air bubbles stop flowing from the bleeder.
16. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.
17. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 12-16.

18. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
19. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
20. Close the brake pressure bleeder fluid tank valve.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.**

21. Remove the brake pressure bleeding equipment from the vehicle.
22. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .
23. Slowly press and release the brake pedal. Observe the brake pedal feel.
24. If the brake pedal feels spongy, perform the following procedure.
    1. If equipped with antilock brakes, install a scan tool and perform the **Antilock Brake System Automated Bleed** to remove air which may be trapped in the BPMV.
    2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**.
    3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
25. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)** .
26. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

27. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM FLUSHING

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:

- Fluid separation, indicating 2 types of fluid are present; a substance other than the recommended brake fluid has been introduced into the brake hydraulic system
  - Swirled appearance - oil-based substance
  - Layered appearance - silicone-based substance
- Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system
  - Cloudy appearance - moisture
  - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust

2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
   1. Remove ALL of the following components listed from the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

      Refer to the procedures indicated:

      - **Master Cylinder Replacement**
      - **Front Brake Hose Replacement**
      - **Rear Brake Hose Replacement**
      - **Front Brake Caliper Replacement**
      - **Rear Brake Caliper Replacement**
      - **Brake Pressure Modulator Valve Replacement**
   2. Clean out all the hydraulic brake pipes using denatured alcohol, or equivalent.
   3. Dry the brake pipes using non-lubricated, filtered air.
   4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

      Refer to the procedures indicated:

      - **Master Cylinder Overhaul**, or **Master Cylinder Replacement** ; also perform the following:

        Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. Refer to **Master Cylinder Reservoir Replacement**.

        Replace the brake master cylinder reservoir cap diaphragm.

      - **Front Brake Hose Replacement**
      - **Rear Brake Hose Replacement**

- **Front Brake Caliper Overhaul** , or **Front Brake Caliper Replacement**
- **Rear Brake Caliper Overhaul** , or **Rear Brake Caliper Replacement**
- **Brake Pressure Modulator Valve Replacement**

4. If the brake fluid was NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm. The diaphragm may have allowed the moisture or particles to enter the hydraulic system.
5. Fill the brake master cylinder reservoir to the maximum-fill level with Delco Supreme 11Â®, GM P/N 12377967 (Canada P/N 992667) or equivalent, DOT-3 brake fluid from a clean, sealed brake fluid container.
6. Pressure bleed the hydraulic brake system. Begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. Refer to **Hydraulic Brake System Bleeding (Manual)Hydraulic Brake System Bleeding (Pressure)**.

POWER VACUUM BRAKE BOOSTER REPLACEMENT

Special Tools

J-22805-C Brake Booster Holder

Removal Procedure

1. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .
2. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
3. Disconnect the brake fluid level indicator switch electrical connector.

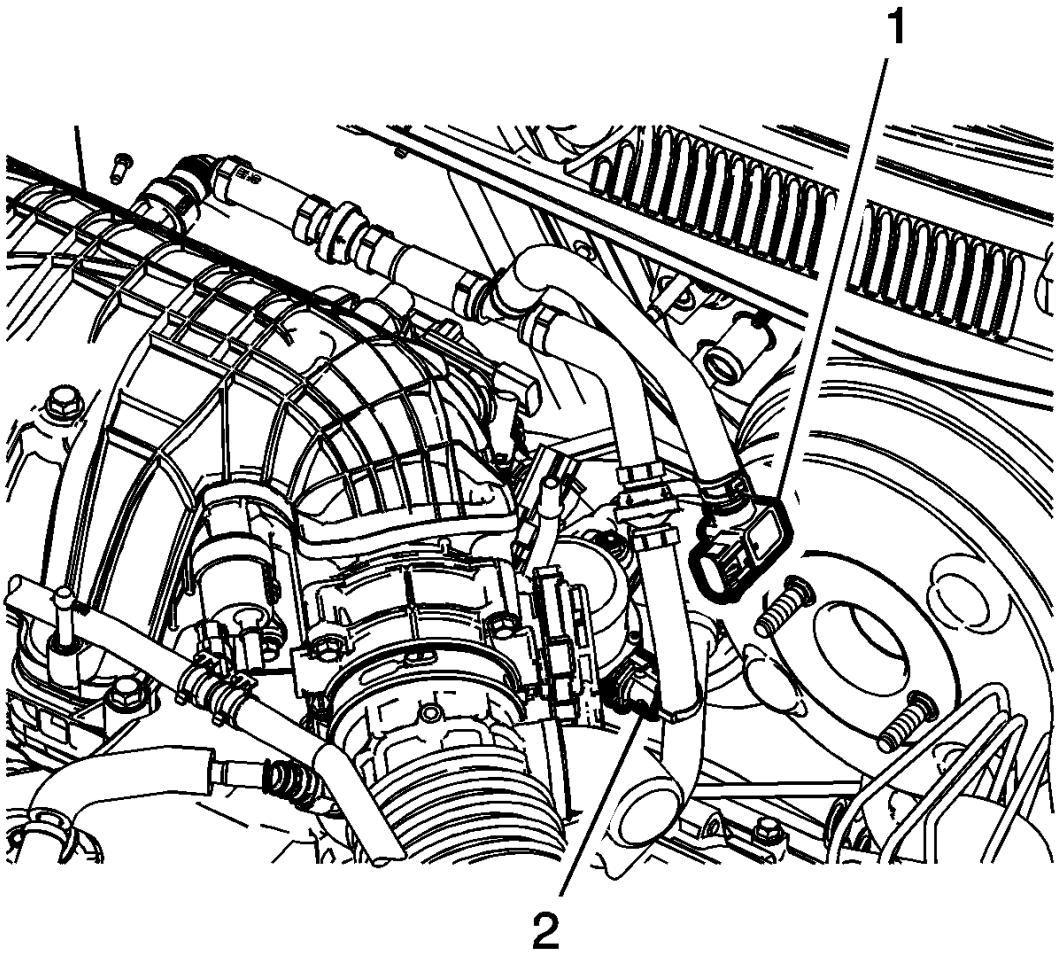

Fig. 54: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

4. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster.
5. Disconnect the power brake vacuum booster hose quick connect (2) from the power brake booster pump.
6. Position the power brake booster vacuum hose and check valve assembly upward.

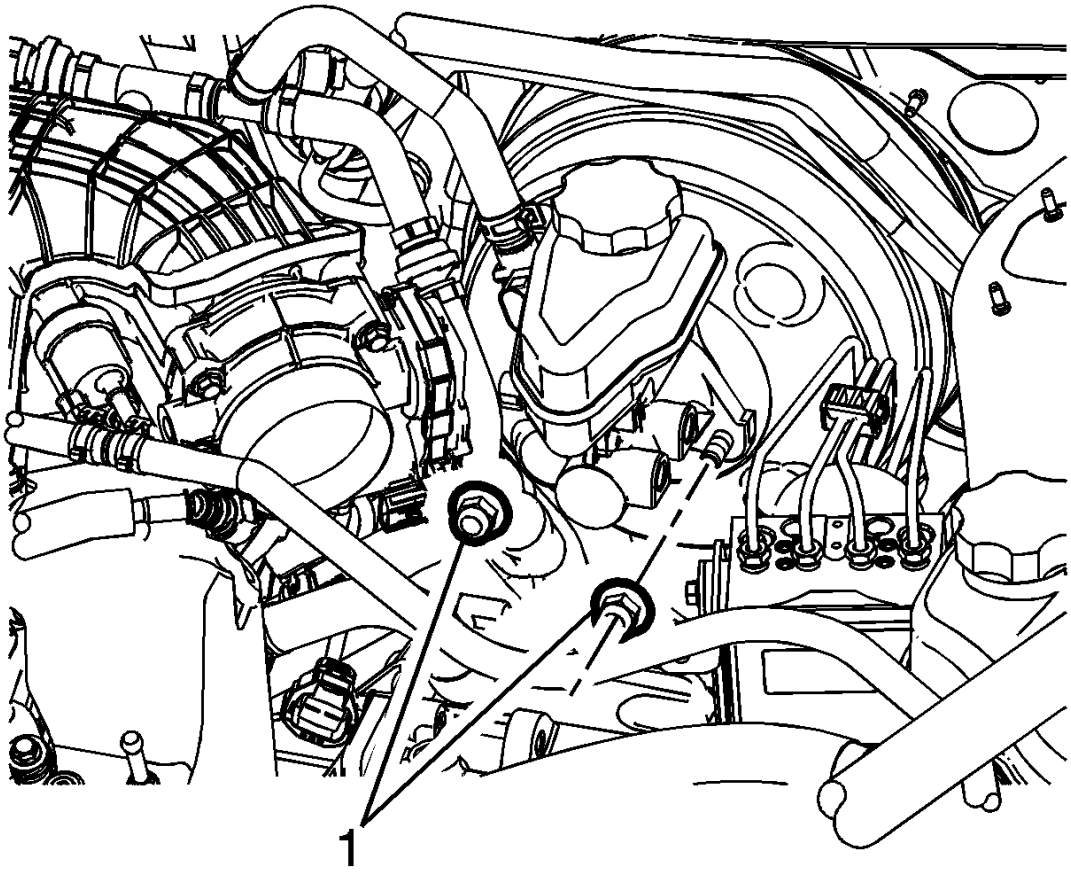

Fig. 55: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the master cylinder nuts (1).
8. Without disconnecting the brake pipes, remove and position aside the master cylinder.
9. Secure the master cylinder in an upright position and secure with heavy mechanics wire.
10. Install the **J-22805-C** Brake Booster Holder to the power vacuum brake booster studs and secure using the master cylinder nuts.

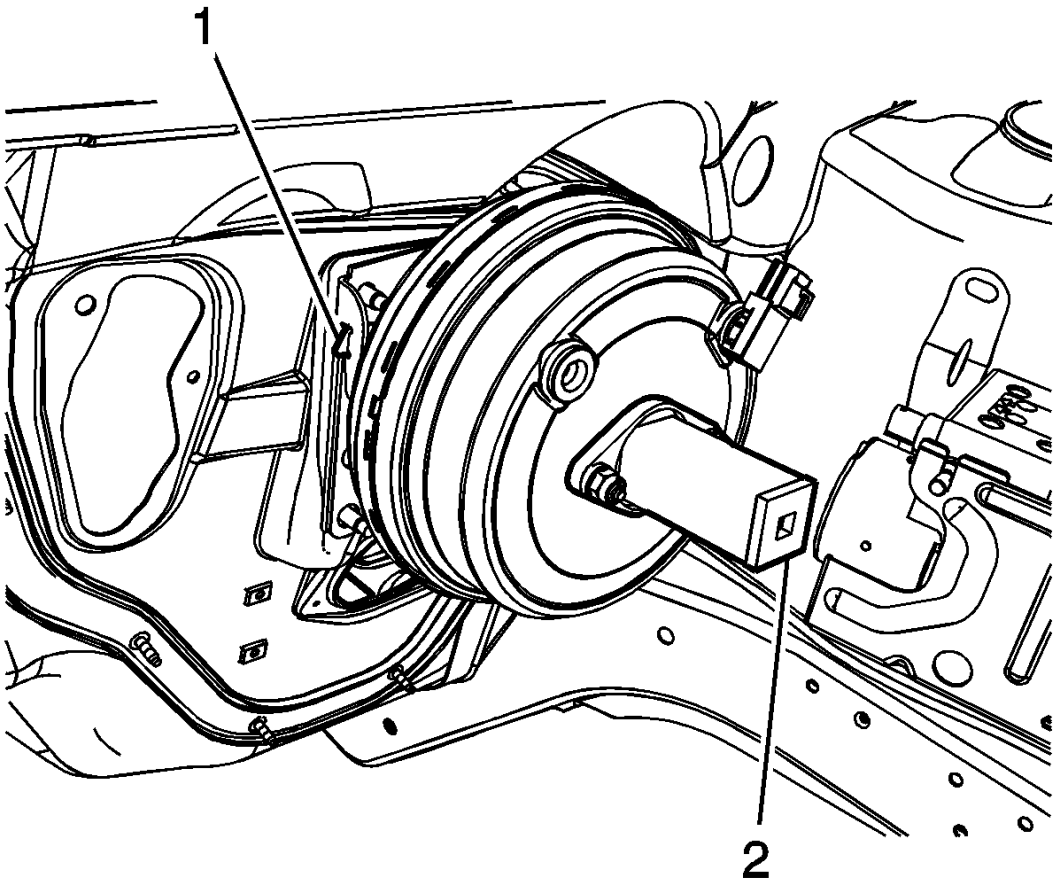

Fig. 56: View Of Power Brake Booster Assembly
Courtesy of GENERAL MOTORS COMPANY

11. Press the locking tab (1) and rotate the **J-22805-C** Brake Booster Holder (2) counter clockwise.
12. Carefully pull the power vacuum brake booster forward slightly and support the booster to access the brake booster pushrod retaining clip.

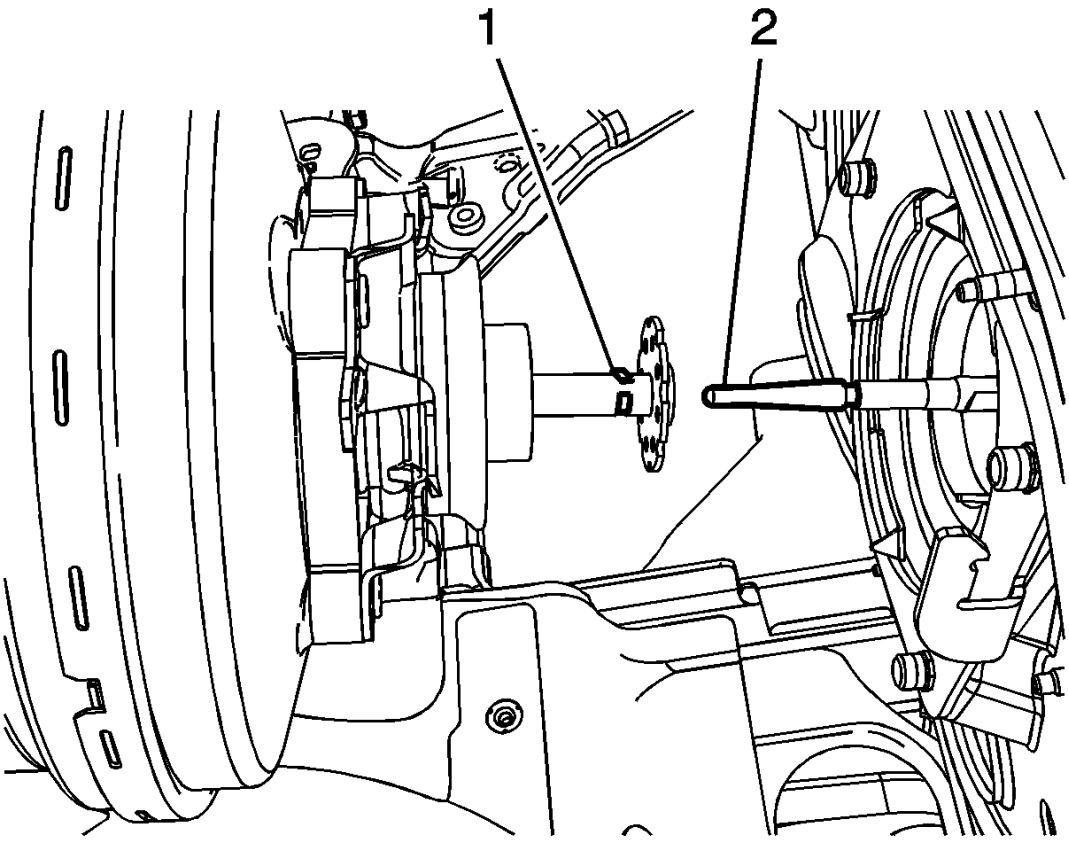

Fig. 57: View Of Brake Booster Pushrod & Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

13. Release the retaining clip (1) and disengage the power vacuum brake booster input rod from the brake booster pushrod (2).
14. Remove the power vacuum brake booster from the vehicle.

Installation Procedure

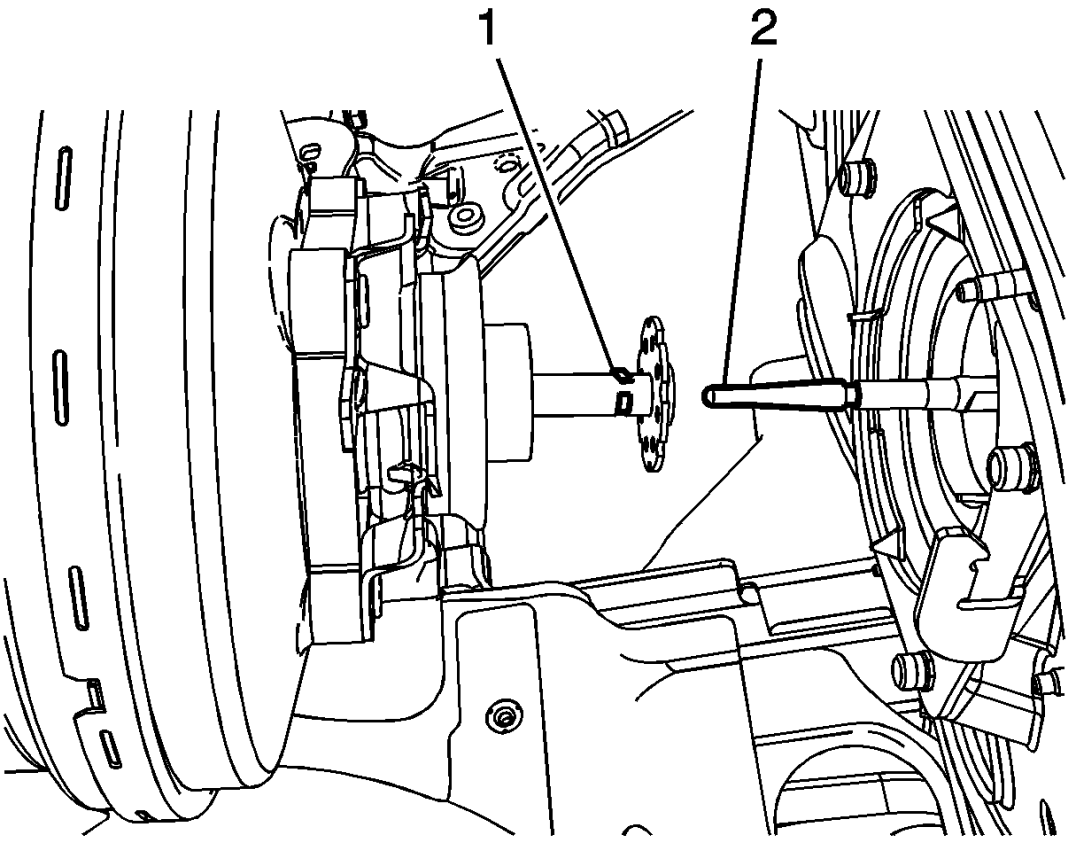

Fig. 58: View Of Brake Booster Pushrod & Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

1. Install the power vacuum brake booster to the vehicle.
2. Release the retaining clip (1) and engage the power vacuum brake booster input rod to the brake booster pushrod (2).
3. Press the retaining clip into position on the brake booster pushrod

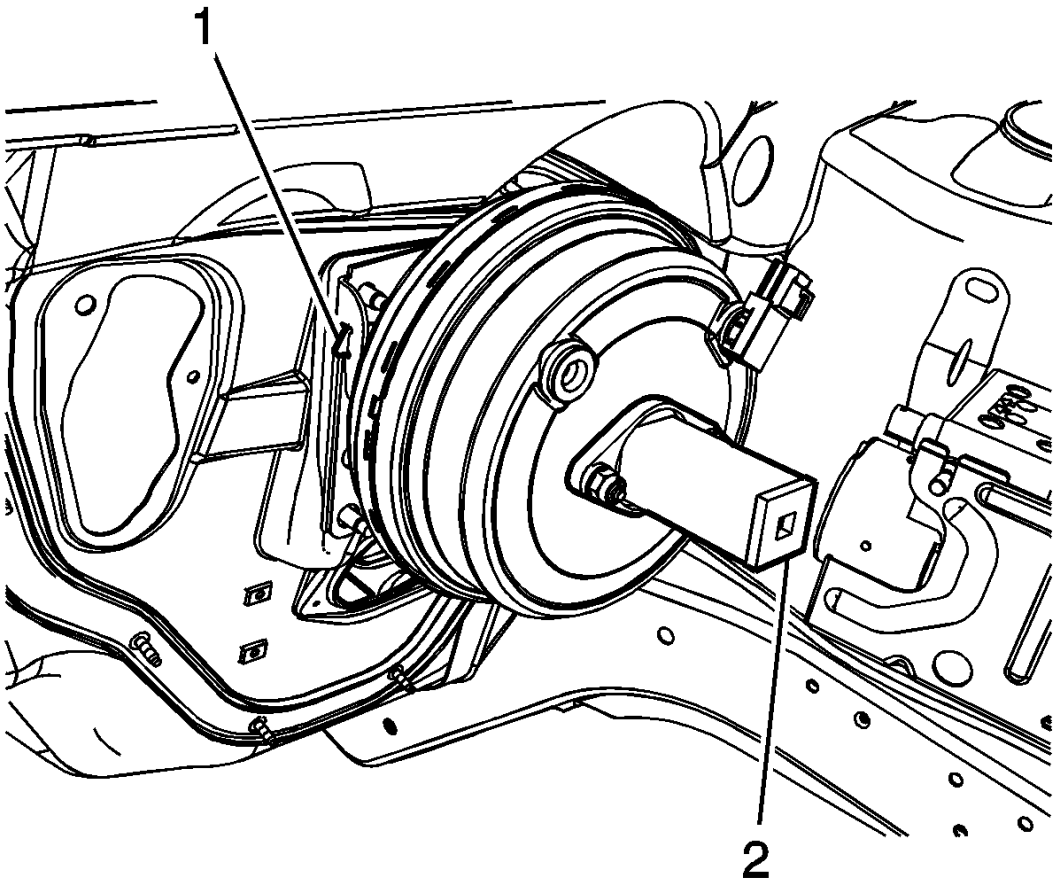

Fig. 59: View Of Power Brake Booster Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Position the power vacuum brake booster to the vehicle front of dash.
5. Install the **J-22805-C** Brake Booster Holder to the power vacuum brake booster studs.
6. Secure the **J-22805-C** Brake Booster Holder using the master cylinder nuts.
7. Press the locking tab (1) and rotate the **J-22805-C** Brake Booster Holder (2) clockwise.
8. Ensure the locking tab is fully engaged in the power vacuum brake booster mounting plate on the front of dash.
9. Remove the **J-22805-C** Brake Booster Holder and discard the master cylinder nuts.

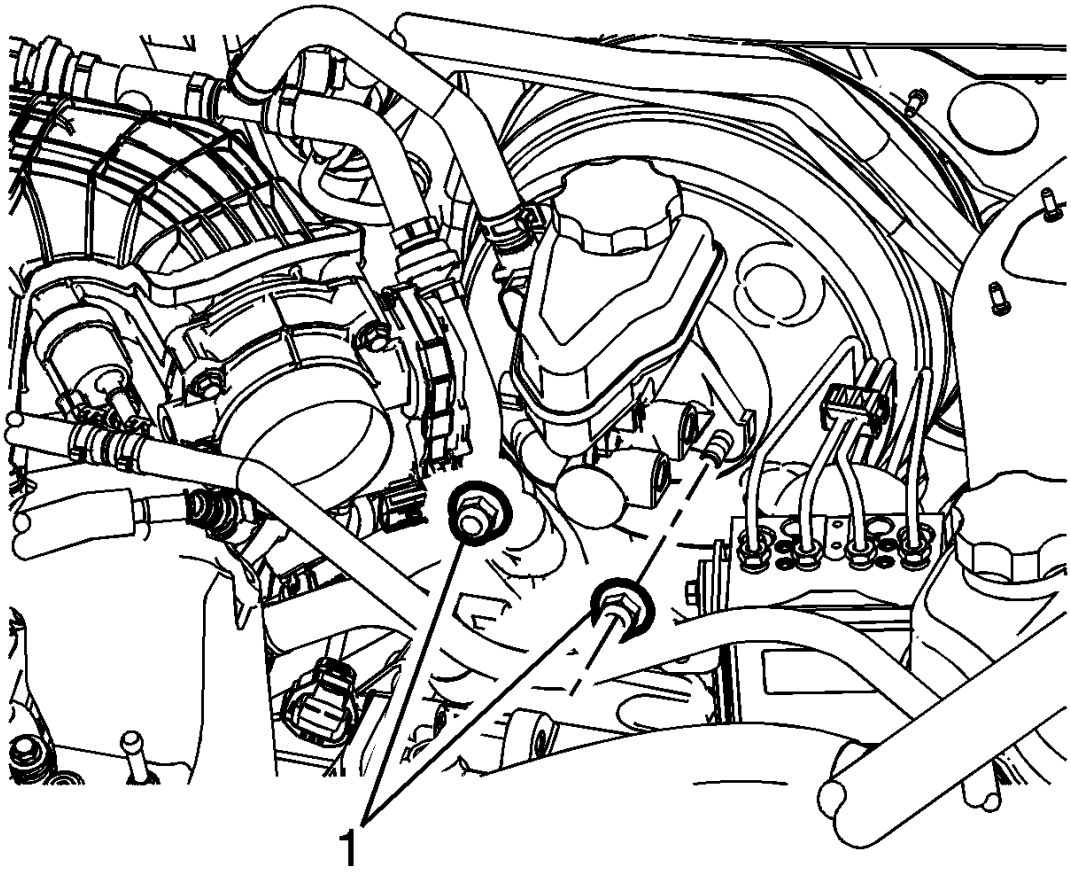

Fig. 60: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Install the master cylinder to the power vacuum brake booster.

CAUTION: Refer to Fastener Caution .

11. Install new master cylinder nuts (1) and tighten to 33 N.m (24 lb ft).

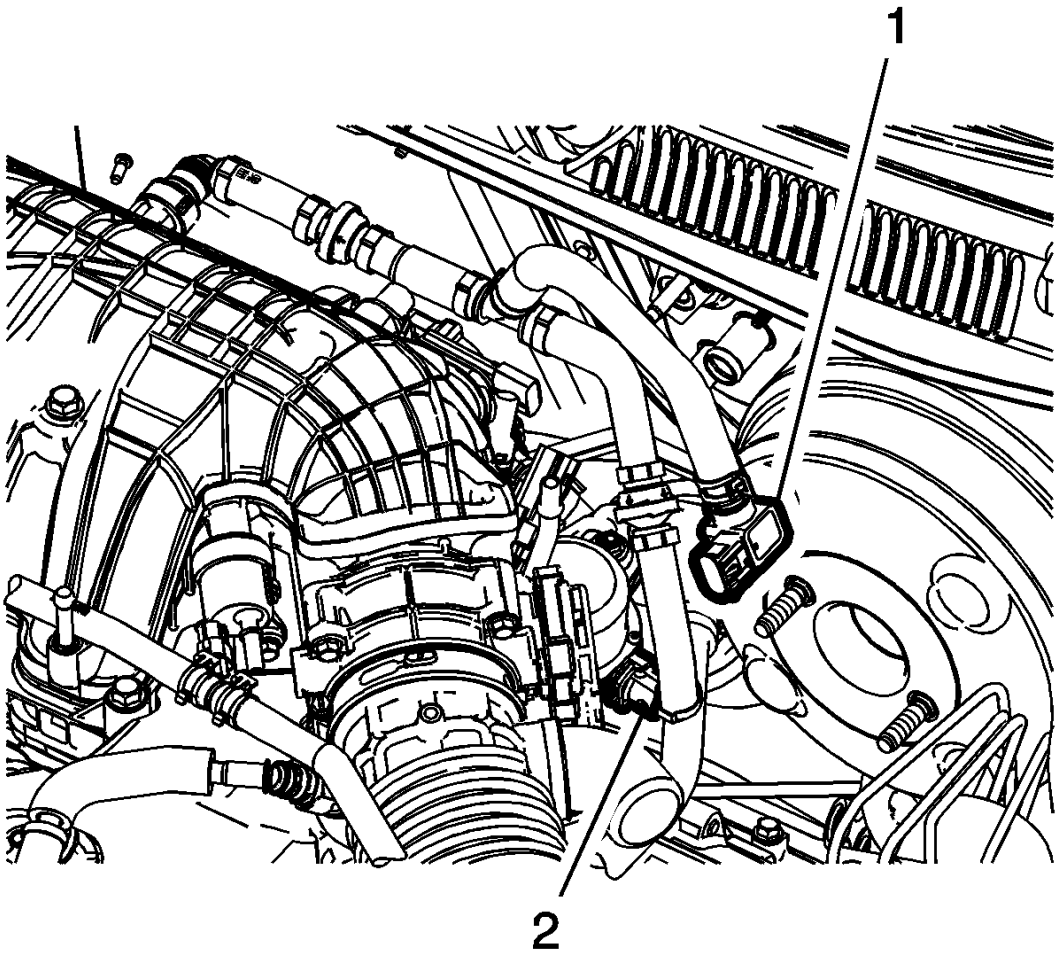

Fig. 61: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

NOTE: **A small amount of denatured alcohol may be used as a lubricant for assembly.**

12. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.
13. Connect the power brake vacuum booster hose quick connect (2) to the power brake booster pump.
14. Connect the brake fluid level indicator switch electrical connector.
15. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
16. Install the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .

POWER BRAKE BOOSTER VACUUM CHECK VALVE AND HOSE REPLACEMENT

Removal Procedure

1. Turn the ignition to the OFF position.
2. Apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power

vacuum brake booster vacuum reserve.

3. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .
4. Disconnect the power brake booster vacuum sensor electrical connector.

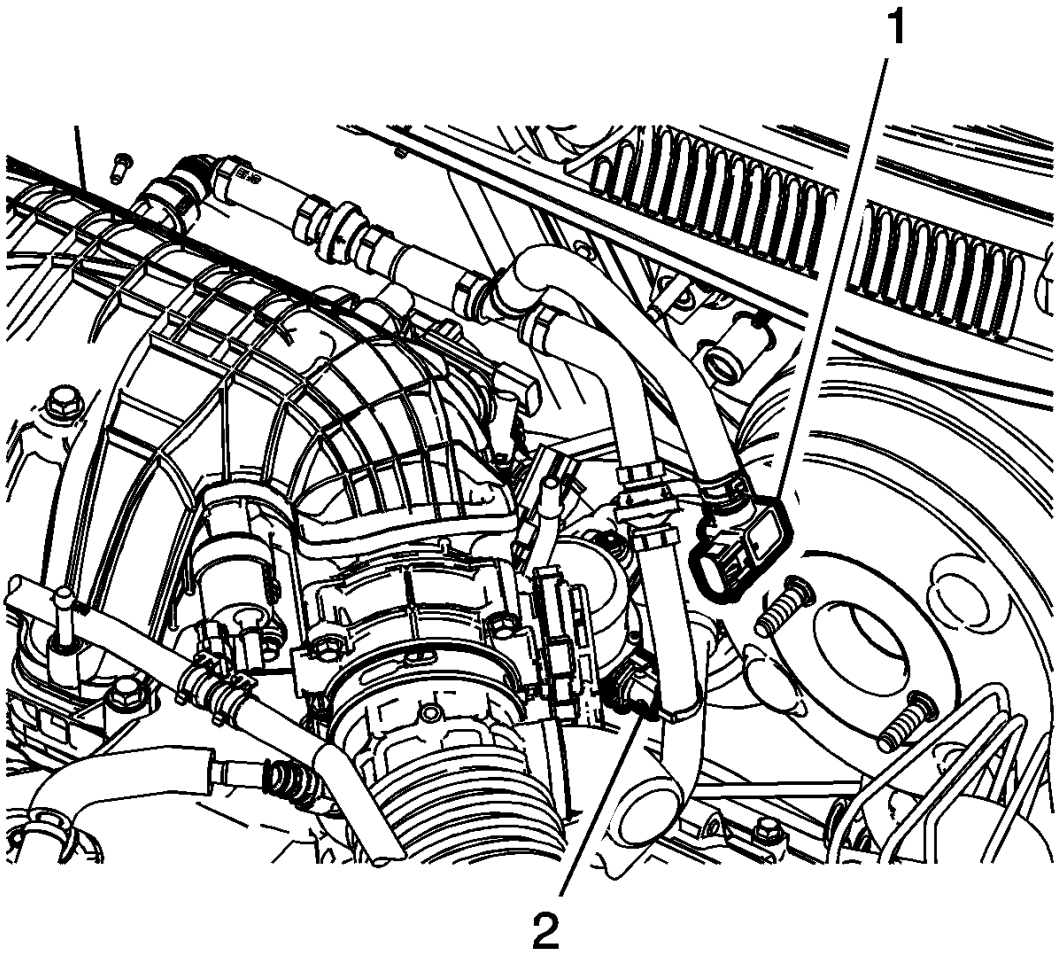

Fig. 62: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

5. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster.
6. Disconnect the power brake booster vacuum hose quick connect (2) from the power brake booster pump.

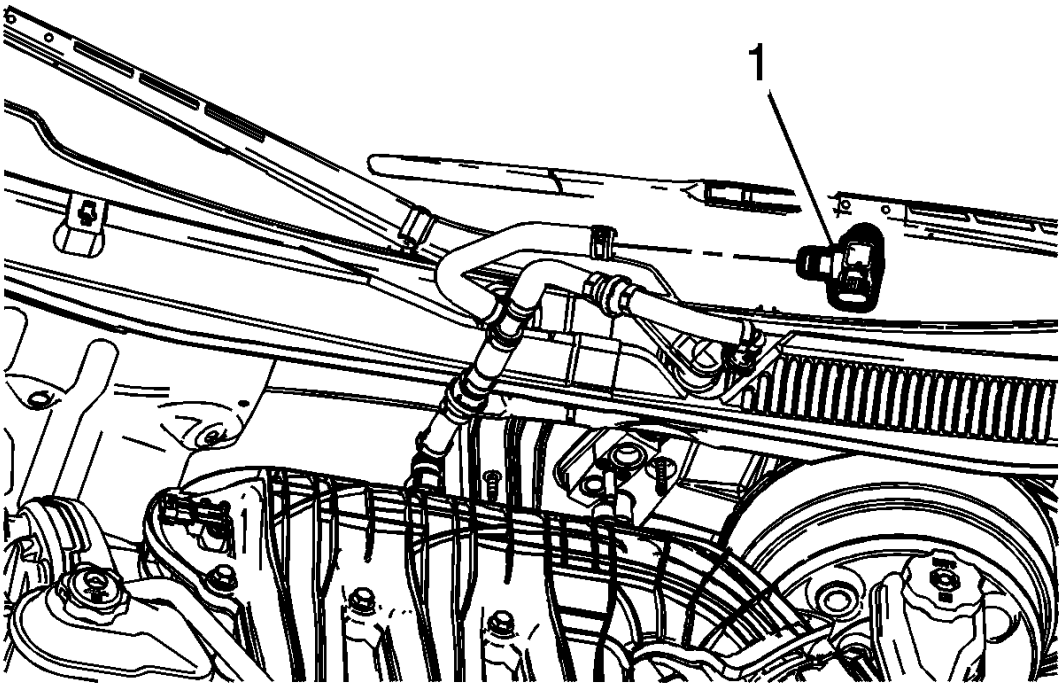

Fig. 63: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

7. If necessary, compress the clamp and remove the power brake booster vacuum sensor (1) from the power brake booster vacuum hose.

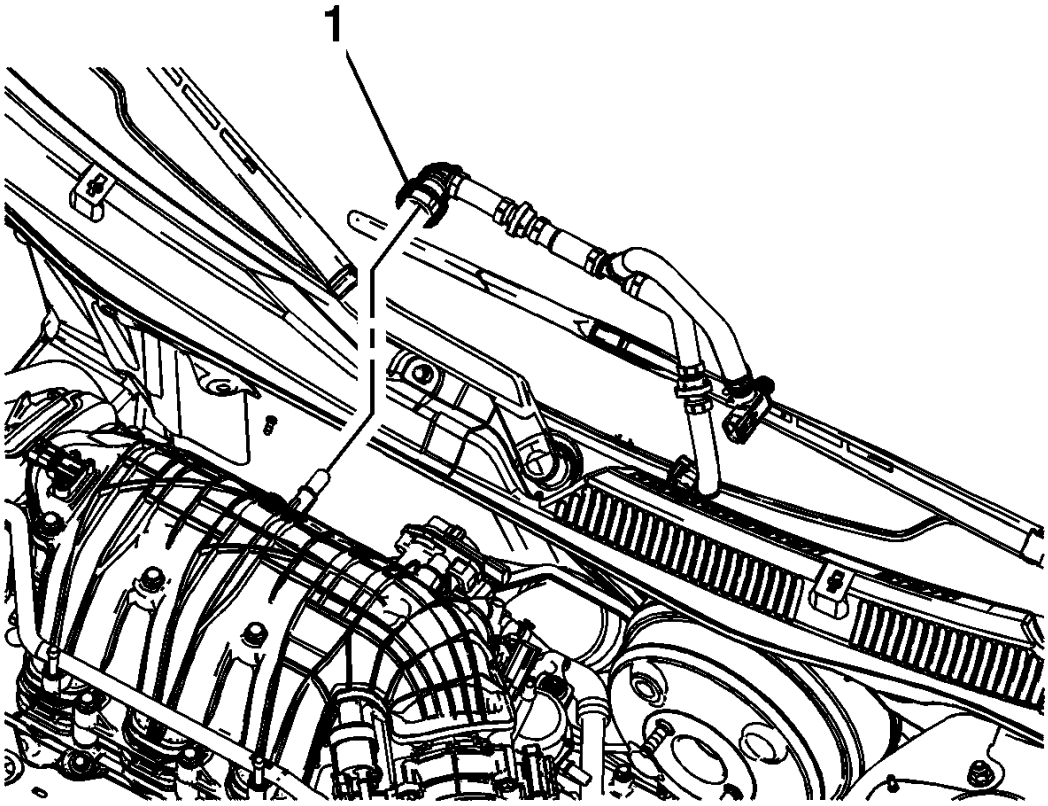

Fig. 64: Power Brake Booster Vacuum Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the power brake booster vacuum hose quick connect (1) from the intake manifold fitting.

Installation Procedure

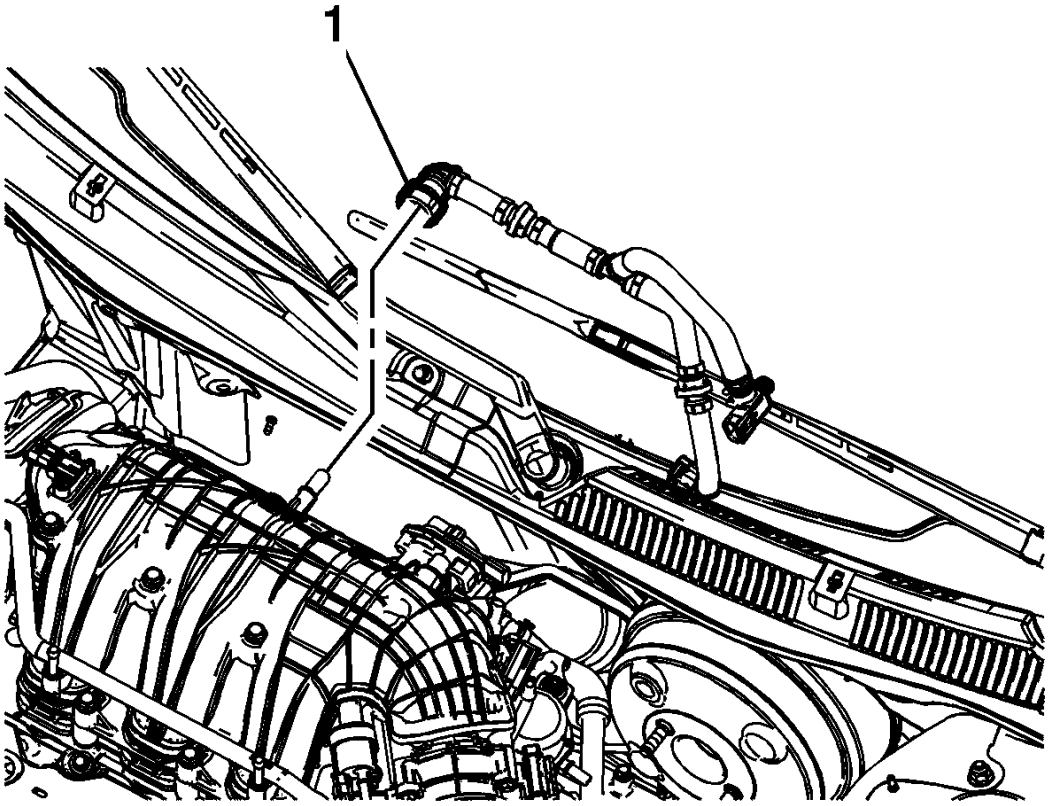

Fig. 65: Power Brake Booster Vacuum Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

1. Install the power brake booster vacuum hose and install the quick connect (1) to the intake manifold fitting.

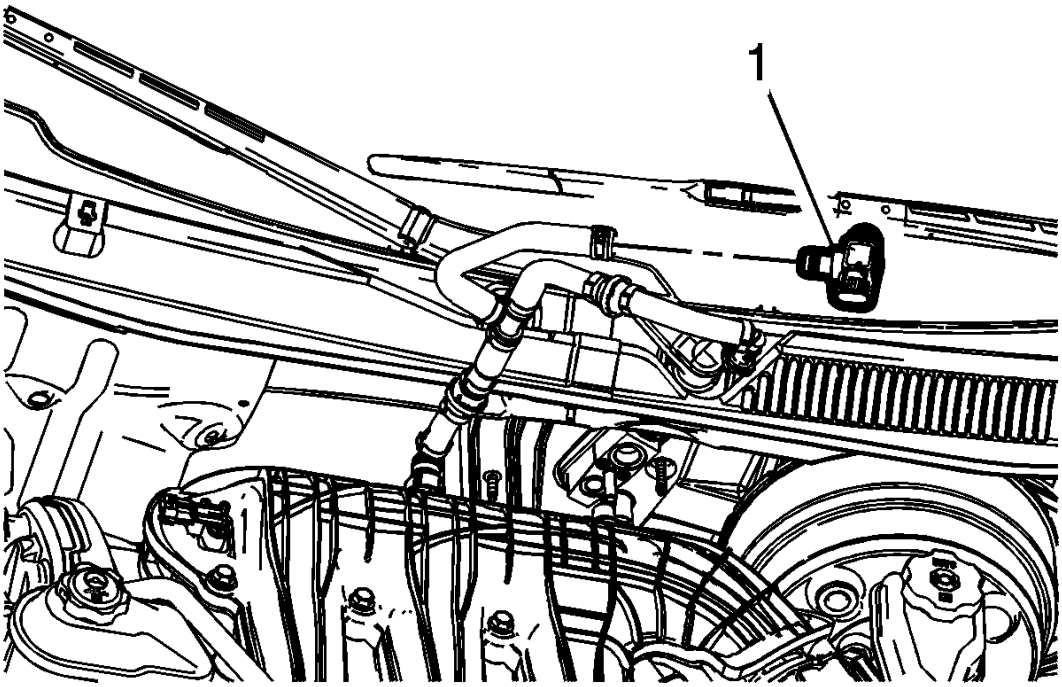

Fig. 66: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If necessary, a small amount of denatured alcohol may be used as a lubricant for installation.**

2. If removed, compress the clamp and install the power brake booster vacuum sensor (1). to the power brake booster vacuum hose.

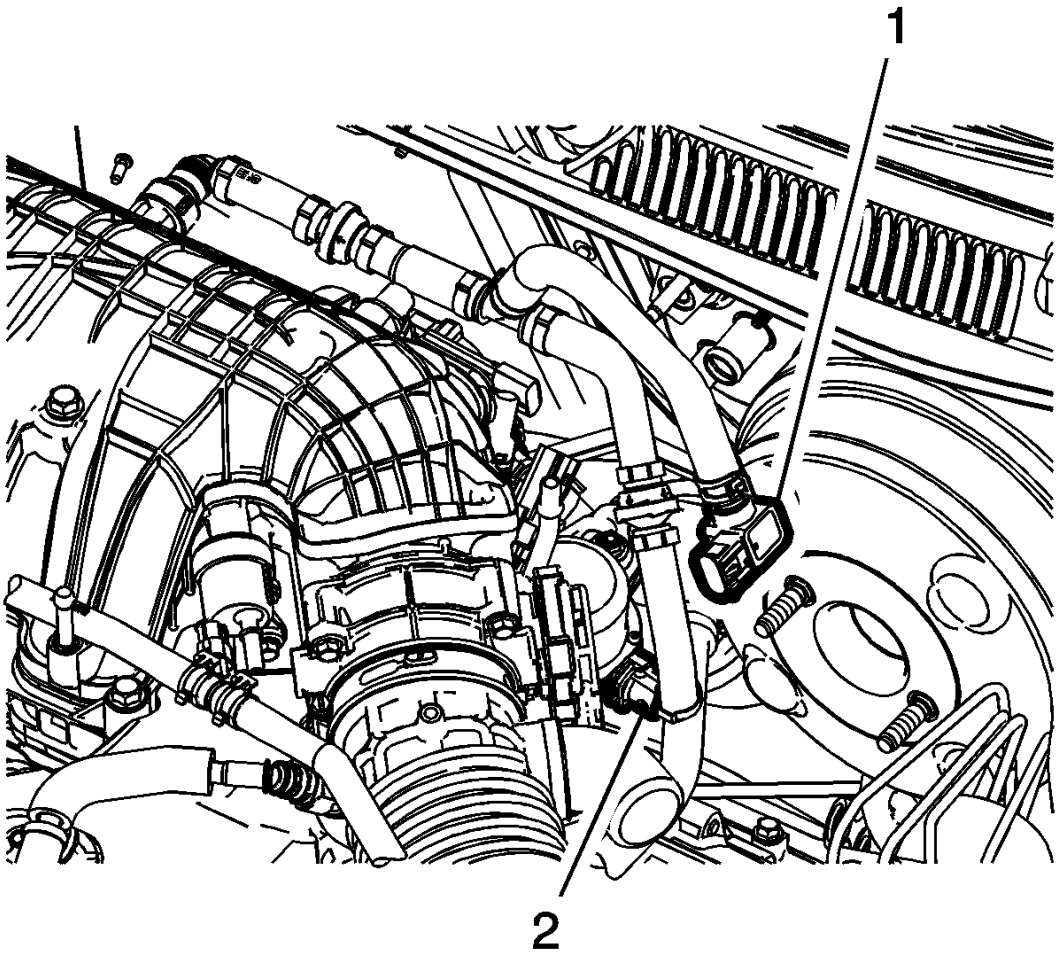

Fig. 67: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If necessary, a small amount of denatured alcohol may be used as a lubricant for installation.**

3. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.
4. Connect the power brake booster vacuum hose quick connect (2) to the power brake booster pump.
5. Connect the power brake booster vacuum sensor electrical connector.
6. Install the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .

POWER BRAKE BOOSTER VACUUM SENSOR REPLACEMENT

Removal Procedure

1. Turn the ignition to the OFF position.
2. Apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

3. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .
4. Disconnect the power brake booster vacuum sensor electrical connector.

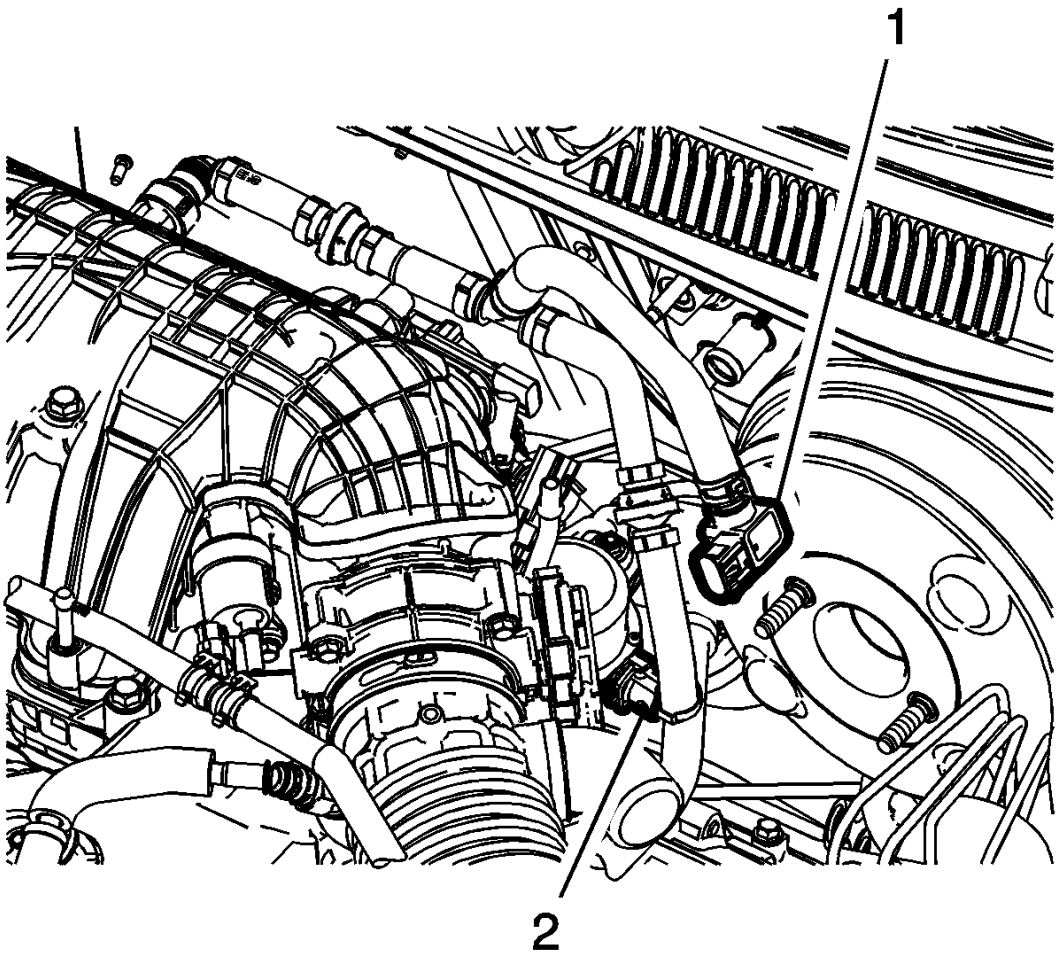

Fig. 68: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

5. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster.
6. Disconnect the power brake booster vacuum hose quick connect (2) from the power brake booster pump.

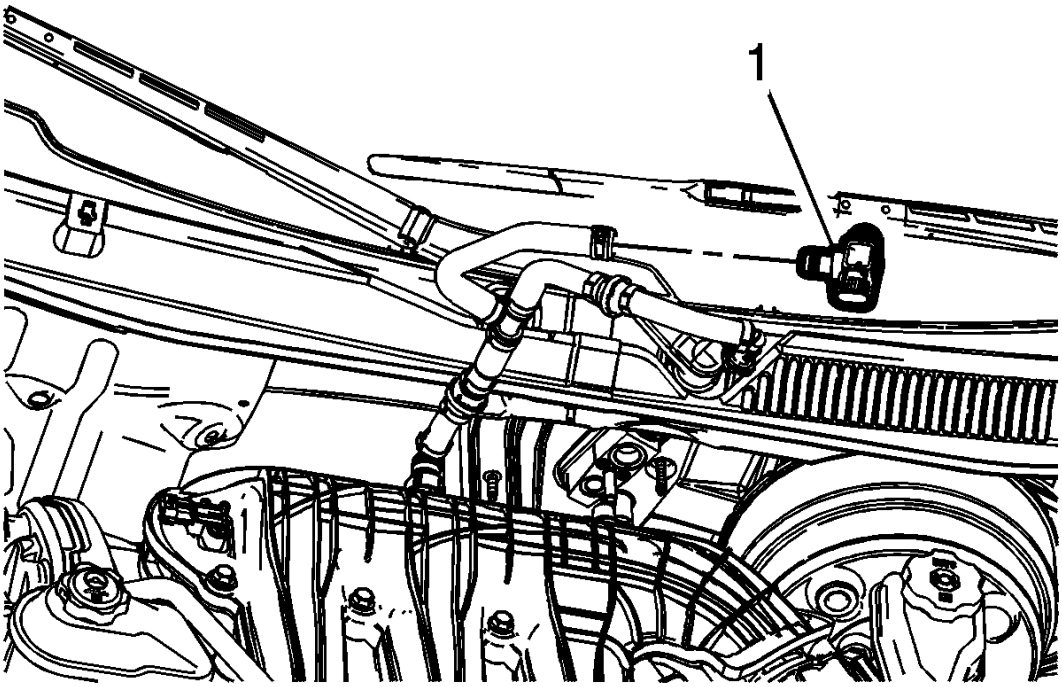

Fig. 69: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

7. Rotate the power brake booster vacuum hose assembly upward, compress the clamp and remove the power brake booster vacuum sensor (1) from the power brake booster vacuum hose.

Installation Procedure

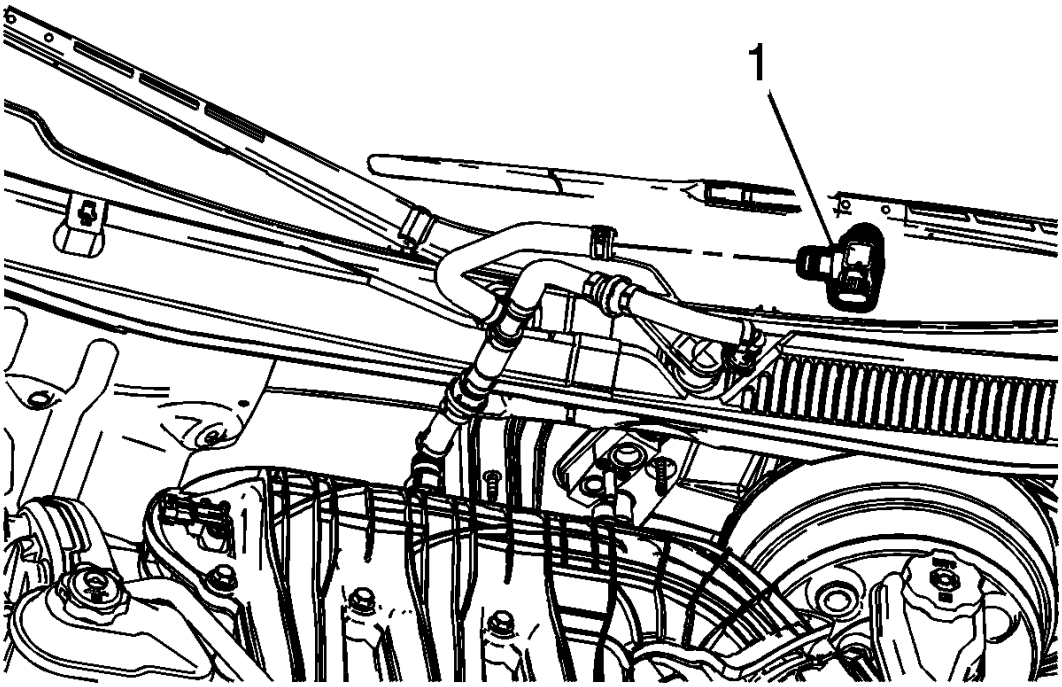

Fig. 70: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If necessary, a small amount of denatured alcohol may be used as a lubricant for installation.**

1. Compress the clamp and install the power brake booster vacuum sensor (1). to the power brake booster vacuum hose.

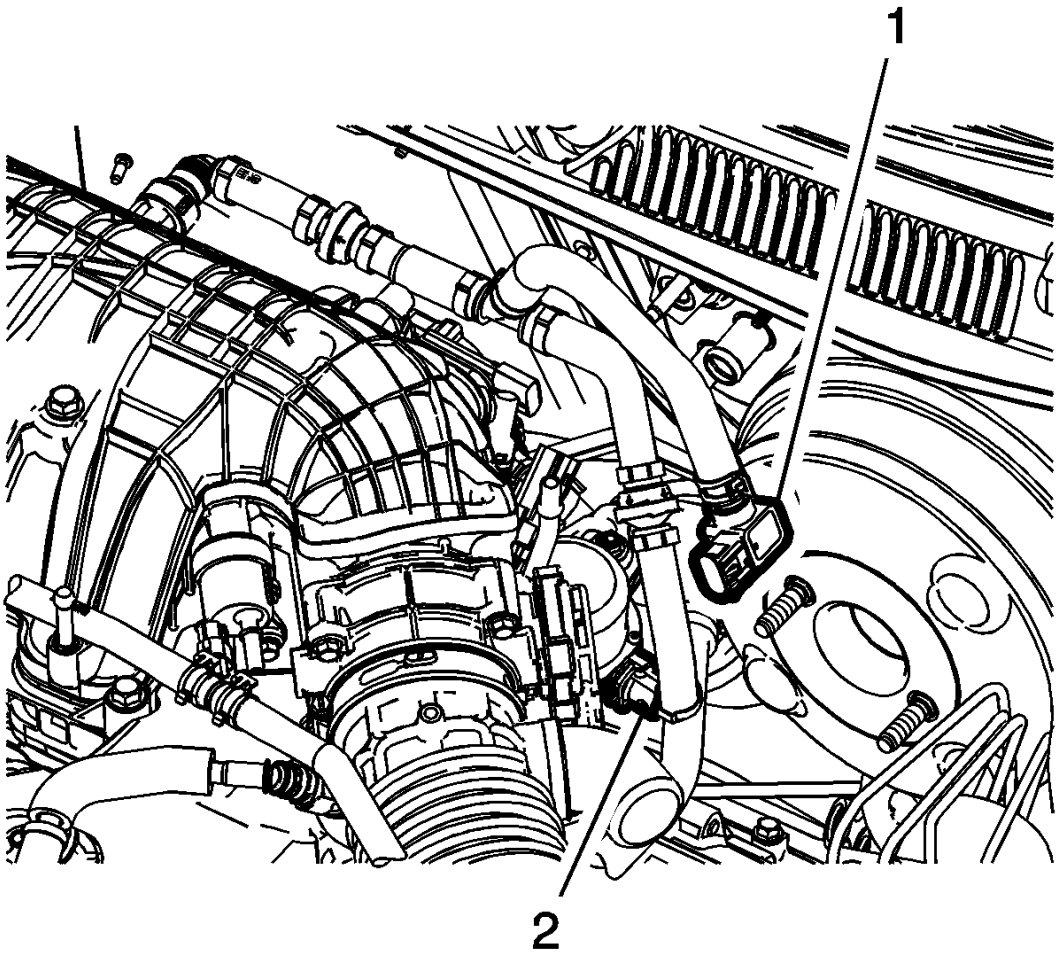

Fig. 71: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If necessary, a small amount of denatured alcohol may be used as a lubricant for installation.**

2. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.
3. Connect the power brake booster vacuum hose quick connect (2) to the power brake booster pump.
4. Connect the power brake booster vacuum sensor electrical connector.
5. Install the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .

POWER BRAKE BOOSTER AUXILIARY PUMP REPLACEMENT

Removal Procedure

1. Turn the ignition to the OFF position.
2. Apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

3. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .
4. Disconnect the power brake booster vacuum sensor electrical connector.

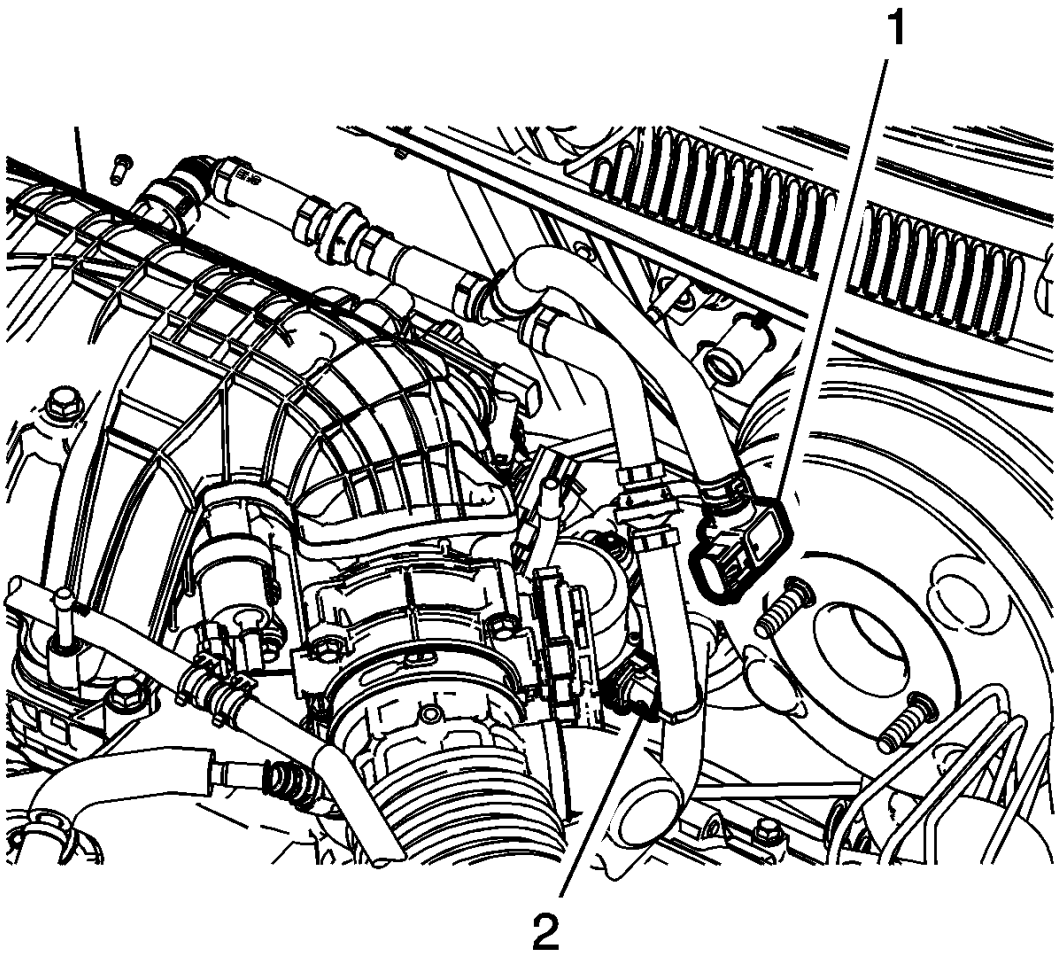

Fig. 72: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

5. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster.
6. Disconnect the power brake booster vacuum hose quick connect (2) from the power brake booster pump.
7. Position the power brake booster vacuum hose aside.

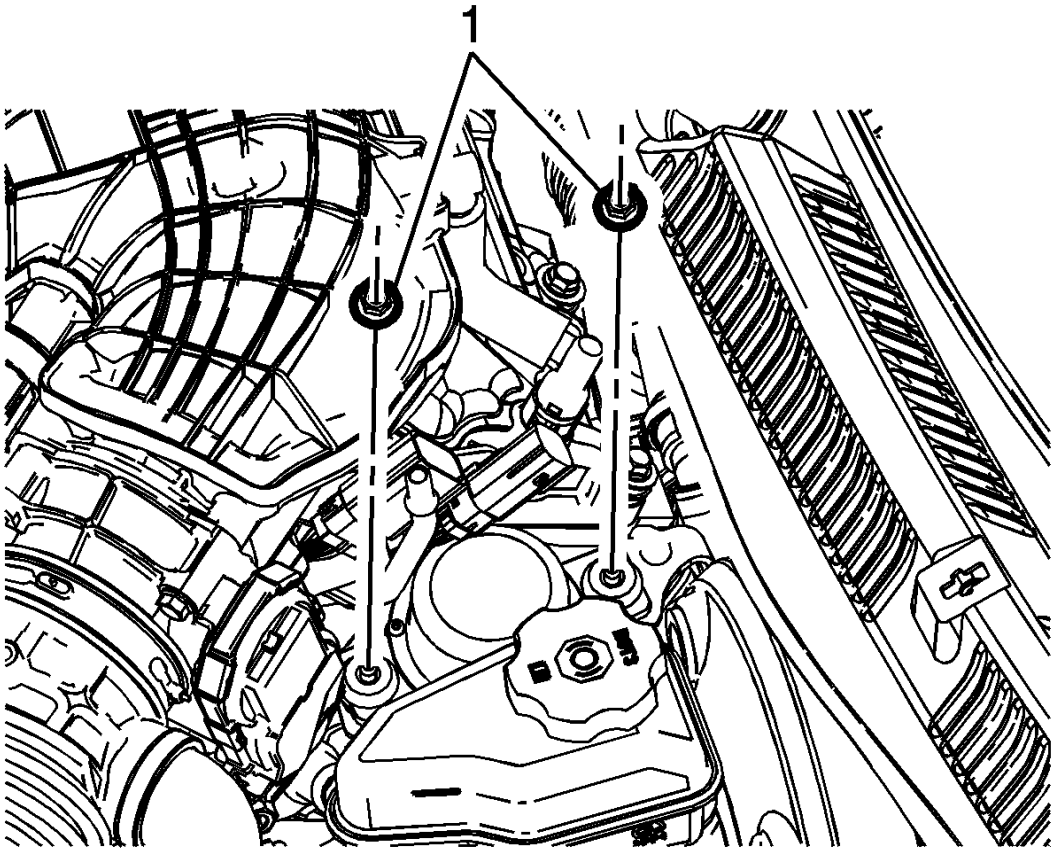

Fig. 73: Power Brake Booster Pump Nuts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the power brake booster pump nuts (1).

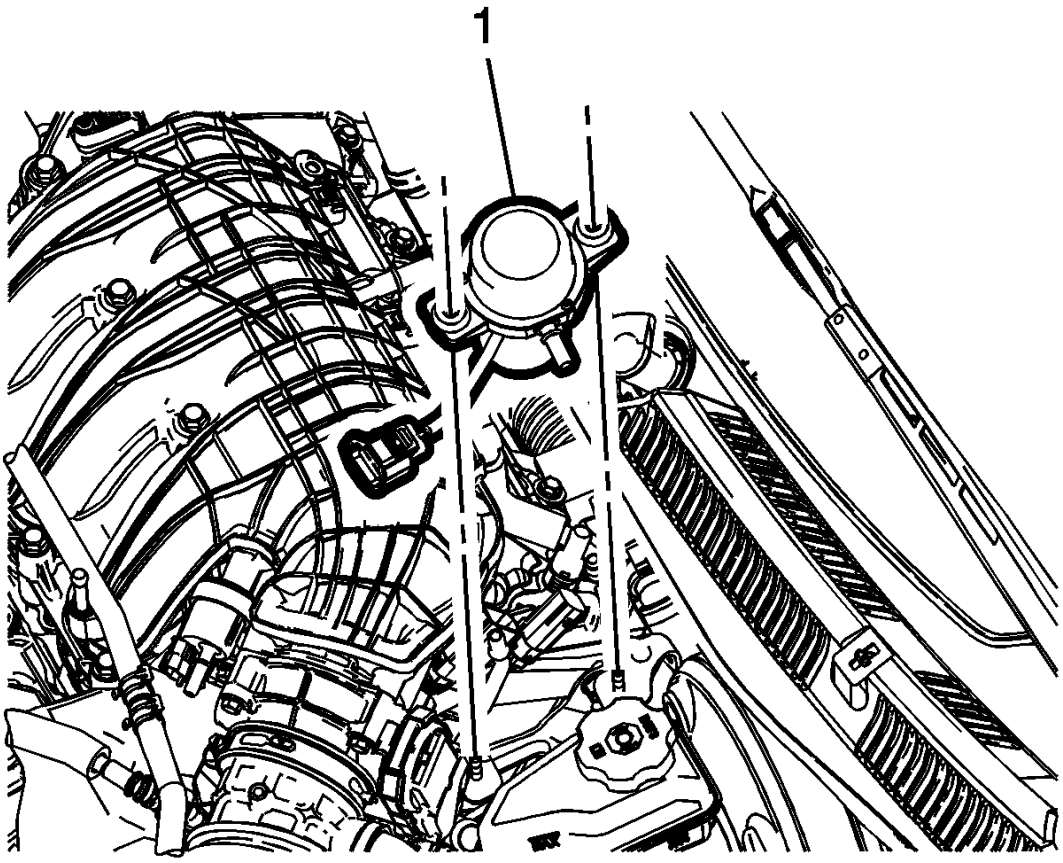

Fig. 74: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the power brake booster pump electrical connector.
10. Remove the power brake booster pump (1).

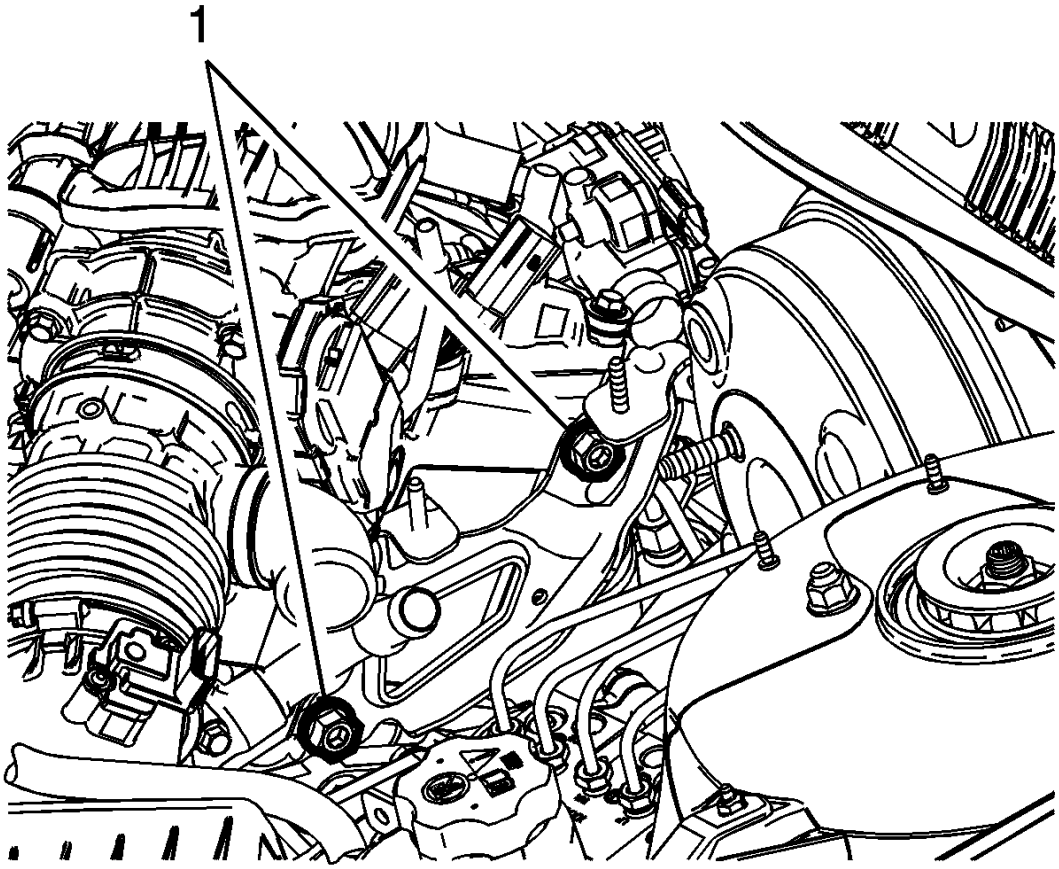

Fig. 75: Power Brake Booster Pump Bracket Bolts

12. If necessary, remove the power brake booster pump bracket (1).

Installation Procedure

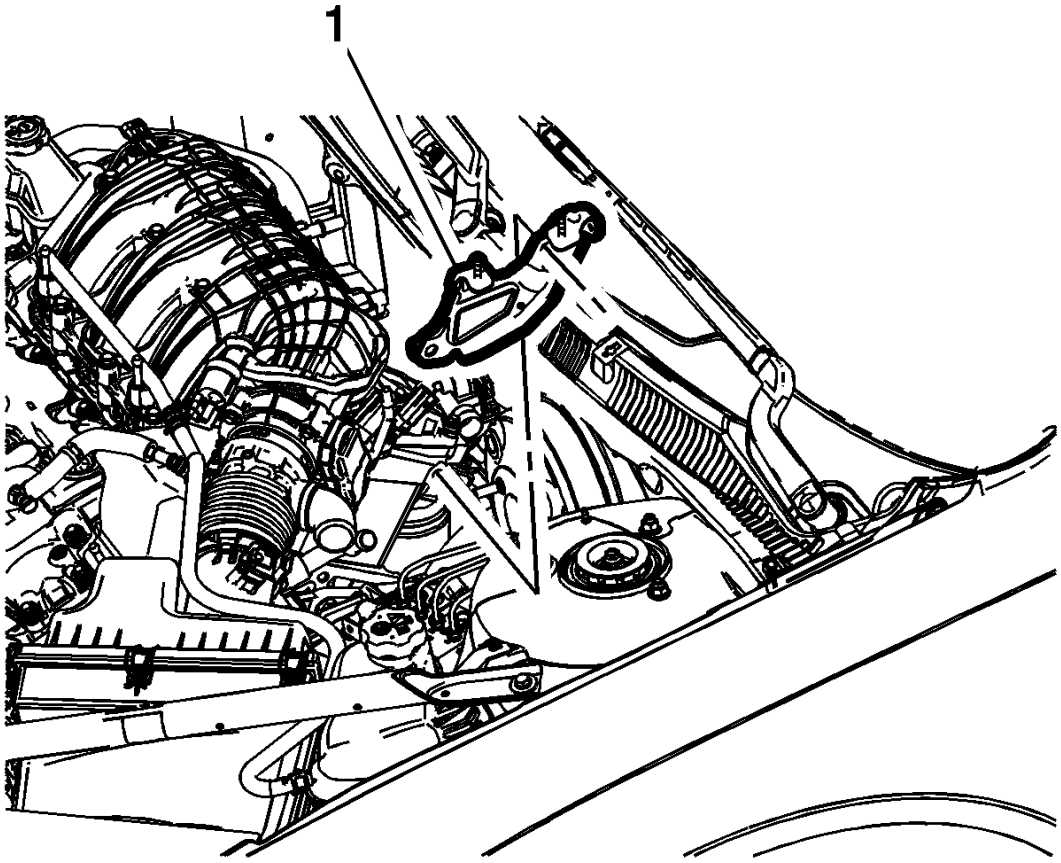

Fig. 77: Power Brake Booster Pump Bracket
Courtesy of GENERAL MOTORS COMPANY

1. If removed, install the power brake booster pump bracket (1).

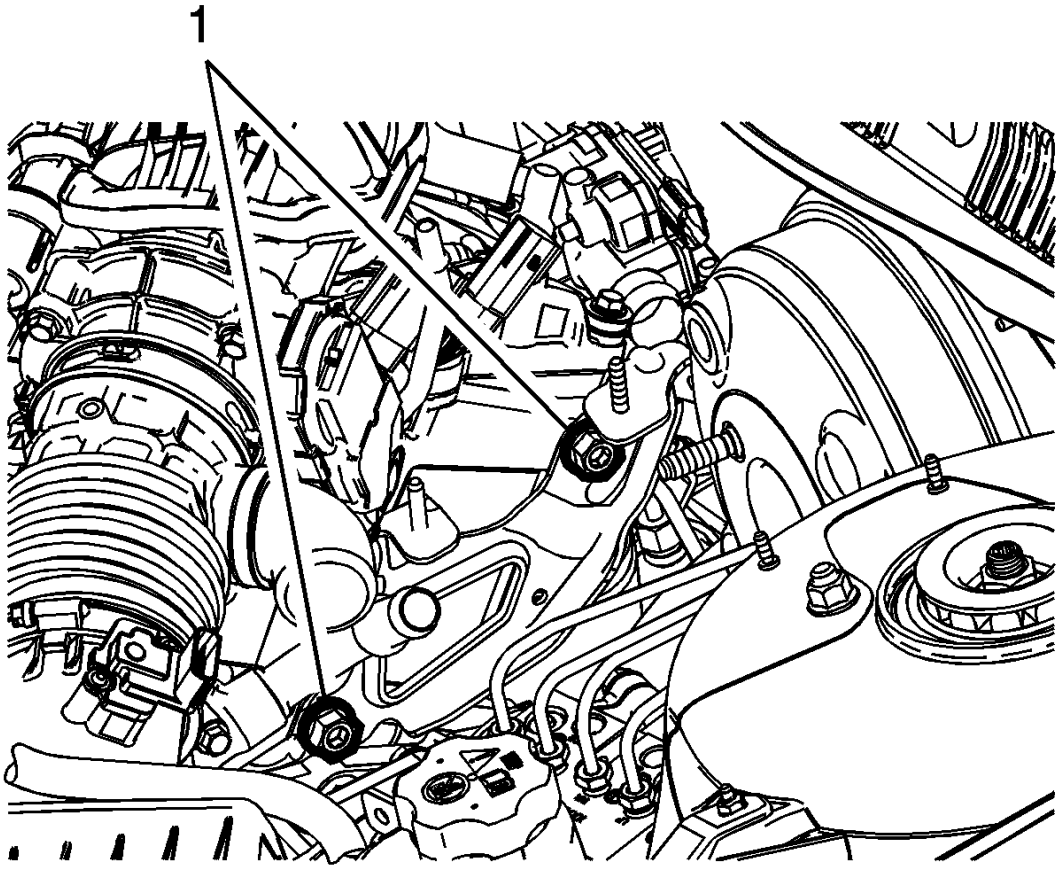

Fig. 78: Power Brake Booster Pump Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. If removed, install the power brake booster pump bracket bolts (1) and tighten to 58 N.m (43 lb ft).

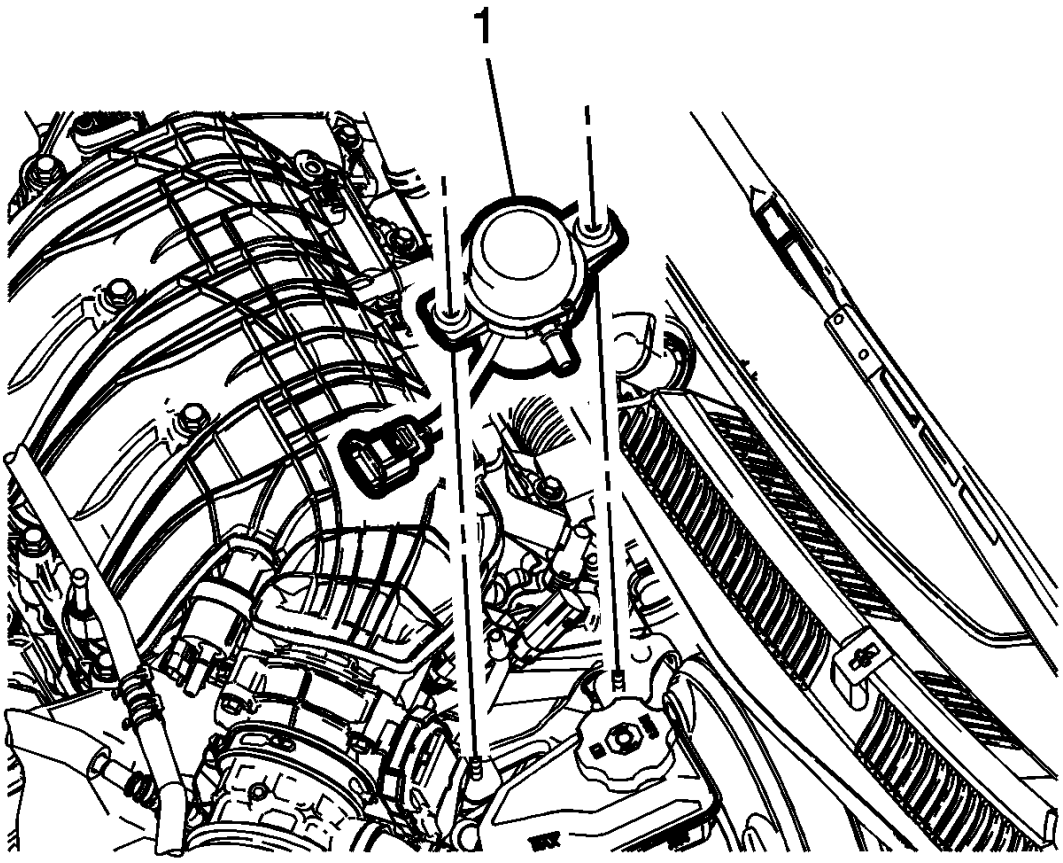

Fig. 79: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

3. Install the power brake booster pump (1).
4. Connect the power brake booster pump electrical connector.

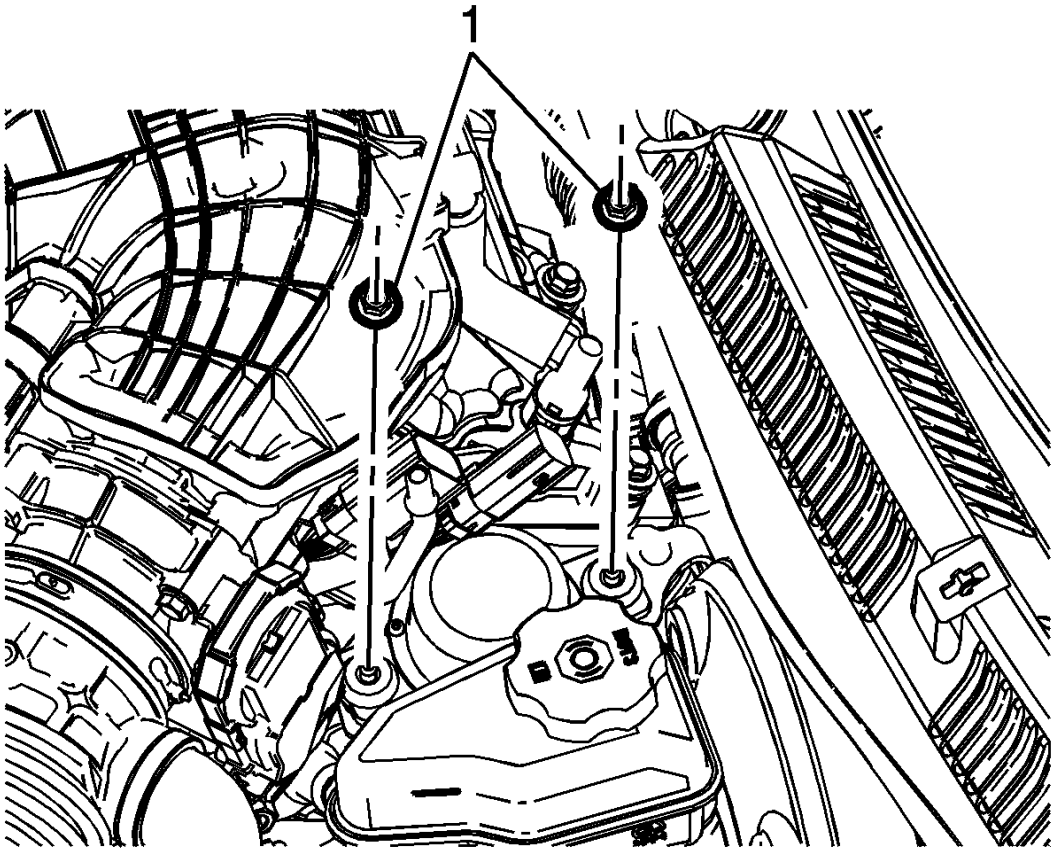

Fig. 80: Power Brake Booster Pump Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Install the power brake booster pump nuts (1) and tighten to 9 N.m (80 lb in).

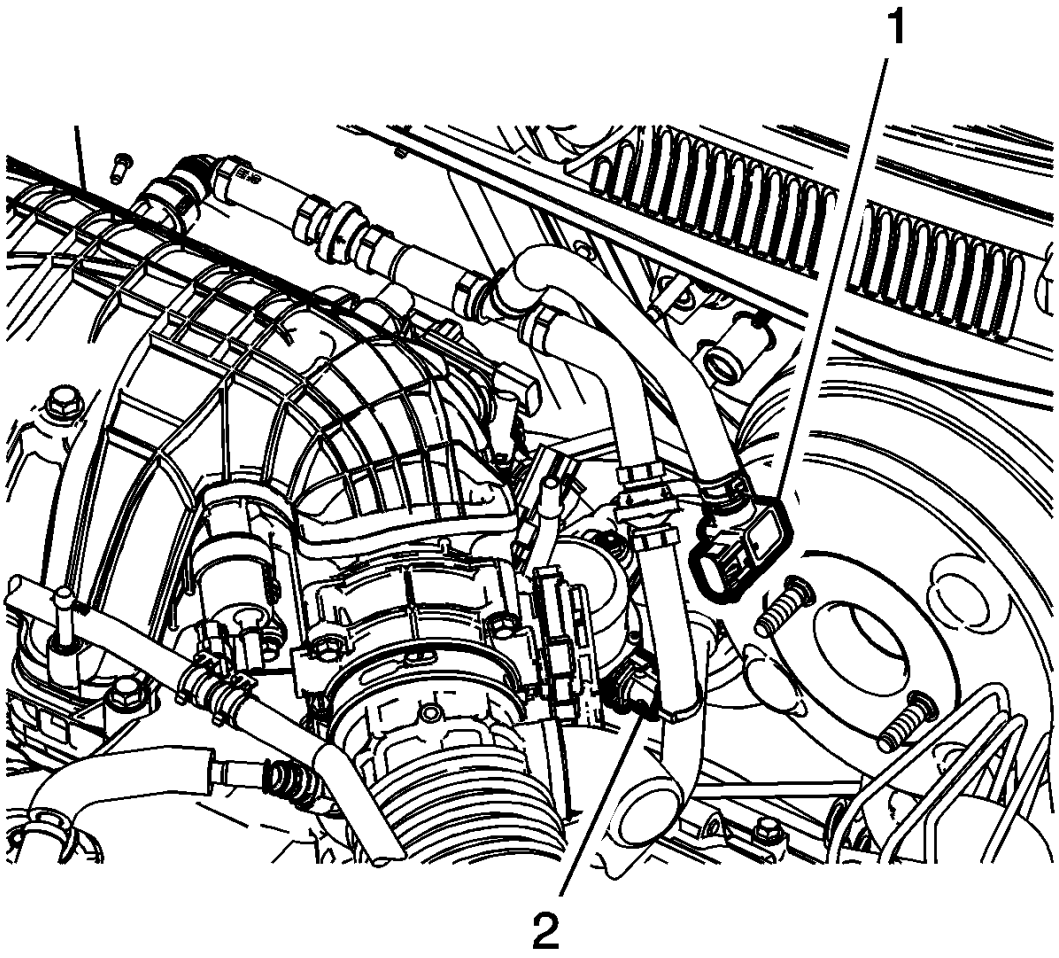

Fig. 81: Power Brake Booster Vacuum Sensor And Power Brake Vacuum Booster Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If necessary, a small amount of denatured alcohol may be used as a lubricant for installation.**

6. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.
7. Connect the power brake booster vacuum hose quick connect (2) to the power brake booster pump.
8. Connect the power brake booster vacuum sensor electrical connector.
9. Install the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .

DESCRIPTION AND OPERATION

BRAKE ASSIST SYSTEM DESCRIPTION AND OPERATION

System Component Description

The brake assist system consists of the following:

Brake Pedal

Receives, multiplies and transfers brake system input force from driver.

Brake Pedal Pushrod

Transfers multiplied input force received from brake pedal to brake booster.

Vacuum Brake Booster

Uses source vacuum to decrease effort required by driver when applying brake system input force.
At rest, source vacuum is applied to both sides of the vacuum diaphragm for single boosters, or to both sides of each of the diaphragms for tandem boosters. Return springs maintain the booster in a rest position.
When brake system input force is applied, vacuum to the rear of the diaphragm(s) is cut off, and air at atmospheric pressure is admitted in its place. This provides a decrease in brake pedal effort required.
When input force is removed, vacuum again replaces atmospheric pressure within the booster.

Vacuum Source

Supplies force used by vacuum brake booster to decrease brake pedal effort.
The primary source for vacuum is typically the vehicle's internal combustion engine. Some vehicles may use a vacuum pump to ensure and adequate supply of vacuum under various operating conditions, such as during cold start-up, heavy throttle, and high altitude.

Vacuum Pump Relay

Vehicles equipped with a vacuum pump will typically be equipped with a relay used to provide voltage to the vacuum pump motor, when commanded by the powertrain controller.

Vacuum Monitoring System

Provides a feedback voltage signal relative to the amount of vacuum available for the vacuum power brake booster.
This typically consists of a vacuum sensor mounted either into the power vacuum brake booster, integrated with the vacuum check valve, or in-line within the vacuum hose. The sensor feedback is typically monitored by the powertrain control module(s).

Vacuum Source Control

If equipped with a system to monitor available levels of vacuum for the brake assist system, the powertrain control module(s) typically perform the primary monitoring function.
The powertrain controller will typically monitor the feedback signal of a vacuum sensor, as it relates to available vacuum at the vacuum power brake booster. The powertrain controller uses the information to make sure available vacuum remains above predetermined levels. If additional vacuum is required, the powertrain controller may reactivate engine cylinders, if equipped, or command a vacuum pump ON, if equipped, and/or may alter the operation of various other engine controls and devices, as necessary.

Vacuum Source Delivery System

Enables delivery and retention of source vacuum for vacuum brake booster.

This typically consists of a vacuum check valve and a vacuum hose or pipe. If a vacuum pump is used, additional check valves may be used.

System Operation

Brake system input force from the driver is multiplied by the brake pedal and transferred by the pedal pushrod to the hydraulic brake master cylinder. Effort required to apply the brake system is reduced by the operation of the vacuum brake booster.

When brake system force is applied, vacuum to the rear of the diaphragm(s) is cut off, and air at atmospheric pressure is admitted in its place. The vacuum acts to pull the diaphragm(s) forward, while the atmospheric pressure acts to push from behind. As a result, the amount of effort required by the driver is reduced. When input force is removed, vacuum again replaces atmospheric pressure within the vacuum power brake booster to help return the booster to rest. Return springs maintain the system in a rest position.

If the vehicle is equipped with a vacuum monitoring system, the powertrain control module(s) typically will alter powertrain functions and/or command the vacuum pump ON, if equipped, to provide for the vacuum needs of the brake assist system, as operating conditions warrant.

BRAKE BOOSTER VACUUM ASSIST DESCRIPTION AND OPERATION

System Component Description

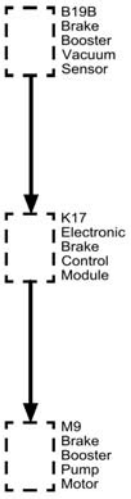

Fig. 82: Hydraulic Brake Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
B19B	B19B Brake Booster Vacuum Sensor
K17	K17 Electronic Brake Control Module
M9	M9 Brake Booster Pump Motor

The brake booster vacuum assist system consists of the following:

Brake Booster Auxiliary Vacuum Pump (electric or mechanical)

The brake booster vacuum pump is a secondary vacuum supply to the brake booster used to maintain sufficient vacuum for brake assist.

Brake Booster Vacuum Sensor

The vacuum sensor is used to measure the level of vacuum available in the brake booster. The electronic brake control module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor is located in the brake booster or vacuum hose. The brake booster vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the electronic brake control module.

Electronic Brake Control Module

The electronic brake control module monitors the vacuum in the brake booster using the brake booster vacuum sensor. When the vacuum within the system drops the electronic brake control module turns ON the brake booster auxiliary vacuum pump.

Vacuum Brake Booster

When brake system input force is applied, air at atmospheric pressure is admitted to the rear of both vacuum diaphragms, providing a decrease in brake pedal effort required. When input force is removed, vacuum replaces the atmospheric pressure within the booster. The booster uses source vacuum to decrease the effort required by driver when applying the brake.

Vacuum Source

Vacuum is supplied by the engine vacuum or by the brake booster auxiliary vacuum pump (electric or mechanical).

System Operation

The electric pump can be switched on and off by the electronic brake control module based on the required vacuum. Pressure variations during braking can be measured, and the pump can be activated to generate additional vacuum if required to increase the braking force.

BRAKE FLUID AND BRAKE FLUID HANDLING

WARNING: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- **Eye contact-rinse thoroughly with water.**

- **Skin contact-wash with soap and water.**
- **If ingested-consult a physician immediately.**

WARNING: **Use only Delco Supreme 11, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT 3 brake fluid from a clean, sealed container. Do not use fluid from an open container that may be contaminated with water. Improper or contaminated fluid could result in damage to components, or loss of braking, with possible injury.**

CAUTION: **When filling the master cylinder, use only Delco Supreme 11, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT 3 brake fluid. Do not use a container which has been used for petroleum based fluids, or a container which is wet with water. Petroleum based fluids will cause swelling and distortion of rubber parts in the hydraulic brake system, and water will mix with brake fluid, lowering the boiling point. Keep all fluid containers capped to prevent contamination.**

CAUTION: **Brake fluid will damage electrical connections and painted surfaces. Use shop cloths, suitable containers, and fender covers to prevent brake fluid from contacting these areas. Always re-seal and wipe off brake fluid containers to prevent spills.**

CAUTION: **Avoid spilling brake fluid on any of the vehicle's painted surfaces, wiring, cables or electrical connectors. Brake fluid will damage paint and electrical connections. If any fluid is spilled on the vehicle, immediately flush the area with water to minimize the potential for damage.**

CAUTION: **Power steering fluid, engine oil, brake fluid, or any mineral based fluids cannot be mixed. If brake seals contact power steering fluid or steering seals contact brake fluid, seal damage will result.**

NOTE:

- **Do not reuse the brake fluid collected during the hydraulic brake system bleeding.**
- **Always store brake fluid in a closed container.**
- **Reseal brake fluid containers immediately after use.**
- **Do not use brake fluid left in an open container.**
- **Do not use brake fluid left in an improperly sealed container.**
- **Do not use the following fluids in the hydraulic brake system:**
  - **Power steering fluid**
  - **Automatic transmission fluid**
  - **DOT 5 silicone hydraulic brake fluid**

BRAKE WARNING SYSTEM DESCRIPTION AND OPERATION

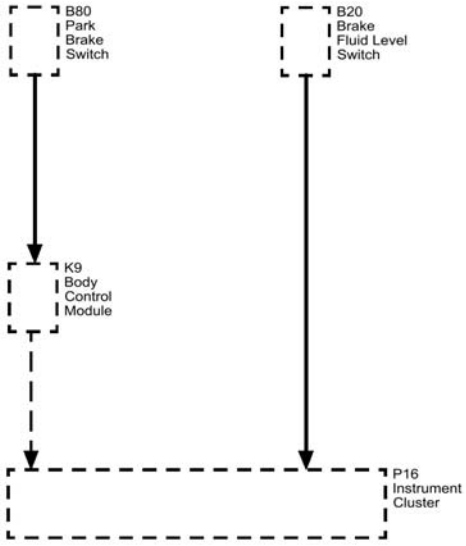

Fig. 83: Hydraulic Brakes Block Diagram

Callout	Component Name
B80	B80 Park Brake Switch
B20	B20 Brake Fluid Level Switch
K9	K9 Body Control Module
P16	P16 Instrument Cluster

Brake

The instrument panel cluster (IPC) illuminates the BRAKE indicator when any of the following occurs:

- The body control module (BCM) detects that the park brake is applied and sends serial data message to illuminate indicator.
- The IPC detects a low brake fluid condition.
- The electronic brake control module (EBCM) detects a malfunction with the antilock brake system (ABS). The IPC receives a serial data message from the EBCM requesting illumination.
- The IPC performs the displays test at the start of each ignition cycle. The indicator illuminates for approximately 5 seconds.

Check Brake Fluid

The IPC illuminates the CHECK BRAKE FLUID indicator in the driver information center (DIC) and sends a

serial data message in order to activate an audible warning when the IPC detects that the brake fluid level is below the normal operating range.

HYDRAULIC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.
Hydraulic output pressure is distributed from the master cylinder through two hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.
Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator. Refer to **ABS Description and Operation** for specific information on the operation of DRP.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - PARK BRAKE

IMPORTANT: Review the system operation in order to familiarize yourself with the system functions.

Refer to **Park Brake System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the park brake system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Park Brake Will Not Hold or Release

PARK BRAKE WILL NOT HOLD OR RELEASE

Step	Action	Yes	No
1	Were you sent here from the Park Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Park Brake**
2	Inspect the park brake system for proper operation. Refer to **Park Brake System Diagnosis**. Did you find and correct a condition?	Go to **Step 5**	Go to **Step 3**
3	Inspect the disc brake system for proper operation. Refer to **Disc Brake System Diagnosis** . Did you find and correct a condition?	Go to **Step 5**	Go to **Step 4**
4	Inspect the hydraulic brake system for proper operation. Refer to **Hydraulic Brake System**	Go to **Step 5**	Go to **Symptoms - Park Brake**

Step	Action	Yes	No
	Diagnosis . Did you find and correct a condition?		
5	Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** . Is the condition still present?	Go to **Step 2**	System OK

PARK BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the mechanical components of the PARK brake system in order to determine if the PARK brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Hydraulic Brake Symptom table?	Go to **Step 4**	Go to **Step 2**
2	Were you sent here from a Park Brake Symptom table?	Go to **Step 4**	Go to **Step 3**
3	1. Raise and support the vehicle with the rear axle supported by jack stands. Refer to **Lifting and Jacking the Vehicle** . 2. With the park brake RELEASED, attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to **Step 7**	Go to **Step 4**
4	1. Apply the park brake. 2. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to **Step 12**	Go to **Step 5**
5	Visually inspect the park brake cable connections and the cables that are accessible on the UNDERSIDE of the vehicle for disconnections and/or damage. Were any of the park brake cables disconnected and/or damaged?	Go to **Step 6**	Go to **Step 7**
6	Reconnect or replace the park brake cables as necessary. Refer to **Parking Brake Front Cable Replacement**, or **Parking Brake Rear Cable Replacement (Z7U)**. Did you complete the repair and/or replacement?	Go to **Step 12**	-
7	1. Disconnect the rear park brake cables from the equalizer and from the brake caliper piston apply levers. Refer to **Parking Brake Rear Cable Replacement (Z7U)**. 2. Have an assistant apply and maintain the caliper piston apply lever to apply the caliper piston.	Go to **Step 9**	Go to **Step 8**

Step	Action	Yes	No
	3. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. 4. Release the caliper piston apply lever. 5. Repeat steps 2-4 for the opposite caliper piston apply lever. 6. Rotate the rear wheels to check the brake for a significant reduction of drag. Did the brake calipers apply and release properly?		
8	Replace the appropriate rear brake caliper. Refer to **Rear Brake Caliper Replacement** . Did you complete the replacement?	Go to **Step 12**	-
9	With the aid of an assistant, apply and release the parking brake while observing the cables for free movement. Did the park brake cables move freely?	Go to **Step 11**	Go to **Step 10**
10	Replace any of the park brake cables inspected that do not have free movement. Refer to **Parking Brake Front Cable Replacement**, or **Parking Brake Rear Cable Replacement (Z7U)**. Did you complete the replacement?	Go to **Step 12**	-
11	Inspect the park brake lever pedal assembly for proper operation and replace if necessary. Refer to **Parking Brake Lever Pedal Assembly Replacement**. Did you complete the replacement?	Go to **Step 12**	-
12	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Park Brake System OK	-

PARKING BRAKE SHOE INSPECTION

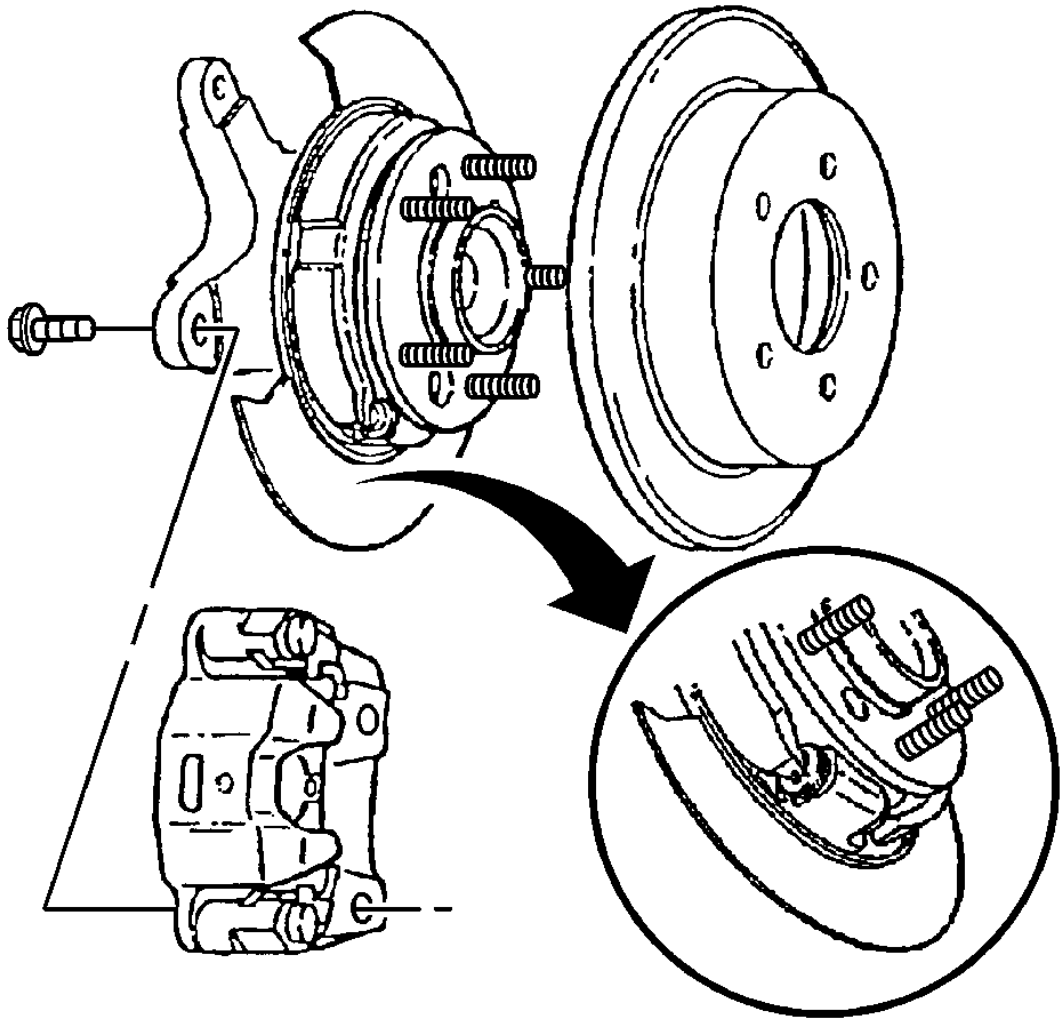

Fig. 1: Identifying Rear Brake Components
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear brake caliper bracket with the rear brake caliper. Refer to **Rear Brake Caliper Bracket Replacement** .
4. Remove the rear brake rotor. Refer to **Rear Brake Rotor Replacement** .
5. Inspect the park brake shoe and lining. If it exhibits any of the following conditions, then it requires replacement :
    - Excessive wear indicated by the park brake lining being worn down to the shoe
    - Brake lining cracking
    - Oil or fluid contamination of the brake lining

6. Install the rear brake rotor. Refer to **Rear Brake Rotor Replacement** .
7. Install the rear brake caliper with the rear brake caliper bracket. Refer to **Rear Brake Caliper Bracket Replacement** .
8. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
9. Lower the vehicle.

REPAIR INSTRUCTIONS

PARKING BRAKE LEVER PEDAL ASSEMBLY REPLACEMENT

Special Tools

J 37043 Parking Brake Cable Release Tool

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

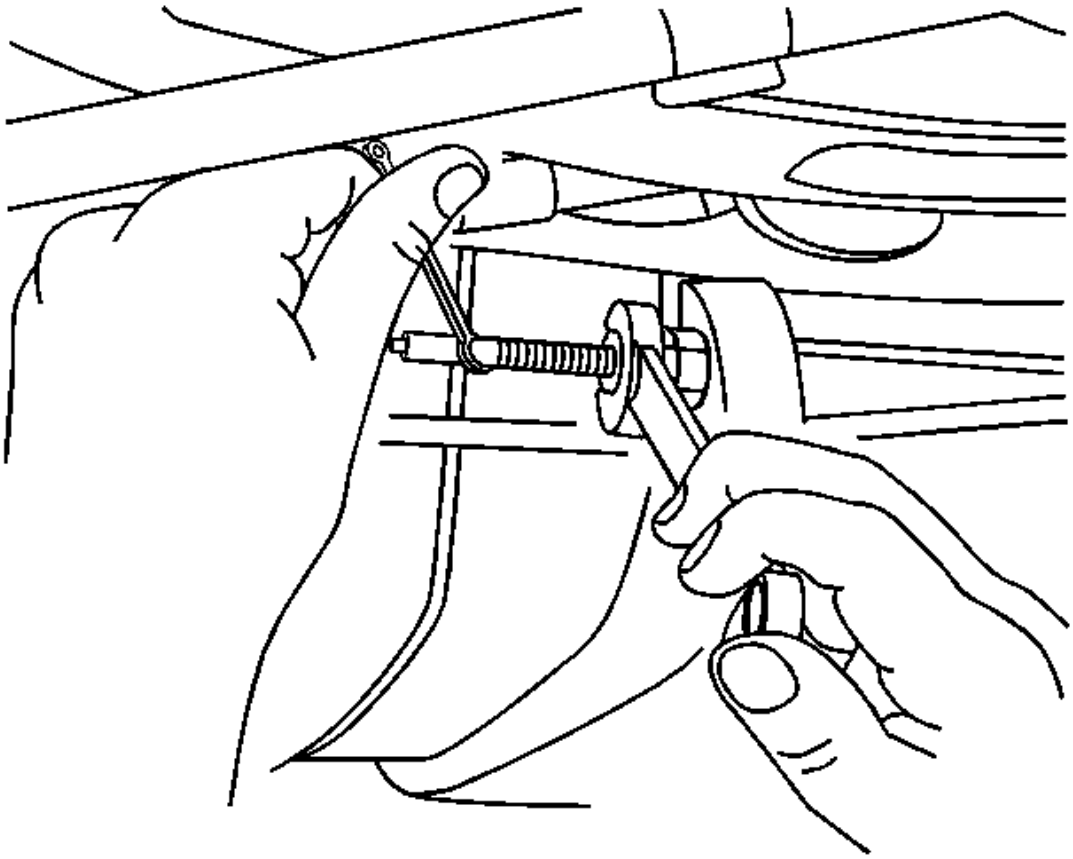

Fig. 2: Adjusting Park Brake Tension At Equalizer Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Relieve the cable tension at the park brake equalizer.

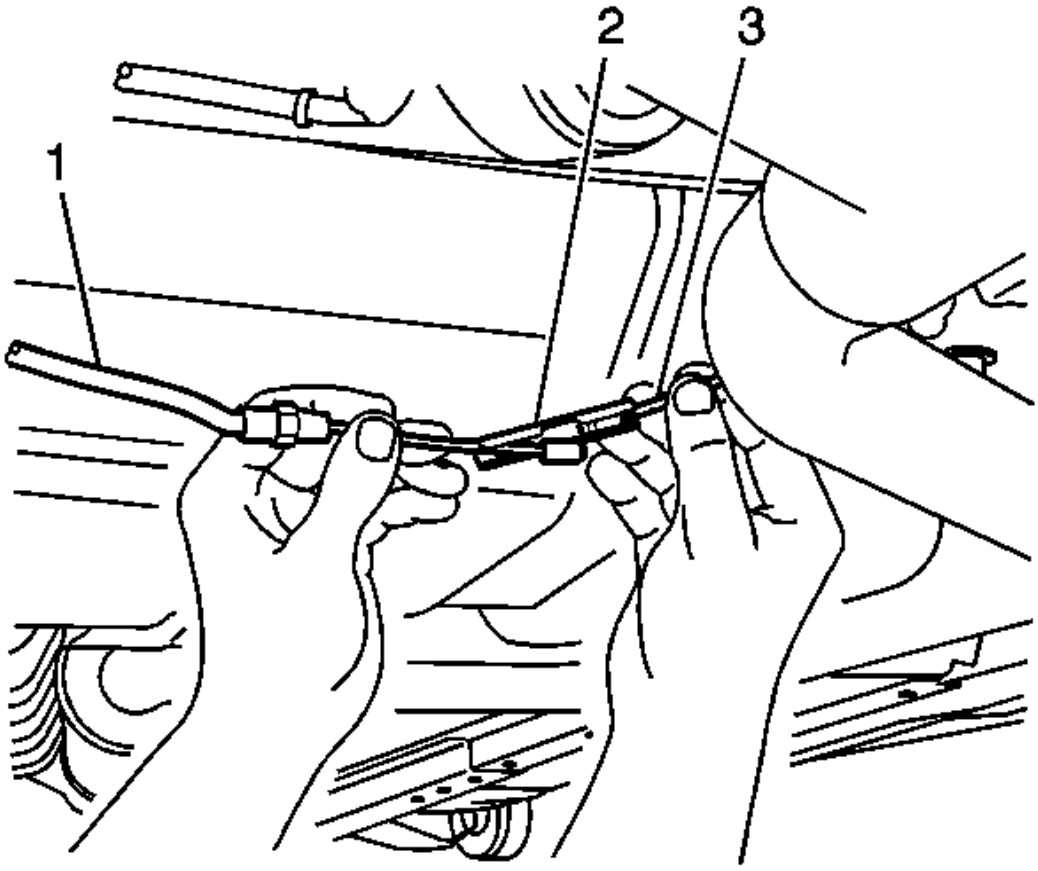

Fig. 3: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the front cable from the connector (2).
4. Lower the vehicle.
5. Remove the left side closeout/insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .
6. Remove the left side front carpet retainers. Refer to **Center Pillar Lower Trim Panel Replacement** .
7. Disconnect the electrical connector at the park brake switch.

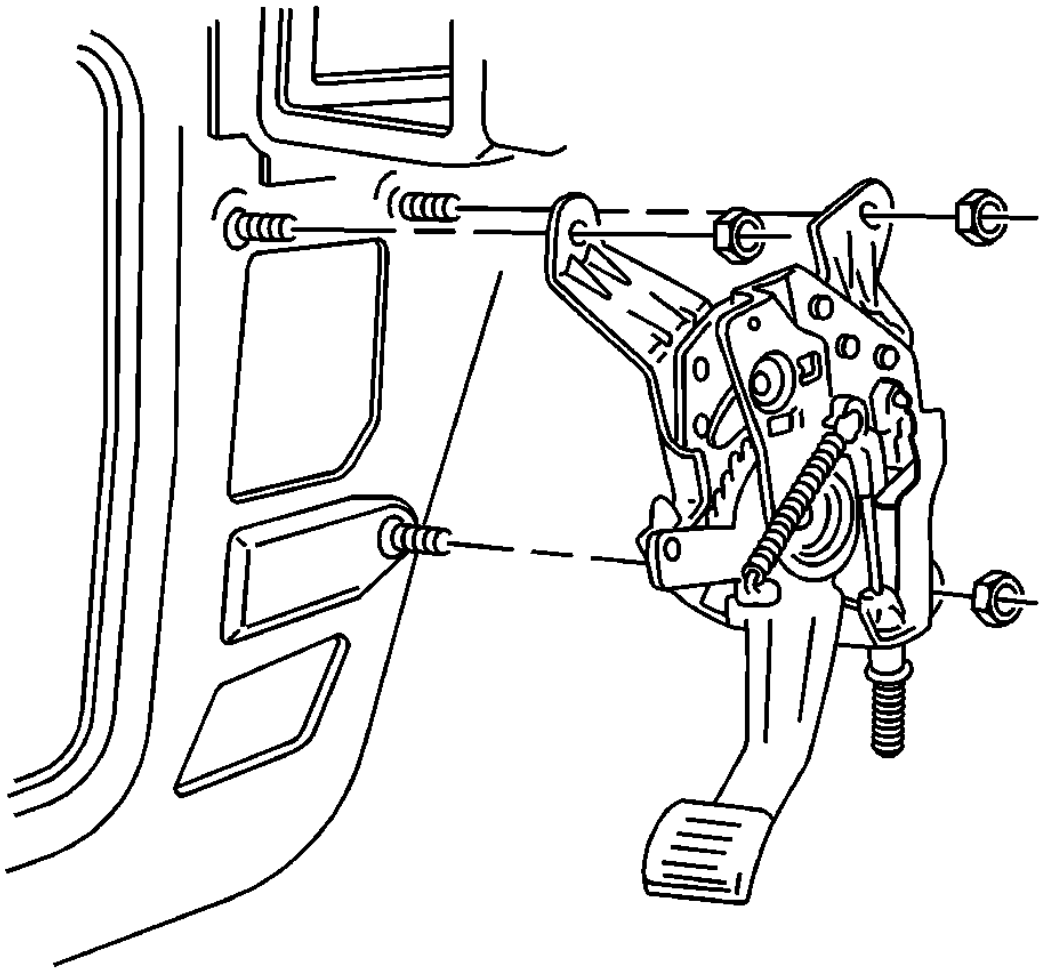

Fig. 4: Park Brake Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Remove the 3 park brake pedal assembly retraining nuts from the body mounting studs.

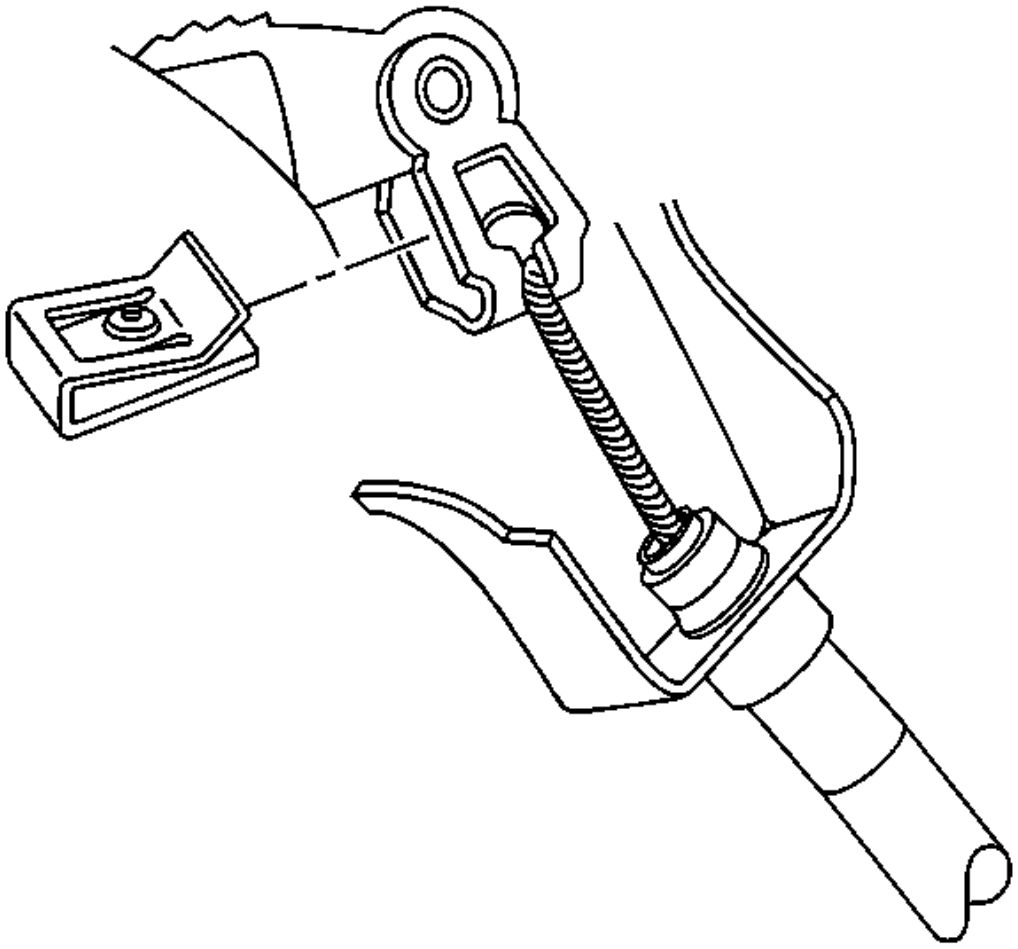

Fig. 5: View Of Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

9. Remove the retaining clip and disconnect the cable button from the clevis.
10. Use the **J 37043** parking brake cable release tool to release and remove cable from the bracket on the pedal assembly.
11. Remove the park brake pedal assembly.

Installation Procedure

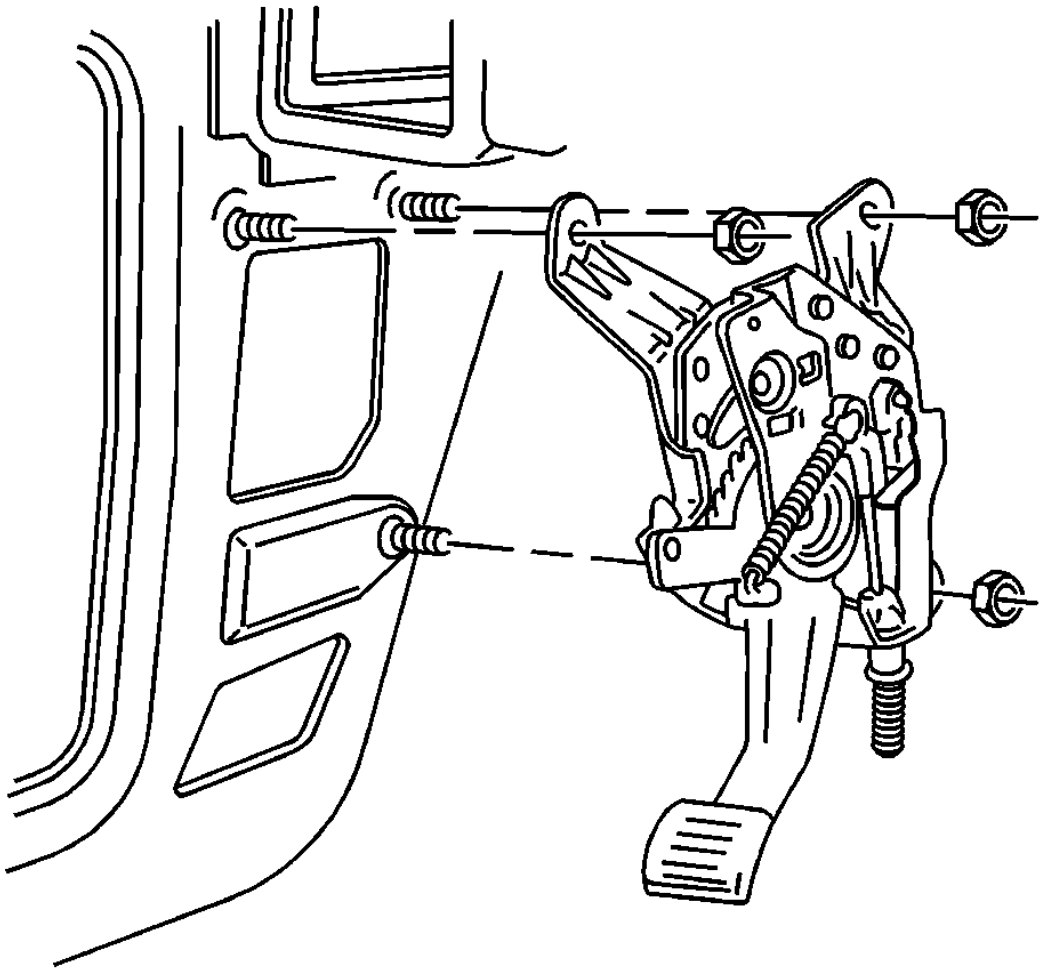

Fig. 6: Park Brake Pedal Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the park brake assembly onto the body mounting studs.

CAUTION: Refer to Fastener Caution .

2. Install the 3 park brake pedal assembly retaining nuts.

Tighten

Tighten the nuts to 25 N.m (18 lb ft).

3. Install the front park brake cable into the bracket on the park brake pedal assembly.

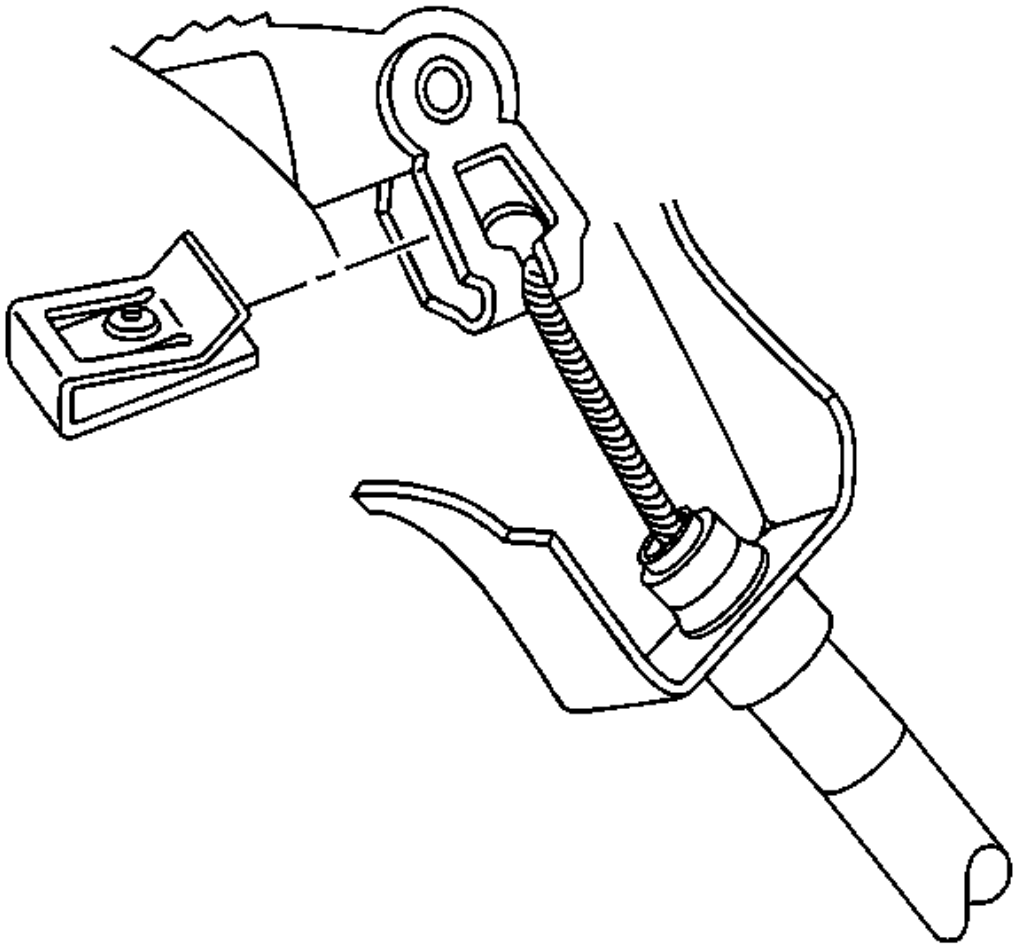

Fig. 7: View Of Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

4. Insert the cable button into the clevis and install the retaining clip.
5. Connect the electrical connector to the park brake switch.
6. Reposition the carpeting properly.
7. Install the left side carpet retainers and the lower center pillar trim panel on the left side. Refer to **Center Pillar Lower Trim Panel Replacement** .
8. Install the left side closeout/insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .
9. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
10. Install the front park brake cable through the park brake cable guides.
